A NEW

SYSTEM

OF

GEOGRAPHY:

OR

A General Deſcription of the World.

CONTAINING

A PARTICULAR and CIRCUMSTANTIAL ACCOUNT of all the COUNTRIES, KINGDOMS, and STATES of

EUROPE, ASIA, AFRICA, and AMERICA.

Their Situation, Climate, Mountains, Seas, Rivers, Lakes, &c.

The Religion, Manners, Cuſtoms, Manufactures, Trade, and Buildings of the Inhabitants.

WITH

The Birds, Beaſts, Reptiles, Inſects, the various Vegetables, and Minerals found in different REGIONS.

EMBELLISHED WITH

A New and Accurate Set of MAPS, by the beſt GEOGRAPHERS.

And Great Variety of COPPER-PLATES, containing PERSPECTIVE VIEWS of the Principal Cities, Structures, Ruins, &c.

By D. FENNING,

(Author of the Royal Engliſh Dictionary, the Uſe of the Globes, the Young Algebraiſt's Companion, &c.)

and J. COLLYER,

(Author of the Letters from Felicia to Charlotte; and Tranſlator of the MESSIAH and NOAH, from the German.)

There is not a Son or a Daughter of Adam but has ſome Concern in GEOGRAPHY. Dr. WATTS.

VOL. I.

The THIRD EDITION, REVISED, CORRECTED, and much IMPROVED.

LONDON:

Printed for J. PAYNE, and Sold by J. JOHNSON, No. 72. St. Paul's Church-Yard.

MDCCLXXI.

THE PREFACE.

IF we conſider Man as an inhabitant of the Earth, as a reaſonable Being endued with curioſity, as a member of Society, and as connected by commerce, and the interchange of arts and manufactures, with the moſt diſtant nations, few ſtudies can appear of ſuch importance, or procure more rational, more uſeful entertainment, than that of Geography. How great are the intellectual advantages ariſing from the contemplation of the different Religions, Manners, and Cuſtoms of our fellow-creatures! How adapted is this pleaſing ſtudy, not only to gratify the moſt unbounded curioſity, but to enlarge the mind, to baniſh prejudices, and to make us ſet a juſt eſtimate on our real characters and advantages! By examining the Hiſtory of the human Heart, and the uncultivated Mind, in various regions, where the abſurdeſt Prejudices uſurp the place of Reaſon; and Cruelty, Vice, Folly, and Tyranny are ſanctified by the venerable name of Religion; we ſhall ſee how much we owe to Education, to the Embelliſhments of Science, and to the purity of our Holy Religion--how much we are indebted to Providence for many peculiar bleſſings---how much to Heaven and our brave Forefathers, for the Syſtem of Religious and Civil Liberty handed down to us!

Even the various face of the Countries, from the ſultry Tropics to the frozen Poles, muſt afford a conſtant ſource of amuſement and delight. Here are extenſive plains and gently riſing hills, enamelled with flowers and adorned with fragrant groves; while, with theſe bleſſings, the wretched inhabitants faint under the too ardent rays of the ſcorching ſun, and bend under the yoke of ſlavery. There ſandy deſarts, diſplaying a dreary waſte: here lofty mountains, raiſing their ſnowy ſummits above the clouds. What a pleaſing amuſement will the moſt curious ſpecies of Trees and Shrubs, of Birds and Beaſts, of Inſects and Reptiles, of Amphibious Animals and Fiſhes, of Foſſils and Minerals, afford the inquiſitive mind! The Reader will inſenſibly know the aſtoniſhing works of Nature, and will become acquainted with Natural Hiſtory almoſt without deſign. While he who is verſed in the Tranſactions of Antient Times, will ſee once populous cities only diſtinguiſhed by ſplendid ruins; and the capitals of mighty empires deſtroyed, and lying in the midſt of deſarts. The Man of Humanity, and the Friend of Liberty, will, through this work, have frequent cauſe to pity the unhappy nations ſubject to the deſpotic tyranny of lewd and ambitious princes: fertile countries rendered deſarts by lawleſs rapine, and the few inhabitants involved in all the miſeries moſt dreadful to Human Nature. On the other hand, the Artiſt and the Manufacturer will, with pleaſure, view the rude or more finiſhed works of different countries; and the Merchant be inſtructed in the produce of every Nation.

This,

THE PREFACE.

This, however, is not the firſt attempt that has been made towards an Univerſal Syſtem of Geography; but as this ſcience is always improving by new diſcoveries, and countries being better known, this work has advantages which no others, at the time they were written, could poſſibly poſſeſs; the compiler being furniſhed with many excellent materials ſince publiſhed.

He has endeavoured to avoid dwelling on dry and unintereſting particulars, and to expreſs himſelf in an eaſy, intelligible, and entertaining manner. All poſſible care has alſo been taken to expunge the errors and fabulous accounts that have been too often copied from injudicious and romantic authors. For this purpoſe he has compared different deſcriptions of the ſame countries, and chiefly relied on perſons of acknowledged veracity and good ſenſe, who were eye-witneſſes of what they deſcribed; and makes a proper diſtinction between the ſentiments of the ignorant, the illiterate, the ſuperſtitious, and thoſe of perſons diſtinguiſhed by their genius and learning, who examine with philoſophical exactneſs, and deſcribe with accuracy.

No expence has been ſpared in the great variety of COPPER-PLATES, containing Maps and remarkable Landſcapes, perſpective Views of Cities, Palaces, and Ruins, &c. in which this Work exceeds every other of the kind yet publiſhed, by which means the reader will have a more adequate idea of what is deſcribed, than he could poſſibly receive from mere verbal Deſcriptions, unaccompanied by theſe ornamental Explanations.

This edition has been carefully reviſed, and conſiderably improved, by the compiler's having recourſe to the freſh materials that have ſince come to hand. Whatever miſtakes or omiſſions there were in the former edition, it is but juſtice to add, that they were not owing to the late Mr. FENNING, who, indeed, undertook to perform a part of the work, but other buſineſs prevented his writing any more than the Introduction, which was entirely by his hand. After this acknowledgment, it becomes neceſſary to add, that the candour and indulgence of the public, ſhewn by the ſpeedy ſale of large impreſſions of this work, have filled the compiler with the higheſt gratitude, and that in reviſing it for this edition, he has endeavoured to render it as complete as the nature of the ſubject will admit.

Of the EARTH *in general.*

THE earth is that terraqueous globe which we inhabit, and is called the fourth of the ſix primary planets.

The antients, it is evident, were unacquainted both with its figure and motion; ſome ſuppoſing it to be flat, others in the form of a cylinder; but it is plain, from the appearances of all the phænomena of nature, ſuch as the riſing and ſetting of the ſun, moon, and ſtars, and particularly in the obſervation of the eclipſes, that the earth is nearly ſpherical, becauſe the ſhadow of the moon caſt upon its ſurface is circular, which would not be were it not a globe, or nearly ſo; for, according to the obſervations of monſieur Richer, Sir Iſaac Newton, Mr. Huygens, and other the beſt mathematicians, there is about twenty-one of twenty-two miles difference in the diameter of the earth, viz. the diameter at the equator being about ſo much more than from pole to pole, it being there flatted a little, and therefore is not a true geometrical ſphere, but rather an oblate ſpheriod.

The diameter of the earth is about 7964 miles, (commonly expreſſed 8000) its circumference in ſquare miles about 25020, and its magnitude or ſolidity in cubic miles about 199,250,205: the diurnal, or daily motion round its own axis from weſt to eaſt is about twenty-three hours fifty ſix minutes, (commonly expreſſed twenty-four hours) and its annual motion or periodical time round the ſun is nearly three hundred and ſixty-five days ſix hours nine minutes, or a year: the circumference of her orbit is nearly 508,939,200 miles; ſo that its daily motion round the ſun is about 1,394,353 miles, her hourly motion about 58,098 miles, and the hourly motion round its own axis about 1042 miles; amazing celerity, which highly ſets forth infinite power and wiſdom!

The knowledge of arriving at theſe properties of the earth and heavens is attained by the ſtudy of thoſe two excellent ſciences called Aſtronomy and Geography; the firſt of which we intend to treat of, in as full and conſpicuous a manner as poſſible.

Of GEOGRAPHY *in general.*

Geography is that ſcience which treats of the globe of the earth, and inſtructs us in the knowledge of land and water, by pointing out to us thoſe properties which depend on quantity.

Geography is divided into two parts, Univerſal and Particular.

Univerſal Geography conſiders the earth in general without regard to particular countries, and treats more of the ſituation of the globe itſelf, its magnitude, figure, motion, &c.

Particular Geography not only conſiders the ſituations and conſtitution of each ſeparate country, but alſo informs us of their various laws, cuſtoms, religions, manners, &c. and acquaints us with every remarkable diſcovery on the ſurface of the earth; ſuch as oceans, ſeas, lakes, rivers, rocks, gulphs, mountains, iſlands, &c. together with the various poſition of the inhabitants in reſpect of each other, their different climates, riſing and ſetting of the ſun, length of days and nights, &c. and therefore this particular method of inſtruction is by ſome called Hiſtorical Geography. In ſhort,

The ſtudy and practice of this noble ſcience always was, and now is, thought worthy the attention of the firſt claſs of mankind: it is eſteemed one of the principal qualifications of polite literature, and according to the knowledge in, or want of it, education is more or leſs complete.

But why ſhould Geography be called a ſtudy? — It is nothing more than to read and remember matters of fact: therefore any perſon who attends to what is laid down in this Syſtem, may eaſily attain a competent knowledge both of Univerſal and Particular Geography in a ſhort time.

Of the DIVISION *of* LAND *and* WATER.

The globe is divided into four quarters, which by ſome geographers are called Europe, Aſia, Africa, and America; but we have treated firſt of Aſia for ſeveral reaſons, which are given under that head in the Syſtem itſelf.

Theſe four quarters are again ſubdivided into ten nominal parts, viz. 1. A Continent. 2. An Iſland. 3. A Promontory, or Cape. 4. A Peninſula. 5. An Iſthmus. 6. An Ocean. 7. A Lake. 8. A Bay. 9. A Gulph: and, 10. A Streight. The firſt five of which are land, and anſwer to the other five parts of waters, by correſponding numbers, as follows:

LAND.	WATER.
1. A Continent is a large tract, or vaſt extent of main land, not ſeparated by any ocean. Thus Europe, Aſia, Africa, &c. are Continents.	1. An Ocean, or Sea, is a large extent or collection of waters, free from land; ſuch as the Atlantic or Weſtern Ocean, the Indian Ocean, &c.
2. An iſland is a tract of land ſurrounded with water, as Great Britain, Ireland, Madagaſcar, &c.	2. A Lake is a tract of water ſurrounded by land; as the lake of Geneva, the Dead Sea, the Caſpian Sea, &c.
3. A Promontory, or Cape, is a portion or part of land running far into the ſea, as Cape Verde, Cape of Good Hope, &c.	3. A Bay is a portion or part of the ſea running far up the main land; as the Bay of Biſcay, Bay of Siam, &c.

LAND.

4. A Peninſula is a part or portion of the earth, almoſt ſurrounded with water, ſave only a narrow part or neck of land which ties or unties it to a continent; as Africa itſelf, Jutland, &c.

5. An Iſthmus is a narrow part of land, by which a peninſula is joined to a continent, or main land; as the Iſthmus of Panama, which joins North and South America together, the Iſthmus of Corinth, &c. &c.

WATER.

4. A Gulph, or inland ſea, is a part of the ocean almoſt ſurrounded with land, ſave ſome ſtreight or narrow gut of water by which it has communication with the ocean, as the Gulph of Arabia, the Mediterranean Sea, &c.

5. A Streight is a narrow paſſage or part of the ſea, which joins one ſea to another; as the Streights of Gibraltar, which joins the Mediterranean Sea to the Atlantic Ocean, the Streights of Babelmandel, &c. &c.

A farther Deſcription of the GLOBE *of the* EARTH, *with the imaginary great Circles and Appendants belonging.*

Great circles are ſuch as cut the globe in two equal parts, paſſing through the center: all ſuch as do not cut the ſphere in two parts are called leſſer circles. There are ſix in number, viz. the Equator or Equinoctial, the Ecliptic or Zodiac, the Brazen Meridian, the Horizon, and the Colures.

1. *Of the* EQUATOR.

The Equator on the Terreſtrial, or Equinoctial on the celeſtial globe, is a line, or circle, that cuts the globe in two equal parts, dividing the north from the ſouth; and upon the artificial globe is eaſily known by two broad lines running parallel to each other, and a fine hair line between them: it is divided into three hundred and ſixty equal parts, called degrees, beginning at the firſt meridian, (or ſign Aries) and is marked from 1 with 10, 20, 30, 40, &c. to 360 quite round: and on ſome globes you will find a cypher (0) at the meridian of London under the Equator, and runs on to 10, 20, 30, &c. to 180 degrees eaſt, called eaſt longitude; and 10, 20, 30, &c. to 180 to the left hand, to ſhew the weſt longitude.

2. *Of the* ECLIPTIC *and* ZODIAC.

The Ecliptic is another great circle of the ſphere, which cuts the Equator at the two points Aries and Libra, making an angle at each point of twenty-three degrees thirty minutes, which is its furtheſt, or remoteſt extent, either north or ſouth, from the Equator.

The Zodiac is a broad imaginary circle, which extends itſelf (according to the rules of aſtronomy) eight degrees on each ſide of the Ecliptic, and is that which contains the twelve ſigns, and in which the planets perform their revolutions. The line in the middle drawn parallel is called the Ecliptic, becauſe eclipſes happen in or near the line. It is alſo called *Via Solis*, the Suns path-way or motion. But in our modern Aſtronomy, it is that circle or path that the earth deſcribes to an eye placed in the center of the ſyſtem, viz. the ſun.

The Ecliptic (like the Equator) is divided into three hundred and ſixty degrees, but not numbered from 1, 10, &c. as the Equator, but is divided into twelve equal parts, containing thirty degrees each, which are called Signs, and have different names and characters; ſix of which are north, and ſix South, viz.

The ſix Northern SIGNS.

♈ Aries. ♉ Taurus. ♊ Gemini. ♋ Cancer. ♌ Leo. ♍ Virgo.

The ſix Southern SIGNS.

♎ Libra. ♏ Scorpio. ♐ Sagittarius. ♑ Capricorn. ♒ Aquarius. ♓ Piſces.

The Signs which ſtand oppoſite to each other ſhew the different ſeaſons of the year; thus Aries ♈ ſhews Spring, Libra ♎ is Autumn, Capricorn ♑ Winter, and Cancer ♋ Summer. Their ſignificant names are Aries ♈, or the Ram; Taurus ♉ the Bull; Gemini ♊ the Twins; Cancer ♋ the Crab; Leo ♌ the Lion; Virgo ♍ the Virgin; Libra ♎ the Scales; Scorpio ♏ the Scorpion; Sagittarius ♐ the Archer; Capricorn ♑ the Goat; Aquarius ♒ the Water-pot; and Piſces ♓ the Fiſhes.

N. B. The Ecliptic cuts or interſects the Equator, or Equinoctial, at the two points, or ſigns, Aries ♈ and Libra ♎, viz. on the twenty-firſt day of March and twenty-ſecond of September, N. S. on which days the ſun is in the Equator, and has no declination either north or ſouth, therefore days and nights are then equal to all the inhabitants on the globe of the earth.

3. *Of the* MERIDIAN.

The Meridian is another great circle, which divides the earth in two equal parts. It is repreſented on the artificial globe by a thick braſs hoop, which ſurrounds it from north to ſouth, and divides the Equator into two equal parts, viz. the eaſt from the weſt, and is that on which the globe itſelf is hung, or turns round upon by its axis, the extremities of which are called the Poles.

This Brazen Meridian, like the Equator and Ecliptic, is divided into three hundred and ſixty degrees; but with this difference, it is divided into four nineties, as follows: from the Equator toward

ward the North and South Poles, the Meridian is marked with a cypher over the Equator thus (o) and on each ſide with 10, 20, 30, 40, &c. to 90, which ends in the Equator.

The uſe of the Brazen Meridian is to ſhew the latitude of places, and their difference of latitude, either north or ſouth from the Equator: for the latitude of a place is the ſame as the elevation of the Pole above the Horizon. That is, whatever figures, or number, the Horizon cuts the Meridian in, ſo many degrees is the Pole elevated, which is the latitude.

4. *Of the* HORIZON.

The Horizon is that great circle which divides the Heavens and Earth into two equal parts, one called the Upper, and the other the Lower Hemiſphere. There are two ſorts, the one called the Senſible, or Natural, the other the Rational, or Mathematical Horizon.

The Senſible Horizon is that which divides the viſible part of the Heavens from the inviſible; as is that great circle which we ſee all around us, (ſtanding upon any hill, or at ſea) and ſeems as if the Heavens and the Earth coincided or joined together.

The Rational, or Real Horizon, is that which paſſes through the center of the Earth, and divides it (as was ſaid before) into the Upper and Lower Hemiſphere.

☞ This Rational Horizon is repreſented by that broad wooden circle, lying with its face upward, having two notches cut in it, one on the north and the other on the ſouth part, in which the Brazen Meridian is ſlipped or moved up and down with Pleaſure: the Poles of the Horizon are the Zenith and Nadir.

There are four circles on the face of the wooden Horizon, viz.

1. The inner circle, or that circle at the inward edge of the Globe, is divided into twelve equal Parts, or Signs, anſwering to the twelve Signs in the Ecliptic, with their names likewiſe prefixed to them: as to this Sign ♈ is wrote Aries, ♉ is wrote Taurus, and ſo of the reſt.

Note. Aries ♈ is in the eaſt, Libra ♎ in the weſt, Cancer ♋ in the north, and Capricorn ♑ in the ſouth point of the Horizon.

2. Next to theſe ſigns is a Calendar of Months, according to the Julian account, or Old Stile, (uſed in England till the year 1752) ſo that the inward circle being divided into degrees, anſwers the days of the month: for right againſt the day is the degree of each Sign the ſun enters in on any day; or, *vice verſa*, right againſt the Sign or Degree, is the day of the month anſwering thereto.

3. Next to this is another Calendar, according to the Gregorian account, (done by pope Gregory XIII. in the year 1582) called the New Stile, which is eleven days ſooner, or before the Old Stile, as may be ſeen by the poſition of the Calendar; the tenth of March, in the firſt or Old Calendar, being right againſt the twenty-firſt in the New, or Gregorian Calendar. This New Stile is now uſed by us in England, as well as in foreign nations, purſuant to an Act of Parliament in 1751.

Laſtly, On the outward verge of the Horizon is the circle of the Winds, or Rhumbs, viz. the Mariner's Compaſs, being 32 in number (beginning at the north): each Point, or Rhumb, contains 11¼ degrees; for 32 multiplyed by 11¼ make 360.

The uſe of the Horizon is to ſhew the Riſing and Setting of the Sun, Length of Day and Night; alſo the Riſing and Setting of the Stars in any latitude; together with the Azimuth, Amplitude, Almacantar, &c. of the Sun or any Star, and the point they riſe or ſet upon, &c.

5. *Of the* COLURES.

The Colures are two great circles, cutting the Equator at right angles, and paſs through the Pole of the World.

The Solſticial Colure is that great circle which paſſes through Cancer and Capricorn, ſhewing Winter and Summer.

The Equinoctial Colures paſs through Aries and Libra, and ſhew the Spring and Autumn.

Of the leſſer Circles of the SPHERE, *commonly called parallel Circles.*

All ſuch circles as do not divide or cut the Globe into two equal parts, but cut off any ſegment or part leſs than the half, are leſſer circles: thus all circles on either ſide of the Equator, which run parallel with the Equator, are leſſer circles, and leſs than each other as they approach the Poles: ſuch are the Tropics of Cancer and Capricorn, and all ſuch circles.

1. *Of the* TROPICS.

At the ſign Cancer, on the north part of the Globe, you will find a circle drawn with a double line from thence round the Globe, parallel to the Equator, which is called the North Tropic, or Tropic of Cancer, being 23½ degrees from the Equator northward, ſhewing the Sun's greateſt northern declination: and at the ſign Capricorn, you will find the ſame ſort of circle, which is called the Southern Tropic, being alſo 23½ degrees from the Equator, and ſhews the Sun's greateſt ſouthern declenſion, or variation from the Equinoctial.

2. *Of*

2. *Of the* POLAR CIRCLES.

There are two ſmall circles lying near the poles, viz. 23½ degrees diſtance, drawn alſo with double lines: that on the north is called the Arctic Circle, and that on the ſouth the Antartic Circle. Theſe circles are the Poles of the Ecliptic.

All thoſe inhabitants that live under theſe lines have their longeſt day juſt twenty-four hours, and their longeſt night the ſame, ſave the benefit of twilight, which is but trifling. If you go farther to the Poles, their days are two, three, and four days, ſix, two, three, four, and ſix Months long.

Of the Names of a SPHERE, *ſhewing the different Poſition or Situation of the Inhabitants of the Earth.*

There are three ſorts of Spheres, viz. a Parallel, a Right, and an Oblique Sphere.

1. *A* PARALLEL SPHERE.

A Parallel Sphere has this poſition: 1. The Poles are in the Zenith and Nadir; that is, one Pole is right up, and the other underneath. 2. The Equator will be in the Horizon.

The PROPERTY *of this* SPHERE.

The inhabitants of this Sphere are thoſe that live under the Poles, and have the longeſt days and nights of any other inhabitants; their ſhorteſt day being twenty-four hours long, and their longeſt ſix months.

2. *A* RIGHT SPHERE.

A Right Sphere has this poſition: 1. The Poles will lie or be in the Horizon. 2. The Equator will paſs through the Zenith and Nadir. 3. The Equator and all the leſſer circles will cut the Horizon at right angles, viz. perpendicularly.

The PROPERTY *of this* SPHERE.

The inhabitants of this Sphere are thoſe who live under the Equinoctial Line, or Equator, and have their days and nights always equal, viz. twelve hours each.

3. *An* OBLIQUE SPHERE.

An Oblique Sphere is the poſition of the Globe, that has the three following properties, viz. 1. One Pole is as much above the Horizon as the other is underneath. 2. The Equator is part above and part under the Horizon. 3. The Equator and all the parallel circles cut the Horizon obliquely.

The PROPERTY *of this* SPHERE.

The inhabitants of this Sphere are thoſe that live in all other parts except under the Poles and Equinoctial Line; and have their days and nights always unequal, except it be on thoſe two days when the ſun enters Aries and Libra.

Of the different Names of the Inhabitants of the Earth in reſpect of their Situation.

Theſe inhabitants lie under different meridians and parallels, and are ſix in number, viz. 1. Antæci. 2. Periæci. 3. Antipodes. 4. Amphiſcii. 5. Periſcii: and, 6. Heteroſcii.

1. *Of the* ANTÆCI.

The Antæci, or Antæcians, are thoſe inhabitants that have the ſame longitude; that is, lie under the ſame meridian, but have as many degrees latitude ſouth as we have north.

Their PROPERTY.

1. Their hour is the ſame as ours, it being noon, &c. with both at the ſame time. 2. Their days are equal to our nights, and *vice verſa:* and, 3. Their ſummer is our winter.

2. *Of the* PERIÆCI.

The Periæcians are thoſe that lie under the ſame parallel of latitude, on the ſame ſide of the Equator, only are diſtant a hundred and eighty degrees of longitude, viz. a ſemicircle.

Their PROPERTY.

1. They have contrary hours, being noon with them when it is mid-night with us. 2. Their day (and nights are of the ſame length of ours. 3. Their ſeaſon or time of the year is alſo the ſame as with us.

3. *Of the* ANTIPODES.

The Antipodes are ſuch inhabitants as have the ſame latitude ſouth as we have north, but differ a hundred and eighty degrees in longitude; that is, they have oppoſite parallels and oppoſite meridians.

Their PROPERTY.

Theſe inhabitants are, as it were, compounded with the former. For, 1. Their hours are contrary, being noon with one when it is midnight with the other. 2. The longeſt day of the one is the ſhorteſt day or longeſt night to the other: and, 3. The four ſeaſons are contrary, their ſummer being our winter, &c. &c.

4. *Of the* AMPHISCII.

They are ſo called becauſe their ſhadows are caſt different ways at different times of the year; that is, their ſhadow is ſouthward from March to September, and northward from September to March: therefore, it is eaſy to perceive theſe are inhabitants living in the Torrid Zone; that is, between the Equator and the two Tropics.

5. *Of the* PERISCII.

Theſe are ſo called becauſe they have their ſhadows go quite round them: ſuch, therefore, are the inhabitants that dwell between the Polar Circles and the Poles: that is, from 66½ degrees of latitude to 90.

6. *Of the* HETEROSCII.

They are ſo called, as having their ſhadow caſt but one way; that is, either always towards the north, or always toward the ſouth.

Theſe then are ſuch as live in the Temperate Zones; that is, between the Tropics and the Polar Circles. Thoſe in the ſouth Temperate Zone have their ſhadow fall always ſouthward, and thoſe in the north Temperate Zone have their ſhadows always caſt northward, as in England, France, Spain, and almoſt all Europe.

Of the ZONES *and* CLIMATES.

1. *Of the* ZONES.

A Zone, or Girdle, is a tract or ſpace that ſurrounds the ſurface of the earth, as a belt or girdle does the body, and are three in number, viz. 1. Torrid. 2. Temperate: and, 3. Frigid Zones.

1. The Torrid Zone extends from the Equator to the Tropic of Cancer northward, and to the Tropic of Capricorn ſouthward 23¼ degrees each, (very nearly), viz. 47 degrees in all.

2. The Temperate Zones extend themſelves from the two Tropics to the Polar Circles on both ſides the Equator, viz. 43 degrees each, being together 86 degrees.

3. The Frigid Zones extend from the Polar Circles to the Poles, being each 23½ degrees, viz. in breadth; ſo that 23½, 43, and 23½ makes 90 degrees, the diſtance from the Equator to either Pole: or rather thus, the Torrid Zones contain 47 degrees, the Temperate 86, and the Frigid 47, in all 180 degrees.

2. *Of the* CLIMATES.

Climates are tracts, or circles upon the ſurface of the Globe, of ſuch a certain breadth from the Equator to either pole, that the length of the artificial day, viz. from the ſun riſe to ſun-ſet, is juſt half an hour longer than in the next Climate nearer the Equator, till you come to the Polar Circles, and then indeed the day differs in each Climate one entire month.

There are ſixty Climates in all, viz. thirty on each ſide of the Equator, called accordingly North and South; of theſe ſixty, forty-eight of them extend from the Equator to the Polar Circles, and each differ by half hours; and the remaining twelve are contained between the Polar Circles and the Poles, each differing one entire month from the other, (as was ſaid before) and will more evidently appear by the following table.

A TABLE *of the different* CLIMATES *between the* EQUATOR *and* POLAR CIRCLES.

Climates.	Hours.	Latitude. D.	M.	Breadth. D.	M.	Climates.	Hours.	Latitude. D.	M.	Breadth. D.	M.

An EXPLANATION *of the moſt uſeful Terms uſed in Geography and Aſtronomy.*

1. Zenith is that point of the Heavens that is right over head.

2. Nadir is that right point under feet, being directly or diametrically oppoſite to the Zenith.

3. Zenith's Diſtance is the number of degrees that the ſun or any ſtar wants of ninety degrees, when they are upon the Meridian or greateſt height.

4. Altitude is height. Meridian Altitude is the greateſt altitude, or height, at twelve o'clock.

5. Declination is the diſtance of the ſun, or any ſtar, from the Equator, or Equinoctial, counted on the Brazen Meridian in degrees, and is called North or South, according to which ſide of the Equinoctial the Declination is.

6. Right Aſcenſion is an arch of the Equinoctial contained between the ſign Aries ♈ and the degree of the Equinoctial that is cut by the Brazen Meridian when the ſun, or ſtar, is brought to the Meridian.

7. Oblique Aſcenſion is that arch or degree of the Equinoctial contained between the Sign ♈ and the degree of the Equinoctial which is cut by the Horizon at the riſing of the ſun, or ſtar.

8. Oblique Deſcenſion is juſt the reverſe, being the degree of Equinoctial cut by the Horizon at the ſetting of the ſun, or ſtar.

9. Aſcenſional Difference is the difference of degrees between the Right and Oblique Aſcenſion, which converted into time, by allowing fifteen degrees for every hour, ſhews how much the ſun, or ſtar, riſes or ſets before or after ſix: that is, ſubſtract the Oblique from the Right Aſcenſion, tells the aſcenſional difference.

10. Amplitude is an arch of the Horizon contained between the true eaſt and weſt points at the riſing and ſetting of the ſun, or ſtars, counted in degrees from the eaſt and weſt points of the Horizon where they riſe and ſet, and is called North and South Amplitude accordingly.

11. Azimuth is in effect the ſame as Amplitude, ſave only with this difference, that whereas Amplitude is only at riſing and ſetting, Azimuth ſhews the diſtance from the eaſt and weſt points, at any time when the ſun, or ſtars, are above the Horizon.

Note. Azimuth is not expreſſed alike by all authors: ſome call it always North or South Azimuth, and reckon the Azimuth from thoſe two points eaſtward or weſtward. Others reckon it from the eaſt and weſt points, either northward or ſouthward, which I think is beſt, they being the two points that Azimuth is neareſt to, in our or any leſſer latitude, at any hour; however, it matters not which, if you mind this one rule; ſuppoſe I ſay, the ſun has ſixty degrees Azimuth from the north eaſtward, it is the ſame as if I ſay he has thirty degrees Azimuth from the eaſt northward.

12. Elevation of the Pole is the ſame as Latitude. There are three ſorts, viz.

Latitude of a place is its diſtance from the Equator, either north or ſouth, numbered in degrees on the Brazen Meridian; or in other words, it is the Elevation of the Pole above the Horizon.

Latitude of Navigation is the diſtance of a ſhip from the Equinoctial, counted on the Meridian: ſo that if a ſhip ſails towards the Equinoctial, ſhe is ſaid to depreſs the Pole; and if ſhe ſails from the Equinoctial, ſhe is ſaid to raiſe the Pole.

Latitude of a Star is its diſtance from the Ecliptic, being an arch of a circle of longitude, reckoned from the Ecliptic towards its Pole, either north or ſouth.

13. Longitude is alſo of three ſorts, viz.

Longitude of a place is an arch of the Equator intercepted between the firſt Meridian (or point Aries ♈) on the Equator and the Meridian of the place.

Longitude of a Star is an arch of the Ecliptic, counted from the beginning of Aries to the place where the ſtar's circle of longitude croſſes the Ecliptic; ſo that it may be ſaid to be the ſtar's place in the Ecliptic, counted from the point Aries, which cannot exceed an hundred and eighty from the Equinoctial Point.

Longitude in Navigation is an arch of the Equator contained between the firſt Meridian and the Meridian the ſhip is in.

Note 1. Longitude of places differ according to what firſt Meridian they are counted from; for ſome place their firſt Meridian at Gratioſo, others at Teneriff, and others at Ferrol.

Note 2. In order to find the longitude of any place on the Globe, only obſerve whether it be eaſt or weſt; if eaſtward, then count ſo many degrees from the point or ſign Aries ♈ on the Globe to the right hand; if weſtward, count ſo many degrees towards the left, which will be the eaſt or weſt longitude required: and the difference of the longitude of any two places is no more than their diſtance from each other counted in degrees on the Equator, or any parallel of latitude in proportion. But

Note

Note 3. If the longitude be taken from the Meridian of London, and you would then find the place to anſwer the following table of longitudes, you muſt remember that you obſerve how far the firſt Meridian is placed from the Meridian of London, and add or ſubſtract accordingly: thus on Senex's Globes the firſt Meridian is about eighteen degrees weſt of London, therefore all places that lie weſt of the firſt Meridian will have the longitude degrees leſs weſt on the Globe than in the table; but all places that lie to the eaſt or right hand of London, will have their longitude eighteen degrees more on the globe than in the table: thus the Havanna, by the following table, is eighty-four degrees weſt longitude of London; but you will find it but ſixty-ſix on the Globe, which is eighteen degrees leſs; and Pekin, a hundred and eleven degrees eaſt longitude in the tables, will by the ſame rule be eighteen degrees more from the firſt Meridian on the ſame Globe.

To find any Place in Maps of Counties.

The metropolis of England is London; therefore you will find London with a cypher at the bottom of the map. Seek then the latitude of the place given on the right or left hand ſide of the map, counting ſo many degrees and minutes upwards, and there place your finger; then count from London ſo many degrees eaſtward or weſtward, as the given longitude expreſſes; then moving this laſt figure directly upwards in the map till you come to an equal height with the firſt finger; move the ſaid firſt finger ſtraight or parallel along till they both coincide, and you will diſcover the place you ſought for.

TABLE I.

Of the LATITUDE *and* LONGITUDE *of the moſt principal Places in the known World, (according to the lateſt Obſervations) from the Meridian of London.*

The USE *of the* GLOBES.

PROBLEMS *on the* TERRESTRIAL GLOBE.

PROB. I.

The Latitude being given, to rectify the Globe for that Place.

Let it be required to rectify the Globe for the Latitude of London 51° 32′ north, and Madrid 40° 10′ north, proceed thus: Turn the pole on which the dial-plate is fixed towards the verge of the Horizon, ſlipping or moving the globe backwards or forwards in the notches of the Horizon, till the Horizon cuts the Brazen Meridian in 51° 32′ (viz. a little more than 51 and a half) ſo is the globe rectified for the latitude of London; that is, the North Pole will then be elevated 51° 32′ above the Horizon; and London being brought to the Meridian, will then be in the Zenith, or right up, and at equal diſtance from all parts of the Horizon.

Depreſs the Pole till the Horizon cuts the Brazen Meridian at 40° 10′ and you have then the poſition of the inhabitants at Madrid; and turning the globe till Madrid comes to the Meridian, you will find it in the Zenith, or top of the globe, under 40° 10′.

Note. If it were required to rectify the globe for ſouth latitude, then you muſt elevate the South Pole to the given latitude inſtead of the North Pole; but this is better explained by the next Problem.

PROB. II.

The Latitude and Longitude of any Place given, to find the ſame.

Firſt, You are to obſerve whether the Longitude be reckoned from London, or from the firſt Meridian; for on ſome globes the firſt Meridian begins 23°, on others 20°, and on Senex's globes 18° weſt of London; but if once you know where the firſt Meridian is on the globe, it is very eaſy to know the difference from the Meridian of London.

Example. There are two certain places, one has 17° 30′ north latitude, and 77° 5′ weſt longitude; the other is 34° 30′ ſouth latitude, and 16° 20′ eaſt longitude from London; I demand what places theſe are?

Rule. For the firſt place, I elevate to the North Pole 17° 30′, becauſe it is 17° 30′ north latitude: then I turn the globe to the right hand, or eaſtward, (becauſe the place lies weſtward) till 77° 5′ upon the Equator, counted from the Meridian of London (which has a cypher thus (o) on the Equator) paſſes through or under the Meridian: or, in other words, I turn the globe till 77° 5′ weſtward is brought under the Meridian, and here I fix the globe with a quill thruſt in between the globe and the Horizon; then I look under the latitude 17° 30′, (which is the Zenith) on the Meridian a-top of the globe, and under 17° 30′ on the Meridian I find Port Royal, in Jamaica, the place required.

For the ſecond place I elevate the South Pole (though there is no occaſion to elevate the Pole barely to find a place, but it is better, becauſe you have then the real ſituation of the inhabitants) to the given latitude 34° 30′ ſouth, and then turn the globe till 16° 20′ eaſt longitude of London come under the Meridian. Then I look under the latitude 34° 30′ on the Meridian, and juſt under this I find the Cape of Good Hope, the place required.

PROB. III.

The Latitude of any Place given, to tell all thoſe Places that have the ſame Latitude.

Definition. All thoſe places that have the ſame latitude, have the days and nights of the ſame length at the ſame time of the year.

Rule. Bring the given place, or places, to the Meridian, (ſuppoſe London 51° 32′, and Madrid 40° 10′ north) then turn the globe, and all thoſe places that paſs under 50° 32′, have the ſame latitude as London, viz. Prague in Germany, &c. and all thoſe that paſs under 40° 10′, have the ſame latitude as Madrid, which you will find to be Pekin nearly, for one, and many other places.

PROB. IV.

To tell the Difference of the Latitude of Places.

Here are two variations, or rules.

Firſt, If the latitudes be both north or both ſouth, then ſubtract the leſs from the greater latitude, and the remainder is the difference, or anſwer. Thus between London and Madrid is 12° 32′; the firſt being 50° 32′, and the other 40°. And between Candy and Stockholm is 52° 30′, for Stockholm is about 59° 30′ north, and Candy 7° 30′ north.

Secondly, If one place lie on the north, and the other on the ſouth ſide of the Equator; (that is, if one be north and the other ſouth latitude) then add them both together, and their ſum is the difference of the latitude required.

Thus Copenhagen is 55° 40′ north, and the iſland of Madagaſcar is 19° 30′ ſouth; theſe added together make 75° 10′, the difference of latitude required.

PROB. V.

The Longitude of any Place given from any Meridian, to tell thoſe Places having the ſame Longitude.

This is done after the ſame manner as the other, only here the anſwer will be on the Equator, as the others were on the Meridian.

We would know what places have the ſame longitude as London, and the ſame longitude as Moſcow.

The Rule is, bring London to the Meridian, then all thoſe places on the globe (from the North Pole, to the ſouth part of the Horizon) that lie under the edge of the Meridian, have the ſame longitude as London. Thus Fort Naſſau, and Fort Mina, in Geneva, have the ſame, or very nearly the ſame longitude as London.

And Moſcow, in Muſcovia, has very nearly the ſame longitude as Aleppo, in Syria: alſo Scanderoon, Antioch, and Tripoli, in Syria, have the ſame longitude, viz. between 37 and 38° eaſt of London.

PROB. VI.

To find the Difference of the Longitude of Places.

Definition. No place can exceed or be above 180° of Longitude from another place; for 181° eaſt longitude is with more propriety 179° weſt longitude, for 180° taken from 360° there remains 179°, which is nearer to the given place than 181°.

Rule. Here are two variations.

Firſt, If the places lie both eaſt or both weſt of the firſt Meridian, or where you reckon the longitude from, viz. if they both be eaſt or both be weſt longitude, then ſubtract one from the other, you have the difference.

Thus Jeruſalem is found 36° 15′ eaſt Longitude from London, and Pekin 117° eaſt longitude; therefore ſubtract 36° 15′ from 117′, and there remains 80° 15′ difference of longitude eaſt or weſt; that is, Pekin is 80° 15′ eaſt longitude of Jeruſalem; or Jeruſalem is 80° 15′ weſt longitude of Pekin.

Secondly, If one place be eaſt and the other weſt longitude of the firſt Meridian, (ſuppoſe London, or any other Meridian) then add their longitudes together, and the ſum is the difference of longitude required.

Example. To know the difference of the Longitude between Jeruſalem 36° 15′ eaſt of London, and Port Royal in Jamaica 77° 5′ weſt.

Here as one is eaſt and the other weſt, add 36° 15′ and 77° 5′ together, and their ſum makes 113° 20′ difference of longitude: that is, Jeruſalem is 113° 20′ eaſt of Port Royal, or Port Royal is 113° 20′ weſt of Jeruſalem.

Example. Pekin in China is 117° eaſt longitude, and Port Royal is 77° 5′ weſt; add theſe ſums together, and 194° 5′ will be found the difference of longitude; but becauſe it is more than 180°, ſubtract 194° 5′ from 360°, and there remains 165° 55′ the difference required.

Moſt of the following problems are common to both globes.

PROB. VII.

The Day of the Month given, to find the Sun's Place in the Ecliptic.

Rule. The day of the month being given, look on the inner calendar on the new globes, and you have the ſign and the degree of that ſign that the ſun is in for that day, according to the New Stile.

If it be upon old globes, look on the outward calendar, you have the ſign and the degree of the ſign.

N. B. It may be further obſerved, that the calendar uſed through Europe, is the calendar for N.S. viz. New Stile, and is always known from the other, becauſe it has the ſaints days, and ſeveral other things wrote upon it on the Horizon.

Example. To know the ſun's place in the Ecliptic on May the 21ſt, N. S. March the 21ſt, June the 21ſt, September the 22d, and December the 21ſt.

Look for theſe days of the month in order as they ſtand in the new calendar; (viz. for N. S. before deſcribed) and right againſt the day of the month, in the innermoſt circle on the Horizon, is found the ſun's place among the ſigns as follows:

Thus right againſt Map the 21ſt is found 1° of ♊ Gemini: and alſo on March the 21ſt is found he enters ♈ Aries: on June 21ſt he enters ♋ Cancer: on September the 22d he enters ♎ Libra: and on December the 21ſt he enters ♑ Capricorn.

Note, That in every problem and operations hereafter, except Old Stile be mentioned, it is to be underſtood for New Stile, viz. N. S. and latitude always means north latitude, except expreſſed ſouth.

PROB. VIII.

The Sun's Place given, to find the Day of the Month.

This is only the reverſe of the former problem; for having the ſun's place given, ſeek it in the innermoſt circle among the ſigns; then againſt that degree in the calendar N. S. you have the Day of the month required.

Example.

Example. To know what time of the year the ſun is in 1° of ♊, as alſo when he enters ♈, ♎, ♑, and ♋: proceed according to the rule, and you will find the days to be May the 21ſt, March the 21ſt, June the 21ſt, September the 22d, and December the 21ſt, as in the laſt.

PROB. IX.

The Latitude and Day of the Month given, to find the Sun's Place in the Ecliptic, and rectify the Globes for Uſe.

Rule. Find the ſun's place on the Horizon by *Prob.* vii. and having noted what degree he is in, look upon the Ecliptic on the globe, and find the ſame ſign and degree as you did on the Horizon; then bring this degree of the Ecliptic very carefully to the graduated edge of the Brazen Meridian, and holding the globe ſteady, turn the index exactly to the upper twelve, (which repreſents twelve at noon) and thus is the globe rectified for that day; and the degree of the Ecliptic that lies under the Equator repreſents the ſun's place at noon, or twelve o'clock, that day.

Note, The Aſtronomer's day is reckoned from or begins at twelve o'clock; and if you fix the quadrant of altitude to the latitude in the Zenith, the globe will be compleatly rectified.

PROB. X.

To find the Declination of the Sun on any Day of the Year.

Rule. Having found the ſun's place in the Ecliptic for the given day, bring it to the Brazen Meridian, and obſerve what degree of the Meridian it lies under, and whether it be on the north or on the ſouth ſide of the Equator, for that is the declination required, which is called north or ſouth declination accordingly. Thus on April the 21ſt the ſun has 11° 30′ north declination, and on May the 21ſt he has 20° 30′ declination, but on October the 27th he has 20° 30′ ſouth declination.

PROB. XI.

The Latitude and Day of the Month given, to tell the Sun's Meridian Altitude, viz. his Height at Noon.

Rule. Bring the ſun's place to the Meridian, and obſerve what degree of the Meridian the ſun's place is under; for thoſe degrees on the Meridian that are intercepted, or lie between the ſouth verge of the Horizon, and the degree which is over the ſun's place on the Meridian, (counted on the Meridian) is the ſun's Meridian altitude required.

Thus is found his Meridian altitude at London, May the 21ſt, to be 59°; but on November the 5th he has but 23° 30′ altitude.

PROB. XII.

The Latitude and Day of the Month given, to tell the Sun's Altitude at any Time.

Example. On May the 21ſt, at nine in the morning, and at five in the afternoon at London, to know the ſun's altitude or height.

Rule. Rectify the globe for the latitude, and bring the ſun's place (1° ♊) to the Meridian, and the index to the upper twelve on the dial-plate; then ſkrew the quadrant of altitude in the Zenith, (viz. the left edge of the nut muſt be fixed on the Meridian at 51° 32′) then turn the globe till the index points to the hour, viz. nine in the morning; this done, fix the globe by thruſting in a quill between it and the Horizon: laſtly, turn the quadrant about till the graduated or figured edge touch the ſun's place, (viz. 1° ♊) and the degrees on the quadrant, counted from the Horizon upward on the quadrant, is his height at that time, viz. 43° 30′. Then turn the globe till the index point to five in the afternoon; and alſo turn the quadrant on the weſt ſide, (without unſkrewing it) till it touches the ſun's place (and you have about 24° on the quadrant, his altitude at that time.

N. B. At North Cape (viz. north latitude 72°) at nine in the morning May 21, he will be but about 32° high.

PROB. XIII.

The Latitude given, to tell the Riſing and Setting of the Sun, and Length of the Day and Night at any Time of the Year in any Place.

Rule. Rectify the globe, (viz. elevate it for the latitude, bring the ſun's place to the Meridian, and index to the upper twelve) then turn it till the ſun's place comes even with, or lies right againſt the inner verge on the eaſt ſide of the Horizon, then the index will ſhew you the time of the ſun's riſing: turn it to the weſt ſide, or verge of the Horizon, and the index will ſhew the ſetting. Or thus, having got the hour the ſun riſes, count how many it wants of Twelve, for ſo many hours will it ſet after. Thus, if the index points to four in the morning at riſing, it will of courſe ſet at eight at night, &c.

Note 1. If you double the time of riſing, that is, double the hours it wants of twelve at the time of riſing, it gives you the length of the day from ſun-riſing to ſun-ſetting.

Note 2. If you ſubtract the length of the day, from ſun-riſing to ſun ſetting, from twenty-four, the remainder ſhews you the length of the night, twilight included.

Proceed thus, and you will find the ſun, on May 26, at London, to riſe about four in the morning, and ſets at eight at night. Now double what he wants of twelve at riſing, viz. eight hours, and it gives the length of that day at London, viz. ſixteen hours.

PROB. XIV.

To tell the Sun's right Aſcenſion.

Bring the ſun's place to the Brazen Meridian, and note what degree of the Equator is cut by the Meridian, for that is his right aſcenſion required.

To know the ſun's right aſcenſion on March the 21ſt, June the 21ſt, September the 22d, and December the 21ſt.

Find the ſun's place for theſe different days, and bringing it to the Meridian, it is found the Meridian cuts the Equator in 0, in 90, in 180, and in 270, his right aſcenſion required

Note. When the ſun enters ♈, March the 21ſt, he has no right aſcenſion, becauſe it is counted from, or begins at ♈; therefore, on March the 20th, he muſt have his greateſt right aſcenſion, viz. 359°.

PROB. XV.

To find the Sun's oblique Aſcenſion and Deſcenſion at any Time, and in any Latitude.

Rule 1. Rectify the globe for the latitude, and bring the ſun's place down to the eaſtern verge of the Horizon, then obſerve what degree the Horizon cuts the Equator in, for that is the oblique aſcenſion required.

2. Turn the globe till the ſun's place come to, or lies level with the weſtern verge of the Horizon, and the degree of the Equator cut by the Horizon is the oblique deſcenſion required.

Thus on March the 21ſt, June the 21ſt, September the 22d, and December the 21ſt, viz. when the ſun enters ♈, ♋, ♎, and ♑, you will find his oblique aſcenſion will be 0, 56, 180, and 304.

And on the ſame days his oblique deſcenſion will be 0, 123, 180, and 237 and a half.

PROB. XVI.

The Latitude and Day of the Month given, to tell the Sun's aſcenſional Difference, viz. how much he riſes or ſets before and after ſix; and conſequently to tell the Length of the Days, ſuppoſe there were no index to the Globe.

Rule. By the laſt problem find the ſun's right and oblique aſcenſion; then ſubtract the oblique from the right aſcenſion, or the contrary, and the remainder is the aſcenſional difference required; which divide by fifteen, the degrees of the Equator that paſs through the Meridian for one hour (or ſeven and a half for half an hour) gives the anſwer in time that the ſun riſes and ſets before and after ſix.

Thus on May the 26th is found the ſun 6° of ♊, and his right aſcenſion is 64°, and on the ſame day his oblique aſcenſion is 34°; now 34° from 64°, there remains 30°, his aſcenſional difference; which divided by fifteen gives two hours, the time that he riſes before or ſets after ſix.

N. B. The right exceeds the oblique aſcenſion from ♑ to ♎, when the ſun riſes before ſix: but the other half year that he riſes after, or ſets before ſix, the oblique exceeds the right aſcenſion.

PROB. XVII.

The Latitude and Day of the Month given, to tell the Sun's Amplitude, viz. his Diſtance from the eaſt and weſt Points at his riſing and ſetting, and the Points of the Compaſs he riſes and ſets upon.

Rule. The globe being rectified, bring the ſun's place to the eaſtern verge of the Horizon, (which ſhews his riſing) then the degrees upon the innermoſt circle of the Horizon, counted from the true eaſt point to that point in the Horizon, which is oppoſite the ſun's place on the globe, ſhews you the ſun's amplitude.

Proceed according to the rule, you will find the ſun's amplitude at London, (May the 21ſt) at riſing to be about 34° from the eaſt to the north, and at ſetting 34° from the weſt to the north, and the point he riſes upon is north-eaſt by eaſt, and ſets north-weſt by weſt. But on November the fifth he has about 25° and a half amplitude from the eaſt to the ſouth, and at ſetting 25° and a half from the weſt to the ſouth. The point he riſes upon is eaſt-ſouth eaſt, and the point he ſets upon is weſt-ſouth-weſt.

PROB. XVIII.

The Latitude and Days given, to tell the Sun's Azimuth, viz. his Diſtance from the Eaſt and Weſt, or from the North and South Points at any Time.

Rule. Rectify the globe in general, then turn the globe till the index points to the given hour; this being done, turn the quadrant till it touches the ſun's place for the given day; and then the quadrant will cut the Horizon in the Azimuth required from the eaſt or weſt points, or from the north or ſouth points, for you may reckon from either, only then name it properly and accordingly.

Thus on Auguſt the 17th, at nine in the morning, the ſun will have about 30° Azimuth from the eaſt to the ſouth; or, which is the ſame, 60° from the ſouth to the eaſt, for 60° and 30° make 90°, the whole quarter from eaſt to ſouth.

N. B. Some authors call this 60° ſouth amplitude; but others call it 30° ſouth amplitude; that is, 30° from the eaſt to the ſouth, as was ſaid before.

PROB. XIX.

The Latitude, Day, and Hour given, to tell the Sun's Almacantar.

Definition. Almacantars are circles of Altitude that run parallel to the Horizon, whoſe poles are the Zenith and Nadir; ſo that you may imagine as many circles of altitude, viz. Almacantars, as you pleaſe.

Rule. The almacantar is found the ſame as the altitude of the ſun at any time, therefore we refer you back to *Prob.* xiii.

PROB. XX.

The Latitude and Length of the Day given, to tell what other Day of the Year will be of the same Length.

Rule. Having found the sun's place for the given day, bring it to the Meridian, and observe well its declination; then turn the globe till some other degree of the Ecliptic comes under the same degree of declination under the Meridian; this being done, see what day of the month answers to the sun's place then under the Meridian, for that is the day required, which you may easily prove.

Thus you will find that July the 13th, and August the 20th, is of the same length as May the 26th, and April the 17th.

PROB. XXI.

The Latitude and Day given, to tell the Beginning, Ending, and (consequently) the Length, or Continuance, of Twilight.

Definition. Twilight is that faint light which begins immediately after the sun sets in the evening, and continues till he is 18° below the Horizon; and it begins in the morning when the sun comes within 18° of the Horizon on the east side, and ends when he rises: therefore it is plain, that twilight is not only longer when days encrease in length, but it is also much stronger, as you will see by the work of the problem.

Observation. You were told that twilight begins and ends when the sun is 18° below the Horizon, and as the quadrant of altitude reaches no lower than the Horizon, therefore the Rule is this:

Rectify the globe, and bring the opposite degree of the sun's place to the quadrant of altitude, so that it touches just 18° on the quadrant, (then it is plain that the sun's real place will be depressed 18° below the Horizon (then look on the index, for that will point (if among the morning hours) to the beginning, or (if among the evening hours) ending of twilight.

Note 1. What is meant by the opposite place of the sun, is this; it is that degree of the Ecliptic opposite to (or 180° from) the given place of the sun. Thus, suppose the sun was in ♈, then bring its opposite sign (viz. ♎) to 18° on the quadrant, so will ♈ be depressed 18°, and the index will shew the hour.

Note 2. There is no real night at London (but twilight) from May the 22d to July the 20th, the sun all that time being less than 18° below the Horizon.

Proceed then according to the Rule, and you will find that on March the 21st, and September the 22d, twilight begins about four in the morning, and ends about eight at night.

The sun on these days you know rises and sets at six. Add, therefore, the length of morning and evening twilight to twelve hours, (the length of the days then) and it gives sixteen hours; this subtracted from twenty-four hours, leaves eight hours, the length of the real or dark night.

So also on April the 24th twilight begins about half past two, and ends about half past nine, which is in all seven hours. But on December the 20th it begins at six, and ends at six, which is in all but three hours and forty minutes.

PROB. XXII.

The Hour given, where you are to tell what Hour it is in any other Part of the World.

Rule. Bring the given place to the Meridian, and set the index at the given hour; then turn the globe till the other place, or places, come under the Meridian, and the index will point to the real time in the place required.

Example. When it is two o'clock in the afternoon at London, to know the time at Jerusalem, and at Port Royal in Jamaica.

Proceed according to the Rule, and you will find, that when it is two in the afternoon at London, it is twenty-five minutes past four at Jerusalem; and but fifty-two minutes past eight in the morning at Port Royal.

Or thus, by *Prob.* vi. Jerusalem is 36° 15′ east longitude of London: divide therefore 36° 15′ by fifteen, and the quotient is two hours, and the remainder is six, which is six times four, or twenty-four minutes, and the odd fifteen minutes, or miles, is one minute; so that the difference is two hours twenty-five minutes: and as Jerusalem is east of London, it has its hour before us, therefore it is twenty-five minutes after four in the afternoon. And thus for other places.

PROB. XXIII.

The day of the Month given, to tell those Inhabitants that will have the Sun in their Zenith (or over their Heads) on that Day.

Observation. This cannot happen to any other inhabitants but in the Torrid Zones, that is, to all such as have not above 23° and a half of Latitude, either north or south.

Rule. Bring the sun's place to the Meridian, and observe exactly his declination for that day; then turn the globe any way, and observe what places pass under that degree of declination on the Meridian; for all such will have the sun right over their heads some time or other on that day.

To know what inhabitants, or places, will have the sun in their Zenith on May the 21st.

Proceed as directed by the Rule, you will find St. Jago in Hispaniola, St. Jago in Cuba, Campeachy, and many other places will pass under that degree of declination, (viz. 20° north) and will have the sun in their Zenith that day.

Alſo on April the 16th the inhabitants of Porto Bello, the Oroonoko iſlands, Bay of Siam, Iſle of Ceylon, and the Philippine iſlands, will have the ſun that day in or near their Zenith.

PROB. XXIV.

The Day and Hour given in any Place, to tell thoſe Inhabitants, or that Place, to which the Sun is then vertical, viz. in the Zenith.

Rule. Bring the given place to the Brazen Meridian, and turn the index to the given hour; this done, turn the globe till the index points to the upper twelve, or noon; then look under the degree of declination on the globe for that day, for that is the very ſpot, or place, to which the ſun is then vertical.

Example. On May the 13th, at eight minutes paſt five in the afternoon, at London, to know what place has the ſun then in Zenith. *Anſwer.* Port Royal in Jamaica.

N. B. There are two days in which the ſun is vertical to all the inhabitants in the Torrid Zones, which muſt be when the ſun has the ſame declination, and in this Problem will be July the 27th, viz. the ſame declination as on May the 13th.

Thus alſo you will find when it is thirty-three minutes paſt ſix in the morning at London, on April the 12th, and Auguſt the 28th, the inhabitants at Candy, in the iſland of Ceylon, will have the ſun then nearly in their Zenith.

PROB. XXV.

To tell the Diſtance from one Place to another in Degrees and Minutes (viz. Miles) in an Arch of a great Circle: * *as alſo their Bearing, or Situation, in reſpect of each other.*

Rule. Bring one of the places to the Meridian, and elevate the globe for the latitude of it, and fix the quadrant in the Zenith: then turn the globe till the quadrant touches the other place, and the degrees on the quadrant between place and place ſhew the diſtance; and the quadrant at the ſame time will cut the Horizon in the point of the compaſs, called the bearing, or ſituation, from the firſt place.

Example. To know the diſtance from London to Port Royal, Jeruſalem, and Moſcow; as alſo their Situation in reſpect of London.

Proceed according to the Rule, and you will find that from London

	Deg.		Miles.
To Port Royal	68½	viz. nearly	4760½ W.
To Jeruſalem	33¼		2311 E. S. E.
To Moſcow	23		1598½ E. N. E.

PROB. XXVI.

The Latitude and Day given, to tell what Time the Sun will be due Eaſt or Weſt.

Rule. Rectify the globe and quadrant as before directed: then turn the quadrant till it touches the eaſt or weſt point of the Horizon; this done, turn the globe tilll the ſun's place for the given day comes to the edge of the quadrant (holding the quadrant to the eaſt or weſt point) ſo will the index point to the hour of his being due eaſt or weſt on that day.

Proceed thus, and you will find above five minutes paſt ſeven in the morning, on May the 21ſt at London, the ſun will be due eaſt, and about five minutes before five in the evening due weſt. On June the 21ſt he will be due eaſt about twenty-two minutes paſt ſeven in the morning, &c. but on December the 21ſt he is due eaſt about thirty-five minutes paſt four in the morning, and due weſt about twenty-five minutes paſt ſeven in the evening.

PROB. XXVII.

To find the Antæci to any Place, (ſuppoſe London.)

Bring London to the Meridian, and count on the Meridian from the Equator as many degrees latitude ſouth as London has north, (viz. 51° 32′) and there make a dot, for that is the place of the Antæci.

PROB. XXVIII.

To find the Periæci to any Place.

Bring London to the Meridian, and turn the globe till 180° of longitude paſs under the Meridian, then under the ſame latitude as London, (viz. under 51° 32′ north latitude) make a dot, for that is the place of the Periœci, to be in the Great South Sea 51° 32′ ſouth latitude, and 180° longitude.

Thus alſo the Antipodes to Cape Antonia in South America is the Bay of Nankin in China: and the Antipodes to Barbadoes is a little ſhoal in the Streights of Sapy.

* *Note.* Sixty miles, or minutes, are reckoned a degree in general; but this is a vulgar error, for it is proved that every degree on the earth's ſurface is every great circle (ſuch as the Equator, Meridian, &c.) is ſixty-nine miles and a half; therefore multiply the degrees by ſixty-nine and a half, you have the diſtance in Engliſh miles.

PROB.

PROB. XXIX.

To find the Antipodes.

There are three ways, but the two beſt are theſe:

1. Bring London to the north verge of the Horizon: which is done by ſlipping the globe up and down till London lies cloſe the edge of the Brazen Meridian, and cloſe to the Horizon on the north: this being done, look on the ſouth verge of the Horizon cloſe to the Brazen Meridian, and there make a dot on the globe, and you have the Antipodes.

2. Bring London to the Meridian, and turn the globe till 180° paſs through the Meridian, and there fix the globe; then count from the Equator ſouthward on the Meridian 51° 32′, and you will find the ſame dot to lie cloſe to the Meridian (at 51° 32′) below the ſouth part of the Horizon.

PROB. XXX.

The longeſt Day in any Latitude given, (ſuppoſing London ſixteen Hours and a Half) to tell in what other Latitude the longeſt Day is one, two, three, &c. Hours longer than in the given Place.

Rule. Rectify the globe for the given latitude, (viz. London) and bring the ſolſticial Colure (viz. ♑) to the Meridian; then where the Horizon cuts the Tropic of ♒ make a dot on the Tropic at the verge of the Horizon: this done, turn the globe weſtward, till 7° and a half of the Equator paſs under the Meridian, and then make a ſecond dot on the Tropic againſt the Horizon as before; then turn the globe back to its firſt poſition, (viz. to ♑) and then elevate the pole, till the ſecond dot appears at the edge of the Horizon, and the Horizon at the ſame time will cut the Meridian in the latitude required.

Proceed as above, and you will find that in the latitude 56° 20′, the days are one hour longer than at London.

2. If you want to know the latitude where the day is two hours longer than at London, then proceed as before, only inſtead of cauſing 7° and a half to paſs under the Meridian, you muſt now turn the globe till 15° paſs under the Meridian, and make then a ſecond dot on the Tropic, and proceed as before.

Note, If you want to know the latitude where the longeſt day is an hour ſhorter than at London, only turn the globe eaſtward inſtead of weſtward, till ſeven degrees and a half paſs through the Meridian, and make a prick on the Tropic, and depreſs the pole till this lies even with the Horizon, you will find the latitude about 45° and a half. Thus for two hours longer about 60°, for four hours about 64° 20; but for two hours ſhorter the latitude is about 35° and a half.

PROB. XXXI.

Any Time not exceeding ſix Months given, to tell that Latitude, or thoſe Places, where the Sun will not ſet for all that Time.

Note. That twenty-eight days are here reckoned to the month. Bring the given time into days, and take the half of the number of days; but remember to abate one if the half exceeds thirty; then count from Cancer on the Ecliptic the ſame number of degrees as the half amounted to, and where this reckoning ends make a dot on the Ecliptic. Laſtly, Bring this dot to the Meridian, and as many degrees as are intercepted, or lie between the dot and the pole itſelf, counted on the Meridian, is the latitude required.

Example. The place, or latitude, is demanded where the ſun does not ſet for the ſpace of four months and ſixteen days.

This is in all one hundred and twenty-eight days, the half is 64°, abate 1° is 63°; this I count from ♒ on the Ecliptic, and make a dot, and bringing it to the Meridian, it is found there are nearly 80° between the dot and the pole, viz. the latitude is 80°, which is at Smith's Inlet, the upper part of Greenland.

So alſo in the latitude of 85°, he ſets not for five months two weeks. And in the latitude of 86° 30′, for five months three weeks and three days; and in the latitude 90°, not for ſix months; as you will ſee by the next problem.

PROB. XXXII.

To tell in the Latitude ninety (the longeſt Day there being ſix Months) how long it continues to be Twilight after Sun-ſet; and how long their Night is after Twilight ends, before Twilight begins again.

Note, Remember you were told before, that twilight begins and ends when the ſun is 18° below the Horizon, and that on September the 22d, the ſun begins to ſet to the inhabitants at the North Pole, and to riſe to the inhabitants at the South Pole; ſo that twilight begins September the 22d to the inhabitants at the North Pole; therefore

Rule 1. Elevate the pole to the Zenith, and turn the globe till ſome degree of the ſun's place in the Ecliptic lies under 18° of the Brazen Meridian, and under the ſouth part of the Horizon, and you will find it 24° ♏, viz. November the 14th, the ending of twilight; that is, they have twilight from September the 22d, to November the 14th, and then they begin to have dark nights (ſave the advantage of the moon) till the 24th of January. For,

2. Turn the globe till ſome other point of the Ecliptic comes under 18° as before, and you will find it about 5° of ♒, which anſwers to the 24th of January, the beginning of twilight to the inhabitants at the North Pole, and then on March the 21ſt he riſes with them.

Thus it appears, that the length of their day (from ſun-riſing to ſun-ſetting) is from March the 21ſt to September the 21ſt. The length or continuance of twilight, is from September the 21ſt to November the 14th, and from January the 24th to March the 21ſt, in all about one hundred and ten days, and their real night is from November the 14th to January the 24th, viz. about ſeventy-one days.

Note. The ſame holds good to the ſouthern inhabitants at the South Pole, for he riſes with them when he enters to ♎, and ſets with them when he comes to ♈, &c.

PROBLEMS *on the* CELESTIAL GLOBE.

PROB. I.

To find the right Aſcenſion of any Star.

Bring the center of the ſtar to the Meridian, and the degree of the Equinoctial, cut by the Meridian, is the right aſcenſion required.

Thus you will find the right aſcenſion of Aldebaran in Taurus to be about 65°, Arcturus in Bootes about 210° 45′, Regel in Orion about 75° 30′, and Sirius, or the Dog-Star, about 98°, &c, &c.

PROB. II.

The Latitude given, to tell the oblique Aſcenſion and Deſcenſion of any Star.

Rectify the globe, and bring the Star down to the eaſtern verge of the Horizon, and the degree of the Equinoctial that is then cut by the Horizon, is the oblique aſcenſion required. Turn the ſtar to the weſtern ſide, and the degree of the Equinoctial, cut by the Horizon, is the ſtar's oblique deſcenſion.

Proceed thus, and you will find the oblique aſcenſion of Regel to be about 86° 30′, of Marhal in Pegaſus about 325°, and of Aldebaran, or Bull's-eye, about 43° 30′. Turn each of theſe to the weſtern ſide, you will find their oblique deſcenſion 64° 360° nearly, and 87°.

Note. There is this difference between the right and oblique aſcenſion and deſcenſion of the ſun and ſtars: for the ſun's oblique aſcenſion, &c. differs every day in the ſame latitude, but the ſtars oblique aſcenſion is every day the ſame.

PROB. III.

To tell the Declination of the Stars.

As for the ſun's place, ſo alſo here, bring the given ſtar to the Brazen Meridian, and obſerve what degree of the Meridian lies right over the center of the ſtar, for that is the declination either north or ſouth, according to which ſide the equinoctial it lies.

Thus you will find the declination of Aldebaran to be about 16° 45 north. The upper Pointer to the Pole in Urſa Major about 63°½, and the lower one nearly 58°½, but Regel in Orion I find about 8°¾ ſouth, and Cor Scorpio about 26° ſouth declination, &c. &c.

PROB. IV.

The right Aſcenſion and Declination of any Star given, to find the ſame at once.

Bring the given degree of right aſcenſion on the Equator to the Brazen Meridian, then look under the degree of declination on the Meridian, and you will find the ſtar at the Meridian under the given degree of declination.

Thus, ſuppoſe it was wanted to find Aldebaran, whoſe right aſcenſion is 65°, and his declination 16° 45′ north: firſt bring 65° of the Equinoctial to the Meridian: and looking under 16° 45′ north, declination on the Meridian, is found Aldebaran.

So alſo Sirius has 98° right aſcenſion, and 16° 30′ ſouth declination; therefore bring 98° of the Equinoctial to the Meridian, and looking under 16° 30′ ſouth declination on the Meridian is found Sirius juſt at the Meridian. The ſame for any other ſtar.

PROB. V.

To tell the riſing and ſetting of the Stars, and the Point of the Compaſs any Star riſes or ſets upon in any Latitude, and on any Day of the Year.

Rectify the globe, and bring the ſun's place to the Meridian; then turn the globe till the given ſtar comes to the eaſtern verge of the Horizon, and the index will point to the time of riſing, and the Horizon will ſhew the point it riſes upon: turn it to the weſt, and the index will point to the time of ſetting, and the Horizon will ſhew you the point it ſets upon.

Proceed thus, and you will find that Aldebaran, on November the fifth at London, riſes a little paſt ſix in the evening, and ſets about nine in the morning. The point he riſes upon is eaſt-north-eaſt, and the point he ſets upon is weſt north-weſt. But Regel in Orion, the ſame night, riſes a little

little before nine at night, and ſets about half paſt ſeven in the morning. The points of riſing are weſt by ſouth, and ſetting eaſt by ſouth.

Note, The ſtars riſe and ſet every day on the ſame point of the compaſs, though at contrary hours.

PROB. VI.

To tell the Time, viz. how many hours any Star continues above the Horizon, from its Riſing to its Setting, in any Latitude.

Rectify the globe, then bring the ſtar to the eaſtern verge, and note the time of riſing; then turn the globe to the weſtern ſide, and the number of hours that paſſed through the dial-plate tells you the continuance of that ſtar above the Horizon.

Thus Aldebaran is found at London to continue up from the time of his riſing on any day (for example take December the 25th) about fifteen hours; and Regel about ten hours and a half.

At Stockholm Aldebaran continues up above ſixteen hours; but at Port Royal he continues up but about twelve hours three quarters.

PROB. VII.

To tell the Diſtance of one Star from another in Degrees and Minutes, in the Arch of a great Circle.

To this Problem are three variations:

1. If the ſtars lie under the ſame Meridian, bring them to the Brazen Meridian, and the degrees intercepted between them, counted on the Meridian, is the diſtance required.

Thus is found the two pointers in the Great Bear to be about $5°\frac{1}{2}$ diſtant from each other; and Aridef and the Dolphin's Eye about $29°\frac{1}{2}$ diſtant.

2. If they lie under the ſame declination, being the firſt (at pleaſure) to the Brazen Meridian, and note the degrees cut by the Equator; then bring the other to the Meridian, and note how many degrees difference has paſſed through the Meridian, for that is their diſtance required.

Thus is found the difference between Aſſengue and Caput Meduſæ to be about $122°\frac{1}{2}$; for Aſſengue ($38°\frac{1}{2}$ declination) being brought to the Meridian, cuts 277° 30′, viz. 82° 30′ from ♈ weſtward; and Caput Meduſæ cuts 40° of the Equator eaſtward; their diſtance therefore is 122° 30′.

3. If neither of the ſtars lie under the ſame degree of the Meridian, or declination, then bring either of them to the Meridian, and elevate the pole to the ſame height as the ſtar has declination, (that is, the ſame as you elevate the terreſtrial globe to the latitude of a place) for then the ſtar will be in the Zenith: therefore fix the quadrant to the Zenith, over the center of the given ſtar, and extend it to the other ſtar, and the degrees on the quadrant is the diſtance required in a true arch of a great circle.

Note. Though the diſtance of the ſtars from each other are thus determined in degrees, yet you are not to ſuppoſe their diſtance is ſo many degrees to be converted into Engliſh miles; but it only means, that they appear ſo far diſtant under ſuch an angle.

Thus is found the diſtance between Capella and Cor Hydra to be about 79°, and between Aldebaran and Sirius about 46° 30′, &c.

4. If the ſtars be at ſuch a diſtance from each other, that the quadrant will not reach them, then bring either of them to the Horizon, and elevate or depreſs the pole, till the other lies alſo at th verge of the Horizon, and the degrees counted upon the Horizon, between ſtar and ſtar, is th diſtance in degrees.

Thus between Aldebaran and Cor Scorpio you will find about 170°.

PROB. VIII.

The Latitude, Day of the Month, and Height of any Star given, to tell the Time or Hour of the Night.

Rule. Rectify the globe for the latitude, &c. &c. then fix the quadrant in the Zenith, and move the globe and the quadrant together, till the ſtar cuts the quadrant in the given height; and the index will point to the hour.

Thus on January the 21ſt (at London) in the evening Aldebaran, was obſerved eaſt ſouth-eaſt to be about 40° high; the time of this obſervation is demanded? *Anſ.* A little paſt five in the evening. Again, on December the 25th, in the evening, Sirius was obſerved to be about 15° high, and at the ſame time Regel to be about $28°\frac{1}{2}$; the hour is demanded? *Anſ.* About ten at night; and Aldebaran is under the Meridian at the ſame time.

PROB. IX.

To tell what Stars never riſe, and thoſe that never ſet at London.

1. Only obſerve what ſtars have above $38°\frac{1}{2}$ north declination; for all ſuch never ſet at London, but are always above the Horizon.

2. Obſerve alſo thoſe ſtars that have above $38°\frac{1}{2}$ ſouth declination, for thoſe never riſe, but are always under the Horizon at London.

Thus the Pointers in the Great Bear, Aridef in Cygnus, and many others, never ſet.

Alſo Canobus in Argo, Navis and Pes Centaurus, and many others, never riſe at London.

Note 1. From what has been ſaid it is eaſy to conceive, that to the inhabitants under the North Pole no ſouth ſtar can ever be ſeen; nor can the inhabitants at the South Pole ever ſee one of the ſtars in the other hemiſphere. But,

2. The inhabitants under the Equator have a pleaſant ſight of all the ſtars from pole to pole; for they riſe and ſet with them at right angles; therefore no ſtar can continue above twelve hours above this Horizon.

PROB. X.

To know at any Time of the Year (in the Latitude of London) where to find any Star, or to tell the Name of any Star at Pleaſure.

Rectify the globe for the day, and turn it till the index points to the given hour; then by a quadrant take the height of the required ſtar; or, for want of this (in a common way of gueſſing) obſerve well what part of the heavens it is in, viz. whether eaſt-north-eaſt, ſouth-weſt, or the like; as alſo its height as near as you can gueſs. This being done, ſet the globe in due order for the day and hour, and you will find the ſame ſtar on the globe; and, by applying the quadrant, you will find the exact point of the compaſs, and the real height the ſtar then has, which, though not perhaps near to what you gueſſed it at, yet, if it be any noted ſtar, you may aſſure yourſelf you were right, as there is no other ſtar of note near it about that height, and upon the ſame point.

Thus, on December the 25th, at eight at night, was obſerved a bright ſtar (as near as can be gueſſed) on the ſouth-eaſt point, and about 48° high; It is deſired to know what ſtar it is? *Anſ.* Aldebaran.

I rectify the globe, and turn the index to the hour, and then turn the quadrant to the given point of the compaſs, and looking about 48° high on the quadrant, Aldebaran is found to be the neareſt bright ſtar by the quadrant on that point and height; therefore I conclude it is Aldebaran.

Alſo at three quarters paſt ten, the ſame night, was ſeen two very bright ſtars, one on, or near, the Meridian, about 30° high, and the other near the ſouth-eaſt point, and about 35° high; I demand their names? *Anſ.* Regel and Procyon in Canicula.

PROB. XI.

To tell the Latitude and Longitude of the Stars.

Firſt, Obſerve whether the given ſtar be on the north or ſouth ſide of the Ecliptic; for if it be on the north ſide, elevate the North Pole 66°½, and turn the globe till ♋ and ♑ lie in the north and ſouth points of the Horizon, viz. the Ecliptic will be parallel, or even to the Horizon, and fix the quadrant in the Zenith; then keeping the globe ſteady, turn the quadrant till the edge of it touches the center of the ſtar; and that degree on the quadrant, viz. the altitude of the ſtar in the latitude 66°½, is the latitude required, and the degree of the Ecliptic, cut by the quadrant, reckoned from Aries (or rather reckoned among the ſigns, as it happens) is the longitude required.

Thus you will find Arcturus in Bootes to be about 30°½ north latitude, and 230° longitude from ♈ or rather 23° of ♎. Alſo, Alcair is about 29°½ bf north Latitude, and 28° of longitude in ♒.

2. *For any ſouth ſtar.* Elevate the South Pole 66°½, and fix the quadrant in the Zenith, and apply it to the ſtar, as before directed, you have the latitude and longitude required. Thus you will find Pes Centaurus to have about 42°½ of ſouth latitude, and 236° longitude from ♈, or rather 26° in ♏; and thus for any other ſtar.

PROB. XII.

The Latitude and Day of the Month given (ſuppoſe December 25, at Nine at Night at London) to ſet the Globe ſo as to repreſent the Face of the Heavens at that Time, and ſhew your Acquaintance, the Name and Poſition of the moſt eminent fixed Stars.

Rectify the globe for the latitude, and bring the ſun's place to the Meridian, and the index to twelve: then turn the globe to the given hour, viz. five minutes paſt nine at night, and there fix it, ſo will every ſtar on the globe (if you ſet the globe north and ſouth) correſpond with, or point to the ſame ſtar in the heavens.

Thus (at London) is found Capella eaſt by ſouth about 75° high, Caſtor and Pollux, one about 40°, and the other about 45° high, near the eaſt point: Procyon below them, to the left hand, 23° high eaſt-ſouth-eaſt: Sirius yet lower, to the left, ſouth-eaſt about 10° high: Betelgeuze higher, on the ſame point, about 38° high; Regel, more ſouthward, about 26° high: Aldebaran, on the ſame point, much higher, viz. about 53°: the Seven Stars, or Pleiades, ſouth nearly about 62° high: Mencar, ſouth by weſt 40° high: Aridef, north-weſt about 26° high, &c. &c.

PROB. XIII.

To tell the Time of the acronical Riſing and Setting of any Star.

Definition. 1. The acronical riſing of a ſtar is when the ſtar riſes juſt at the ſun-ſet.

2. A ſtar is ſaid to ſet acronically when it ſets with the ſun.

Bring the ſun's place for the given day to the weſtern ſide of the Horizon, and all thoſe ſtars that are on, or near the eaſtern ſide of the Horizon, riſe acronically; and thoſe on the weſtern verge of the Horizon ſet acronically.

Thus it is found on December the ſixth, that Aldebaran riſes acronically, but it ſets acronically on May the 21ſt. Alſo Sirius riſes acronically on February the fourth, and ſets acronically on May the fourteenth.

PROB. XIV.

To tell the cosmical Rising and Setting of the Stars in any Latitude.

Definition. 1. A star is said to rise cosmically when it rises with the sun.

2. A star is said to set cosmically when it sets at sun-rising.

Rectify the globe, &c. and bring the sun's place to the eastern side of the Horizon for the given day; then all those stars cut by the eastern verge of the Horizon rise cosmically. The globe still remaining in the same position, look at the western verge or edge of the Horizon, and all those stars cut by it, or that are very near it, set on that day cosmically.

Thus is found that Arcturus, and two small stars in Herculos's Thigh, rise cosmically September the 25th. Also two stars in Eridanus, Asseugue in Lyra, &c. &c. set cosmically. Marhal in Pegasus is but just below the Horizon, therefore may be said to set nearly cosmically, as it will within a day or two.

For the cosmical setting. Turn the globe till the star comes to the western side of the Horizon, and observe the degree of the Ecliptic then cut by the eastern side of the Horizon, for that will answer to the day of the cosmical setting.

Thus Arcturus sets cosmically June the 22d: also Aldebaran sets cosmically December the 20th.

PROB. XV.

To tell the heliacal rising or setting of the Stars.

Definition. 1. Heliacal rising is when a star once in the sun's beams gets out of them, so as to be seen at the eastern verge of the Horizon, just before sun-rising.

2. Heliacal setting is when a star once in the sun's beams gets out of them, so as to be seen setting on the western side of the horizon, just after sun-set.

Note 1. This heliacal rising and setting of the stars is different, according to their different magnitudes. For,

Note 2. Stars of the first magnitude are seen rising and setting, when the sun is but 12° below the Horizon. Stars of the second magnitude are not perfectly seen till the sun is 13° below the Horizon. Those of the third degree, when he is 14°. Those of the fourth degree of magnitude when he is 15° below the Horizon. Those of the fifth degree, when he is 16°. Those of the sixth degree, when he is 17°; and the nebulous, or small ones, not till he is 18° below the Horizon, viz. about the beginning and ending of twilight.

To find the heliacal rising or setting, the Rule is, rectify the globe, and bring the given star to the eastern verge of the Horizon; then fix the globe, and turn the quadrant to the western side, till 12° of the quadrant touches the Ecliptic; this done, note the degree of the Ecliptic that is cut by 12° of the quadrant on the western side, (for then will the real place of the sun be depressed 12° on the eastern side) for that degree sought in the calendar gives the heliacal rising. The same is to be observed with the quadrant on the eastern side of the heliacal setting. Thus you will find Aldebaran rises heliacally July the fourth, sets heliacally May the fifth; and Sirius, the Dog Star, rises heliacally about August the 26th.

Note, The poets, and others, formerly used to reckon their *Dies Caniculares*, or Dog Days, from the heliacal rising of Sirius; but they did not agree when they ended. Some reckoned them to continue thirty or forty, and others fifty days. However, in this they agreed, that the weather at that time was very sultry and faint for five or six weeks after the rising of Sirius. But (as it was then, so now) it is a ridiculous whim; for Sirius does not now rise heliacally till near September, though our Almanack-makers (for what reason is not known) continue the beginning of Dog Days July the 30th. But, however, it is plain that Sirius can no ways be charged with bringing this sultry weather; because three or four thousand years hence he will not rise heliacally till November, and then, perhaps, will be charged with bringing as much cold by the same rule.

PROBLEMS *in* NAVIGATION.

PROB. I.

The Sun's Declination and Hour when he is due East given, to find the Latitude, viz. the Elevation of the Pole.

Rectify the globe to the same latitude as the given number of degrees of declination, and fix the quadrant in the Zenith; then convert the hours that the sun is due east before, or after, six o'clock into degrees, and count the same number of degrees on the horizon from the east point southward, and bring the quadrant to that degree of the Horizon, so shall the degree on the quadrant that is cut by the Equator be the complement of latitude; which taken from 90°, gives the latitude itself, or height of the pole.

Example. Sailing May the 21st, an observation was made that the sun was due east about seven minutes past seven in the morning, and his declination 20′ north; it is demanded what latitude I was in?

Proceed by the Rule, you will find the latitude to be 51°½ nearly.

PROB.

PROB. II.

Having the Sun's Azimuth at six o'Clock, and Declination, to find the Latitude.

Rule. As many degrees as are contained in the Azimuth given, so much elevate the pole, and fix the quadrant in the Zenith, and bring ♈ to the Meridian: this done, count on the quadrant upwards the complement of the sun's declination to ninety, and bring that degree to the Equator; then the degree of the Horizon cut by the quadrant, shall be the complement of latitude, counted from the south point, or else from the north, as it may happen, and the remainder to ninety is the latitude required; or otherwise, the degrees counted from the other two cardinal points, either east or west, as it may happen, will give the latitude.

Thus is found the sun's azimuth, at six o'clock, to be 12° 15′, and his declination 20° 10′, what is the latitude? Work according to the rule, you will have the answer 38°½ complement, that is, 51°½ latitude required.

PROB. III.

The Sun's Amplitude and ascensional Difference given, to find the Elevation of the Pole, and Sun's Declination.

Rule. Raise or elevate the pole so many degrees as is the ascensional difference, and fix the quadrant in the Zenith, and bring ♈ to the Meridian; then count on the quadrant upwards the complement of altitude, and move the quadrant till that same number on the quadrant cuts the Equator; and the quadrant will cut the Horizon in the degree of the pole's elevation, and the Equator in the degree of declination.

PROB. IV.

The Sun's Altitude East, and his Declination given, to prove the Elevation of the Pole.

Rule. Elevate the pole to the complement of the sun's altitude at east, and fix the quadrant in the Zenith, and bring ♈ to the Meridian; then number on the quadrant of altitude, the degree of declination, and bringing the same to the equator, observe what degree the quadrant cuts the Equator in; for its complement to 90° is the height of the pole.

Example. The sun's declination is 20° 10′ north, his altitude at east (at London) is nearly 26°, it is desired to know whether the supposed latitude (51°½) agrees herewith in operation.

Here subtract 36° from 90°, and there remains 64° complement of altitude, and elevate the pole accordingly, &c. Then bring ♈ to the Meridian, and cause 20° 10′ on the quadrant to cut the Equator, and you will find it nearly 38°½, the complement of latitude required; which subtracted from 90° gives 51°½, the real latitude of the place.

PROB. V.

The Sun's Declination and Amplitude given, to find the Height of the Pole.

Rule. Elevate the pole to the complement of amplitude, and fix the quadrant in the Zenith, and bring ♈ to the Meridian; then count the sun's declination on the quadrant, and bring that degree to the Equator; and the degree of the Equator cut by the quadrant is the latitude required.

Example. Suppose the sun's amplitude 33° 20′, his declination 20° 10′, what's the latitude?

Proceed according to the rule, you will find it about 51° 30′.

On the different Syſtems of the WORLD.

THE motions of the heavenly bodies have, from the infancy of time, engaged the attention of mankind, and various hypotheſes have been propoſed to account for them, ſome of which were formed and forgotten in the ſame age; and the reſt, namely, the Ptolemaic, the Brahean, and Compoſite ſyſtems, preſerved only as monuments of ancient inventions. As the Copernicon, or true ſolar ſyſtem, is now univerſally adopted by every one that deſerves the name of an aſtronomer, we ſhall lay before our readers a copious explanation of that ſyſtem.

The Copernican ſyſtem places the ſun in the center, and ſuppoſes that the planets and comets revolve about it at different periods of time, and at different diſtances from it, in the following order.

Mercury, at the diſtance of about 32,000,000 of miles, revolves about the ſun in the ſpace of 87 days, 23 hours, and 16 minutes.

Venus, at the diſtance of 59,000,000 of miles, in 224 days, 16 hours, and 49 minutes.

The Earth, at the diſtance of about 82,000,000 of miles in 365 days, 6 hours, and 9 minutes, or a Sydereal year.

Mars, at the diſtance of 123,000,000 of miles, in 686 days, 23 hours, and 27 minutes.

Jupiter, at the diſtance of 424,000,000 of miles, in 4332 days, 12 hours, and 20 minutes, or almoſt 12 years.

Saturn, at the diſtance of 777,000,000 of miles, in 10,759 days, 6 hours, and 36 minutes, or nearly 30 years.

The comets in various, and vaſtly eccentric orbits, revolve about the ſun in different ſituations and periods of time, but too numerous to be inſerted here; nor is their theory yet ſufficiently known to calculate exactly their periodical times.

Theſe are all the heavenly bodies yet known to circulate about the ſun, as the centre of their motions; but among the planets there are three which have ſecondary planets, ſatellites, or moons, revolving conſtantly about them, as the centers of their motions; namely, the Earth, Jupiter, and Saturn.

The Earth has only one ſatellite or moon, which revolves about it in 27 days, 7 hours, 43 minutes, at the mean diſtance of about 240,000 miles.

Jupiter is obſerved with a teleſcope to have four ſatellites or moons conſtantly moving about him. The firſt in 1 day, 18 hours, 27 minutes, at the diſtance of 65 ſemidiameters from his center, as meaſured with a micrometer. The ſecond in 3 days, 13 hours, 13 minutes, at the diſtance of 9 ſemidiaters. The third in 7 days, 3 hours, 42 minutes, at the diſtance of 14.5 ſemidiameters. The fourth in 16 days, 16 hours, 32 minutes, at the diſtance of 25.5 ſemidiameters.

Saturn has five moons continually moving round him. The firſt, or that neareſt the body of the planet, revolves about him in 1 day, 21 hours, 18 minutes. The ſecond in 2 days 17 hours, 41 minutes, at the diſtance of almoſt two and a half ſemidiameters. The third in 4 days, 12 hours, 25 minutes, at the diſtance of three and two thirds ſemidiameters. The fourth in 15 days, 22 hours, 41 minutes, at the diſtance of 8 ſemidiameters. The fifth in 70 days, 22 hours, 4 minutes, at the diſtance of 23.3 ſemidiameters.

But beſides theſe ſatellites, he is ſurrounded by a thin broad ring, as an artificial globe is by its horizon. This ring appears double when ſeen through a good teleſcope. It is inclined thirty degrees to the ecliptic, and is about 21,000 miles in breadth, which is equal to its diſtance from Saturn on all ſides. There is reaſon to believe that the ring turns round its own axis; becauſe when it is almoſt edgeways to us, it appears ſomewhat thicker on one ſide of the planet than on the other; and the thickeſt edge has been ſeen on different ſides at different times.

The comets are ſolid opaque bodies, with long tranſparent tails, iſſuing from that ſide which is oppoſite to the ſun. They move about the ſun in very eccentric ellipſes, and are of a much greater denſity than the earth; for ſome of them are heated in every period to ſuch a degree, as would vitrify or diſſipate any ſubſtance known to us. Sir Iſaac Newton computed the heat of the comet which appeared in the year 1680, when neareſt the ſun, to be 2000 times hotter than red hot iron, and that being thus heated, it muſt retain its heat till it again approaches the ſun, even though its period ſhould be 20,000 years, and it is computed to be only 575. It is believed that there are at leaſt twenty-one comets belonging to our ſyſtem, moving in all ſorts of directions; and all thoſe which have been obſerved have moved through the etherial regions and the orbits of the planets, without ſuffering the leaſt ſenſible reſiſtance in their motions; which ſufficiently proves that the planets do not move in ſolid orbits. Of all the comets, periods of three only are known with any degree of certainty; and of theſe that which appeared in 1680, is by far the moſt remarkable. This comet at its greateſt diſtance is about 12 thouſand 200 millions of miles from the ſun, and at its leaſt within a third part of the ſun's ſemidiameter from his ſurface. In that part of its orbit which is neareſt to the ſun, it flies with the amazing velocity of 880,000 miles in an hour; and the ſun as ſeen from it, appears 100 degrees in breadth, conſequently 40,000 times as large as he appears to us. The aſtoniſhing diſtance that this comet runs out into empty ſpace, ſuggeſts to our minds an idea of the vaſt diſtance between the ſun and the neareſt fixed ſtars, within whoſe attraction no comet muſt approach, that returns periodically round the ſun.

The extreme heat, the denſe atmoſphere, the groſs vapours, the chaotic ſtate of the comets, ſeem, at firſt ſight, to declare them abſolutely uninhabitable, altogether unfit for the purpoſes of animal life, and a moſt miſerable habitation for rational beings: and hence ſome are of opinion, that they are ſo many hells for tormenting the wicked with perpetual viciſſitudes of heat and cold. But when we conſider, on the other hand, the infinite power and goodneſs of the Deity, the latter inclining, and the former enabling him, to make creatures ſuited to all ſtages and circumſtances; that matter exiſts only for the ſake of intelligence; and that wherever we find it, we find it pregnant with life, or neceſſarily ſubſervient thereto; the numberleſs ſpecies, the aſtoniſhing diverſity of animals in earth, air, water, and even in other animals; every blade of graſs, every tender leaf, every natural fluid, ſwarming with life; and every one of theſe enjoying ſuch gratifications as the nature and ſtate of each requires: when we reflect moreover, that ſome centuries ago, till experience undeceived us, a great part of the earth was judged uninhabitable: when we conſider, I ſay, theſe particulars, and a thouſand others that might be mentioned, we ſhall have reaſon to think, that ſuch numerous and large maſſes of durable matter, as the comets undoubtedly are, however unlike they may be to our earth, are not deſtitute of beings capable of contemplating with wonder, and acknowledging with gratitude, the wiſdom, ſymmetry, and beauty of the creation; which is more plainly to be obſerved in their extenſive tour through the unbounded fields of ſpace; than in our more confined circuit.

Of the Motion and Figure of the EARTH.

WE have already obſerved, that the earth revolves round the ſun between the planets Mars and Venus; and that it alſo revolves about its own axis in twenty-four hours. The latter produces the viciſſitudes of day and night, and the former the change of the ſeaſons. The revolution round its axis is from weſt to eaſt, which cauſes all the heavenly bodies to move apparently the contrary way, namely, from eaſt to weſt. This is very eaſily conceived; but its annual motion round the ſun is attended with more difficulty, and therefore we ſhall endeavour to explain it.

It is eaſy to conceive, that the ſun will always enlighten one half of the earth, and that when the ſun is in the equinoctial, the circle which terminates the enlightened and darkened hemiſpheres, called the circle of illumination, will paſs through the poles of the earth, dividing the parallels of latitude into two equal parts: but as the earth does not move in the plane of the equinoctial, but in that of the ecliptic, the axis of the earth will be inclined to that of the ecliptic in an angle of 23 deg. 29 min. and therefore the circle of illumination will at all other times divide the parallels of latitude into two unequal parts.

Now, ſince any parallel is the path or tract which any place therein deſcribes in one revolution of the earth or 24 hours, therefore that part of the parallel which lies in the enlightened hemiſphere, will repreſent the diurnal arch, or length of the day; and that part in the dark hemiſphere will be the nocturnal path, or length of the night, in that parallel of latitude.

Hence, as the earth always moves with its axis parallel to itſelf, and always inclined to the plane of the ecliptic, the northern parts will one time of the year be more turned towards the ſun, and conſequently more enlightened than the ſouthern; and the other part of the year the ſouthern parts will enjoy the ſame advantage. Hence various alterations of heat and cold, and length of days and nights, will enſue in the courſe of the revolution of the earth about the ſun, which will conſtitute all the variety of ſeaſons.

We will begin the earth's motion on the 21ſt of March, when the earth is in Libra, and conſequently the ſun appears to be in Aries, and is the vernal equinox. In this poſition of the ſun all parts of the earth are equally enlightened from pole to pole, and all the parallels of latitude divided into two equal parts by the circle of illumination; conſequently the days and nights will be equal, and the ſun's heat at a mean between the greateſt and leaſt; particulars that conſtitute the agreeable ſeaſon we call ſpring.

As the earth paſſes from weſt to eaſt through Libra, Scorpio, and Sagittarius, to the beginning of Capricorn, the ſun will appear to move through the oppoſite ſigns of the ecliptic, namely, Aries, Taurus, and Gemini, to the beginning of Cancer; during which time, by the inclination of the earth's axis, the northern parts will be gradually turned towards the ſun, and the ſouthern parts from it; the enlightened parts of the arches of the parallels of latitude in northern parts will alſo increaſe, and thoſe of the ſouthern decreaſe; conſequently the length of the days will increaſe in the former, and decreaſe in the latter. And when the ſun reaches Cancer, it will be the middle of that ſeaſon we call ſummer in north latitude; but in ſouth latitude it will be the winter ſeaſon.

The north frigid zone is during the time of the ſun's being in Cancer, wholly enlightened, and the pole turned as far as poſſible toward the ſun; but as the earth moves on, the north pole returns, the diurnal arches grow gradually leſs, and the nocturnal greater; conſequently the ſun's rays fall more and more obliquely, and his heat proportionally diminiſhes till the earth comes to Aries, when the ſun will appear in Libra; and thus produce an equality of light and heat, and of day and night, to all parts of the world. This will be the middle of the ſeaſon called autumn, and the day of the autumnal equinox, which happens about the 22d of September.

But as the earth moves on through Aries, Taurus, and Gemini, the ſun appears to move through the oppoſite ſigns Libra, Scorpio, and Sagittarius; the north pole is immerſed in the dark hemiſphere, and the ſouth pole becomes enlightened; the north frigid zone is more and more obſcured,

and

and the ſouth more and more enlightened; all the northern latitudes turn continually from the ſun; by which means his rays fall on them more obliquely, and paſs through a larger body of the atmoſphere; the nocturnal arches gradually increaſe, and the diurnal decreaſe; all which contribute to form the diſmal ſcene we call winter; the midſt of which is when the earth enters Cancer, and the ſun appears in Capricorn, which happens about the 21ſt of December.

Laſtly, as the ſun continues moving on from thence through Cancer, Leo, and Virgo, the ſun appears to paſs through Capricorn, Aquarius, and Piſces: and all things change their appearance. The northern climes begin to return, and receive more directly the enlivening beams of the ſun, whoſe meridian height every day increaſes: the days lengthen, the tedious nights contract their arches, and every thing contributes to advance the delightful ſeaſon of the ſpring.

Thus have we followed the earth round her annual orbit; and ſhewn how the various ſeaſons, and length of the days and nights are formed by means of the inclination of the earth's axis to the ecliptic. Had the earth's axis been perpendicular to the ecliptic, there could have been no diverſity of ſeaſons, nor any difference in the length of the days and nights. No alteration of heat and cold, ſo agreeable now both to the torrid and frozen zones; but the ſame uniform eternal round of unvariable ſuns had been our lot, ſo foreign to the diſpoſition of all mankind, who are charmed with variety, and diſguſted with the ſame perpetual appearance, and undiverſified proſpect. The obliquity of the ecliptic is therefore not to be looked upon as a matter of chance or indifferency, but an inſtance of wiſdom and deſign in the adorable Author of nature, who does nothing in vain.

Thus we ſee that the ſun appears to change his place daily, ſo as to make a tour round the ſtarry heavens in a year, yet he is fixed in the center of the ſyſtem, and only moves in appearance: for whether it be, in reality, the ſun or earth that moves, the phænomena will be the ſame; no objection therefore can be drawn againſt the earth's motion, from the apparent motion of the ſun.

And it is well known to every perſon who has ſailed on ſmooth water, or been carried by a current in a calm, that however faſt the veſſel goes, he is not ſenſible of her progreſſive motion. Now, as the motion of the earth is beyond compariſon more ſmooth and uniform than that of a ſhip, or any machine made and moved by human art, it is not to be imagined that we can feel its motions. It is therefore no argument againſt the earth's motion that we do not feel it.

If we could tranſlate ourſelves from planet to planet, we ſhould ſtill find that the ſtars would appear of the ſame magnitudes, and at the ſame diſtances from each other, as they do now to us; becauſe the dimenſions of the remoteſt planet's orbit bears no ſenſible proportion to the diſtance of the fixed ſtars. But then the heavens would ſeem to revolve about very different axis, and conſequently theſe quieſcent points which are our poles in the heavens, would ſeem to revolve about other points; which, though apparently in motion to us on earth, would be at reſt ſeen from any other planet. Thus the axis of Venus, which lies almoſt at right angles to the axis of the earth, would have it motionleſs poles in two oppoſite points of the heavens lying almoſt in our equinoctial, where to us the motion appears quickeſt, becauſe it is performed in the greateſt circle. And the very poles, which are at reſt to us, have the quickeſt motion of all as ſeen from Venus. To the inhabitants Mars and Jupiter the heavens appears to move round with very different velocities on the ſame axis, which are about 23 degrees and a half from ours. Where we tranſported to Jupiter, we ſhould be amazed with the rapid motion of the heavens; the ſun and ſtars appearing to move round in nine hours and fifty-ſix minutes. Could we go from thence to Venus, we ſhould be as much ſurprized at the ſlowneſs of the heavenly motions; the ſun going but once round in 584 hours, and the ſtars in 540. As it is impoſſible theſe various circumvolutions, in ſuch different times, and on ſuch different axis, can be real, ſo it is unreaſonable to ſuppoſe the heavens to revolve about the earth more than it does about any other planet. When we reflect on the vaſt diſtance of the fixed ſtars to which 162,000,000 of miles is but a point, we are filled with an amazement at the immenſity of the diſtance; but if we attempt to form an idea of the aſtoniſhing rapidity with which the ſtars muſt move, if they move round the earth in twenty-four hours, the thought ſo far ſurpaſſes our imagination, that we can no more conceive it than we do eternity, or an infinite number. If the ſun moved round the earth in a day, he muſt travel above 3000 miles in a minute; but as the ſtars are at leaſt 10,000 times farther than the ſun from us, they muſt move 10,000 times quicker. And all this to ſerve no other purpoſe than what can be as fully, and much more ſimply obtained, by the earth's turning round eaſtward as on its axis every twenty-four hours, cauſing thereby an apparent diurnal motion of the ſun weſtward, and bringing about the alternate returns of day and night.

As for the expreſſions in ſcripture, which ſeem to contradict the earth's motion, one general anſwer will be ſufficient, namely, that it is abundantly evident to every impartial perſon, that as the ſcriptures were never intended to teach men aſtronomy and philoſophy, ſo the expreſſions relating to theſe ſciences are not always to be taken in the ſtricteſt ſenſe, being adapted to the common apprehenſions of mankind. Men of ſenſe, in all ages, when not treating on the ſciences, always uſe the ſame method; and it would be in vain to follow any other in addreſſing the bulk of mankind Moſes calls the moon a great light, as well as the ſun; but the moon is known to be an opaque body; and the ſmalleſt aſtronomers have obſerved in the heavens, that the light ſhe caſts upon the earth is not her own, but the light of the ſun reflected. Many other inſtances might be given if neceſſary; but as every perſon who makes any pretenſion to learning, agrees in admitting the motion of the earth, any thing farther would be ſuperfluous.

The moſt natural, and at the ſame time, the moſt certain method of determining the magnitude of the earth, is to meaſure the length of a degree of latitude on the meridian of any place; becauſe, as every circle is ſuppoſed to be divided into 360 degrees, if we find the length of one of theſe diviſions,

and multiply it by 360, we ſhall have the circumference of the earth in ſome known meaſure, ſuppoſing the earth to be a ſphere.

Thus, if we find the latitude of any place, or take the altitude of any known ſtar with a good quadrant, and then proceed directly northward or ſouthward, till we find by the ſame inſtrument that the difference of latitude is one degree, or the ſame ſtar is raiſed or depreſſed one degree; it is evident that we muſt have paſſed over juſt one degree of the earth's ſurface, which might therefore be known by actual menſuration, were it poſſible to find ſuch a part of the earth's ſurface exactly even, ſpherical, and under the ſame meridian.

But this can hardly be expected, except in ſome very low and level country, which being overflowed in the winter, and the water converted into ice, the frozen ſurface might be ſufficiently accurate. Accordingly Snellius attempted this in Holland, by meaſuring the diſtance between a tower at Leyden, and another at Souterwode three times over, and then a ſtraight line in the meridian on the ice: whence, by a trigonometrical proceſs, he meaſured the length of a degree, but ſome error in the calculation rendered his intentions abortive. This induced the ingenious M. Muſchenbroeck to attempt the ſame thing anew in the year 1700, by forming triangles on the fundamental baſe of Snellius, and happily ſucceeded. According to his menſuration the length of a degree of the meridian in Holland is 69 Engliſh miles, and 711 yards; which nearly agrees with the menſuration of our countryman Mr. Richard Norwood, who found, by meaſuring the diſtance between London and York, in the year 1635. that the length of a degree is ſixty-nine Engliſh miles and a half.

But though the earth be of a ſperical form, yet it is not a true ſphere, but flatted at the poles, and the diameter at the equator longer than the axis. This is a natural conſequence of its revolution round its axis. For all globes that have a circular rotation will be oblate ſpheroids; that is, their ſurfaces will be higher, or farther from the center in the regions of the equator, than in thoſe of the poles; becauſe, as the former move with a much greater velocity than the latter, they will recede farther from the center of motion, and conſequently enlarge their diameter. That our earth is really of a ſpheroidical figure, is demonſtrable from the unequal vibrations of pendulums; for it has been found that pendulums ſwinging ſeconds muſt be $2\frac{169}{1000}$ lines ſhorter at the equator than at the poles; a line is the twelfth part of an inch. This diſcovery, which was made by M. Richer, in the year 1672, engaged the attention of the greateſt mathemations of Europe; and the illuſtrious Sir Iſaac Newton, by a moſt ſubtle theory, found, that the two diameters of the earth were in proportion to each other as 229 to 230. And, from accurate menſurations ſince made in Lapland and Peru, it is demonſtrated, that this proportion is very near the truth.

The learned Dr. Long, in the firſt volume of his Aſtronomy, page 168, mentions an ingenious and eaſy method of finding nearly what proportion the land bears to the ſea, namely, by taking the papers of a large terreſtrial globe, and after carefully ſeparating the land from the ſea with a pair of ſciſſors, to weigh them accurately in a pair of ſcales. This ſuppoſes that the globes are truly delineated, and that the paper is every where of an equal thickneſs. The Doctor adds, that he actually made the experiment on the papers of Mr. Senex's ſeventeen inch globe; and found that the ſea paper weighed 349 grains, and the land only 214; whence it appears, that almoſt three-fourths of the ſurface of our earth, between the polar circles and the equator, are covered with water; and that little more than one fourth is dry land. The Doctor omitted weighing all within the polar circles, becauſe a ſufficient number of obſervations have not been made in theſe uncomfortable parts to diſtinguiſh, with the neceſſary accuracy, the proportion between the land and ſea.

Of WINDS.

THE air is a fine inviſible fluid, ſurrounding the globe of the earth, and extending to ſome miles above its ſurface.

The atmoſphere is that collection of air, and the bodies contained in it, that circumſcribe the earth.

The air has been found by a multitude of experiments to be both heavy and elaſtic. By the former it is capable of ſupporting other bodies, as watery vapours, fumes, and exhalations from different bodies, in the ſame manner as wood is ſupported by water: and by the latter, namely, its elaſticity, a ſmall quantity of it is capable of being expanded ſo as to fill a very large ſpace; or of being compreſſed, or confined in a much ſmaller compaſs.

A multitude of experiments have alſo demonſtrated that air is compreſſed or condenſed by cold, and expanded or rarified by heat. Whence it follows, that if an alteration be made by heat or cold in any part of the atmoſphere, its neighbouring part will be put into motion, by the endeavour the air always makes to reſtore itſelf to its former ſtate; for experiments ſhew, that either condenſed or rarified air, will return to its natural ſtate, as ſoon as the cauſe, whatever it be, of that condenſation or rarifaction is removed.

Wind is a ſtream or current of air which may be felt, and uſually blows from one point of the horizon to its oppoſite; as from north to ſouth, from eaſt to weſt, from ſouth-eaſt to north-weſt, and the like.

Winds are either conſtant or variable, general or particular.

Conſtant winds are ſuch as continue blowing the ſame way, at leaſt for ſeveral hours or days; but variable winds are ſuch as frequently ſhift within an hour or a day.

A general wind is that which blows the ſame way over a large tract of the earth during the greateſt part of the whole year.

A particular wind is that which blows in any place, ſometimes one way, and ſometimes another indifferently.

If the wind blows gently, it is called a breeze; if it blows harder, a gale, or a ſtiff gale; and when very hard, a ſtorm. Experiments have ſhewn, that the ſwiftneſs of the wind in a great ſtorm is about ſixty miles an hour; and in a common briſk gale, about fifteen.

The great Dr. Halley, from accurate obſervations made in ſeveral voyages, found

1. That between the limits of ſixty degrees, namely, from thirty of north latitude to thirty of ſouth, there is a conſtant eaſt-wind throughout the year, blowing on the Atlantic and Pacific oceans, called the trade-wind. For as the ſun in moving from eaſt to weſt, heats the air more immediately under him, and thereby expands it, the air to the eaſtward is conſtantly ruſhing towards the weſt, to reſtore the equilibrium, or natural ſtate of the atmoſphere; and this occaſions a perpetual eaſt wind within thoſe limits.

2. That the trade winds near their northern limits, blow between the north and eaſt; and near their ſouthern limits, between the ſouth and eaſt. For as the atmoſphere is expanded by the heat of the ſun, near the equator; the air therefore from the northward and ſouthward will both tend towards the equator, to reſtore the equilibrium. Now theſe motions from the north and ſouth, joined with the foregoing eaſterly motion, will produce thoſe obſerved near the ſaid limits between the north and eaſt, and between the ſouth and weſt.

3. That theſe general motions of the wind are diſturbed on the continents, and near the coaſt: for the nature of the ſoil may either cauſe the air to be heated or cooled; and hence will ariſe motions that may be contrary to the foregoing general ones.

4. That in ſome parts of the Indian ocean there are periodical winds, called monſoons; that is, ſuch as blow half the year one way, and the other half the contrary way: for air that is cool and denſe will force the warm and rarified air in a continual ſtream upwards, where it muſt ſpread itſelf to maintain the equilibrium; ſo that the upper courſe or current of the air will be contrary to the under current; for the upper air muſt move from thoſe parts where the greateſt heat is, and ſo by a kind of circulation, the north-eaſt wind below will be attended with a ſouth-weſt wind above: and a ſouth-eaſt wind below with a north-weſt wind above: and this is confirmed by the experience of ſeamen, who, as ſoon as they get out of the trade winds, immediately find a wind blowing from an oppoſite quarter.

5. That in the Atlantic ocean, near the coaſt of Africa, at about 100 leagues from the ſhore, between the latitudes of 28 deg. and 10 deg. N. ſeamen conſtantly meet with a freſh gale of wind blowing from the north-eaſt.

6. That thoſe bound to the Caribbee iſlands acroſs the Atlantic ocean, find, as they approach the American ſide, that the north-eaſt wind becomes eaſterly, or ſeldom blows more than a point from the eaſt, either to the northward or ſouthward. Theſe trade winds on the American ſide are extended to 30, 31, or even 32 degrees north latitude; which is about four degrees farther than what they extend on the African ſide: alſo to the ſouthward of the Equator, the trade wind extends three or four degrees farther towards the coaſt of Braſil on the American ſide, than they do near the Cape of Good Hope on the African ſide.

7. That between the latitude of four degrees north, and four degrees ſouth, the wind always blows between the ſouth and eaſt: on the African ſide they are neareſt to the ſouth, and on the American ſide neareſt the eaſt. In theſe ſeas Dr. Halley obſerved, that when the wind was to the eaſtward, the weather was gloomy, dark, and rainy, with hard gales of wind; but when the wind veered to the ſouthward, the weather generally became ſerene, with gentle breezes nearly approaching to a calm. Theſe winds are ſomewhat changed by the ſeaſons of the year: for when the ſun is far northward, the Braſil ſouth-eaſt wind changes to the ſouth, and the north-eaſt wind to the eaſt; and when the ſun is far ſouth, the ſouth-eaſt wind gets to the eaſt, and north eaſt on this ſide the equator veers more to the north.

8. That along the coaſt of Guiney, from Sierra Leone to the iſland of St. Thomas under the equinoctial, which is above 500 leagues, the ſoutherly and ſouth-weſt winds blow perpetually: for the ſouth eaſt trade wind having croſſed the equator, and approaching the Guiney coaſt within 80 or 100 leagues, inclines towards the ſhore, and becomes ſouth, then ſouth eaſt, and by degrees, as it comes near the land, it veers about to the ſouth, ſouth-ſouth-weſt, and cloſe in with the land it is ſouth-weſt, and ſometimes weſt-ſouth-weſt. This tract is troubled with frequent calms, violent ſudden guſts of winds called tornadoes, blowing from all points of the horizon. The reaſon of the wind ſetting in weſt on the coaſt of Guiney, is, in all probability, owing to the nature of the coaſt, which being greatly heated by the ſun, rarifies the air exceedingly, and conſequently the cool air from off the ſea will keep ruſhing in to the equilibrium.

9. That between the fourth and tenth degrees of north latitude, and between the longitudes of Cape Verd and the eaſtermoſt of the Cape Verd iſlands, there is a tract of ſea which ſeems to be condemned to perpetual calms, attended with terrible thunder and lightning, and ſuch amazing rains, that part of this ſea has acquired the name of *the Rains*. Ships in ſailing theſe ſix degrees, have been ſometimes detained whole months. The cauſe of this ſeems to be, that the weſterly winds ſetting in on this coaſt, and meeting the general eaſterly winds in this tract, balance each other; and ſo cauſe the calms; and the vapours carried thither by each wind meeting and condenſing, occaſion the almoſt continual rains.

10. That between the ſouthern latitudes of ten and thirty degrees, in the Indian ocean, the general trade-wind about the ſouth eaſt by-ſouth, is found to blow all the year long in the ſame manner as in ſimilar latitudes in the Ethiopic ocean; and during the other ſix months between May and December, theſe winds reach to within two degrees of the equator; but during the other ſix months, from the beginning of December to the beginning of June, a north-weſt wind blows in the tract lying between the third and tenth degrees of ſouth latitude, in the meridian of the north end of Madagaſcar, and between the ſecond and twelfth degree of ſouth latitude, near the longitude of Sumatra and Java.

11. That in the tract between Sumatra and the African coaſt, and from three degrees of ſouth latitude quite northward to the Aſiatic coaſt, including the Arabian ſea and the Bay of Bengal, the monſoons blow from September to April at north eaſt, and from March to October at ſouth-weſt. The ſhifting of theſe monſoons is not all at once, and in ſome places the change is attended with calms, in ſome with variable winds, and in others with tempeſts; and ſuch is their violence, that they render the navigation of theſe parts very unſafe at that time of the year. Theſe tempeſts the ſeamen call the breaking up of the monſoons.

We have already obſerved, that the atmoſphere ſurrounding the earth is an elaſtic fluid; and its lower parts being preſſed by the weight of all the air above them, are ſqueezed the cloſer together; and conſequently the denſeſt of all at the earth's ſurface, and gradually rarer the higher they aſcend. The weight of air ſuſtained by every ſquare inch at the earth's ſurface, is found by experiments on the air-pump, and alſo by the quantity of mercury the air balances in a barometer, to be fifteen pounds; therefore every ſquare foot muſt ſuſtain 2016 pounds; conſequently every middle ſized man, whoſe ſurface may be about 14 ſquare feet, is preſſed by 28,224 pound weight of air all round; for fluids preſs equally up and down and on all ſides; but becauſe this enormous weight is equal on all ſides, and counter-balanced by the ſpring or the internal air in our blood veſſels, it is not felt. We often feel ourſelves languid and dull, and impute the cauſe to the air's being heavy and foggy about us; but this is a miſtake: the cauſe ariſes from its being too light, as is evident from the mercury's ſinking in the barometer, at which time it is generally found the air has not ſufficient gravity to bear up the vapours which compoſe the clouds; for when it is otherwiſe, the clouds mount high, the air is more elaſtic and weighty about us, by which means it balances the internal ſpring of the air within us, braces up our blood-veſſels and nerves, and renders us briſk and lively.

The atmoſphere is alſo the cauſe why the heavens appear bright in the day-time; for, without an atmoſphere, that part of the heavens only would ſhine in which the ſun was placed: and if an obſerver could live without air, and ſhould turn his back towards the ſun, the whole heavens would appear as dark as in the night, and the ſtars would be ſeen as clear as in the nocturnal ſky. In this caſe we ſhould have no twilight, but a momentory tranſition from the brighteſt ſun-ſhine to the blackeſt darkneſs immediately after ſun-ſet; and from the blackeſt darkneſs to the brighteſt ſun-ſhine at ſun-riſing: but by means of the atmoſphere we enjoy the ſun's light reflected from the aerial particles, before he riſes and after he ſets; for when the earth by its rotation, hath concealed the ſun from our ſight, the atmoſphere being ſtill higher than we, has his light imparted to it; which gradually decreaſes till he has got eighteen degrees below the horizon, and then all that part of the atmoſphere above us is dark. From the length of twilight Dr. Keil calculated the height of the atmoſphere, ſo far as it is denſe enough to reflect the light, and found it to be about forty-four miles; but it is ſeldom denſe enough at two miles height to ſupport the clouds.

Of the TIDES.

BY the tides is meant that motion of the waters in the ſea and rivers, by which they are found regularly to riſe and fall. The general cauſe of the tides, or flux and reflux of the ſea, was diſcovered by Sir Iſaac Newton, and may be deduced from the following conſiderations.

Daily experience ſhews that all bodies thrown upwards from the earth, fall down to its ſurface in perpendicular lines; and as lines perpendicular to the ſurface of a ſphere, tend towards the center, therefore the lines along which all heavy bodies fall are directed towards the center of the earth: and as thoſe bodies apparently fall by their own weight or gravity, the law by which they fall is called the law of gravitation.

A piece of glaſs, amber, or ſealing-wax, being rubbed againſt the palm of the hand or a woolen-cloth till warm, will draw ſmall bits of feathers or other light ſubſtances towards it, when held ſufficiently near thoſe ſubſtances: alſo a magnet, or load-ſtone, being held near the filings of iron or ſteel, will draw them to itſelf; and a piece of hammered iron or ſteel, that has been touched by a magnet, will acquire a like property of drawing iron or ſteel to itſelf. And this property in ſome bodies, of drawing others to themſelves, is called attraction.

Now, as bodies fall towards the earth by their gravity, it is not improper to ſay it attracts thoſe bodies; and therefore in reſpect to the earth, the words attraction and gravitation may be uſed for one another, as they imply no more than the power or law by which bodies tend towards its center.

The incomparable Sir Iſaac Newton, by a ſagacity peculiar to himſelf, diſcovered, from many obſervations, that this law of gravitation or attraction was univerſally diffuſed throughout the world; and that the regular motions obſerved among the heavenly bodies were governed by this principle; ſo that the earth and the moon attracted each other, and were both attracted by the ſun: and alſo that the force of attraction, exerted by theſe bodies on each other, was leſs and leſs as the diſtance increaſed, in proportion to the ſquares of thoſe diſtances; that is, the power of attraction at double the diſtance was four times leſs, at triple the diſtance nine times leſs, and ſo on.

Now, as the earth is attracted by the ſun and moon, all the parts of the earth will not gravitate towards its center in the ſame manner as if thoſe parts were not affected by ſuch attractions. And it is very evident, that was the earth entirely free from ſuch actions of the ſun and moon, the ocean being equally attracted towards its center on all ſides by the force of gravity, would continue in a perfect ſtagnation, without ever ebbing or flowing; but ſince the caſe is otherwiſe, the ocean muſt needs riſe higher in theſe parts, where the ſun and moon diminiſh their gravity, or where the ſun and moon have the greateſt attraction; and as the force of gravity muſt be diminiſhed moſt in thoſe places of the earth to which the moon is neareſt, or in the Zenith, that is, where ſhe is vertical, her attraction there is conſequently moſt powerful; therefore the waters in ſuch places will riſe higher than others, and it will be there full ſea.

The parts of the earth directly under the moon, and alſo thoſe that are diametrically oppoſite, will have high-water at the ſame time; for either half of the earth would equally gravitate towards the other half, were they free from all external attraction: but by the action of the moon, the gravitation of one half of the earth towards its center is diminiſhed, and the other increaſed. Now in that hemiſphere of the earth next the moon, the parts in the Zenith being moſt attracted, and thereby their gravitation towards the earth's center diminiſhed; therefore the waters in thoſe parts muſt be higher than in any other part of this hemiſphere: and in the hemiſphere fartheſt from the moon, the parts in the Nadir being leſs attracted by the moon than in the parts nearer to her, gravitate leſs towards the earth's center; and conſequently the waters in theſe parts alſo muſt be higher than they are in any other parts of this hemiſphere.

Theſe parts of the earth where the moon appears in the horizon, or ninety degrees diſtant from the Zenith and Nadir, will have low-water: for as the waters in the Zenith and Nadir riſe at the ſame time, the waters in their neighbourhood will preſs towards thoſe places to maintain the equilibrium; and to ſupply the places of theſe, others will move the ſame way, and ſo on to the places ninety degrees diſtant from the Zenith and Nadir; conſequently in thoſe places, where the moon appears in the horizon, the waters will have more liberty to deſcend towards the center; and therefore in thoſe places they will be the loweſt.

Hence it plainly follows, that the ocean, if it entirely covered the ſurface of the earth, would be of a ſpheroidical or oval figure, whoſe tranſverſe or longeſt diameter would paſs through the place where the moon is vertical, and the conjugate or ſhorteſt diameter where ſhe is in the horizon; and as the moon apparently ſhifts her poſition from eaſt to weſt in going round the earth every day, the longer diameter of the ſpheriod following the motion, will occaſion the two floods and ebbs obſervable in about every twenty-five hours, which is the length of a lunar day; that is, the interval of time between the moon's leaving the meridian of any place, and her return to it again: ſo that the time of high-water any day is almoſt an hour later than it was the preceding day.

The time of high-water is not preciſely the time of the moon's coming to the meridian, but about three hours after; for the moon acts with ſome force after ſhe has paſſed the meridian, and thereby increaſes the libratory or waving motion ſhe has put the water into while ſhe was in the meridian; in the ſame manner as a ſmall force applied to a ball already raiſed to ſome height, will raiſe it ſtill higher.

The tides are higher than ordinary twice every month; that is, about the times of the new and full moon, and are called ſpring tides; for at theſe times, the actions of both the ſun and moon concur, or draw in the ſame right line; and conſequently the ſea muſt be more elevated: at the conjunction, or when the ſun and moon are on the ſame ſide of the earth, they both conſpire to raiſe the waters in the Zenith, and conſequently in the Nadir: and when the ſun and moon are in oppoſition, that is, when the earth is between them, while one makes high-water in the Zenith and Nadir, the other does the ſame.

The tides are leſs than ordinary twice every month; namely, about the firſt and laſt quarters of the moon; and are called neap-tides; becauſe in the quarters of the moon, the ſun riſes the water where the moon depreſſes it, and depreſſes where the moon riſes the water; ſo that the tides are made only by the difference of their actions. It muſt however be obſerved, that the ſpring-tides do not happen directly on the new and full moons, but a day or two after, when the attractions of the ſun and moon have acted together for a conſiderable time. In like manner the neap-tides happen a day or two after the quarters, when the moon's attraction has been leſſened by that of the ſun for ſeveral days together.

The ſpring-tides are greater about the times of the equinox, that is about the middle of March and September, than at any other times of the year; and the neap-tides are then alſo leſs, becauſe the tranſverſe diameter of the ſpheriod, or the two oppoſite high-waters, will at that time be in the earth's equator, and conſequently deſcribe a great circle of the earth, by whoſe diurnal rotations thoſe high-waters will move ſwifter, deſcribing a great circle in the ſame time they uſed to deſcribe a leſſer circle parallel to the equator; and conſequently the waters being thrown more forcibly againſt the ſhores, they muſt riſe higher

All things hitherto explained would happen exactly, if the whole ſurface of the earth was covered with ſea: but ſince this is not the caſe, there are a multitude of iſlands, beſides continents, lying in the way of the tide, which interrupts its courſe; therefore in many places near the ſhores, there ariſe a great variety of other appearances, beſides thoſe already mentioned, which require particular ſolutions, wherein the ſituation of the ſhore, ſtraits, and other objects, muſt neceſſarily be conſidered: for inſtance, as the ſea has no viſible paſſage between Europe and Africa, let them be conſidered as one

conti-

continent, exceeding from ſeventy-two degrees north to thirty four degrees ſouth, the middle between thoſe two will be near Cape Blancho, in the latitude of nineteen degrees north; but it is impoſſible the flood-tide ſhould ſet to the weſtward on the weſt coaſt of Africa, like the general tide following the courſe of the moon, becauſe the continent for above fifty degrees north and ſouth bounds that ſea on the eaſt; and therefore, if any regular tide, as proceeding from the motion of the ſea from eaſt to weſt, ſhould reach this place, it muſt either come from the north of Europe ſouthward, or from the ſouth of Africa northward, to the ſaid latitudes on the weſt coaſt of Africa.

This opinion is confirmed by common experience, that the flood tide ſets to the ſouthward along the coaſt of Norway, from the North Cape to the Naze, or entrance of the Baltic ſea, and ſo proceeds to the ſouthward along the eaſt coaſt of Great Britain; and in its paſſage ſupplies all theſe ports with the tide one after another, the coaſt of Scotland having the tide firſt, becauſe it proceeds from the northward to the ſouthward; and thus, on the days of the full or change, it is high-water at Aberdeen at forty-five minutes at twelve at night; but at Tinmouth-bar not till three in the morning. From hence rolling to the ſouthward, it makes high-water at the Spurn a little after five, but not till ſix at Hull, by reaſon of the time required for its paſſing up the river; from thence paſſing over the Well-bank into Yarmouth Roads, it makes high-water there a little after eight, but in the Pier not till nine, and it requires an hour more to make high-water at Yarmouth: in the mean time ſetting away to the ſouthward, it makes high-water at Harwich at half an hour after ten, at the Nore at twelve, at Graveſend at half an hour after one, and at London at three, all the ſame day; and though this at firſt ſight ſeems to contradict the hypotheſis of the natural motion of the tide being from eaſt to weſt, yet as no tide can flow weſt from the main continent of Norway or Holland, or out of the Baltic, which is ſurrounded by the main continent except at its entrance, it is evident that the tide we have been now tracing by its ſeveral ſtages from Scotland to London, is ſupplied by the tide, whoſe original motion is from eaſt to weſt; and as water always endeavours to maintain a level, it will in its paſſage flow towards any other point of the compaſs to fill up vacancies where it finds them, without contradicting, but rather confirming the firſt hypotheſis.

While the tide or high-water is thus gliding along the eaſtern coaſt of England, it alſo ſets to the ſouthward along the weſtern coaſts of Scotland and Ireland, a branch of it falls into St. George's-channel, the flood running up north-eaſt, as may be naturally inferred from its being high-water at Waterford above three hours before it is high water at Dublin, and near three quarters ebb at Dublin before it is high-water at the Iſle of Man.

But it will be ſufficient for our purpoſe to trace the tides on our own coaſt; and therefore we ſhall return to the Britiſh channel, where we find the tides ſet to the ſouthward from the coaſt of Ireland, and in its paſſage a branch of it falls into the Britiſh channel between the Lizard and Uſhant. Its progreſs to the ſouthward may be eaſily proved by its being high-water on the full and change at Cape Clear at four, at Uſhant at ſix, and at the Lizard at ſeven. The Lizard and Uſhant may be conſidered as the chops of the Britiſh channel, between which the flood ſets to the eaſtward along the coaſt of England and France, till it comes to the Galloper, or Goodwin ſands, where it meets the tide above-mentioned ſetting to the ſouthward, along the coaſt of England to the Thames; where thoſe two tides meeting, greatly contribute to the ſending a ſtrong tide up the Thames to London. And hence we may account for a very ſingular phænomenon that ſometimes happens in the river, and has been conſidered as a prodigy, we mean a double flux and reflux: for when the natural courſe of the tide is interrupted by a ſudden change of the wind, driving one back, and the other in, the conſequence muſt be a double flux and reflux, and accordingly it has been twice high-water within three or four hours.

But it will perhaps be objected, that this courſe of the flood tide to the eaſtward up the Channel, is quite contrary to the hypotheſis of the general motion of the tides being from eaſt to weſt, and conſequently of its being high-water where the moon is vertical, or any where elſe in the meridian.

But this objection will be eaſily removed, if we conſider, that the particular direction of any branch of the tide doth not in the leaſt contradict the general direction of the whole; a river whoſe courſe is weſt may ſupply canals that wind to the north, ſouth, or even to the eaſt, and yet the river keep its natural courſe; and if the river ebb and flow, the canals ſupplied by it will do the ſame, but not keep exact times with the river, becauſe it would be flood, and the river advanced to ſome height, before the flood reached the further part of the canals, and the more remote the longer time it would require; and it may be added, that if it was high-water in the river juſt when the moon was on the meridian, ſhe would be conſiderably paſt it, before it could be high-water in the fartheſt part of theſe canals or ditches, and the tide would ſet according to the courſe of the canals that received it. Now, as St George's and the Britiſh channels are no more in proportion to the vaſt ocean, than ſuch canals are to a large navigable river, it plainly follows, that among thoſe obſtructions and confinements, the flood may ſet upon any other point of the compaſs as well as weſt, and may make high-water at any other time, as well as when the moon is upon the meridian, and yet no way contradict the general theory of the tide above aſſerted.

Of the Conſtruction of MAPS and CHARTES.

AS it is impoſſible to repreſent every part of a ſpherical ſurface upon a plane, in its due proportion, without diſtortion or contraction; ſo every map, on which the ſuperficies of the earth are delineated, will be diſtorted in ſome parts, and contracted in others; and though every part, when truly meaſured, will be found to agree very accurately with the globe; yet the appearance of the whole will be different, the ſame parts of the earth exhibit a different figure, as different methods of projection are made uſe of. The two principal methods uſed in delineating maps are, the Orthographic, and the Stereographic; the former ſuppoſes the eye placed at an infinite diſtance, and the latter in the pole or center of the plane of projection. In order therefore to make an orthographic projection, the following obſervations muſt be carefully attended to.

Conceive the eye placed at an infinite diſtance from the globe; and at the ſame time, a plane to paſs through the center of the globe, and to ſtand at right angles to the line connecting the centers of the globe and eye; if from the eye thus poſited, an infinite right line be imagined to be drawn, through any point of the circumference of any circle deſcribed upon the ſurface of the globe, and the ſame right line be carried about the circumference of the given circle, till it return to the place from whence it began to move; or which is the ſame thing, if from any point in the circumference of any circle deſcribed upon the ſurface of the globe, a right line be imagined to fall perpendicular on the given plane, and that this line be carried round the circumference of the given circle, conſtantly perpendicularly to the plane, and parallel to itſelf, it will deſcribe on the cutting plane an orthographic repreſentation of that circle; and after the ſame manner, if rays infinitely long be imagined to flow from the eye to the circumference of every circle deſcribed upon the globe, and theſe rays be carried about the circumference of each reſpective circle till they return to the place from whence they began to move, they will trace out on the given plane, what is called an orthographic projection of the ſphere.

This parallelifm and perpendicularity of the generating and deſcribing ray, is the eſſential and primary property of orthographic projection: and though, according to the Euclidian idea of parallel lines, they can never be conceived to meet if infinitely produced; yet if we conſider the infinitely ſmall inclination of the infinitely ſmall portion of the incident rays, intercepted between the ſurface of the ſphere and the plane, the inclination itſelf vaniſhes, and the parallel and perpendicular property actually exiſts.

We ſhall not dwell any longer on the nature of orthographic projection, as maps are very rarely, if ever, drawn in that manner, its principal uſe being the aſtronomical computations, to which it is excellently adapted.

The Stereographic projection is that on which our maps are generally made, and depends upon this principle: That if the plane of any meridian be ſuppoſed the plane of projection, then an eye placed in one pole of that meridian will project all the circles in the oppoſite hemiſphere into circular arches on the ſaid plane; and the diameter dividing it into upper and lower hemiſpheres, is called the line of meaſures. The map of the world annexed, is projected in this manner, and the eye is ſuppoſed to be fixed in the poles, and the equator becomes the line of meaſures. And hence we ſee the reaſon why the meridians and parallels of latitudes lie nearer to each other in the middle part of the map, than at the extremities: conſequently the parts of the earth are diſtorted, and exhibit a different appearance from what they do on the globe. And hence we ſee the reaſon why no ſcale is added to maps of the world, namely, becauſe the miles near the circumference are much longer than thoſe near the center. The conſtruction is performed in this manner. With the chord of 60 degrees deſcribe the primitive circle, whoſe pole will be the center of the map, and divide it into 360 equal parts, called degrees. Through this center draw the right line o o, which will repreſent the equator. On each ſide from the center, ſet off on the equator as many diviſions as are neceſſary from the ſemitangents, and through theſe points and the two poles let circles be deſcribed, which will repreſent the meridians. Then ſet off on the axis or right line 90, 90, paſſing through the poles, from the center as before, the ſame number of diviſions as before on the equinoctial; and through theſe points and diviſions on the primitive circle, let circles be drawn, which will repreſent the parallels of latitude. In the ſame manner the tropics or polar circles are drawn, the former at 23 deg. 29 min. diſtant from the equator, and the latter at 66 deg. 31 min. Let both the meridians and parallels of latitude be properly numbered as in the map annexed; and then from a table of the latitude and longitude of places, extract thoſe you intend to inſert on your map, and make dots where the meridians and parallels belonging to the latitudes and longitudes of thoſe places interſect each other, which will be their true places on the map.

Beſides theſe different projections, there is another, commonly uſed in the conſtructions of ſea-charts, called Mercator's projection. We have given a map of the known parts of the world conſtructed in this manner, which depends on the method of applying the globe of the earth to a plane, which was firſt accompliſhed by our countryman Mr. Edward Wright, by the following ingenious conception.

Suppoſe a rectangular plane was rolled about a globe, till the edges of the plane met, and formed a kind of concave cylinder, incloſing the globe, and touching its equator. Conceive the ſurface of this globe to ſwell, like a bladder while it is blowing up, from the equator towards the poles, proportionally in latitude as it does in longitude, until every part of its ſurface meets that of the con-

cave cylinder, and impreſſes thereon the lines that are drawn on the globular ſurface. Then will the cylinder or rectangular plane, on being unrolled, repreſent a ſea-chart, whoſe parts bear the ſame proportion to one another, as the correſpondent parts do on the globe. But both the meridians and parallels of latitude will be ſtraight lines. Every parallel of latitude will become equal to the equator, and the meridians lenghtened as the parallels increaſe; conſequently the diſtances between the parallels of latitude will be wider and wider as they approach the poles; and theſe will increaſe in proportion to the ſecants of their reſpective channels.

Hence it appears, that the ſecantes by the addition of the diſtances of the parallels from the equator are obtained. And theſe ſeveral diſtances, which are called meridional parts, being diſpoſed in a table correſponding to the degrees and minutes in a quadrant, from a table of meridional parts; and theſe ſet off from the equator, and on the meridian both ways towards the north and ſouth, will give the points through which the parallels of latitude muſt paſs. A view of the map annexed will explain this conſtruction, in which the meridians are at equal diſtances from each other; but the diſtances between the parallels of latitude unequal. The great uſe of this projection is in navigation; becauſe on it the rhumb line, or the tract a ſhip deſcribes on the ſurface of the ocean in ſailing on a ſingle courſe, is repreſented by a ſtrait line, which is not the caſe in any other projection, where the ſeveral degrees of latitude and longitude are repreſented in a true proportion to each other.

DIRECTIONS to the BINDER.

The MAPS and PRINTS for the Firſt VOLUME are to be placed in the following Order.

FRONTISPIECE, facing the title

SYSTEM

OF

GEOGRAPHY.

BOOK I.

Of ASIA in general.

WE ſhall begin with deſcribing thoſe countries in our hemiſphere that are firſt enlightened by the riſing ſun, and proceeding with that glorious orb from eaſt to weſt, ſhall regularly advance, viewing in progreſſive order the various regions of the terraqueous globe. It was in Aſia that the all-wiſe Creator is generally ſuppoſed to have planted the garden of Paradiſe, in which he formed the firſt of the human race. It was there that arts firſt were known, that edifices were firſt erected, and cities built. It was Aſia that became the nurſery of the riſing world, after it had been deſtroyed by the general deluge, and from thence the deſcendants of Noah founded colonies in all parts of the ſpacious earth. In Aſia the Moſt High placed his once favourite people the Jews, whom he enlightened by revelations delivered by the prophets, and to whom he gave the oracles of truth. It was in Aſia too, that the moſt glorious inſtance of the Divine love was accompliſhed, by the birth, the life, the doctrines, the miracles, the ſufferings, and death of the great Meſſiah. There the firſt Chriſtian churches were founded, and watered by the blood of the martyrs. There Chriſtianity ſpread with an amazing rapidity, and, even in the apoſtolic age, was carried from Judea to India.

Theſe advantages render it highly proper that we ſhould begin with Aſia, which is alſo ſuperior to Europe and Africa in the largeneſs of its territories, it extending into all climates, from the frozen wilds of Siberia, where the hardy inhabitants, cloathed in furs, are drawn in ſledges over the ſnow, to the ſultry regions of India and of Siam, where, ſeated on the heavy elephant, the people ſhelter themſelves from the ſcorching ſun by the ſpreading umbrella. In many parts of theſe vaſt regions the ſerenity of the air, the fertility of the ſoil, the deliciouſneſs of the fruits, the fragrancy and balſamic qualities of the plants, ſpices, and gums, the beauty and value of the gems, and the fineneſs of its ſilks and cottons, gave it ſuch charms, that in the earlieſt ages, it was the ſeat of the empires of the Aſſyrians, Medes, Perſians, and Greeks, and its inhabitants were poſſeſſed of power wealth, and opulence; till at length the Mahometans, the enemies of liberty, and of the polite arts, deſtroyed all its ancient ſplendor, and rendered the moſt fertile ſpots of Aſia uncultivated deſarts. However, on account of the rich commodities which the ſouthern parts of Aſia afford, the people of many diſtant countries ſtill carry on a conſiderable trade with each other; and the Indies are reſorted to, for the ſake of commerce, by ſeveral of the moſt powerful nations of Europe.

With reſpect to religion, there are many Jews diſperſed through the regions of Aſia, and conſiderable numbers of them were ſettled in ſome of the moſt remote parts of the East Indies, many centuries before the paſſage to thoſe countries was diſcovered by the Portugueſe. Chriſtianity is far from being eſtabliſhed in Aſia: there are, however, ſeveral ſects tolerated in different parts; but its profeſſors generally groan under the yoke of Turkiſh oppreſſion. The two ſects of the religion of Mahomet have over-ſpread one-third of Aſia, and almoſt all the reſt are involved in the groſſeſt idolatry, under different forms; the moſt conſiderable of which are the worſhippers of Brama and of Foe: beſides theſe there are the more ſagacious followers of Confucius, and ſome of a far more ancient ſect, who derive their principles from Zoroaſter, acknowledging but one ſupreme Deity, whom they worſhip under the ſymbol of fire, which they eſteem the brighteſt and pureſt emblem of the all-perfect God.

As to the extent, limits, and boundaries of Aſia, that vaſt continent is ſituated between 25 and 148 degrees of eaſt longitude from London, and between the equator and 72 degrees north latitude, without including the iſlands that lie to the ſouth. It is about 4740 miles in length, from the Dardanels on the weſt, to the eaſtern ſhore of Tartary; and about 4380 miles in breadth, from the moſt ſouthern part of Malacca, to the moſt northern cape of Nova Zembla. It is bounded by the Frozen Ocean on the north. On the weſt it is ſeparated from Africa by the Red Sea, and from Europe by the Levant, the Archipelago, the Helleſpont, Propontis, Boſphorus, the Black Sea, the river Don, and a line drawn from it to the river Tobol, and from thence to the Oby, which falls into the Frozen Ocean. On the eaſt it is bounded by the Pacific Ocean; and on the ſouth, by the ſeas that waſh the coaſts of Japan, China, India, Perſia, and Arabia.

This vaſt extent of territories contains a great number of ſovereignties, the moſt conſiderable of which are four empires, which, beginning at the eaſt, are thoſe of Japan, China, the empire of the Great Mogul, and Perſia; with part of two more, viz. Turky and Ruſſia, where the moſt conſiderable provinces lie in Europe. It has alſo about thirty-three kingdoms, beſides the governments of the Nabobs of India, which may be termed monarchies, as they

are now independent of the Mogul. Of these kingdoms the twenty six following are on the continent, and the other seven in the East Indian islands. Of the former are those of 1. Corea; 2. Samarcand; 3. Beca, in Great Tartary; 4. Kalghar; 5. Great Tibet; 6. Little Tibet; 7. Nanyu; 8. Neckbat; 9. Barantola, or Lassa; 10. Cochinchina; 11. Jaos, in the peninsula on the other side the Ganges; 12. Tonquin; 13. Siam; 14. Aracham; 15. Acham; 16. Cochin, on the peninsula of India on this side the Ganges; 17. Pegu, or Ava; 18. Camboya; 19. Calicut; 20. Bisnagar; 21. Golconda; 22. Vizapor; 23. Mingrelia, and 24. Imeretta in Georgia; 25. Sarta; and 26. Yemen, in Arabia.

The seven insular kingdoms are, 1. Macasser, and 2. Ternate, in the Molucca islands; 3. Borneo; 4. Materan; 5. Achem, in the island of Sumatra; 6. Candy, in the isle of Ceylon; and 7. the Maldivia islands.

To these may be added the dominions established here by the Europeans; namely, the Spaniards in the Philippine islands; 2. the Dutch at Batavia in the isle of Java, the Spice islands, Celebes or Macasser, and on the coast of the isle of Ceylon, &c. 3. the Portuguese in Goa, and other coasts of India. These have all an absolute and supreme authority; and the European governors have, in a great measure, the power of arbitrary princes. To these we shall subjoin, 4. the English settlements at Fort St. George, Bombay, &c. 5. the French at Pondicherry, &c. 6. the Danes at Tranquebar and Danesburg, on the coast of Coromandel, &c.

The languages spoke in Asia are so numerous, that it is impossible to enumerate them. The principal are the Japanese, the Chinese, the Malayan, the Arabic, Persian, Tartarian, Russian, Turkish, the modern Greek, and many others, almost every country and island having a distinct language.

A concise view of Asia, beginning at the east, and proceeding to the west.

I. The empire of Japan.
II. China, which is divided into north and south.
III. India, comprehending
  1. The peninsula of India beyond the Ganges; containing Cochinchina, Tonquin, Pegu, and Siam; which latter is subdivided into Martaban, Siam and Malacca.
  2. The peninsula on this side the Ganges; containing Decan, Golconda, Bisnagar, and Malabar.
IV. Indostan, or the empire of the Great Mogul, in which are many petty kingdoms.
V. Great Tartary, Siberia, Samojedia, and Asiatic Russia.
VI. Persia.
VII. Turky in Asia, which is divided into Eastern and Western. The Eastern contains Diarbeck, Turcomania, and Georgia. The Western comprehends Arabia, Palestine Syria, and Anatolia.
VIII. The Asiatic islands are divided into three classes:
  1. Those on the Eastern Ocean, viz. the Marian or Ladrone islands, Formosa, and the Phillippine islands.
  2. Those on the Indian Ocean, which are the Moluccas, viz. Ternate, Tidor, &c. and the Spice islands, namely, Buda, Amboyna, Ceram, Ternate, Timor, Gilola, &c. Celebes, Borneo, Java, Sumatra, Ceylon, the Maldivia islands, &c.
  3. On the coasts of Asia, and in the Mediterranean, as Cyprus, Rhodes, Lesbos or Mytelene, Chios or Scio, Samos, Coos, and a few others of less note.

Though the great empire of Japan is composed of several islands, none of which bear the name given by the Europeans to the whole country; yet as it is situated to the east of China, and is too considerable to be confounded with the multitude of islands in the Indies, we shall begin with that empire.

CHAP. I.

Of JAPAN.

SECT. I.

Of its Situation, Form, and Extent. The Rocks and Whirlpools on its Coasts. Its Volcanoes, Hot-Springs, and frequent Earthquakes.

THE great and wealthy empire of Japan is called by the natives Niphon, which signifies the foundation of the sun, and is thus named from the largest of the islands of which that empire is composed; but by the Chinese it is called Zippon, or Siphon.

The islands of Japan are situated in the Pacific Ocean, to the east of China, and lying between 31 and 42 degrees of north latitude, and between 130 and 147 degrees of east longitude from London; the sun rises there about nine hours before it appears to us.

Niphon, the largest of these islands, extends from south to west, and then turns up to the north; it is about 900 miles in length, and in some parts near 360 in breadth. To this island are added two others, much smaller, and separated from it only by narrow streights. Mr. Kæmpfer observes, that the empire of Japan may, in many respects, be compared to the kingdoms of Great Britain and Ireland, being much after the same manner, though in a more eminent degree, divided and broke through by forelands, arms of the sea, great bays, and inlets, running deep into the country, and forming many small islands, peninsulas, gulphs, and harbours. Besides, as the king of Great Britain is sovereign of three kingdoms, England, Scotland, and Ireland; so likewise, he adds, the Japanese emperor hath the supreme jurisdiction of three islands. The first and largest, called Niphon, runs lengthways, from east to west, in the form of a jaw-bone, whose crooked part is turned to the north. A narrow channel, or streight, full of rocks and islands, some inhabited, some uninhabited, parts it from the second, which is next to it in largeness: and, from its lying to the south-west of Niphon, is called Saikokf, or the Western Country; and is about 592 English miles in circumference. The third island is situated between the first and second, and is nearly of a square figure; and, from its being divided into four provinces, the Japanese call it Sikokf, or the Country of Four. These three large islands are encompassed by an inconceivable number of others, some of which are small, rocky, and barren; others, large, rich, and so fruitful as to be governed by petty princes.

These islands, to which are added two more conquered from the kingdom of Corea, are divided into sixty-eight provinces, and these again into six hundred and four lesser districts. It is proper here to add, that, besides the islands and provinces already mentioned, there are some at a greater distance, which, though they do not properly belong to the empire of Japan, either acknowledge the emperor's supremacy, or live under his protection.

The borders of the empire are secured by its rocky, mountainous coasts, and a tempestuous sea, which, on account of its shallowness, will admit none but small vessels, nor can those approach without imminent danger; for the depth of most of the gulphs and harbours being yet unknown, and others, which the pilots of the country are better acquainted with, being unfit to secure ships of considerable burthen, it seems as if nature designed these islands to be a kind of little world, independent of the rest; especially as they possess whatever is necessary to render the lives of the inhabitants pleasant and delightful, and to enable them to subsist without a commerce with distant nations.

The coasts of Japan are also secured by two remarkable and dangerous whirlpools. The one lying near Simabara, is at high-water even with the surface of the sea; but the tide no sooner begins to ebb, than, after some violent turnings, it is said suddenly to sink to the depth of fifteen fathoms,

fathoms, ſwallowing up with great force the ſhips, boats, and whatever, at that fatal juncture, comes within its reach, and dashing them to pieces againſt the rocks at the bottom, where they ſometimes remain under water, and at others are thrown out again at many miles diſtance. The other, which lies near the coaſt of the province of Kijnokuni, ruſhes with a loud boiſterous noiſe about a ſmall rocky iſland, which, by the violence of the motion, is kept in a perpetual trembling. But though this has a very formidable appearance, it is eſteemed leſs dangerous than the other; for as its noiſe may be heard at a conſiderable diſtance it may be eaſily avoided.

Water-ſpouts are alſo frequently obſerved to riſe in the ſeas of Japan, and to turn towards the coaſts. Theſe the ignorant Japaneſe fancy are a kind of water-dragons, with a long watery tail, flying up into the air with a ſwift and violent motion; for which reaſon they give them the name of ſpouting dragons.

Japan is very remarkable for the great number of its burning mountains: particularly not far from Firando is a ſmall rocky iſland, which hath been burning and trembling for many centuries; and in another ſmall iſland, oppoſite to Satzuma, is a volcano that has been burning at different intervals, for many ages. On the ſummit of a mountain, in the province of Figo, is a large cavern, formerly the mouth of a volcano, but the flame has ceaſed, probably for want of combuſtible matter. In the ſame province, near a religious ſtructure called the Temple of the jealous God of Aſo, a perpetual flame iſſues from the top of a mountain. In the province of Tſikuſen is another burning mountain, where was formerly a coal-pit; but it being ſet on fire by the careleſſneſs of the workmen, it has been burning ever ſince. Sometimes a black ſmoak, accompanied with a very diſagreeable ſtench, is obſerved to iſſue out of the top of a famous mountain called Feſi, in the province of Seruga. This mountain is ſaid to be nearly as high as the pike of Teneriff: but, in ſhape and beauty is ſuppoſed to have no equal; and its top is covered with perpetual ſnow. Unſen is a large, though not very high mountain, near Simabara; its top is conſtantly bare and whitiſh from the colour of the ſulphur, and its ſmoak may be diſcerned at the diſtance of ſeveral miles. The earth is in ſeveral places burning hot, and is ſo looſe and ſpungy, that, except on a few ſpots where trees grow, one cannot walk over it, without being in continual fear from the crackling hollow noiſe perceived under foot. Its ſulphureous ſmell is ſo ſtrong, that, for the ſpace of many miles round, there is not a bird to be ſeen; and, when it rains, the water bubbles up, and the whole mountain ſeems as if it were boiling.

It is worthy of remark, that many cold-ſprings and hot-baths ariſe upon and about this mountain; among which there is a famous hot-bath, eſteemed an infallible cure for the venereal diſeaſe, by the patient's bathing in it for a few moments for ſeveral days together. He muſt begin the cure with another hot-bath, which has a more moderate heat, and is ſituated at a few leagues diſtance. As ſoon as he leaves the bath, the patient muſt go to bed, and endeavour to ſweat; and all the while he uſes the waters, he muſt keep to a hot warming diet. Beſides theſe there are many other hot-baths in different parts of the empire, ſome of which are ſaid to have extraordinary virtues in curing external and internal diſeaſes.

The very cauſe which produces ſo many volcanoes is probably the reaſon why this country is more ſubject to earthquakes than perhaps any other in the known world, ſince both doubtleſs proceed from the vaſt quantity of ſulphureous and nitrous materials diſperſed through the bowels of the earth. Indeed earthquakes are ſo frequent in Japan, that the natives dread them no more than the Europeans do ſtorms of thunder and lightning. They imagine that earthquakes are cauſed by a huge whale creeping under ground. Yet ſometimes the ſhocks are ſo violent, and laſt ſo long, that whole cities are deſtroyed, and many thouſands of the inhabitants buried under the ruins. Particularly in the year 1703, an earthquake, attended by a great fire, which broke out at the ſame time, deſtroyed almoſt the whole city of Jedo, together with the king's palace, and 200,000 of the inhabitants. Yet it is obſervable, that ſome particular places in Japan are conſtantly free from this calamity. The Japaneſe reaſon variouſly upon this phænomenon; ſome attributing it to thoſe places being fixed on the immoveable centre of the earth; and others ſuppoſing that it is owing to the ſanctity of thoſe places, and to the powerful protection of their tutelar gods.

SECT. II.

A general Account of the Climate, Soil, Produce, and Rivers of JAPAN. *Of its Minerals and Gems, Trees, Shrubs, Plants, Flowers, and different Kinds of Corn.*

JAPAN enjoys a happy and healthful climate, it not being expoſed to the burning heat of a more ſouthern ſun, nor to the extreme cold and ſevere froſts of the more northern regions: for it is well known, that in general no countries are ſo fruitful, and none ſo pleaſant and agreeable, as thoſe which lie in between 30 and 40 degrees of north latitude. The weather is, however, ſubject to frequent changes; for in the winter they have ſnow, and pretty hard froſts. On the contrary, the ſummer, particularly during the Dog-days, is extremely hot, and thunder and lightning frequently happen. Rains fall throughout the whole year; but with the greateſt profuſion in the months of June and July, which are on that account called Water-months. However, the rainy ſeaſon is far from coming up to that regularity which is obſerved in other and hotter parts of the Eaſt Indies.

The country is for the moſt part mountainous, rocky, and naturally barren; but, through the indefatigable care and induſtry of the inhabitants, they have rendered it ſo fruitful as to ſupply them with all manner of neceſſaries, beſides the fiſh which the rivers and the ſea afford. Even the moſt rocky and uncultivated places yield plants, fruits, and roots for the ſuſtenance of the natives, which their indigent anceſtors learnt to dreſs and to prepare, ſo as not only to render them fit for food, but likewiſe pleaſing and agreeable to the taſte. If we conſider this and the frugal way of living of the Japaneſe in general, we need not wonder that this vaſt and populous empire is ſo abundantly provided with all the neceſſaries of life, that it can eaſily ſubſiſt of itſelf, without any aſſiſtance from foreign countries, as long as arts and agriculture are followed and improved by the natives. Even this ſeeming defect of the ſoil, in requiring the moſt laborious culture, is an inſtance of the kindneſs of heaven, ſince it keeps up among the inhabitants a commendable ſpirit of labour and induſtry. Such in other reſpects is the fruitfulneſs of the climate, that there is ſcarce a hill, though ever ſo ſteep, or ſcarce a mountain, though ever ſo high, which, on being cultivated, as moſt are, do not ſufficiently reward the induſtrious labourer for the pains and care he beſtows on them. The country being divided and interſected by an almoſt infinite number of little iſlands on the coaſt, and in the channels that ſeparate the three largeſt iſlands, is alſo another inſtance of the kindneſs of nature: ſince the many and different iſlands are, with regard to the whole empire, what different countries and provinces are with reſpect to the whole globe: for differing in ſoil and ſituation, they produce all the various neceſſaries and luxuries of life; and there is ſcarce any thing that can be wiſhed for, but what is produced in ſome province, in ſome iſland or other, in ſuch quantities as are ſufficient to ſupply the whole empire. Several provinces produce gold, others ſilver, others copper, others tin, others lead, and others iron. One of the burning mountains throws out great quantities of ſulphur, which is alſo dug up in many other places; and another produces the white clay of which they make all ſorts of porcelain-wares. From others are brought great quantities of timber; and from others pit-coal. Others breed oxen; others horſes. One province is remarkably fruitful in rice, another in cheſnuts, another in figs, and another in fruit. The coaſt of one province is famous for its ſhell-fiſh, another for its ſea-weeds and other ſub-marine plants, and the coaſts in general afford a plentiful ſupply of a variety of fiſh. Pearls are found in the gulph of Omura ambergris upon the coaſts of the Riuku iſlands, and ſeveral provinces produce cryſtals and precious ſtones. Nor have they occaſion to ſend for medicines from abroad; the many mountains and valleys producing, in the compaſs of one country, what plants and trees grow in different climates.

The country is alſo plentifully ſupplied with freſh water, and abounds in ſprings, lakes, and rivers; ſome of which are ſo large and rapid, from their riſing on ſteep high mountains, or from the profuſe ſhowers of rain which frequently fall, that no bridges can be built over them, and they cannot be paſſed without danger. One of the moſt famous of theſe is the river Ujin, which is a mile and a half broad; and it having no bridge, it muſt be forded over. But the force and rapidity with which it falls down from the mountains is ſo great, that even when the water is ſo low as to be ſcarcely knee deep, five ſtrong men, well acquainted with its bed, muſt be employed to lead a horſe over; for, beſides its rapidity, the many large ſtones that lie at the bottom contribute to render the paſſage equally difficult and dangerous. But the people whoſe buſineſs it is to ford paſſengers a-croſs this, and other rivers, to prevent their not taking due care, are, by the laws of the country, made anſwerable for their lives.

It has been obſerved, that gold is found in ſeveral provinces. The greateſt quantity is melted out of its own ore; but ſome they waſh out of the ſands; and a ſmall quantity is alſo contained in the copper. The emperor claims the ſupreme juriſdiction, not only of all the gold mines, but of all the mines of the empire, none of which may be worked without a licence obtained from him: for of the produce of all the mines that are worked, he claims two-thirds, and the other third is left to the lord of the province in which the mines lie; but as theſe lords generally reſide upon the ſpot, they take care to render their ſhare nearly equal to that received by the emperor. The richeſt gold ore, and that which yields the fineſt gold, is dug up in one of the northern provinces of the great iſland Niphon; theſe mines formerly yielded conſiderable quantities of that valuable metal; but the veins there, and in moſt of the other mines, do not yield near the quantity of gold they did formerly. Among the other gold mines there is one in the province of Tſikungo; but it is ſo full of water, that the people have been obliged to deſiſt from working it. However, it being ſo ſituated, that, by cutting the rock and making an opening beneath the mine, the water might be eaſily drawn off; this was attempted: but there happening to ariſe, juſt as they began, ſuch a violent ſtorm of thunder and lightning, that the men were obliged to fly for ſhelter; theſe ſuperſtitious people imagined, that the tutelar god and protector of the place, unwilling to have the bowels of the earth thus rifled, raiſed this ſtorm in order to make them ſenſible how much he was diſpleaſed at this undertaking; and therefore no farther attempt was made, for fear of incurring his diſpleaſure.

The ſilver found here is very fine, and there are mines of it in ſeveral places, particularly in the northern provinces.

One of the provinces alſo affords a ſmall quantity of tin, which is ſo exceeding fine and white, that it almoſt comes up to ſilver: but the Japaneſe make little uſe of this metal.

Copper is the moſt common of all the metals found in Japan. Some of it is the fineſt and moſt malleable of any in the world; others are not only exceeding fine, but mixed with a conſiderable quantity of gold, which the Japaneſe ſeparate and refine. All this copper is brought to Saccai, one of the five principal cities, where it is refined and caſt into ſmall cylinders, about a ſpan and a half long, and a finger thick. There is beſides a coarſer ſort of copper, which is caſt into large flat cakes, and ſold a great deal cheaper than the other. Braſs is very ſcarce, and much dearer than copper; lapis calaminaris being imported from Tonquin in flat cakes, and ſold at an high price.

Iron ore is dug up only on the confines of three of the provinces; but it is found there in large quantities. The iron is formed into cylinders two ſpans long, and bought upon the ſpot by the Japaneſe merchants, who ſend it to all parts of the empire. As iron is ſomewhat dearer than copper, ſuch kinds of houſhold-goods, hooks, cramp-irons in buildings and ſhips, and ſuch other things as in moſt countries are made of iron, are in Japan made of copper: they do not however dreſs their proviſions in veſſels of that metal, but have a particular ſort of light kettles made of a compoſition of iron.

Coals are dug up in great quantities in moſt of the northern provinces.

Agates of ſeveral ſorts, ſome of which are extraordinary fine, and of a bluiſh colour, reſembling ſapphires, and alſo cornelians and jaſpers are brought from a mountain on the northern extremities of the province of Osju.

Pearls, by the Japaneſe called ſhell-jewels, are found almoſt every where about Saikokf in oyſters and ſeveral other ſea-ſhells. The natives formerly ſet little value on them, till they learnt that the Chineſe were willing to purchaſe them at an high price. The largeſt and fineſt pearls are found in a ſmall ſort of oyſter, not unlike the Perſian pearl-ſhell; for both valves ſhut cloſe: they are about an hand broad, exceeding thin and brittle, on the out-ſide black, ſmooth and ſhining, and within pretty rough and unequal, of a whitiſh colour, and glittering like mother of pearl.

Moſt of their ſulphur is brought from a ſmall neighbouring iſland, which, from the great plenty it affords, is called the Sulphur Iſland.

Formerly it was thought inacceſſible, on account of the thick ſmoke which was obſerved continually to ariſe from it, and from the imaginary ſpectres by which the people ſuppoſed it to be haunted: but, at laſt, a man of courage and reſolution obtaining leave to examine its ſtate and ſituation, he choſe fifty reſolute fellows to accompany him, who going on ſhore, found at the top of an eminence a large flat ſpot of ground covered with ſulphur; and ever ſince that iſland brings in to the prince of Satzuma about twenty cheſts of ſilver, *per annum*, ariſing from the ſulphur dug up there, beſides the profit he makes of the trees and timber that grow along the ſhore. The country of Simabara, particularly about the hot baths, affords a fine pure native ſulphur; but the inhabitants dare not venture to dig it up, for fear of offending the tutelar genius of the place, whom they imagine unwilling to ſpare it.

Here alſo is found a naphtha of a reddiſh colour, which the natives burn in lamps, inſtead of oil,

Ambergris is found upon the coaſts, chiefly in the inteſtines of a whale which is frequently caught near the ſhore.

All ſorts of ſubmarine plants, ſhrubs, corallines, corals, ſtones, muſhrooms, ſea-fans, algæ, fuci, and the like; as alſo ſhells of all kinds, are found in the greateſt plenty in the Japaneſe ſeas, no ways inferior in beauty to thoſe found about Amboyna and the other Spice Iſlands: but the natives ſet ſo little value on them, that they will not be at the trouble of looking for them.

The varniſh-tree is one of the moſt uſeful trees of this country; it affording a milky juice which the Japaneſe make uſe of in varniſhing, or, as we call it, japanning, all their houſhold-goods, diſhes, and plates of wood: which are ſo highly eſteemed, both by the prince and peaſant, that even at the emperor's table ſervices of lackered-ware are preferred to thoſe of gold and ſilver. The true varniſh tree is of a kind peculiar to this country, and produces a more beautiful varniſh than is any where elſe to be found.

Though the fruit of both the black and white mulberry-tree is entirely inſipid, and not fit to be eaten; yet this defect is fully compenſated by the extenſive uſefulneſs of its leaves in feeding ſilk-worms. The mulberry-tree grows in moſt parts of Japan, but in the greateſt plenty in the northern provinces, where many cities and villages almoſt entirely ſubſiſt upon the ſilk manufactures.

The kadſi, or paper-tree, is of the mulberry kind. Though it grows wild in the country, yet, on account of its great uſefulneſs, they tranſplant and cultivate it in ſeveral places. It grows with ſurpriſing quickneſs, and ſpreads its branches very far. It affords a great quantity of bark, of which they make not only paper, but ſtuffs, cloth, ropes and ſeveral other things. But a farther account will be given of this tree under the manufactures of Japan.

The ſanſio is a middle ſized tree, armed with prickles. Its bark and huſks are uſed inſtead of pepper and ginger, and the natives eat the leaves on account of their pleaſant aromatic taſte.

Bay trees of ſeveral kinds grow in Japan. That which bears red berries exactly reſembles the cinnamon tree, both in its ſhape, and in the figure and ſubſtance of its leaves: its bark has an aromatic taſte, but it is much inferior to the agreeable ſweetneſs of the true cinnamon.

The

The camphire-tree alſo reſembles a bay-tree; but bears black and purple berries. The country people prepare the camphire by a ſingle decoction of the roots and wood cut into ſmall pieces. This is extremely cheap, and much inferior to the true Bornean camphire, which is ſaid to be gathered from the ſtumps of old camphire trees in the iſland Borneo, upon inciſions being made between the wood and bark.

The tea ſhrub, though one of the moſt eſteemed plants that grow in Japan, is allowed no other room but round the borders of rice and corn-fields, and in barren places unfit for the culture of other things. This ſhrub grows but ſlowly, and riſes to the height of a fathom, or more; and the riſing ſtem ſoon ſpreads into many irregular branches and twigs. The bark is dry, thin, and of a cheſnut colour, a little greyiſh on the ſtem, and inclined to green on the extremities of the twigs. The branches are irregularly beſet with leaves, ſtanding on very ſmall foot-ſtalks, which would not drop off were they not plucked, the plant being an ever-green. The flowers come forth in autumn, one or two together, not unlike wild roſes, an inch or ſomething more in diameter, with very little ſmell, white, and compoſed of ſix round petala, or leaves, ſtanding on foot-ſtalks half an inch long, which, from a ſmall ſlender beginning, inſenſibly grow larger, and end in an uncertain number, commonly five or ſix ſmall round leaves, which ſerve inſtead of the calyx. To the flowers ſucceed the fruit in great plenty, commonly compoſed of three round capſulæ of the bigneſs of wild plums grown together to one common foot-ſtalk, as to a center, but diſtinguiſhed by three pretty deep partitions. Each capſula contains a huſk, nut, and ſeed. The huſk is green inclining to black, when ripe of a fat, membranous, and ſomewhat woody ſubſtance, gaping on its upper ſurface, after a year's ſtanding, for the nut, which lies within, to appear. The nut is almoſt round, and is covered with a thin hardiſh ſhining cheſnut ſhell, which, being cracked, diſcovers a reddiſh kernel of a firm ſubſtance like that of a filbert, at firſt of a ſweetiſh, and not very agreeable taſte, which ſpon grows rough and bitter. The ſeeds are not planted in a continued row, which would make them grow up in hedges, but at ſome diſtance from each other. Eight or ten of them are generally put into one hole; moſt of them being naught. As the ſhrub riſes, the careful and induſtrious once a year fatten the ſoil about them with human dung mixed with earth, which is neglected by others. They muſt be at leaſt of three years growth before the leaves are fit to be plucked, and then they bear very good ones in great plenty. In about ſeven years time the ſhrub riſes to a man's height; but as it then grows but ſlowly, and bears but a few leaves, it is cut down, and the next year many young twigs and branches grow out of the remaining ſtem, bearing ſuch plenty of leaves as abundantly repay the loſs of cutting it down.

With peaches, apricots, and plums, they are well ſupplied: and, in particular, they have two ſorts of plums different from ours, one purple and the other white, and both granulated like mulberries.

As grapes will not eaſily ripen, they plant but few vines. Strawberries are there intirely inſipid; and both the raſpberries and bramble-berries are not very agreeable to the taſte. Cherry-trees, and the like, are kept only for the ſake of the flowers, as are by ſome the apricot and plum-trees, which they improve by culture, ſo that the flowers become as big as roſes, and in the ſpring, when they are in full bloom, afford a delightful ſight about their temples, and in their gardens and walks.

Pomecitrons are to be ſeen only in the gardens of the curious; but there is plenty of different ſorts of oranges and lemons. A ſort of lemons which reſembles the peach, both in ſhape and ſize, is eſteemed the beſt; for it has an excellent aromatic flavour. Another ſort, that is much ſcarcer, in ſhape and ſize reſembles a nutmeg, and is exceeding ſour. It grows rather on a ſhrub than on a tree, and is much uſed in cookery.

In Japan there are three different ſorts of fig-trees: one called kaki, differs from the European fig-tree in ſeveral particulars. It grows on a tree that reſembles an old apple-tree, the leaves being long, and without notches. The fruit in ſhape and colour alſo reſembles a reddiſh apple; but its fleſhy part has the taſte of a delicate fig; yet the ſeed is hard, and almoſt of a ſtony ſubſtance. This tree is no leſs admirable for its extraordinary fruitfulneſs, than for the great uſe made of the fruit, which, on being dried, affords an agreable food both for rich and poor. The ſecond ſort reſembles that which we have in Europe, only it grows on a tree with broad oblong rough leaves, without notches. The third ſort, which is very ſcarce, is the European fig-tree, which was tranſplanted into the country by the Portugueſe.

They have no apple-trees like thoſe of Europe: nor have they any other beſides winter-pears, which are very plentiful, and grow to an extraordinary ſize: but they are not fit to be eaten raw.

Cheſnut-trees grow there in great plenty, and the fruit is both larger and better than ours.

Walnut-trees grow chiefly in the northern provinces. The nuts are incloſed in a fleſhy pulp, and in ſize and ſhape are not unlike to the areka-nut. The kernels, when freſh, are not agreeable to the taſte; but when dried, they are more palatable. They have a gentle purging quality, which is owing to their ſweet oil, and, on account of their many medicinal virtues, they are ſerved up at table along with the deſſert. The oil expreſſed out of theſe nuts is very ſweet and agreeable, and taſtes not unlike the oil of ſweet-almonds. It is much eſteemed for its medicinal virtues, and is alſo uſed in dreſſing proviſions. The ſmoke of the kernels of theſe nuts is the chief ingredient of the beſt Japan-ink. Another ſort of nuts, called ginau, is as big as large piſtacho-nuts, and grow in great plenty on fine tall trees in almoſt all parts of Japan. Theſe nuts afford an oil which is much commended for ſeveral uſes.

Two ſorts of oaks grow in the country, both different from ours; and the acorns of the larger ſort are boiled and eat by the common people. But firs and cypreſs-trees are moſt common in their woods and foreſts. For the ſake of ornament, they are planted in rows along the roads, and over the ridges of the hills and mountains, which renders travelling very pleaſant. The natives plant them in ſandy and barren places, good for nothing elſe; and yet, to prevent their becoming ſcarce, none muſt be cut down without leave from the magiſtrate of the place, or without new ones being planted in their room.

The finoki and ſuggi are two ſorts of cypreſs-trees that yield a beautiful light wood, remarkable for its imbibing no water. The emperor has ſometimes forbid the felling of theſe trees for any uſe whatſoever: however, little regard is had to orders of this kind, particularly in the remote provinces, unleſs the tranſgreſſor be liable to a ſevere puniſhment.

Here is alſo the iron-tree, ſo called from the hardneſs of the wood; and a kind of maple, of which there are two ſorts, which differ from each other in this particular, the leaves of one turn purple in the ſpring, and the other in autumn, and both appear very beautiful. The faſi-tree is alſo ſaid to change the colour of its leaves into a fine purple in autumn.

Japan may vie with moſt, if not all the countries in the known world, for the great variety of beautiful plants and flowers with which nature has adorned its fields, hills, woods, and foreſts. Some of theſe they tranſplant into gardens, and greatly improve by culture. Among theſe is the tſubacki, a pretty large ſhrub that grows in woods and hedges, and has flowers not unlike roſes. Of this ſhrub there are many beautiful varieties. The ſatſuki is a ſhrub with lily-flowers, of which there are many ſorts; particularly two kinds that grow wild, one with purple flowers, and the other with thoſe of a fine carnation: theſe in the proper ſeaſon, are a great ornament to the hills and fields. The ſakanandſio is another ſhrub with lily-flowers, but much larger than the former. There are likewiſe numberleſs varieties of feverfews and lilies growing in the country. The firſt, being improved by art and culture, are the chief ornaments of houſes and gardens; as the other are of deſarts and uncultivated places: nor hath nature been leſs liberal with reſpect to clove-gilly flowers, narciſſuſes, and the like. But it is remarkable, that theſe ſeveral flowers fall as ſhort of others of their kind growing in Europe, in ſtrength and agreeableneſs of ſmell, as they exceed them in the exquiſite beauty of their colours. The ſame obſervation holds true with reſpect to moſt fruits that grow in Japan, they being far from coming up to the pleaſant aromatic taſte of thoſe that grow in China, and other countries of the Eaſt.

The chief productions of the fields that moſt contribute to the ſupport of life, are by the Japaneſe comprehended under the name of the five fruits of the fields. Theſe are, 1. Rice, of which there are ſeveral ſorts; the beſt has not its equal in the Indies; it is perfectly white, and extremely nouriſhing. They boil it to a good conſiſtence, and then eat it at their meals inſtead of bread; and from this they alſo brew a ſtrong ſort of beer, named ſacki. 2. Barley, with which they feed their cattle; and alſo make cakes of it. They have alſo a ſort of barley with purple-coloured ears, which, when ripe, are a great ornament to the fields. 3. Wheat, which is extremely cheap. 4. A ſort of beans about the bigneſs of Turkiſh peaſe, and that grow after the manner of lupins. 5. Sobeans, which are black and not unlike lentils; theſe are ground, and the flour baked with ſugar in ſeveral kinds of cakes. Under theſe five claſſes they comprehend alſo India corn, millet, and all ſorts of peaſe and pulſe.

They have exceeding large turneps, which the natives eat raw, boiled, and pickled: likewiſe horſe-radiſh, carrots, gourds, melons, cucumbers, and ſome ſorts of lettuces. But, beſides all the above plants, there are numberleſs others that grow in the fields upon hills and mountains, in woods and foreſts, in barren and uncultivated places, and along the ſea-coaſts. Of all theſe there are very few but what afford their roots, leaves, flowers, and fruits, not only for the ſupport of the common people, but even for the luxurious tables of the people of quality. There is a great variety of muſhrooms, moſt of which are eat; and of all the ſoft ſubmarine plants, there is hardly one but what the natives uſe for food. The fiſhermen's wives waſh, ſort, and ſell them; and they are alſo very dexterous in diving for them, and bringing them up from the bottom of the ſea, from twenty to forty fathoms deep.

SECT. III.

Of the Beaſts, Birds, Inſects, and Reptiles.

CONSIDERING the great extent of the empire of Japan, it is but ſparingly ſupplied with four-footed beaſts, either wild or tame. The former find but few deſart places where they can increaſe and multiply, and the latter are only bred up for agriculture and carriage. The doctrine of the tranſmigration of ſouls being almoſt univerſally received, the natives live chiefly upon vegetables, and know how to improve the land to much better advantage than in turning it into fields for the breeding of cattle.

The horſes in this country are ſmall; but ſome of them not inferior in ſhape, ſwiftneſs, and dexterity, to the Perſian breed. They here ſerve for ſtate, for riding, for carriage, and plowing. Bulls and cows ſerve only for plowing and carriage. It is ſurpriſing that the natives know nothing of milk, butter, and cheeſe; but probably the cows, as in other eaſtern countries, yield but little milk. They have a ſort of buffaloes of a very large ſize, that have bunches on their backs like camels, and in large cities ſerve for carriage and the tranſporting of goods. They have no elephants, camels, aſſes, mules, ſheep and goats, and but few ſwine, which were brought over from China, and are bred by the country people in one province, in order to ſell them to the Chineſe who trade with Japan. Dogs are very numerous, but they have only the common ſort, and no greyhounds or ſpaniels. They have a beautiful kind of cats, which are of a whitiſh colour, with large yellow and black ſpots, and a very ſhort tail. They are not fond of mouſing, but love to be carried about and careſſed, particularly by women.

Of the wild beaſts, they have a few monkeys of a docile kind, of a dark-brown colour, with ſhort tails, and with naked faces and backs. They have alſo a few bears of a ſmall kind in the northern provinces. There are likewiſe a ſmall number of deer, hares, and wild boars, which ſome ſects are permitted to eat at certain times of the year. Foxes are very common, and the natives imagine that they are animated by an evil ſpirit: but the fox-hunters are very expert in catching and ſtripping them of their fur, which is uſed for their writing and painting pencils. From lions, tygers, leopards, and ſuch other voracious animals, Japan is entirely free. The ituts is a ſmall four-footed animal of a reddiſh colour. Another larger ſort of it is called tin. They both live under the roofs of houſes. They are very dexterous at catching fowls and fiſh, and are ſo tame that they may be ranked in the claſs of domeſtic animals. The whole country ſwarms with rats and mice. Some of the rats are tamed, and taught to perform ſeveral tricks. Thoſe which play with moſt dexterity are to be ſeen at Oſacca, a city to which mountebanks, jugglers, and men with ſhews reſort from all parts.

Of tame-fowl they keep chickens, and ſometimes ducks, which are killed and ſold by the meaneſt of the people, to ſuch as will venture to eat them: but in the mourning years for the death of an emperor, and at any other time when the emperor thinks fit to order it, no living creature whatever may be killed or brought to market, in any part of his dominions. The cocks oftener eſcape than the hens; they being held in great eſteem, chiefly among the religious orders, on account of their meaſuring time, and their being ſuppoſed to foretel future changes of the weather. Tho' wild-fowl are naturally ſhy, yet in this populous country they are ſo familiar, that many kinds of them may be juſtly ranked among the tame.

Cranes are the chief of the wild birds of the country, and have this privilege, that it is unlawful to ſhoot them without an expreſs order from the emperor. They are of two different kinds, one white as ſnow, the other aſh-coloured.

Of herons there are ſeveral kinds, which differ in ſize and colour. The chief are the white and the grey, both very common; and a heron of a bluiſh colour, almoſt as big as a crane.

There are two different ſorts of wild-geeſe, which couple only with their kind; the one aſh-coloured, and the other as white as ſnow, with only the extremities of the wings black. Both are very common, particularly the grey ones; and ſo familiar, that they will not fly away at any body's approach. They do a great deal of miſchief in the fields, and yet nobody muſt kill or even diſturb them on pain of death, except thoſe who have bought the privilege of ſhooting them on ſome tracts of ground.

There are ſeveral ſorts of wild-ducks, as tame as the geeſe. The male of one of theſe kinds is extremely beautiful; for its feathers are wonderfully diverſified with the fineſt colours imaginable; the neck and breaſt are red; the head is crowned with a moſt magnificent topping; beſides, the tail riſing obliquely, and the wings ſtanding up over the back in a very ſingular manner, afford a ſight as curious as it is uncommon.

There are pheaſants of ſingular beauty; particularly one kind is remarkable for the various colours and luſtre of its feathers, and for the beauty of its tail, which is about a yard long, and in the variety and mixture of the fineſt colours, chiefly blue, is not inferior to that of the peacock.

Woodcocks are very common, and are eat by ſome ſects, as are alſo the wild-geeſe, ducks, and pheaſants.

Storks ſtay in the country all the year. Hawks are as common here as in other parts of the Eaſt Indies. The beſt falcons are caught in the northern provinces.

The miſago, or biſago, is a voracious bird of the hawk-kind, which preys chiefly on fiſh. It makes a hole in ſome rock upon the coaſts, where it lays up the prey it has caught, which is obſerved to keep as well as pickled fiſh. It taſtes very ſalt, and is ſold dear. Whoever has diſcovered ſuch a cave may make a good deal of money of it, provided he does not take out too much at a time.

The ſoken is a ſcarce night-bird, of a moſt delicious taſte; and therefore affords a diſh for the tables of people of quality.

Larks ſing much better here than in Europe; and nightingales, if they have a good voice, are ſometimes ſold to curious people at a very high price. In ſhort, ſnipes, ſea-pies, mews, ſea-ravens, ſwallows, and ſparrows, are as common here as in Europe.

Here are bees, and conſequently ſome honey and wax, though but in a ſmall quantity: alſo humble bees, waſps, gnats, flies, locuſts, beetles, and a great variety of other inſects common in Europe; beſides ſome other remarkable ſorts, the chief of which we ſhall here mention. Among the butterflies there is a large ſort called the mountain-butterfly, which is either entirely black, or curiouſly diverſified

Ceremony of Marriage of the Japanese.

fified with white, black, and other ſpots. The komuri is a beautiful, large, ſpotted, and hairy night fly.

They have alſo ſeveral very extraordinary kinds of beetles, among which is a brown one called ſebi, that muſt appear very curious to the attentive eye of the naturaliſt. They are of three kinds, and the largeſt reſemble in ſhape the flies which in Europe fly about in the evening; but they have no wings. They lie in the ground all the winter, and creeping out in ſpring, in the night-time, faſten themſelves to the trees, or whatever in their march they can lay hold of. A little while after they burſt, and their back ſplitting lengthwiſe, makes way for the deliverance of a fly, like a beetle, that was incloſed within it, and which inſtantly appears much bigger than the priſon in which it was confined; when burſting forth, it ſpreads its four wings, and flies away, ſinging with a loud voice, which, it is ſaid, may be heard at the diſtance of an Engliſh mile. The woods and mountains are filled with the noiſe; but they gradually diſappear in the dog-days, when they are ſaid to creep into the ground again, in order to undergo a new metamorphoſis, and that they may re-appear in the ſame ſtate the following year. Another ſmaller kind is ſeen later in the year, about the time when the others diſappear. They ſing from noon to ſun-ſet; but their muſic is not near ſo loud as that of the others, and they continue abroad till late in autumn. The third ſort differs from the ſecond only in ſinging from morning till night. The females of all the three kinds are mute.

They have cantharides of ſeveral beautiful kinds; but their uſe is unknown. The fineſt of all the flying tribe of inſects is a ſcarce night fly, which, on account of its incomparable beauty, is kept by the ladies among their curioſities. It is of about the length of a finger, ſlender, round-bodied, and with four wings; two of which are tranſparent and hid under a pair of others, which ſhine with the fineſt poliſh, and are moſt curiouſly adorned with lines and ſpots of blue and gold.

Among the inſects are ſmall miſchievous creatures, called white ants. Theſe live together in community like the European ants, and nearly reſemble them in ſhape and ſize. The Japaneſe call them piercers, an epithet which they well deſerve, for they pierce whatever they meet with, ſtones and ores excepted; and when once they get into a ware-houſe, they are able, in a ſhort time, to deſtroy all the goods. Nothing has been as yet diſcovered that will keep them off, but ſalt laid under the goods and ſpread about them.

The lizards of this country reſemble thoſe of Europe. There are but few ſnakes. One of the moſt famous is of a green colour, with a flat head and ſharp teeth. Its bite is followed by a ſpeedy death; yet the ſoldiers are very fond of its fleſh, from their firmly believing that their eating it makes them bold and courageous. Another ſort of ſnakes is of a monſtrous ſize. Theſe are found in waters and upon mountains; they are very ſcarce, and when taken are ſhewn for money.

SECT. IV.

Of the Perſons of the Natives; their Dreſs at home and when they travel. Their Marriages, Funerals, Character, Temper, and Diſpoſition. Their ſkill in Agriculture, Arts, and Manufactures. More particularly the Manner in which they make Paper of the Bark of the Paper-tree; their Method of making Salt; the Preparation of Tea, and the Manner in which they drink it.

WE ſhall now proceed to the rational inhabitants of Japan, and conſider their perſons, their dreſſes, their origin, religion, and manners.

The difference obſervable between the inhabitants of ſeveral provinces in their ſhape and features is as great as if the country had been peopled at different times, and from different nations. The Japaneſe in general, particularly the inhabitants of Niphon, ſeem very diſagreeable: they are ſhort ſized, tawney, with flattiſh noſes, thick eye-lids, and are ſtrong and thick-legged: but the deſcendants of the eldeſt and nobleſt families are more like the Europeans, and have ſomething more majeſtic in their ſhape and countenances. The natives of the provinces of Satzuma and Fiuga are of a middle ſize, ſtrong, brave and manly, civil and polite. This is alſo obſervable in ſome of the northern provinces in the great iſland Niphon; but thoſe of the eaſtern provinces of that iſland are diſtinguiſhed by their big heads, flat noſes, and muſcular fleſhy features. Yet the natives of ſome of the provinces of the iſland of Saikokf, though ſhort, are ſlender, well ſhaped, of a handſome appearance, and are extremely polite.

The dreſs of the Japaneſe is of ſilk or cotton, and conſiſts of a ſhort veſt next the ſkin, a long gown over it, and, which is pretty ſingular, a cloak or mantle within doors, which they pull off when they go abroad. Notwithſtanding their being ſhaved, one lock alone being left on the crown of the head, they commonly go bare-headed: but when they walk abroad generally make uſe of an umbrella, which thoſe in genteel circumſtances have carried over their heads by a ſervant. Both the rich and poor wear a ſword by their ſide, or at leaſt a dagger, and a fan in their hand. But the nobility and the ſoldiers have the privilege of wearing two ſwords. The diſtinction of dreſs, according to rank, chiefly conſiſts in the richneſs and colour of the ſtuff; but, contrary to the cuſtom of moſt nations, they uſe black at their feſtivals, and white for mourning. The ſame ſingularity appears in ſome other of their cuſtoms.

As the Japaneſe make a different appearance on horſeback, and the dreſs uſed at home does not reſemble that worn by travellers, we ſhall now deſcribe the the latter. To keep off the heat of the ſun, travellers, inſtead of an umbrella, wear a large hat, neatly made of ſplit bamboos, or ſtraw, and tied under the chin with broad ſilk bands lined with cotton. It is tranſparent and exceeding light; and yet, if once wet, will let no rain come through. This hat is not only worn by men on their journeys, but by women in cities and villages at all times and in all weathers. A traveller muſt alſo provide himſelf with a long cloak againſt rainy weather, made of double varniſhed oil paper, and ſo very large and wide, as to cover not only the man and his baggage, but the back and ſides of the horſe. They alſo wear very wide drawers, which cover their legs, and are ſlit on both ſides to put in the ends of their long gowns, which would otherwiſe be troubleſome to them in riding or walking. Some wear a ſhort cloak over the drawers; and ſome, inſtead of ſtockings, wrap a broad ribbon about their legs. Ordinary ſervants wear no breeches, and, for expedition ſake, tuck their gowns quite up to their belts, expoſing their backſides and privy-parts, which they ſay they have not the leaſt reaſon to be aſhamed of. As both ſexes never go abroad without fans, in their journeys they commonly make uſe of thoſe which have the roads printed upon them, and tell them how many miles they are to travel, what inns they are to go to, and what is the price of proviſions. Some, inſtead of ſuch a fan, make uſe of a road-book. Theſe are offered to ſale by numbers of poor children begging along the roads. A Japaneſe tucked up after this faſhion makes a very odd figure; for beſides their being generally ſhort and thick, their large hat, wide breeches and cloak, together with their ſitting croſs-legg'd on the horſe, make them appear broader than they are long. As to the bridle, the traveller hath nothing to do with that, the horſe being led by one of his footmen, who walks on the horſe's right-ſide, near the head, and, both he and his companions, ſing merry ſongs to divert themſelves and animate the horſes. This cuſtom is univerſal; for none guide their horſes themſelves. The great men are carried by their ſervants in a kind of ſedans, though the journey be ever ſo long.

Their marriages are celebrated before ſome of the bonzes, or prieſts, at the foot of an idol; where the bridegroom and bride have two tapers, or lamps, put into their hands, while the prieſt pronounces the words, after which the bride throws the toys ſhe had played with in her childhood into the fire; and, in their ſtead, receives from the relations preſents ſuitable to her preſent condition, together with their congratulations and good-wiſhes. At length, after ſome offerings made to the idol, the whole company, attended with vocal and inſtrumental muſic, are conducted to the bridegroom's houſe, where the feaſt laſts a week; during which the muſic, dancing, banquets, and ſtrong liquors, are ſeldom ſpared.

The noble and the wealthy ſtrive to honour the dead with great pomp and ceremony; and drinking at the funeral

feaſt is rendered in ſome meaſure expedient, in order to diſpel the gloomineſs excited by the funeral, and by the mournful ſongs, ſpeeches, and geſtures of the prieſts; and more eſpecially by the ſuperſtitious charms, paſſes, bills of exchange, and other knaviſh impoſitions, by which they pretend to keep back or diſperſe thoſe malicious ſpirits which the credulous laity ſuppoſe lie in wait for departed ſouls, and to procure them a comfortable place in the other world.

Notwithſtanding the extreme ſuperſtition of the Japaneſe, which appears on every occaſion, their behaviour, from the meaneſt countryman up to the greateſt lord, is ſuch, that the whole empire may be termed a ſchool of civility and good manners. They have ſuch an innate curioſity, that were they not abſolutely denied a free and open converſation and correſpondence with foreigners, they would receive them with the utmoſt kindneſs and pleaſure. But both their love and hatred, their eſteem and contempt, are handed down to the lateſt poſterity; for wrongs and injuries are reſented by ſucceeding generations, and mutual enmities ſeldom ceaſe, but with the death and total deſtruction of one of the parties. But, notwithſtanding this vindictive ſpirit, they do not in other reſpects want generoſity and humanity: nor are they at all deficient in perſonal bravery. Such is the education of their children, that ideas of courage and reſolution ſeem the firſt and chief impreſſion they endeavour to make upon their tender minds. In the very firſt ſtage of infancy, when they cry, warlike ſongs are made uſe of to appeaſe them. The boys when they learn to read, have ſcarce any other books but the hiſtories of their heroes; and grown perſons, when in company, turn the converſation chiefly upon the heroic exploits of their forefathers, calling to mind the minuteſt circumſtances recorded in their hiſtories. Hence when fires are lighted at night, according to the cuſtom of the country, on the tops of the mountains, which is ſeldom done but upon ſome imminent danger, when the princes are to ſend their quotas of troops, the people crowd to be enrolled, carrying their arms along with them; and, in time of battle, are ſo inflamed with martial ardour, that they are impatient of expoſing themſelves by ruſhing into places of the greateſt danger; nor do they want proper arms, for at a diſtance they fight with guns and arrows, and when they get hand to hand they make uſe of pikes, and of ſabres ſo ſharp and well tempered, that they will cut a man in two at the middle.

The Japaneſe are induſtrious, and enured to hardſhips. They are ſatisfied with little, and the generality live on plants and roots, turtle, ſhell-fiſh, ſea-weeds, and the like. Water is their common drink, and, as hath been already intimated, they go bare-headed and bare-legged. They wear no ſhirts, and ſleeping on a mat, inſtead of a pillow, lay their heads on a piece of wood ſomewhat depreſſed in the middle: yet they are very nice in keeping themſelves, their cloaths, and houſes, neat and clean.

The Japaneſe are probably an original nation, no ways indebted to their neighbours, the Chineſe, for their deſcent; and though they have received from them ſeveral uſeful arts and ſciences, as the Romans did from the Greeks, yet it appears from their hiſtories, that they were never conquered, either by them or by any other nation. While the Chineſe are juſtly conſidered as a crafty, cunning, covetous, and knaviſh people, the Japaneſe are admired for their ſtrict honeſty, faithfulneſs, and generoſity; and no people are more careful to breed up their children to a love of theſe and every other virtue. For this purpoſe they have a prodigious number of academies, the principal of which is Frenajam, or Frenoxama, about nine or ten miles from Miaco.

The Japaneſe language, which has ſcarcely any affinity to the Chineſe, is very grammatical and copious, abounding in ſynonimas. They in general write like the Chineſe, from top to bottom, but have different hands, none of which reſemble the Chineſe characters. Indeed ſeveral profeſſions have their peculiar ways of writing, among which one runs from right to left, and back again from left to right.

The Japaneſe are perhaps as good huſbandmen as any people upon earth, and, indeed, it is not ſurpriſing that they have made great improvements in agriculture, conſidering not only the extreme populouſneſs of the country, but that the natives are denied almoſt all commerce and communication with foreigners, and are obliged to ſupport themſelves by their own labour and induſtry. Hence not only the fields and flat country, which are ſeldom turned into paſture-ground, but the hills and mountains, afford corn, rice, pulſe, and numberleſs edible plants. Every inch of ground is improved to the beſt advantage, and none can behold, without admiration, the hills and mountains, many inacceſſible to cattle, and that in other countries would lie wholly neglected, cultivated up to their very tops. They are ſkilful in manuring their ground, which they do in various ways, and with many different ſubſtances. Flat low lands are plowed with oxen, ſteep and high ones by men, and both manured with human dung. As to rice, which is the principal food of the natives, ſuch grounds as are proper for it are turned into rice fields; particularly the low flat lands, where they have a command of water, and can cut canals. All lands are ſurveyed every year before they are ſown, by ſworn ſurveyors, who are proud of their ſkill in geometry, and, as well as the nobles and ſoldiers, have the privilege of wearing two ſwords. At the approach of harveſt they are ſurveyed again, when it is computed what the whole crop will amount to, which is generally done by gueſs with a ſurpriſing accuracy: but if the harveſt is likely to prove extraordinary good, they cauſe the corn upon a ſquare piece of ground to be cut and threſhed, and thence compute the produce of the whole. This is done for the ſecurity of the landlords, who have ſix parts in ten of all the produce of their lands; and the tenant, for his trouble and maintenance, the other four. Such as hold lands of the crown, give only four parts in ten to the emperor's ſteward. But, for the encouragement of ſuch as cultivate untilled ground, they have the whole crop for the firſt two or three years. Among many extraordinary laws in relation to agriculture they have one, by virtue of which whoever does not cultivate his ground for the term of one year, forfeits his title and poſſeſſions.

As to curious and uſeful mechanical arts, they want neither proper materials, nor induſtry and application; and are ſo far from having any occaſion to ſend abroad for maſters, that they exceed all the other eaſtern nations in ingenuity and neatneſs of workmanſhip, particularly in gold, ſilver, braſs, and copper. Their ſkill in tempering of iron is evident from the goodneſs and neatneſs of their arms, their ſabres being ſaid to exceed thoſe of all other countries. No nation in the Eaſt is ſo dexterous in carving, engraving, and gilding of what they call ſowaas, a particular kind of metal, made of a mixture of copper with a little gold. They weave ſilk ſtuffs ſo fine, neat, and even, that they are inimitable even to the Chineſe. This is the uſual amuſement of the great men of the emperor's court, when in diſgrace or baniſhed to certain iſlands, where they have nothing elſe to do, but to exerciſe their ingenuity in this or the like curious manufactures. Their porcelain, both in the excellence and whiteneſs of the earth, and in the beauty of the colours and painting, greatly exceed any made in China. The ſame may be ſaid of their varniſhed or japanned houſhold-goods, which are ſurpriſingly fine, and the varniſh harder and more durable than that of any other country. They have alſo the admirable art of printing, which they probably learnt from the Chineſe.

Their beer, which they call ſaki, and which is brewed from rice, is much better and ſtronger than that of the Chineſe; whom they alſo exceed in dreſſing of their proviſions, which they generally ſeaſon with ſpices of their own growth. Their paper too, which they make of the bark of the paper-tree, is ſtronger, of a better body, and whiter than that made by the Chineſe. The manner in which this is performed deſerves a particular deſcription.

Every year when the leaves of the paper-tree fall off, the young ſhoots are cut into ſticks about three feet long, and being tied up in bundles, are boiled with water till the bark ſkrinks from the wood. The ſticks are then expoſed to the air till they grow cold, and being ſlit open lengthways, the bark is taken off, dried, and carefully preſerved. Afterwards being ſoaked in water till it is ſoft, it is ſcraped, and the ſtronger bark, which is full a year's growth, is ſeparated from the thinner, which covered the younger branches; the former yielding the beſt and whiteſt paper. The bark, being then cleanſed from all knots and impurities, is boiled in clear lye, and conſtantly ſtirred about till it is grown ſo tender, that on being ſlightly touched, it will ſeparate into ſmall fibres. The bark thus ſoftened is waſhed in a river in ſieves, and conſtantly ſtirred about with the

hands, till it is diluted into a ſoft delicate woolly ſubſtance, and then put upon a thick, ſmooth, wooden table to be beat with ſticks till it reſembles the pulp of ſoaked paper. The bark thus prepared is put into a narrow tub, with the ſlimy infuſion of rice, and the infuſion of the oreni root, which is alſo ſlimy and mucous; and being mixed into an uniform liquid ſubſtance by ſtirring it with a thin reed, the ſheets are formed one by one, by taking up this liquid ſubſtance in a proper mould made of bulruſhes inſtead of wire, carefully laid one upon another on a table covered with a double mat, while a ſmall piece of reed is put between every ſheet; which ſtanding out a little, ſerves in time to lift them up conveniently, and take them off ſingly. Every heap is covered with a ſmall board of the ſame ſhape and ſize with the paper, on which are laid weights, which are at firſt ſmall ones, leſt the ſheets, which are as yet wet and tender, ſhould be preſſed together into one lump; but by degrees more and heavier, to ſqueeze out the water. The next day the weights are taken off, and the ſheets lifted up one by one, and with the palm of the hand clapt to long planks and expoſed to the ſun: and when fully dry, taken off, laid up in heaps, pared round, and then kept for uſe or ſale.

In the province of Fiſen is made the Japaneſe porcelain, or china ware, of a whitiſh fat clay, which is found there in great plenty. Though this clay be of itſelf good and clean, it requires a great deal of kneading and waſhing before it is brought to the proper degree of perfection; which is attended with ſuch labour, as to give birth to the old hyperbolical expreſſion, *That human bones are an ingredient in china-ware.*

In ſeveral maritime provinces ſalt is thus made: they cloſe in a ſpot of ground, and filling it with fine looſe ſand, pour ſea-water upon it and let it dry. This being repeated ſeveral times, they take out the ſand, and put it into a large trough with ſmall holes at the bottom; and putting ſea-water again upon it, let it filtrate through the ſand, and then boil it to a good conſiſtence. The ſalt thus obtained is calcined in earthen pots till it becomes white and fit for uſe.

We have already given a particular account of the cultivation of the tea-ſhrub in Sect. II. but as tea makes ſo conſiderable an article in European luxury, we cannot here forbear deſcribing the manner in which the Japaneſe gather and prepare it for uſe. Thoſe who have a great number of ſhrubs hire day-labourers, who make it their particular buſineſs, and are very dexterous in gathering the leaves, which muſt be plucked one by one. Thoſe who gather them thrice a year, begin their firſt gathering at the latter end of February, or the beginning of March, when the ſhrub has but few leaves, which are very young and tender, and not fully opened; theſe are reckoned the beſt, and are called imperial tea, and by ſome the flower of tea. The ſecond gathering is in the latter end of March, or the beginning of April, when care is taken to ſort them into claſſes, according to their ſize and goodneſs; thoſe that are not fully grown coming neareſt to thoſe of the firſt gathering. The third gathering is made when the leaves are come to their full growth. Some neglect the two former gatherings, and confine themſelves to this, in which the leaves are again ſorted into different claſſes, the third of which contains the coarſeſt leaves, that are full two months grown, and is the tea commonly drank by the vulgar.

The climate of Udſi, a town and diſtrict near the city of Miaco, has been obſerved to be ſingularly favourable for the culture of tea; and hence all that is drank at the emperor's court, and in the imperial family, is cultivated on a mountain in the ſame diſtrict. The chief purveyor of tea at the imperial court, who has the inſpection of this mountain, ſends his deputies to cultivate the ſhrub, and gather and prepare the leaves. The mountain is pleaſant, and ſurrounded with a broad ditch to keep off man and beaſt. The ſhrubs are there planted in walks, which are ſwept every day, and care muſt be taken that no duſt falls on the leaves. Two or three weeks before the time of gathering, the men muſt abſtain from the eating of fiſh, or any unclean food, leaſt the leaves ſhould be injured by the impurity of their breath. During the time of gathering they muſt bathe two or three times a day, nor muſt they touch the leaves without gloves. The fineſt imperial tea, being thus gathered and prepared according to art, are put into paper-bags, and theſe into large porcelain veſſels, which, for the preſervation of the leaves, are filled up with common tea. The chief ſurveyor of the works then ſends them up to court with a ſtrong guard, and a numerous attendance. Hence ariſes the great price of this imperial tea; for the chief purveyor of tea, in the accounts he lays before the imperial exchequer, is not aſhamed to bring in the price of ſome of this tea at one obani a pound: the obani being a gold coin worth an hundred ounces of ſilver. And Mr. Kæmpfer obſerves, that when he had an audience at court, one of the gentlemen in waiting preſented him a diſh with the following compliment: "Drink heartily, and with "pleaſure, for one diſh coſts an itzebo;" that is, about twelve or thirteen ſhillings Engliſh.

The Japaneſe uſe the following method in preparing the leaves: when freſh gathered, they are dried or roaſted over the fire in an iron pan, and when hot rolled with the palm of the hand on a mat, till they become curled. This is repeated ſeveral times, at each of which the heat of the fire is decreaſed. For this purpoſe they are carried to public roaſting-houſes as ſoon as they are gathered, for if they were kept but one night, they would turn black, and loſe much of their virtue. In theſe roaſting-houſes are ſeveral ovens, each three feet high, with a wide flat ſquare or round iron pan at the top. The ſide juſt over the mouth of the oven is bent upwards for the roaſter, who ſtands on the oppoſite ſide, to ſecure him from the fire, that he may be able conſtantly to turn the roaſting leaves. They have alſo ſeveral long tables covered with fine mats, on which the leaves are rolled. The tea, after its being thus roaſted and curled, is no ſooner cold, than it is put into earthen-jars with narrow mouths, which are ſtopped up to preſerve it from the air.

The Japaneſe manner of drinking tea is very different from that of the Chineſe and Europeans. Before the leaves are uſed, they are reduced into a very fine powder by grinding them in a hand-mill, made of a black greeniſh ſtone; after which it is ſerved up in company in the following manner: the powder is incloſed in a box, and the reſt of the tea-table furniture is brought into the room where the company ſits. All the cups are filled with water, and the cheſt being opened, they take out with a ſmall neat ſpoon about as much of the powder as will lie on the point of a pretty large knife, and put it into every diſh. They then mix it with a curious denticulated inſtrument till it foams, and ſo preſent it to be ſipped while hot.

There is another method of making tea, uſed by the vulgar and the country people, who uſe it as their common drink. Before ſun riſe one of the domeſtics hangs a kettle of water over the fire, and puts in, either when the water is cold, or after it has been made hot, two, three, or more handfuls of the coarſeſt kind of leaves, according to the number of the heads of the family, and at the ſame time puts in a baſket of a ſize and ſhape that exactly fits the inſide of the kettle, to keep the leaves down to the bottom, that they may be no hindrance in lading out the water. This is to quench the thirſt of the whole family all day, and therefore a baſon of cold water is put by it, that in caſe they ſhould not have time to ſip it leiſurely, they may cool it as they pleaſe, and drink large draughts.

As there are people in Europe who teach to carve, to fence, to dance, &c. ſo there are maſters in Japan who teach children of both ſexes to do the honours of the tea-table, and to behave well in the company of thoſe who drink tea.

We ſhall now endeavour at leaſt, to give the reader ſome idea of the ſhips, boats, and different kinds of buildings erected by the Japaneſe.

SECT. V.

Of their Ships, Boats, and Houſes. The Emperor's Palace at Jedo deſcribed. The Populouſneſs of the Country. A Deſcription of Jedo, and of the Cities of Miaco and Oſacca.

THE merchant-ſhips, which ſerve for tranſporting men and goods from one iſland or province to another, are the largeſt naval buildings of this country. They are commonly fourteen fathoms long, and four broad; built for rowing as well as ſailing: they run tapering from the

middle towards the ſtem, and both ends of the keel riſe high above the water. The ſtem is broad and flat, with a wide opening in the middle, which reaches down almoſt to the bottom of the ſhip, and lays open the inſide to the eye: for, by the emperor's order, no ſhip is to be built without ſuch an opening, in order to prevent his ſubjects from attempting to venture out to ſea, on any voyage whatever. The deck conſiſts only of deal-boards laid looſe, and, when the ſhip is fully laden, riſes but little above the ſurface of the water. It is almoſt covered with a ſort of cabin, which projects out of the ſhip about two feet on each ſide, and round it are folding windows, that may be opened or ſhut at pleaſure. Here ſmall rooms for paſſengers are ſeparated from each other by folding-ſcreens and doors, and the floor covered with mats. The roof or upper-deck is flat, and made of neat boards curiouſly joined together; and, in rainy weather, the maſt is let down upon it, with the ſail extended over it for the ſailors and ſhip people employed in the ſervice of the ſhip to ſleep in the night. Sometimes, the better to defend the upper-deck, it is covered with ſtraw-mats. The ſhip has but one maſt, which is of the ſame length with the veſſel, and is wound up by pullys. But though the anchors are of iron, the cables are only of twiſted ſtraw. The largeſt of theſe ſhips have commonly thirty or forty hands to row them, which they do when the wind fails. Theſe rowers are ſeated on benches towards the ſtern, and row according to the air of a ſong, which ſerves at the ſame time to regulate their motions, and animate them at their work. The timbers and boards are faſtened together with hooks and bands of copper, and the ſtern is adorned with black fringe. Men of quality, when they undertake one of theſe ſmall voyages, have their cabin hung with cloth, on which is ſewed their coat of arms. Their pike of ſtate, the badge of their authority, is put on the ſtem by the rudder, and on the other ſide is a weather-flag for the uſe of the pilot. Small ſhips no ſooner come to an anchor, than the rudder is wound up and their end put aſhore; ſo that any one may paſs through the opening of the ſtern as through a back-door, and walk to land over the rudder, as over a bridge.

Both their ſhips and boats are built of cedar or fir, which grow in great plenty in the country. The latter are of a different ſtructure, according to the purpoſes and the waters for which they are built. The pleaſure-boats, which are only uſed in the rivers, or in croſſing ſmall bays, are alſo widely different in their ſtructure, according to the fancy of their owner. As they are commonly built for rowing, the firſt and lowermoſt deck is low, and upon it ſtands another more lofty with open windows; and this may be divided at pleaſure into ſeveral ſmall rooms. The roof and ſeveral parts of the boat are adorned with a variety of flags and other ornaments.

As both theſe ſhips and pleaſure-boats muſt appear very trifling and puerile works, when compared with our ſhips, and the gallies uſed in many parts of Europe, ſo all the buildings in the country, whether eccleſiaſtical or civil, public or private, though richly decorated, are deſtitute of that ſimple grandeur obſerved in ours. By the laws of the empire, the houſes of private perſons are not to exceed ſix fathoms in height, and they are ſeldom built ſo high, except they are deſigned for ware-houſes; and though there are many common houſes of two ſtories, the upper ſtory is only fit for a lumber-room. The reaſon of their building their houſes ſo very low, is the frequency of earthquakes, which prove moſt fatal to lofty edifices. The houſes of the Japaneſe are however to be admired for their cleanlineſs, neatneſs, and curious furniture. They have none or but few partition-walls; but, inſtead of them, make uſe of folding-ſkreens, made of coloured or gilt paper, faſtened on wooden frames, by which means they enlarge their rooms and make them narrower, as beſt ſuits their fancy or convenience. The floors are raiſed above the level of the ſtreet, and are all made of boards neatly covered with fine mats, the borders of which are fringed, embroidered, or otherwiſe neatly adorned; and upon theſe mats they ſit croſs-legged. In all the lower part of the houſe the doors, windows, poſts, and paſſages, are painted and varniſhed; and the ceilings covered with gilt or ſilvered paper, embelliſhed with flowers, and the ſkreens in ſeveral rooms curiouſly painted. In ſhort, there is not a corner in the whole houſe but has a pretty appearance. In the noblemen's houſes there are two diſtinct ſets of rooms, and in that which is fartheſt from the entrance the women live, while the other is occupied by the men. Theſe houſes have commonly a ſpacious court, with an aſcent to the houſe; and alſo a deſcent on the back of it of three or four ſteps, leading into a garden, adorned with walks, terraces, mounts, flowers, and other embelliſhments; which yield a beautiful proſpect, even from the firſt entrance, and there is always an open paſſage through the houſe. The apartments of the moſt wealthy people are furniſhed rather in a neat than expenſive manner. If they appear extravagant in any thing, it is in the ceilings of their halls and ſummer-houſes, which are of fine cedar, plated with gold and ſilver of curious workmanſhip, and embelliſhed with a great variety of other ornaments. But as the houſes in general are low wooden ſtructures, in which they make up in length and depth what they want in height, this renders their cities very ſubject to fire, which frequently cauſes great deva ſtations; however, to preſerve themſelves and their moſt valuable effects on theſe dreadful occaſions, they have an apartment all of ſtone ſeparate from the reſt of the building, to which they fly with their richeſt goods, whenever threatened by ſuch diſaſters.

The imperial palace at Jedo, the metropolis of the empire, which in 1703 was deſtroyed by an earthquake, has been ſince rebuilt with ſurpriſing magnificence. It is on all ſides fortified by three lofty walls and as many deep ditches, with large plains between them; the water being conveyed from one ditch to another by ſubterranean pipes. Theſe walls have eight or nine gates, which are placed in ſuch a manner, that one muſt turn to the right and left before one enters the inner court. Beſides, between every two gates there is firſt a large plain; then an aſcent by a flight of ſteps to out-works, ſurrounded by high walls, with void ſpaces large enough for a thouſand men to be ranged in order of battle. In the center of all are the imperial apartments, conſiſting of three rows of buildings in front, each nine ſtories high, and formed on the top like pyramids, with large dolphins over them plated with gold. Theſe ſtructures contain a great number of ſpacious halls, lodging rooms, and offices for the emperor, his wives, and attendants, all of them magnificently furniſhed; and behind are parks and gardens, in which are groves, terraces, canals, fiſh ponds, and water-works. The ceilings of the halls and lodgings are plated with gold and ſilver, curiouſly raiſed, and enriched with a variety of precious ſtones; and theſe rooms are hung with the richeſt ſilks flowered with ſilver, gold, and pearls. The hall where the emperor receives homage, has a throne of maſſy gold, enriched with precious ſtones of incredible ſize and inеſtimable value. The roof, which is all plated with gold, richly enamelled with figures and landſcapes, is ſupported by large and lofty pillars, finely gilt. In the area before the palace is a ſtately theatre, in which plays are acted, for the diverſion of the imperial family. In the next circuit without are the palaces of the emperor's relations and chief counſellors; and in the outermoſt are thoſe of the kings and princes, who are the governors of provinces, placed according to their rank. Every palace of the whole ſtructure is covered with gold. The ornaments and furniture within the apartments of the princes and nobles, who are obliged to reſide there ſix months in the year, are no leſs beautiful; it being eſteemed a ſingular mark of reſpect to the emperor for them to ſtrive to exceed each other both in the richneſs and ſplendor of their palaces and their furniture, as well as in the multitude and grandeur of their retinue: whence the palace, which is about five miles in circuit, appears like a populous and opulent city inhabited by kings and nobles; among whom the children of all the princes, who are here educated and kept as pledges of their father's loyalty, make no inconſiderable appearance, as they are richly dreſſed, and adorned with all the ornaments that are moſt beautiful and coſtly. The emperor is ſaid to ſpend no leſs than twenty-five millions ſterling in his penſions and the expences of his table. Beſides this, he has a number of other palaces in different parts of the country. We ſhall omit any deſcription of their temples till we come to treat of their religion.

The

The populouſneſs of Japan exceeds all imagination; for the ſeveral productions of art, whether abſolutely neceſſary for the ſupport of life, or ſerving only the purpoſes of luxury and magnificence being not performed with equal ſkill in all the provinces of the empire, nor every where to be purchaſed at the ſame price; an incredible trade and commerce is carried on between the ſeveral parts of the emperor's dominions. How buſy and induſtrious, ſays Mr. Kæmpfer, are the merchants! how full are the ports of ſhips! how many rich and trading towns are ſcattered through the country! Along the coaſts, and near the ſea-ports, there are ſuch multitudes of people, ſuch numbers of ſhips and boats both for uſe and pleaſure, that our author ſays, one would be apt to imagine that the whole nation had ſettled there, and that all the inland parts of the country were left quite deſart and empty. Yet it is ſcarce credible what numbers daily travel through the roads of this country, ſome of which are on particular days more crowded than the ſtreets of the moſt populous towns in Europe; which is partly owing to the frequent journeys which the natives undertake, oftener perhaps than any other nation; and to the princes and lords, with their numerous retinues, going to or returning from court.

Moſt of the towns are very populous and well built, and the ſtreets are generally regular, running in ſtraight lines, and croſſing each other at right angles. The towns are neither ſurrounded with walls nor ditches: but there are two chief gates where the people enter the town from the road. Theſe, however, are generally no better than the ordinary gates that ſtand at the end of every ſtreet, and are ſhut up at night: but, in large towns, where ſome prince reſides, theſe gates are a little handſomer, and a ſtrong guard is commonly mounted there out of reſpect to the reſiding prince. The reſt of the town commonly lies open to the fields, and is but ſeldom incloſed even with a common hedge and ditch. Having given this account of the towns in general, we ſhall add a more particular deſcription of two or three of the principal cities.

Jedo, the metropolis of the whole empire of Japan, is ſituated in 35 degrees 54 minutes north latitude, and in 144 degrees 5 minutes eaſt longitude, in a ſpacious plain, at the head of a bay, famed for its great plenty of fiſh, particularly lobſters, crabs, and oyſters: but the water is ſo ſhallow, as to permit no ſhips of bulk to come up to the city; and therefore they are obliged to unload them about a league below it. It is ſaid to be 21 miles in length, 15 in breadth, and near 60 in circumference, extending along the bay in the form of a creſcent. Though it is not ſurrounded with walls, it is in ſeveral places interſected by ditches and high ramparts planted with trees, not ſo much for defence and ornament, as to prevent the ſpreading of thoſe conflagrations by which it frequently ſuffers. A large river runs through it, and, before it enters the bay, divides into ſeveral branches, over each of which is a handſome bridge, the fineſt and largeſt of which is ſtiled, by way of eminence, The bridge of Niphon; and from it is computed the diſtance of places throughout the whole empire. The houſes, like thoſe in all other parts of Japan, are low and built of fir, covered on the outſide with a whitiſh clay; but they are very neat within. Almoſt every houſe has a place under the roof, or upon it, where they conſtantly keep a trough of water and a couple of mops; by which precaution fires, when firſt broke out, are often extinguiſhed: but this expedient is far from being ſufficient to ſtop the fury of the raging flames, when they have already gained ground; and againſt this they have no better remedy than to pull down ſome of the neighbouring houſes. The city is well ſtocked with temples, monaſteries, and other religious ſtructures. There are alſo many handſome edifices in it belonging to perſons of diſtinguiſhed rank; theſe have large court-yards before them, and ſtately gates; fine varniſhed ſtair-caſes, conſiſting only of a few ſteps, leading up to the door of the houſe; and the inſide is divided into ſeveral magnificent apartments, all of one floor. The city of Jedo is a nurſery of merchants, tradeſmen, and artiſts; and yet every thing is ſold dearer there than in any other part of the empire, on account of the great concourſe of people, the number of courtiers, and of the religious, who lead an idle monaſtic life, and from the difficulties of furniſhing a ſufficient ſupply of proviſions.

Kio, or Miaco, was anciently the capital of the empire, and is the reſidence of the dairi, or eccleſiaſtical hereditary emperor. It is ſituated in a large plain in the province of Jamatto, in the moſt ſouthern part of the iſland of Niphon, and is upwards of three miles long and a mile broad. It is ſurrounded with pleaſant green hills and mountains, in which riſe a number of ſprings and ſmall rivers. The city approaches neareſt to the mountains on the eaſt ſide, where abundance of temples, chapels, and religious houſes ſtand on the aſcent. Three ſhallow rivers enter the city on that ſide, and are all united into one in the middle of Miaco, where there is a bridge 200 paces in length. The dairi, with his family and court, reſides in the north ſide of the city, in a particular ward, conſiſting of twelve or thirteen ſtreets, ſeparated from the reſt by walls and ditches. On the weſt ſide of the town is a ſtrong caſtle built of free-ſtone, in which the emperor reſides when he comes to pay a viſit to the dairi. This ſtructure is 150 paces long, and is incloſed by a wall, and a deep ditch filled with water. The ſtreets are narrow, but run regularly in ſtraight lines: yet it is impoſſible for a perſon at one end of a great ſtreet to ſee the other, on account of their extraordinary length, and the duſt raiſed by the crouds of people with which they are daily filled. This city is the great magazine of all Japaneſe manufactures and commodities, and the chief trading town in the empire. There is ſcarce a houſe where there is not ſomething made or ſold; for here they refine copper, weave the richeſt ſilks with gold and ſilver flowers, coin money, and print books. The moſt curious carvings, the beſt and ſcarceſt dies, all ſorts of japanned cabinets, pictures, muſical inſtruments; all ſorts of things wrought in gold and other metals, particularly ſteel, as the beſt tempered blades, and other arms, are made here in the utmoſt perfection. Here alſo are made the richeſt dreſſes; and all ſorts of toys, puppets with moving heads, and numberleſs other things, may be found at Miaco.

Oſacca is commodiouſly and agreeably ſituated on the banks of the river Jedogawa, in 34 degrees 50 minutes north latitude. It is defended at the weſt end by two ſtrong and handſome guard-houſes, which ſeparate it from the ſuburbs, and at the eaſtern extremity by a ſtrong caſtle. Its length from eaſt to weſt, from the caſtle to the ſuburbs, is between 3 and 4000 common paces, and its breadth ſomewhat leſs. The river, which brings immenſe riches to the city, runs on the north ſide; and having waſhed one-third of it, part of its waters are conveyed through a broad canal to ſupply the ſouth part, which is the largeſt, and the reſidence of the richeſt of the inhabitants. The better to diſtribute the waters, ſeveral ſmaller canals are cut out of the lage one, through ſome of the principal ſtreets, while other canals convey the waters back to the river. Theſe are deep enough to become navigable for ſmall boats, which enter the city, and bring the goods to the merchants doors. All theſe ſeveral canals run along the ſtreets with great regularity; and over them are upwards of an hundred bridges, many of which are very beautiful. Here the night-watch make known the hour by different muſical inſtruments: thus, at the firſt hour, after ſun-ſet, they beat a drum; and on the ſecond, ſtrike upon a braſs inſtrument, called a gumgum, which is in the form of a large flat baſon; the third, or hour of midnight, by ſtriking upon a bell with a ſtick. The firſt hour after midnight they again beat the drum, the ſecond the gumgum, and the third the bell. This third hour after midnight is the laſt, and ends with the riſing ſun: for both the day and night are by the Japaneſe divided into ſix equal parts, or hours, all the year round. Hence thoſe of the day are longer, and thoſe of the night ſhorter in ſummer, than they are in winter.

This is the beſt trading city in Japan, it being extremely well ſituated for commerce; on which account it is well inhabited by rich merchants, artificers, and manufacturers. Though the city is extremely populous, proviſions are cheap; and even what tends to diſſipate the mind, and to promote luxury, may be had at as eaſy a rate here as any where in the world. For this reaſon the Japaneſe call Oſacca the univerſal theatre of pleaſures and diverſions. Plays are daily exhibited; tumblers, jugglers, and all who

have either ſome uncommon animal to ſhew, or animals that have been taught to play tricks, flock thither from all parts of the empire. Hence ſtrangers and travellers daily reſort thither; and chiefly the rich, as to a place where they can ſpend their time and money with greater ſatisfaction than in any other city of the empire. Yet the water drank at Oſacca taſtes a little brackiſh: they have, however, the beſt ſacki in the empire, which is brewed from rice in great quantities in a neighbouring village, and from thence ſent to moſt of the other provinces, and even exported by the Chineſe and Dutch. The caſtle is ſituated in a large plain at the north-eaſt extremity of the city. It is ſquare, about an hour's walk in circumference, and ſtrongly fortified with round baſtions, according to the military architecture of the country. On the north ſide it is defended by the river Jedogawa, which waſhes its walls, after it has received two other rivers. On the eaſt ſide its walls are waſhed by the Kaſijwarigawa, juſt before it falls into the Jedogawa. The ſouth and weſt ends border upon the extremities of the city. The moles or buttreſſes that ſupport the outward wall are of uncommon bigneſs, and about ſeven fathoms thick. Theſe are built to ſupport a high, ſtrong, brick wall lined with free ſtone, which at its upper end is planted with trees. On entering through the gate, a ſecond caſtle of the ſame architecture, but ſmaller, appears before you; and, having entered this ſecond, you come to the third and middlemoſt, which, according to the faſhion of the country, has the corners adorned with beautiful towers ſeveral ſtories high. A ſtrong garriſon is conſtantly kept here, both for the defence of the imperial treaſures, and the revenues of the weſtern provinces, which are depoſited here, and to keep thoſe provinces in awe and ſubjection. The caſtle and garriſon are commanded by two of the emperor's chief favourites, who enjoy their command by turns, each for the term of three years. When one of the governors returns from court to his government, his predeceſſor muſt inſtantly quit the caſtle, and go to court to give an account of his behaviour: he muſt not even ſpeak to his ſucceſſor; but leave the neceſſary inſtructions for him in writing in his apartment in the caſtle. The governors of the caſtle have no buſineſs with the affairs of the city, or its governors, though they are ſuperior to them in point of rank.

SECT. VI.

The pretended Origin of the Japaneſe inſeparably connected with the Government. Their Hiſtory and Laws. The Portugueze expelled. The Power and Dignity of the Secular Emperor; and of the Dairi and his Court. The Civil Policy obſerved in the Government of the Cities; the Ceremony of trading on the Cruciſix at Nagaſaki; and the ſolemn form of a Japaneſe Oath.

THE government and religion of the Japaneſe are ſo cloſely connected with their pretended origin, that it is impoſſible to ſeparate them. Theſe people are highly offended at the ſuppoſition of their being deſcended from the Chineſe, or any other nation; for they pretend, that they aroſe within the compaſs of their own empire, and eſteem themſelves the offspring of their gods, who, during an inconceivable number of ages, governed that empire, in a regular ſucceſſion from father to ſon. Of theſe gods they imagine there were two races; the firſt perfectly divine; and the laſt, which deſcended from the former, partly divine, and partly human. But who were the ſubjects of theſe imaginary deities, they do not preſume to determine; for they imagine, that the preſent inhabitants were deſcended from Awaſe Dſu no Mikotto, the laſt of this ſecond race; and that their orignal anceſtors were all of them his children by his wife the goddeſs Iſarami Nomikotto. Thus, though they trace their original, as deſcended from the gods, many thouſand years before the Chineſe, for each of theſe imaginary deities reigned during a long ſucceſſion of ages, yet they place the original of the preſent inhabitant ſo late as about 600 years before Chriſt, when the genuine hiſtory of Japan begins with the reign of Sin Mu Ten Oo, the elder ſon of Awaſe Dſu No Mikotto. To the dairi, or eccleſiaſtical hereditary emperors, who are ſaid to deſcend in a direct line from his heirs of the eldeſt branch, the people attributed an almoſt divine power, and an unlimited authority over their fellow-creatures; while theſe emperors, proud of their illuſtrious and divine extraction, aſſumed a ſuperſtitious holineſs, ſupported by the utmoſt pomp and magnificence. As they were reſpected as gods, they thought it beneath their dignity to trouble themſelves with the management of political affairs; theſe therefore they left to the laity. In conſequence of this, the power of the nobility increaſed, and thoſe princes of the empire not only made themſelves ſovereign and independent in the provinces the emperor had committed to their government, but quarrelling with the princes their neighbours, attempted by force to diſpoſſeſs each other of their dominions. Hence all ſuffered the dreadful effects that ſpring from ambition, jealouſy, enmity, and a thirſt of revenge.

At length, in order to check the inſolence and ambition of the princes of the empire, the crown-general was ſent againſt them at the head of the imperial army. This important poſt was commonly intruſted to one of the emperor's ſons, and in time became the foundation of the ſecular monarchy; for about 500 years ago, Joritomo, the crown-general, being diſappointed in his hopes of ſucceeding to the imperial throne, aſſumed the ſovereignty in ſecular affairs, and is therefore mentioned in the hiſtory of Japan as the firſt ſecular ſovereign. The power of the eccleſiaſtical monarch was, however, ſtill very great; and he had the privilege of nominating the perſon who ſhould ſucceed to the high office of ſecular: but, in the ſixteenth century, the latter ſovereign made himſelf abſolute ſovereign in the ſecular government of the empire. He was the dairi's ſecond ſon, and being excluded by his birth from the ſucceſſion to the imperial throne, he forcibly maintained himſelf in the command of the army, and ſtript the emperor, his father, of all his authority in the management of ſecular affairs. But he was far from enjoying in peace the poſſeſſion of the throne; for many of the moſt powerful princes of the empire diſputed it with him, till at laſt, in the year 1583, a common ſoldier, named Taico, a man of an obſcure birth, but of an enterpriſing genius, obtained the crown. At firſt indeed he had only 50 ſoldiers, who were of intrepid courage; but their number ſoon increaſed to a great army, and he carried on his conqueſts with equal celerity and ſucceſs; ſo that in a few years he ſubdued all the contending princes, took their cities and caſtles, ſeated himſelf on the imperial throne, and the dairi, or eccleſiaſtical emperor, was obliged to yield him the entire poſſeſſion of the ſecular government; while he, knowing the prejudices of the army and all the people in favour of their ancient monarchs and high-prieſts, freely allowed him to be ſupreme in ſpirituals, and to enjoy the high honours and prerogatives that were before annexed to his office. To humble the nobility, and keep them in ſubjection, he obliged them to bring their wives and families to his court at Jedo, where they were to remain as hoſtages of their fidelity: while thoſe princes themſelves were obliged to attend him ſix months in the year, and every year to renew their oath of fidelity.

The ambition of the princes of the empire being thus curbed, and their power broken, he next ſecured the new modelled authority of his government, by preſerving it from the ſeditious rage of the licentious vulgar by a ſyſtem of new laws; which were perhaps the moſt ſevere that ever were enacted, and, like thoſe which Draco gave to the Spartans, may be juſtly ſaid to be written with blood: for there is ſcarce a crime that is not publickly puniſhed with death, except the criminal be a prince, and then he has only the privilege of diſpatching himſelf, which is commonly done by ripping up his own bowels. In this caſe the emperor ſends his order by lettter, which if not immediately complied with, the perſon is either put to the moſt excruciating tortures, or, if he be a prince of the royal blood, baniſhed to ſome barren iſland, where he is perhaps forced to ſuffer a life more ſevere and painful than death itſelf. But in other caſes the criminal is no ſooner found guilty, than he is hurried to execution. A lie, or prevarication; theft, though of the ſmalleſt kind; a breach of the peace; a blow with a ſword, even though the ſcabbard be on; cheating, even at play; detraction, or any other injury done to a man's character, are all puniſhed with death: for mere chaſtiſements are ſeldom uſed but by the lords to their ſlaves. In ſome provinces fathers of families, except thoſe of the lower rank, have power over the lives

and limbs of their wives, children and domeſtics. But in crimes againſt the government, as neglecting to obey the emperor's edicts, cheating him in his revenue, counterfeiting the coin, ſetting a houſe on fire, robberies, burglaries, debauching a married woman, or ravithing an unmarried one; injuſtice or mal-adminiſtration in publick officers, whether in governors, judges or magiſtrates; the puniſhment is not confined to the criminals, but inhumanly extended to his parents, brethren, children, and more diſtant relations, all of whom are put to death at the ſame hour, though at ever ſo great a diſtance from each other. This is done by reſpiting the execution of thoſe who are near, till the ſentence can be conveyed by proper couriers to the other places; and then, on the appointed time, all are brought forth, and executed at mid-day: but the female relations are commonly only ſold for ſlaves, for a longer or ſhorter term of years, according to the nearneſs of their relation to the offender, and other circumſtances, except in caſes of high-treaſon, where the wives and daughters are put to death. For thefts and robberies, the unhappy criminals are crucified with the head downwards, and conſigned to a longer or ſhorter torture, according to the nature of the crime; ſo that, in caſes of aggravated guilt, they are left to hang on the croſs till they expire, which in ſome is not till after three or four days: but if the theft admits of a milder death, they are diſpatched by a dagger, or by ſtrangling. In caſes of high-treaſon, not only all the relations, but the whole ward in which they live, undergo the ſame dreadful fate; for, in theſe caſes, the law ſuppoſes that they are worthy of death for ſuffering ſuch enemies to ſociety to live among them; and this cruel puniſhment of the innocent is an effectual means of cauſing the criminal, when known, to be immediately diſcovered, ſince the informer not only ſaves himſelf, but his whole family.

Theſe laws, contrary as they are to every ſentiment of equity and humanity, are ſtill in force, and executed with the greateſt rigour; but criminals, as ſoon as they find they are diſcovered, frequently avoid a too ſevere puniſhment, by ſtabbing themſelves, or ripping open their bellies.

As a farther ſecurity to the new-eſtabliſhed government, and the ſafety of the emperor, it was now reſolved, that the empire ſhould be ſhut up for ever, and thoroughly purged from foreigners and foreign cuſtoms. No foreigners had got ſo ſtrong a footing in the empire as the Portugueſe, who firſt diſcovered the country in the year 1543, when, being invited by the proſpect of gain, they had made large ſettlements in Japan, and with their foreign commodities, with the doctrine taught by the miſſionaries, by which it is ſaid they gained over one-third of the people, and even ſeveral of the princes of the empire, and by the marriages contracted between the Portugueſe and the new converts, they ſo ingratiated themſelves into the favour of the nation, that, flufhed with their ſucceſs, they projected a revolution in the government. The emperor was ſtruck with horror and ſurprize at the ſight of two letters which laid open their treacherous deſigns, one of which was intercepted by the Dutch, who were then at war with Portugal, and ſeized this opportunity of diſcovering their deſigns, in hopes of gaining this profitable branch of trade to themſelves; and the other was ſent over by the Japaneſe from Canton, in China. The Japaneſe prieſts could not, without the greateſt envy and regret, ſee their old religion, with all its powerful attractives of profit and popular eſteem, daily loſing ground; and heavy complaints were inſtantly made at court by one of the chief counſellors of ſtate, who being met on the road by a jeſuit biſhop, the haughty prelate refuſed to pay him the ſame deference and reſpect which he was intitled to receive from the natives. The exceſſive profits the Portugueſe received, and the immenſe treaſures they ſent out of the country, alſo touched the government to the quick; while the rapid progreſs made by the new religion, the union of the converts, and the hatred they bore to the gods and religion of their country, filled the emperor and his court with dreadful apprehenſions.

Taico, the emperor, therefore began to put a ſtop to the encreaſe of the Portugueſe intereſt, and the propagation of their religion; he however made a ſlow progreſs, and dying ſoon after in 1598, left the work to be finiſhed by his ſucceſſors, who placed him among the gods by the name of the Second Fatzman, or Mars of the country. The Portugueſe, with their clergy and Japaneſe kindred, were ordered to depart the country, under the penalty of ſuffering the pain of crucifixion; all the other Japaneſe were commanded to ſtay at home; thoſe who were actually abroad were to return within a certain limited time, after which they ſhould be liable, if taken, to the ſame puniſhment; and thoſe who had embraced the new religion, were commanded to forſake it. Theſe orders were the beginning of a moſt dreadful perſecution; for the new converts being unmoved by the weak reaſons that were urged againſt their faith, the ſword, the halter, the croſs, and fire, were barbarouſly and vainly uſed as arguments to convince their underſtandings, and to render them ſenſible of their error. Yet death in all theſe various forms was far from ſhaking their fortitude; for they bravely ſealed their faith with their blood, and ſhewed ſuch amazing examples of conſtancy, that their enemies were filled with ſurprize and admiration. This cruel perſecution, which exceeded every thing of the kind mentioned in hiſtory, laſted about forty years, when at laſt all the remains of chriſtianity in Japan were exterminated in one day; for upwards of 37,000 chriſtians, being reduced to deſpair at beholding the inſufferable torments endured by their brethren, took up arms, and got poſſeſſion of the caſtle of Sinabra, ſeated upon the ſea-coaſt, with a firm reſolution of defending their lives till the very laſt; but after a ſiege of three months, the caſtle was taken on the 12th of April, 1638, and all who remained alive were cruelly butchered. Thus was the Japaneſe empire cleared from chriſtianity by the death of the chriſtians, and that nation ſhut up to the natives as well as foreigners. In vain did the Portugueſe at Macao afterwards ſend thither a ſplendid embaſſy; neither the law of nations, nor the ſacred characters of ambaſſadors, were ſufficient to protect them; for thoſe ambaſſadors, and their whole retinue, to the number of ſixty-one perſons, were beheaded by the ſpecial command of the emperor, except a few of their meaneſt ſervants, who were ſaved, that they might carry to their countrymen the melancholy news of their barbarous reception.

The preſent emperors of Japan are as deſpotic as any of the dairi ever were. It has been already obſerved, that as he has a great number of petty princes and nobles, who have abſolute power in their ſeveral governments, the greateſt care is taken to keep them in due ſubjection. Of theſe 21 bear the title of kings, 6 are princes, 4 are dukes, 17 are counts, and 41 are lords, or ſomething equivalent to theſe dignities, beſides a great number of noblemen of inferior rank. The emperor's council conſiſts of the former, who are obliged to attend in their turns, and have always four of the kingly dignity at their head. The emperor's ſtanding forces, including garriſons, &c. conſiſt of 100,000 foot and 20,000 horſe; but in time of war each of the governors of the provinces is obliged to bring into the field a body of horſe and foot ready armed, proportionable to the extent of his province, or to the penſion he receives from the emperor; which, in all, amount to 368,000 foot and 38,000 horſe. Their weapons are fire-arms, javelins, bows and arrows, ſabres and daggers. The horſe wear cuiraſſes, and the foot helmets, finely wrought.

From what has been before obſerved, the reader may form ſome idea of the numerous court of this monarch in his capital, ſince it muſt conſiſt of one half of the princes and nobility of the empire, together with all their families, beſides his own officers and guards, which generally amount to about 5 or 6000 men. He has, as we have already obſerved, many places magnificently built and furniſhed, in which the royal apartments, halls of audience, &c. are enriched with every thing curious and coſtly in art or nature. The cielings are generally plated with gold, finely wrought and embelliſhed with precious ſtones; and the beds, ſcreens and cabinets, with the gardens, walks, ponds, fountains, terraces, groves, and ſummer-houſes, are anſwerable to the grandeur of the place. But of all the royal palaces, that of Jedo, where he moſt reſides, and which we have already deſcribed in treating of the buildings of Japan, is the largeſt and nobleſt: the reſt, though grand and ſumptuous, are only as houſes of pleaſure, for his diverſion in hunting, fiſhing, and other recreations.

It is very ſurpriſing that the emperors ſhould ſtill allow the dairi to be treated with the ſame profound veneration

that was formerly paid him by his anceſtors; for though he has loſt the greateſt branch of his power, and is only head over all religious matters, while the emperor enjoys not only the imperial dignity, but the government both in civil and military affairs, yet he is allowed to preſerve his priſtine grandeur. He is not ſuffered to ſet his foot on the ground, and wherever he goes, is carried on men's ſhoulders. He is kept ſo retired, that the ſun is not thought worthy to ſhine on his head, or the wind to blow upon him. He never wears the ſame cloaths above one day, or eats above once out of the ſame diſhes, and all the veſſels and utenſils of his table are new every day; but theſe, though very clean and neat, are made only of common clay, and are generally broke; for they imagine, that if any layman ſhould preſume to eat his food out of thoſe ſacred diſhes, it would ſwell and inflame his mouth and throat. He is addreſſed in pompous titles little ſhort of blaſphemy; and all, except the emperor, when they ſpeak to him in public, proſtrate themſelves flat on the ground; beſides, as every thing belonging to his perſon is eſteemed ſacred, he never ſhaves his beard, cuts his hair, or pares his nails. He is chiefly ſerved by his twelve wives, whom he marries with great ſolemnity, and, like the other monarchs of the Eaſt, keeps himſelf as much as poſſible concealed. Upon the deceaſe of the dairi, the miniſtry of that eccleſiaſtical court chuſe for his ſucceſſor the next heir, without regard to age or ſex; hence it has often happened, that a prince under age, or a young unmarried princeſs, has aſcended the throne; and there are inſtances where the deceaſed dairi's relict has ſucceeded her huſband.

The ſecular emperor now grants the neceſſary ſubſidies for the maintenance of the dairi and his eccleſiaſtical court. For this purpoſe the dairi is allowed the whole revenue of the city of Miaco; and that being inſufficient to defray his expences, it has been agreed to make up the deficiencies out of the emperor's treaſury; but theſe allowances are ſo ſmall, and ſo indifferently paid, that the court cannot make that figure which they formerly did, when the dairi himſelf was maſter of the empire, and had all the revenues at his own diſpoſal. They ſtill, however, endeavour to keep up their former grandeur and magnificence; and this court may be truly ſaid to be remarkable for a ſplendid poverty. The great run in debt, and the inferior officers and ſervants, whoſe ſalaries are far from being ſufficient to maintain them, muſt work for their living; but though the revenues of the dairi are ſmall in compariſon of what they were formerly, yet, as he has the management of them, he is ſure to take care to provide whatever is neceſſary to keep up as much as poſſible his former ſplendor, and to ſatisfy his luxury and profuſeneſs. This he is the better able to accompliſh, as he ſtill enjoys the high privilege of beſtowing titles of honour on the great men of the empire, their children and relations, which brings him in vaſt treaſures. Among his twelve wives, ſhe who is the mother of the hereditary prince, or princeſs, has the title of empreſs; but it would take up too much room, were we here to deſcribe the pompous ceremonies obſerved in his marriages, upon the birth of an heir to the crown, and on chuſing a nurſe for the royal infant: theſe are magnificent beyond expreſſion; nor could they be more ſo, if the welfare and happineſs of the whole empire depended on theſe events.

All who belong to the dairi's court are cloathed after a particular manner, and their habits are very different from thoſe of ſecular princes, whom they ſcorn and deſpiſe, as being of a mean and unholy extraction. They wear long wide drawers, and a large gown with a long train, which they trail after them on the ground. Their heads are covered with a black lacker'd cap, by the ſhape of which, among other marks of diſtinction, is known what quality they are of, and what poſt they enjoy. Some have a large band of black ſilk or crape ſewed to their caps, which either hangs down behind their ſhoulders, or is tied up. Others have a kind of flap, like a fan, ſtanding out before their eyes. Some have a ſort of ſcarf hanging down before from their ſhoulders, the length of which is different according to the quality of the wearer: for it is the cuſtom of this court, that nobody bows lower than juſt to touch the floor with the end of his ſcarf. The dreſs of the women of this court is alſo different from that of ſecular women; particularly the dairi's twelve wives, who, when full dreſſed, are ſo loaded with large wide gowns of ſilk, interwove with flowers of gold and ſilver, that it is difficult for them to walk.

An application to different kinds of learning forms the chief amuſement of the dairi's court; and not only the courtiers, but many of the fair ſex, have acquired great reputation by their poetical, hiſtorical, and other writings. All the almanacks were formerly made there; but though this is not now the caſe, they muſt receive the approbation of the court. They are great lovers of muſic, and the women in particular play with great dexterity on all the muſical inſtruments they are acquainted with; the young noblemen alſo divert themſelves with riding, running races, dancing, and other exerciſes.

When the dairi was ſole maſter of the country, he honoured with his ſacred preſence whatever city he pleaſed; and it ſeldom happened that two ſucceeding emperors choſe the ſame place of reſidence. The dairi's court is now fixed at Miaco, where he has a large and ſpacious palace, diſtinguiſhed by its having a lofty and magnificent tower. His imperial conſort lives with him in the ſame palace, and the palaces of his other wives are ſituated next to his. At a ſmall diſtance are the houſes of the lords whoſe offices require a conſtant and more immediate attendance on his perſon; there are alſo a number of other palaces and ſtreets, divided among the officers belonging to the court according to their rank, and all ſeparated from Miaco, and defended againſt the ſudden approach of an enemy, by walls, gates, ditches, and ramparts. The ſecular monarch conſtantly keeps a ſtrong guard of ſoldiers at the dairi's court, in appearance out of tenderneſs and care for the preſervation and ſafety of his ſacred perſon and family; but moſt probably in order to put it out of his power ever to attempt the recovery of the ſupreme authority.

Every imperial city is committed to the care of two governors; Nagaſaki alone has three. Theſe have the command of the city by turns, each generally for the ſpace of two years. When the time is expired, he delivers up his power and his apartment in the palace to the other governor, and immediately ſets out for Jedo, to make the uſual preſents, and give an account of the moſt material tranſactions of his government. He ſtays at Jedo about ſix months, during which he is at liberty to live with his family: but as ſoon as he has received orders from the council of ſtate to depart to his laſt, or to any other government, he muſt ſet out, leaving his wife and children at Jedo till his return, in a manner as hoſtages of his fidelity: nay, while he is in his government, he is to admit no woman within the ſpace of his reſidence, on pain of incurring the imperial diſpleaſure, the fatal conſequences of which are no leſs than death, baniſhment, or impriſonment, with the entire ruin of his family; it being eſteemed beneath the majeſty of the emperor to inflict lighter puniſhments on the leaſt diſregard ſhewn to his commands. Their ſalary is but ſmall; but their perquiſites are ſo conſiderable, that in a few years time they might get great eſtates, were it not for the preſents that muſt be made to the emperor and the grandees of his court, and their being obliged to keep up all that ſtate and grandeur which is thought becoming the dignity of their employment, and the majeſty of their maſter.

Under the imperial governors are four magiſtrates, and their deputies. Theſe magiſtrates hold their office a year; but they are obliged daily to communicate to the governor every thing that comes before them; and in difficult caſes, or where they cannot agree among themſelves, to lay the cauſe before the emperor's bench or court of juſtice, or, with the conſent of that court, to leave it to the determination of the governor in the laſt reſort. All civil affairs are brought before this imperial court of judicature, which, having examined the parties and their witneſſes, give judgment according to the laws of the empire, and their imperial orders and proclamations. From this court there is no appeal; but thoſe who have received ſentence of death cannot be executed without a warrant ſigned by the council of ſtate at Jedo, which muſt be alſo conſulted in all affairs of great moment.

The deputies of the magiſtrates are next to them in authority, but enjoy their poſts for life. It is one branch of their office to compoſe differences of ſmall conſequence ariſing in that part of the town committed to their care.

Next to theſe are four officers, who enjoy their poſt only one year, and are appointed by the magiſtrates to make a faithful

faithful report in their name to the governor, of the daily tranſactions in the execution of their office; and being alſo a kind of repreſentatives of the people, whoſe intereſt they are to promote at the governor's court, they have a ſmall room aſſigned them in his palace, where two of them conſtantly attend till the governor is at leiſure to receive the meſſages they are to deliver in the name of the magiſtrates, or the petitions they are to preſent him with in the name of private perſons.

Among the inferior officers are the town meſſengers, who alſo ſerve as bailiffs and conſtables, and commonly live together in one ſtreet. They are chiefly employed in purſuing and arreſting of criminals, and ſometimes in public executions, chiefly in beheading. But no profeſſion is ſo much deſpiſed by the Japaneſe as the tanners, who take off the ſkins from the dead cattle, in order to dreſs and tan them for ſhoes, ſlippers, and the like. They live by themſelves near the place of execution, and are obliged to put priſoners to the torture, to crucify them, or put them to any other death whatſoever. The keepers of bawdy-houſes are obliged to lend them their ſervants to aſſiſt them at public executions.

Having thus given an account of the officers in general, we ſhall now proceed to the policy and regulations obſerved in every ſtreet, in order to keep a watchful eye over the conduct of the inhabitants, and to eaſe the governors, magiſtrates, and other chief officers, in the diſcharge of their duty. For this purpoſe they have the following officers for every ſtreet; the principal is the ottona, who gives the neceſſary orders in caſe of fire, ſees that a regular watch be kept at night, and that the orders of the governors and magiſtrates be punctually executed. He keeps books in which he enters the children born, the perſons who marry, travel, die, or remove out of the ſtreet; and the names, birth, and trades of ſuch new inhabitants as come into it. In caſe of ſmall differences ariſing between the inhabitants of his ſtreet, he ſummons the parties before him, and, in conjunction with the deputies of the magiſtrates, endeavours, if poſſible, to reconcile them. He puniſhes ſmall crimes by ſeizing the criminals, and putting them in irons. He cauſes criminals to be taken up by his own people within his diſtrict, and confines them till he receives farther orders from the ſuperior magiſtrates, before whom he lays all criminal affairs and caſes of moment; and is himſelf anſwerable for what accidents happen within the ſtreet under his inſpection. He is choſen by the inhabitants of that ſtreet from among themſelves, each of them writing upon a piece of paper the name of the perſon he would have preferred to this dignity, adding his own name and ſeal. The votes are all taken in, the papers opened, and the names of thoſe who have moſt votes are laid before the governor, with the petition of the inhabitants that he would be pleaſed to nominate one of them as ottona. His ſalary is a tenfold portion out of the treaſury of the ſtreet.

Every ottona has three deputies, who give him their advice and aſſiſtance in the execution of his office.

In every ſtreet the inhabitants are divided into companies of five men, of which there are ten or fifteen in every ſtreet: but though theſe are termed companies of five, a few more of the neighbours are frequently added, ſo that they ſometimes conſiſt of ten or fifteen heads of families, all of whom muſt be the proprietors of the ground and houſes in which they live; for thoſe who have no houſes of their own, notwithſtanding their being inhabitants of the ſame ſtreet, are not admitted into thoſe corporations, but conſidered as tenants dependant on the landlords, and are therefore exempted from taxes and other burdens, except the night-watch and round, in which they are obliged to ſerve themſelves, or to get ſomebody to ſerve in their ſtead, it being a duty which all the inhabitants are forced to obſerve in turn. Theſe tenants have no vote in the election of the officers of the ſtreet, nor any ſhare in the public money; and beſides, the rents they pay to the landlords are very high, conſidering the ſmallneſs of the houſes in which they live. Each of theſe little companies has one of its own body at their head, who is anſwerable for their actions; and if they be contrary to law, he ſhares with the reſt of the members the penalty they are ſentenced to undergo by the ſupreme magiſtrate.

Every ſtreet has alſo a ſecretary, or public notary, who writes and publiſhes the commands of the ottona to the inhabitants of the ſtreet, and gives paſſports, teſtimonials, and letters of diſmiſſion. He keeps the ottona's books, as the liſt of the houſes and their inhabitants, with their names, age, trade, and religion: the names of all who die in the ſtreet, with the time and manner of their death: a regiſter-book of the paſſports that have been iſſued out of the office, with the names of the perſons to whom they were granted, the buſineſs which called them abroad, the time of their departure and return: and alſo a journal of the daily occurrences that happen within the compaſs of the ſtreet.

The next officer is the treaſurer of the ſtreet, who keeps the public money, and from time to time accounts for it to the reſt of the inhabitants, ſpecifying the ſums he has received and paid out. The public treaſure chiefly conſiſts of the ſums the magiſtrates of the city order to be detained from the price of foreign goods, for the joint benefit of the inhabitants, among whom it is equally diſtributed, according to the number of the ſtreets, in order to enable them to pay the additional taxes levied upon them; but this is peculiar to Nagaſaki, which is the only imperial city where the trade with foreigners is permitted. The inhabitants ſerve this office each a year in turn.

There is another officer, named the meſſenger of the ſtreet, who is to give information when any body dies, or when any thing elſe happens that is eſteemed worth their notice. He alſo delivers to the chief officers the petitions of the inhabitants of the ſtreet, collects the contribution-money for the preſent which at certain times is made to the governors and chief magiſtrates, tells the commands of the magiſtrates to the heads of the companies, and publiſhes them in the ſtreet.

Two watches are kept for the ſecurity of the ſtreets during the night. The firſt is the chief guard, upon which the inhabitants do duty themſelves, three at a time. They have a room or houſe aſſigned them towards the middle of the ſtreet, or at the corner of a croſs ſtreet. Upon days of great ſolemnity, or when the magiſtrates think this watch neceſſary, it is kept all day; and when they are apprehenſive of danger it is doubled, in which caſe the ottona aſſiſts in perſon, with one of his deputies: for ſhould any misfortune happen that could be any way attributed to their careleſſneſs or neglect, they and the whole ſtreet would be ſeverely puniſhed for it. Such regard is paid to this watch, that the oppoſing or inſulting it is a capital crime.

The other guard is appointed to watch againſt thieves and accidents of fire, and to give notice upon the leaſt ſuſpicion. It conſiſts of two of the pooreſt inhabitants of the ſtreet, ſitting in a centry-box at each gate by which the ſtreet is ſhut up in the night: but, at certain intervals, they walk till they meet, ſhewing the hours of the night generally by beating two ſticks one againſt the other. In ſome towns there is a ſmall hut built at the top or ſide of a houſe, about the middle of the ſtreets, on purpoſe for a man to watch accidental fires.

If an inhabitant deſigns to remove from the houſe and ſtreet in which he lives to another, he muſt firſt apply to the ottona of the other ſtreet, and making him a preſent of a diſh of fiſh, give him a petition expreſſing his deſire to be admitted among the inhabitants of that ſtreet. The ottona, upon this, makes enquiry into his life, character, and conduct, and then ſends his meſſenger of the ſtreet to every one of the inhabitants, deſiring to know if they will conſent to admit the petitioner as a neighbour; and if any one of the inhabitants oppoſes his admiſſion, urging that he is a drunkard, quarrelſome, or addicted to any other crime, and that he will not be anſwerable for the conſequences, it is ſufficient to exclude him. But if he obtains all their conſents, the petitioner muſt apply to the public notary of his former ſtreet for a certificate of his behaviour, and a letter of admiſſion, both ſigned by the ottona, and theſe muſt be carried by the ſtreet-meſſenger to the ottona of the ſtreet to which the petitioner intends to remove; upon which he receives him under his protection, and incorporates him among the inhabitants of his ſtreet. Mean while he is not anſwerable for the petitioner's behaviour before his delivery of thoſe inſtruments; and ſhould he be found guilty of any crime committed before that time, it would be laid to the charge of the ſtreet in which he formerly lived. After his being admitted among the inhabitants of the new ſtreet, and his name entered in the regiſter-books, he ſolemnizes his entry with a handſome dinner; which he gives

either to the company of five, or, if he pleaſes, to the whole ſtreet. His greateſt trouble, however, ſtill remains, and that is his ſelling his old houſe; for this cannot be done without the conſent of all the inhabitants of the ſtreet, who often oppoſe it for upwards of a year, the buyer, for whoſe crimes they are for the future to ſuffer, not being ſufficiently known, or not agreeable to them. Suppoſing all obſtacles at length removed, the buyer is to pay an eighth part of the price into the public treaſure of the ſtreet, five parts of which are to be equally diſtributed among the inhabitants, for the pains they have taken on account of the purchaſer's admiſſion, and the three remaining parts are deſigned for a public dinner. This, however, is ſeldom given: but the new inhabitant has no ſooner taken poſſeſſion of his houſe, than all his neighbours come to wiſh him joy, and to offer him their ſervices.

When an inhabitant of a ſtreet is accuſed of any miſdemeanor, his caſe is laid before the ſtreet council, that is, the ottona, his three deputies, and the heads of the ſmall companies; when, if the affair be too intricate for them to determine, they lay it before the council of the town; if they meet with the ſame difficulties, the Nengioſi, or four annual officers under the magiſtrates, are deſired to confer upon the affair with ſome of the ſtewards of the governor's houſhold; and if they find it neceſſary, to communicate it to the governor himſelf.

If quarrels or diſputes ariſe in a ſtreet, either between the inhabitants or ſtrangers, the next neighbours are obliged to part them; for if one ſhould happen to be killed, tho' it were the aggreſſor, the other muſt inevitably ſuffer death, notwithſtanding his alledging that it was done in his own defence; and he knows no other method of preventing the ſhame of a public execution, than by ripping up his own belly. Nor is his death thought a ſufficient ſatisfaction to their laws: three of thoſe families who live next to the place where the accident happened are ſhut up in their houſes for three, four, or more months, and rough boards nailed acroſs their doors and windows, after they have prepared for this impriſonment by getting the neceſſary proviſions; and the reſt of the inhabitants of the ſame ſtreet are ſentenced to paſs ſome days or months in hard labour at the public works. Theſe penalties are inflicted in proportion to their guilt, in not endeavouring to the utmoſt of their power to prevent the fatal conſequences of ſuch a quarrel. A like puniſhment, but greater in degree, is inflicted on the heads of the companies of five in that ſtreet where the crime was committed; and it is an high aggravation of their guilt and puniſhment, if they knew beforehand that the perſons were of a quarrelſome diſpoſition, or, in other caſes, were inclined to the crime for which they ſuffer. The landlords, and alſo the maſters of the criminals, partake of the puniſhment inflicted for the miſdemeanors of their lodgers and ſervants. Whoever draws his ſword, though he does not hurt or even touch his enemy, muſt, if the fact be proved, ſuffer death. If an inhabitant flies from juſtice, the head of the company of five to which he belongs muſt follow, or hire people to follow him till he be found, and delivered up to the civil magiſtrate, under pain of corporal puniſhment.

There is a very remarkable ceremony obſerved only in the city of Nagaſaki, where the Chriſtian religion had the ſtrongeſt footing. This is called the figure-treading: for in the beginning of the year they trample, with great ceremony, upon a crucifix, an image of the Virgin Mary, or ſome other ſaint, as a proof of their renouncing the Chriſtian religion. They begin in two different parts of the city, going from houſe to houſe, and ſtreet to ſtreet, till all the people, both old and young, have trampled on theſe images, which are of braſs, and about a foot long: even young children, unable to walk, are held down by their mothers to touch the images with their feet.

It is remarkable, that there is no other tax laid upon the inhabitants, but that on the land of thoſe who have houſes or pieces of ground of their own; which may properly be conſidered as a ground-rent; except we may call a tax the voluntary contributions for a preſent to be made to the governors by ſuch perſons as have hereditary lands and tenements in their poſſeſſion within the city of Nagaſaki, or the preſents made to ſuperior officers by the inferior.

As oaths are a civil ſecurity as well as a religious obligation, we ſhall here mention the form of thoſe of Japan. The perſon who takes an oath invokes the vengeance of the ſupreme gods of the heavens, and of the chief magiſtrates of his country, upon him, his family, his domeſtics, his friends, and near relations, in caſe he does not ſincerely fulfil all the articles he ſwears to perform; after which he ſigns both the words of the oath and thoſe articles, and dipping his ſeal in black ink, ſeals them; and, as a farther confirmation, lets fall ſome drops of his own blood upon the ſeal, by pricking one of his fingers behind the nail.

SECT. VII.

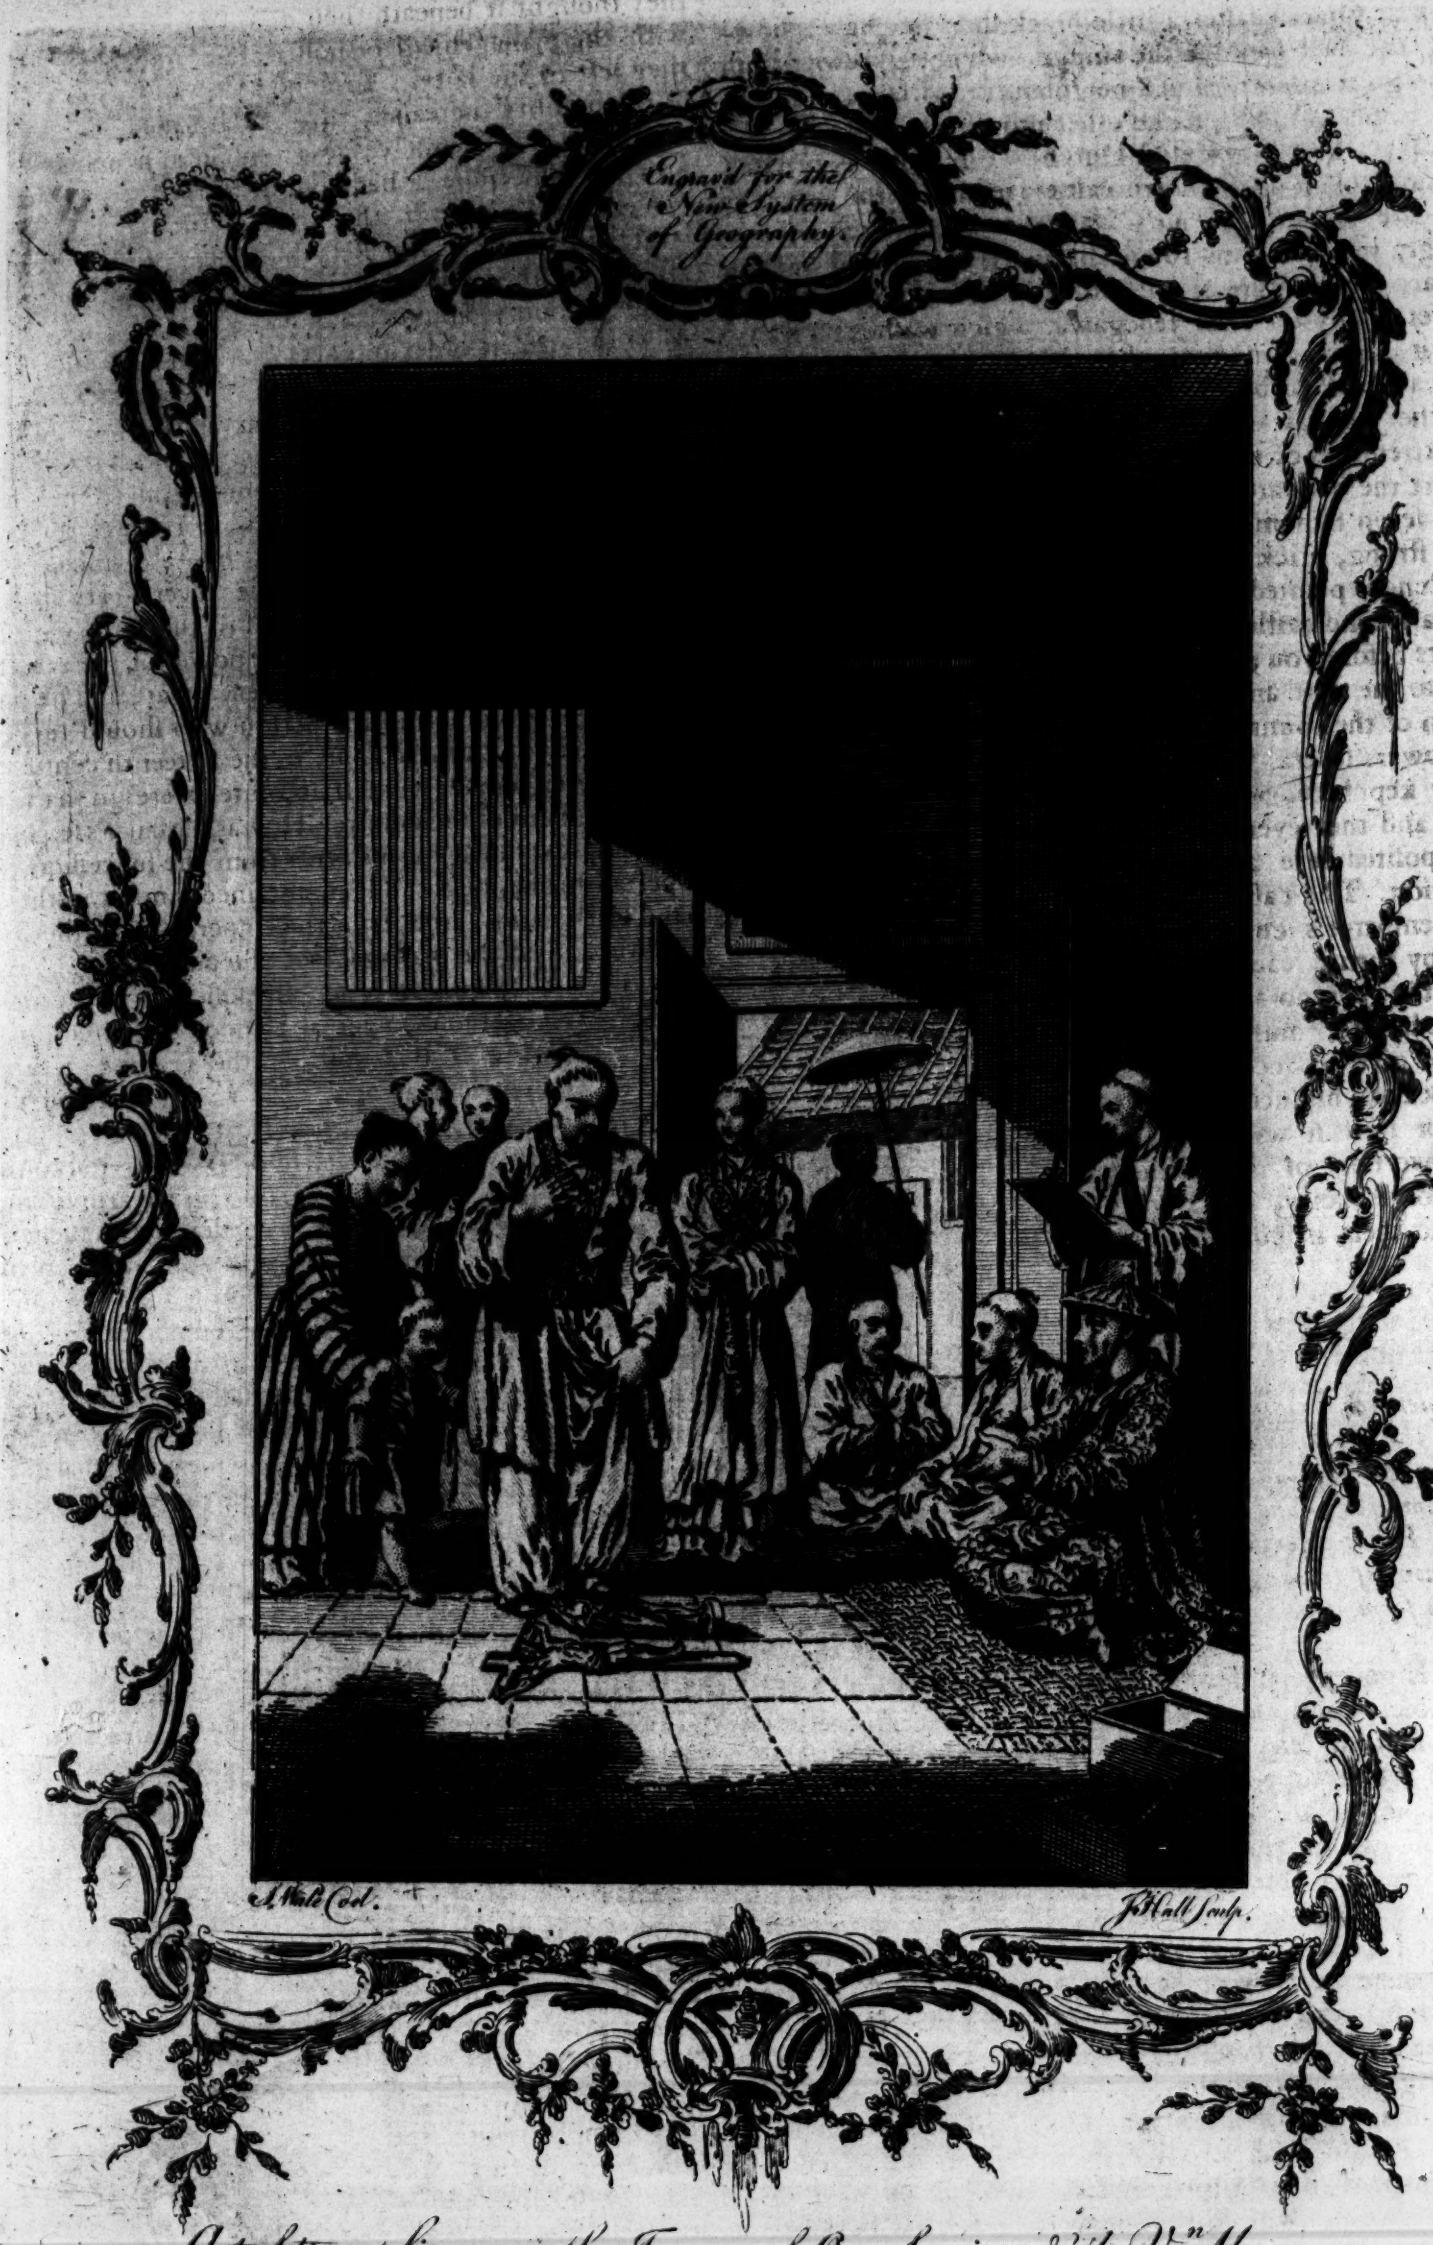
Of the Religion of the Japaneſe; particularly the Sinto, the Budſo, and the Religion of the Philoſophers.

THEIR religion is in general the groſſeſt heatheniſm and idolatry; but religious liberty, ſo far as it is allowed not to interfere with the intereſt of the ſecular government, or to affect the peace and tranquillity of the empire, has always been allowed in Japan: hence foreign religions have been eaſily introduced, and propagated with ſucceſs; there are therefore many religions in Japan, the principal of which are the three following:

I. The Sinto, or antient idol-worſhip of the Japaneſe.
II. The Budſo, or foreign idol-worſhip, introduced into Japan from the empire of China and the kingdom of Siam; and
III. The religion of their philoſophers and moraliſts.

I. As to the Sinto's religion, it deſerves to be conſidered in the firſt place, more on account of its antiquity, than for the number of its profeſſors. Theſe have ſome obſcure and imperfect notions of the immortality of the ſoul, and a future ſtate of bliſs or miſery, and yet worſhip only thoſe gods whom they believe are peculiarly concerned in the government of the world; for though they acknowledge a Supreme Being, who they believe dwells in the higheſt heaven, and admit of ſome inferior gods, whom they place among the ſtars; yet they do not worſhip and adore them, nor have they any feſtival-days ſacred to them, thinking that beings ſo much above us, will concern themſelves but little about our affairs. They, however, ſwear by theſe ſuperior gods: but they alone worſhip and invoke thoſe gods whom they believe to have the ſovereign command of their country, and the ſupreme direction of its elements, its produce, and its animals; and who, by virtue of this power, will, they ſuppoſe, not only render them happy here, but, interceding for them at the hour of death, procure for them rewards proportionable to their former behaviour. Hence their dairis, or eccleſiaſtical emperors, being eſteemed lineally deſcended from the eldeſt and moſt favoured ſons of theſe deities, the ſuppoſed heirs of their excellent qualities, are conſidered as the true and living images of their gods, and poſſeſſed of ſuch an eminent degree of holineſs, that none of the people dare preſume to appear in their preſence. In ſhort, the whole ſyſtem of the Sinto's divinity is a lame and ridiculous jumble of abſurdities, and would not perhaps have ſtood its ground ſo long, had it not been for its cloſe connection with the civil cuſtoms, in the obſervance of which this nation is exceedingly ſcrupulous.

The temples of the Sintoiſts are exceeding mean; within them is hung up white paper, cut into ſmall bits, as emblems of the purity of the place; and ſometimes there is a large mirror in the middle, that the worſhippers, when they behold themſelves, may conſider, that as diſtinctly as all their bodily defects appear in the mirror, ſo conſpicuous do the ſecret ſtains of their hearts appear before the eyes of the immortal gods. Theſe temples are frequently without any viſible idols of the gods to whom they are conſecrated, they being locked up in a caſe at the upper end, and to this caſe the people bow. Theſe temples are not attended by prieſts, but by ſeculars, who are, generally ſpeaking, entirely ignorant of the principles of the religion they profeſs, and wholly unacquainted with the hiſtory of the gods they worſhip. Theſe, when they go abroad, are dreſſed, for diſtinction ſake, in large gowns, commonly white, but ſometimes yellow, and ſometimes of other colours; however, they wear their common ſecular dreſs under them. They ſhave their beards; but let their hair grow, and wear a ſtiff,



Act of trampling over the Images of Our Saviour & the V.n Mary,
at the beginning of the New Year, at Nagasaki.

ſtiff, oblong, lacker'd cap, reſembling in ſhape a ſhip, tied under their chins with twiſted ſilk ſtrings, terminated with taſſels, which hang lower or higher according to the office or quality of the perſon who wears them, who is not obliged to bow lower to perſons of ſuperior rank than to make theſe taſſels touch the floor. Their ſuperiors have their hair twiſted under black gauze or crape, in a very particular manner; and have their ears covered by a kind of flap, which ſtands out or hangs according to the dignities or honourable titles conferred upon them by the dairi. They are under his direction in ſpiritual affairs; but in temporals they and all the other eccleſiaſtical perſons in the empire are under the command of two imperial temple judges, appointed by the ſecular emperor. Their haughtineſs and pride exceed all expreſſion; for when they appear in a ſecular dreſs, they, like the nobles, wear two ſabres, and think it becomes their ſtation to abſtain from all communication and intimacy with the common people.

The Sintoiſts do not adhere to the doctrine of the tranſmigration of ſouls; yet abſtain from killing and eating of thoſe beaſts that are of ſervice to mankind, becauſe they imagine that ſlaying them would be an act of cruelty and ingratitude. They believe that the ſoul, after its departure from the body, is removed to the high and ſubceleſtial fields, ſeated juſt beneath the thirty-three heavens, the dwelling-places of their gods: that thoſe who have led a good life find an immediate admiſſion, while the ſouls of the wicked and the impious are denied entrance, and condemned to wander till they have expiated their crimes; but they admit no hell or place of torment. One of the eſſential points of their religion is, that they ought to preſerve an inward purity of heart, conſiſting of the doing or omiſſion of what they are ordered to do or avoid by the law of nature and the dictates of reaſon, or the more immediate and ſpecial command of the civil magiſtrate. They have no form, either by divine or eccleſiaſtical authority, for regulating their outward conduct. Hence it may be imagined, that they would indulge, without reſtraint, every gratification of their wiſhes and deſires, as being free from the fear of acting contrary to the will of the gods, and little apprehenſive of incurring the effects of their diſpleaſure; but they have a powerful ruler within their own hearts, the friendly and tender ſenſibilities of humanity, which, aided by the force of reaſon, and the ſeverity of the laws, reſtrain them from the indulgence of vice, and are ſufficient to win over to the dominion of virtue all that are willing to hearken to her dictates.

Another eſſential point of the Sinto's religion is a rigorous abſtinence from whatever makes a man impure. This conſiſts in abſtaining from blood, from eating of fleſh, and being near a dead body; by which a perſon is for a time rendered unfit to go to the temples, to viſit holy places, and to appear in the preſence of the gods. Whoever is ſtained with his own or another's blood, is for ſeven days unfit to approach the holy places; and if, in building a temple, one of the workmen happens to be hurt, ſo as to draw blood, he is from thenceforward rendered incapable of working on that ſacred building. But if the ſame accident ſhould happen in building or repairing any of the Sinto's temples at Iſje, the temple itſelf muſt be pulled down and rebuilt. Whoever eats the fleſh of any four-footed beaſt, deer only excepted, is unclean for thirty days: yet whoever eats a wild or tame fowl, water-fowls, cranes, and pheaſants, is unclean only a Japaneſe hour, which is equal to two of ours. Whoever kills a beaſt, or is preſent at an execution, attends a dying perſon, or enters a houſe where a dead body lies, is unclean for that day; and the nearer a perſon is related to the deceaſed, ſo much the greater is the impurity. By not obſerving theſe precepts people are rendered guilty of external defilement, which they ſay is deteſted by the gods, and made unfit to approach their temples.

The other great points of their religion are, 1. A diligent obſervation of the ſolemn feſtivals, which are very numerous. 2. Pilgrimages to the holy place at Iſje: that is, to the temple of Tenſio Dai Sin, the greateſt of all the gods of the Japaneſe. The laſt eſſential doctrine of their religion is, that they ought to chaſtize and mortify their bodies; but few of them pay much regard to this precept.

The orthodox Sintoiſts go in pilgrimage to Iſje once a year, or at leaſt once in their lives; for, beſides their conſidering it as a duty, they imagine they ſhall reap great advantages from this journey, ſuch as being abſolved from all their ſins, and receiving the aſſurance of immediate happineſs after death, beſides having in this life the poſſeſſion of health, children, riches, dignities, and other temporal bleſſings. To keep alive theſe ſentiments in the minds of the ſuperſtitious vulgar, every pilgrim is, for a ſmall conſideration, preſented by the canuſies, or ſecular prieſts, with an inſtrument containing the remiſſion of their ſins. This pilgrimage is made at all times of the year, but chiefly in the three firſt months, March, April, and May, when the fineneſs of the weather renders the journey very agreeable and pleaſant. Every one is at liberty to travel in what manner he pleaſes; thoſe who are able do it at their own expence, in ſedans, or on horſeback, with a retinue ſuitable to their rank: but the poor go on foot, living on charity. Theſe carry upon their back a ſtraw mat rolled up, which ſerves them for a bed, and have a ſtaff in their hands. They have a veſſel hanging to their girdle, out of which they drink, and wherein they receive the charity of the people. Generally their names and the place from whence they came, are written both upon this veſſel and on their great hat made of ſplit reeds, that in caſe of ſudden death, or any other accident upon the road, it may be known who they are, and to whom they belong. Thoſe who can afford it wear over their other clothes, a ſhort white coat, without ſleeves, with their names ſtitched upon the breaſt and back. Incredible multitudes of theſe pilgrims crowd the roads. The very children, if apprehenſive of a ſevere puniſhment for their faults, will run away from their parents, and go to Iſje, to fetch an ofarrai, which, upon their return, is deemed a ſufficient expiation of their crimes, and a ſure means of procuring a reconciliation. When a pilgrim is about to undertake this holy journey, he muſt religiouſly abſtain from every thing impure, particularly from fornication, and even lying with his own wife; tho' otherwiſe complying with matrimonial duties is not thought unpleaſing to the gods. After he is ſet out on his journey, a rope, with a piece of white paper twiſted round it, is hung over the door of the houſe, to inform all who are impure, from the death of their parents or near relations, to forbear entering; from the opinion that it would occaſion the pilgrim's having ſtrange uneaſy dreams, or his being expoſed to ſome misfortune.

The temple of Iſje is ſeated in a large plain, and is a low thatched wooden building, as a monument of the ſimplicity and poverty of its original founders. In the middle of it is a mirror of poliſhed metal, as an emblem of the all-ſeeing eye of the god, and his knowledge of what paſſes in the inmoſt receſſes of the worſhippers hearts; and ſome cut paper is hung round the walls, to repreſent the purity of the place. This principal temple is ſurrounded with near a hundred ſmall temples, built in honour of inferior gods; the greateſt part of which are ſo low and ſmall, that a man can ſcarcely ſtand upright in them; but each is attended by a canuſi, or ſecular prieſt. Next to the temple are the houſes of the officers of the temple, who ſtile themſelves the meſſengers of the gods, and keep lodgings for the accommodation of pilgrims. At a ſmall diſtance is a town that bears the ſame name with the temple, and is inhabited by inn-keepers, paper-makers, book-binders, cabinet-makers, joiners, and other workmen, whoſe buſineſs depends on the holy trade carried on there.

On the pilgrim's arrival at Iſje, he applies with great ſolemnity to one of the canuſies, bowing, according to the cuſtom of the country, till his forehead touches the ground; upon which the canuſi either conducts him and the other pilgrims, or commands his ſervants to conduct them to the ſeveral temples, and to tell them the names of the gods to whom they were built; which being done, he takes them before the chief temple, where, proſtrating themſelves on the ground, they addreſs their ſupplications to Tenſio Dai Sin, expreſs their wants and neceſſities, and pray for health, long life, happineſs, riches, and the like. They are afterwards entertained and lodged by the canuſi in his own houſe, if they are unable to bear the expence of lodging at a public inn: they, however, generally make him a preſent in return for his civility, though it be out of what they got by begging.

The pilgrim having performed all the acts of devotion this pilgrimage requires, the canuſi preſents him with an

ofarrai, or indulgence. This is an oblong box, about a ſpan and a half long, two inches broad, and an inch and a half high, full of ſmall ſticks, ſome of which are wrapped in bits of white paper, to remind him that he muſt be pure and humble. Dai Singu, that is, the temple of the great god, printed in large characters, is paſted on the front of the box; and the name of the canuſi who gave it, with the title, Meſſenger of the gods, in ſmall characters, is paſted on the oppoſite ſide. This they receive with great tokens of reſpect and humility, and immediately tie it under their hats to keep it from the rain, wearing it juſt under their forehead, and balancing it with another box, or a bundle of ſtraw of about the ſame weight tied behind; but thoſe who travel on horſeback have better conveniencies for keeping it. When they have got ſafe home they take great care of the ofarrai, as of a thing of the utmoſt value; and though its effects are limited only to a year, yet, after that is expired, they place it in one of their beſt rooms, on a ſhelf made on purpoſe. In ſome places they keep the old ofarrais over the doors of their houſes, under a ſmall roof; but the poor, for want of a better place, keep them in hollow trees behind their houſes. Large quantities of theſe ofarrais are annually ſent by the canuſies into all parts of the empire, to ſupply thoſe who cannot or will not fetch them. The pedlars who carry thoſe bawbles, reſort to the moſt populous towns towards New Year's-day, which is one of their ſolemn feſtivals, and ſell at the ſame time new almanacks, which muſt be printed no where but at Isje.

The ſuperſtitious Japaneſe are as much inclined to make religious vows as to go in pilgrimage to holy places. Hence there are a great number of religious houſes of both ſexes, and of many different orders. Among theſe are the Jammaboes, a kind of hermits, who pretend to abandon their temporal concerns for the ſake of thoſe that are ſpiritual and eternal: yet thoſe who can live at their eaſe dwell in their own houſes, while the poor ſtroll and beg about the country. They have been ſplit into two orders; the Toſanfa and the Fonſanfa. Thoſe who embrace the former claſs muſt once a year climb to the top of the mountain Fikooſan, a journey of no ſmall difficulty and danger, on account of the height and ſteepneſs of that mountain, and the many precipices all around it; and beſides, it is imagined, that all who preſume to aſcend it with any degree of impurity, are puniſhed for their impious raſhneſs by being ſtruck with madneſs. On the other hand, thoſe who enter into the order of Fonſanfa, muſt once a year go in pilgrimage to the grave of their founder, at the top of an high mountain named Omine; where the air is ſaid to be exceſſive cold, and the ſteepneſs and precipices make its aſcent no leſs dangerous than that of the other. Theſe ſuppoſe, that ſhould any one undertake this journey without being ſufficiently purified, he would be thrown down the horrid precipices and daſhed to pieces, or at leaſt would pay for his contempt of the anger of the gods by a lingering ſickneſs, or ſome dreadful misfortune. They therefore qualify themſelves by previous mortifications, abſtaining from impure food, from lying with their wives, and from whatever may render them defiled. While they are upon their journey, they muſt live only upon the roots and plants they find on the mountains. If they return ſafe home, they go each to the general of his order, who reſides at Miaco, and make him a ſmall preſent of money, which, if poor, they muſt procure by begging, and in return they receive from him a more honourable title, which occaſions ſome alteration in their dreſs, and encreaſes the reſpect ſhewn them by their brethren of the ſame order. Thus ambition is far from being baniſhed from theſe ſocieties.

Theſe hermits are however very much degenerated from the auſterity of their predeceſſors, who, in imitation of the example ſet them by their founder, and purſuant to the rules he laid down, lived upon nothing but plants and roots, expoſing themſelves to ſevere mortifications, to faſting, bathing in cold water, and wandering through woods and foreſts, and through deſart and uninhabited places. They have alſo deviated much from the ſimplicity of their religion, and have admitted the worſhip of ſuch foreign idols as they imagine have the greateſt influence on the occurrences of life. They alſo now pretend to be well verſed in magical arts, and that, by certain myſtical ceremonies, words, and charms, they can prevail on all the gods of the country, as well of the Sintoiſts as thoſe of the Budſdoiſts, to drive out evil ſpirits, to aſſiſt them in diving into ſecrets, recovering ſtolen goods, and in finding out thieves; in foretelling future events, explaining dreams, in curing deſperate diſeaſes, and in finding out the guilt and innocence of perſons accuſed of crimes. They talk with great aſſurance of the wonderful virtues of their charms, pretending that they are able to handle burning coals and red-hot iron, without receiving the leaſt hurt; ſuddenly to extinguiſh fires, to make cold water inſtantly boil and hot water in a moment cold; to keep people's ſwords ſo faſt in the ſheath, that no force is able to draw them out; to preſerve themſelves from being hurt by theſe or any other weapons, and to perform many other things of the like nature, which, if cloſely examined, would perhaps be found to be juggler's tricks, and the effects of ſecond cauſes.

Among the other religious ſocieties eſtabliſhed in Japan, we ſhall only mention that of the Blind; which form a very ſingular, as well as a very ancient and numerous body, compoſed of perſons of all ranks. Originally theſe formed but one ſociety; but at laſt they were divided into the Blind Buſetz, and the Blind Fekies. The Blind Buſetz owe their origin to Senmimar, one of the younger ſons of the emperor Jengion. He was a youth of incomparable beauty, and admired by all that approached him. He particularly captivated the heart of a princeſs of the royal blood, whoſe beauty and virtues proved as irreſiſtible charms to the young prince, as his graceful perſon and princely qualities had been to her. The happy lovers had for ſome time enjoyed all the felicity that ariſes from a mutual paſſion, when the death of the fair princeſs deprived him of all comfort, and ſoon, through exceſs of grief, he loſt his ſight. Upon this, to perpetuate her memory, and to make known to poſterity the unhappy effect of his unfeigned ſorrow for her loſs, he, with his father's conſent, erected a ſociety, into which none were admitted but thoſe who were blind by birth or accident. This ſociety flouriſhed exceedingly, and became in great reputation not only at court, but throughout the empire. For ſome centuries they continued united in one body, till the Blind Fekies ſpringing up, and many of the great men of the empire, who had loſt their ſight, voluntarily entering into it, the former were reduced, and confined to eccleſiaſtical perſons.

The Blind Fekies owe their origin to the civil wars between two powerful factions, the Fekies and Gendzies, who long contended for the empire. The cauſe of Feki, and his adherents, at length appearing more juſt to the reigning dairi than that of Gendzi, he reſolved to ſupport it; which he did ſo effectually, that Gendzi, and his party, were defeated and almoſt deſtroyed. But as ſucceſs is often followed by pride and inſolence, the victorious Feki, forgetting the obligations he lay under to the dairi, treated him with ſuch inſolence and ingratitude, that he reſolved to eſpouſe the intereſt of Gendzi and his adherents, to whom he promiſed his aſſiſtance, if they would again aſſemble and take arms againſt Feki. Upon this affairs ſoon took another turn, and victory, in a deciſive battle, declared for Gendzi, and Feki himſelf was ſlain. Among thoſe who eſcaped with their lives was Kakekigo, a general famed for his valour and amazing ſtrength, who fled in a ſmall boat. Jeritomo, general of the Gendzies, and a very reſolute ſoldier, was ſenſible of the conſequence of ſecuring the perſon of Kakekigo, without which he thought his victory incomplete, and therefore cauſed him to be purſued and taken. On his being brought before him, he treated him with all the reſpect due to his rank and character, and gave him ſuch liberty that he ſeveral times eſcaped, but was as often retaken. Though he was his enemy and priſoner, Jeritomo was ſo far from putting him to death, that he generouſly reſolved to purchaſe his friendſhip and affection at any price. But one day, when he was earneſtly preſſing him to enter into his ſervice upon any terms he pleaſed, the captive general boldly replied, "I was once "a faithful ſervant to a kind maſter, and now he is dead, "no other ſhall boaſt of my faith and friendſhip. Thou, "I own, haſt laid me under great obligations, and to thy "clemency I owe even my life. Yet ſuch is my misfor-"tune, that I cannot fix theſe eyes on thee, without re-"ſolving to revenge him by taking off thine head. Theſe "therefore, theſe prompters to miſchief I will offer to thee, "as the only acknowledgment of thy generous behaviour

"my

"my unhappy condition will allow me to give thee." This ſaid, with an undaunted courage, equal to that of the brave Roman, who, in the ſight of Porſenna, burnt his right hand on the altar, he plucked out both his eyes, and on a plate preſented them to Jeritomo, who, aſtoniſhed at ſuch magnanimity and amazing reſolution, gave him his liberty; upon which he retired into the province of Finga, where he learned to play upon the bywa, a muſical inſtrument uſed in Japan, and founded this ſociety of the Blind Feki, of which he himſelf was the head. They are ſince grown very numerous, and are compoſed of people of all ranks: but none of them live upon charity; all applying, according to their ſeveral capacities, to different profeſſions not entirely inconſiſtent with their unhappy ſituation. Many of them are muſicians, and employed at the courts of princes and great men, and alſo in public ſolemnities, proceſſions, feſtivals, and weddings. They are diſperſed through the empire; but their general reſides at Miaco, and has a penſion from the dairi. He is aſſiſted by ten council, who alſo reſide in the ſame city; of this council he is the eldeſt, and all of them have the power of life and death, with this reſtriction, that no perſon can be executed unleſs the ſentence be ſigned by the principal judge of Miaco. This council appoint their inferior officers, who reſide each in his province, and are there what the general is with reſpect to the whole ſociety: and theſe alſo have officers under them.

II. The Budſo, or foreign pagan-worſhip, introduced into Japan, probably owes its origin to Budha, whom the Brahmins of India believe to be Wiſthnu, their deity, who, they ſay, made his ninth appearance in the world under the form of a man of that name. The Chineſe and Japaneſe call him Buds and Siaka, which names indeed at length became a common epithet for all gods and idols in general brought from foreign countries, and ſometimes they were given to the pretended ſaints who preached theſe new doctrines.

The moſt eſſential points of this religion are, that the ſouls of men and animals are immortal, and both of the ſame ſubſtance, differing only according to the bodies in which they are placed; and that after the ſouls of mankind have left their bodies, they ſhall be rewarded or puniſhed according to their behaviour in this life, by being introduced to a ſtate of happineſs or miſery. This ſtate of happineſs they call a place of eternal pleaſures; and ſay, that as the gods differ in their nature, and the ſouls of men in virtue, ſo alſo do the degrees of pleaſure in the ſtate of bliſs, in order that every one may be rewarded as he deſerves: yet the whole place is ſo thoroughly filled with felicity, that each happy inhabitant thinks his portion beſt, and is ſo far from envying the ſuperior happineſs of others, that he wiſhes only for ever to enjoy his own. Their god Amida is the ſovereign commander of theſe bliſsful regions, and is conſidered as the patron and protector of human ſouls; but more particularly as the god and father of thoſe who are happily removed to a ſtate of felicity. Theſe maintain, that leading a virtuous life, and doing nothing contrary to the five commandments, is the only way to become agreeable to Amida, and to render themſelves worthy of eternal happineſs.

On the other hand, all perſons, whether prieſts or laymen, who, by their ſinful lives, and vicious actions, have rendered themſelves unworthy of the pleaſures prepared for the virtuous, are, after death, ſent to a place of miſery, there to be confined and tormented during a certain undetermined time, where every one is to be puniſhed according to the nature and number of his crimes, the number of years he lived upon earth, his ſtation there, and his opportunities for being good and virtuous. To Jemma, who is the ſevere judge of this place of miſery, the vicious actions of mankind appear with all their aggravating circumſtances, by means of a large mirror, called the mirror of knowledge, which is placed before him. Yet the miſeries of the unhappy ſouls confined to theſe gloomy priſons, they imagine, may be greatly alleviated by the good actions and virtuous life of their family, their friends, and relations, whom they left behind; but nothing, they are taught, is ſo conducive to this deſirable end, as the prayers and offerings of the prieſts to the great and good Amida, who can prevail on the almoſt inexorable judge to treat the impriſoned ſouls with ſomewhat leſs ſeverity than their crimes deſerve, and at laſt to ſend them as ſoon as poſſible into the world again. For when they have been confined in theſe infernal priſons a time ſufficient to expiate their crimes, they are ſentenced by Jemma to return to this earth, and animate thoſe creatures whoſe nature is moſt nearly allied to their former ſinful inclinations; as for inſtance, toads, ſerpents, inſects, four-footed beaſts, birds, and fiſhes. From the vileſt of theſe tranſmigrating into others and nobler, they at laſt are ſuffered again to enter human bodies, and thus have it in their power, either by their virtue and piety, to obtain an uninterrupted ſtate of felicity; or, by a new courſe of vices, once more to expoſe themſelves to all the miſeries of confinement in a place of torment, ſucceeded by a new unhappy tranſmigration.

The five commandments of the law of Buds, or Siaka, which are the ſtanding rule of the life and behaviour of all his faithful followers, are, 1. Not to kill any thing that has life. 2. Not to ſteal. 3. Not to commit fornication. 4. To avoid lies, and all falſhood: and 5. Not to drink ſtrong liquors; which laſt Siaka moſt earneſtly recommended to his diſciples.

Beſides theſe chief and general commandments, there are ten counſels or admonitions, which are only theſe five laws branched out, and applied to more particular actions, all tending to a ſtricter obſervance of virtue. A ſtill farther ſub-diviſion hath been made of theſe laws into five hundred counſels and admonitions, in which are ſpecified, with the utmoſt exactneſs, whatever, according to their notions, has the leaſt tendency to virtue and vice. But the number of theſe admonitions being ſo very great, it is no wonder that thoſe who are willing to obſerve them are very few; the rather as they tend to ſuch a thorough mortification of their bodies, as to meaſure and preſcribe the minuteſt part of their diet, and ſcarcely allow them the food neceſſary to keep them from ſtarving. Nothing but the ardent deſire of obtaining a moſt ſublime ſtate of happineſs in the next world, or the ambition of acquiring a great reputation for ſanctity in this, can enable any man to undergo ſuch a rude and ſevere diſcipline. And indeed there ſeems very few, even of the bonzes or prieſts, who would willingly renounce the leaſt of the luxuries and pleaſures of this world for the ſake of enjoying a greater portion of happineſs in the next.

Of the followers of Siaka there are ſeveral ſects, all of which have their temples, their convents, and their prieſts: and of all their religious buildings in the country theſe temples, with their adjoining convents, are the moſt remarkable, as being far ſuperior to all others, from their ſtately height, curious roofs, and numberleſs ornaments, which agreeably ſurpriſe the beholder; ſuch as are built within cities or villages commonly ſtand on a riſing-ground, and in the moſt conſpicuous places. They are all moſt agreeably ſituated: a fine view of the adjacent country, with the neighbourhood of a wood, a clear rivulet, and pleaſant walks, being neceſſary to the places on which theſe temples are built: for with ſuch ſituations, they ſay, the gods are delighted, and the prieſts readily condeſcend to be of the ſame opinion, they being moſt proper for their own pleaſure and diverſion. Beautiful ſtair-caſes of ſtone lead up to theſe ſtructures, and ſeveral ſmall temples, or chapels, are built within the ſame court, adorned with gilt images, lackered columns, gates, and pillars, all very neat, but pretty rather than magnificent. Both the principal temple, and thoſe ſmaller ones that are dependant on it, are built of the beſt cedars and firs; and in the midſt of the large temple ſtands a fine altar with one or more gilt idols upon it, and a beautiful candleſtick with ſweet-ſcented candles burning before it. Theſe temples are frequently ſupported by a great number of pillars, and are ſo neatly adorned, that a man might fancy himſelf tranſported into a Romiſh church, did not the monſtrous ſhape of the idols prove the contrary. One of theſe temples erected at Miaco, is eſteemed the moſt ſumptuous in the empire. It is built with free-ſtone; the roof is bold and lofty. It ſtands on the top of a hill, and on each ſide of the aſcent are lofty pillars of free-ſtone, ten paces from each other; and on the top of each a large lanthorn, which makes a fine ſhew by night. The temple itſelf is ſupported by a great number of pillars, and furniſhed with many idols, among which is one of gilt copper, of a prodigious ſize, ſeated in a chair eighty feet broad, and ſeventy feet in height. No leſs than fifteen men may ſtand on the head of this coloſſus, whoſe thumb is fourteen inches in circumference, and the body and members of this monſtrous

figure in proportion. But indeed the whole country ſwarms with idols, which are to be found not only in their temples, but in their public and private buildings, in their ſtreets, markets, and even along the highways. People are, however, not obliged to fall down before them, or to pay them any other reſpect than they chooſe.

III. The religion of the philoſophers and moraliſts is very different from that of the two former; for they pay no regard to any of the forms of worſhip practiſed in the country. The ſupreme good, ſay they, conſiſts in that pleaſure and delight that ariſes from the ſteady practice of virtue, and alledge that we are obliged to be virtuous becauſe nature has endowed us with reaſon, that by living according to its dictates, we might ſhew our ſuperiority to the irrational inhabitants of the earth. They do not admit of tranſmigration of ſouls, but believe that there is an univerſal ſoul diffuſed through all nature, which animates all things, and which re-aſſumes the departed ſouls, as the ſea does the rivers. This univerſal ſpirit they confound with the Supreme Being. Theſe philoſophers not only admit of ſelf-murder, but conſider it as an heroic and commendable action, and the only honourable means of avoiding a ſhameful death, or of preventing their falling into the hands of a victorious enemy.

They conform to the general cuſtom of the country in celebrating the memory of their deceaſed parents and relations, by putting all ſorts of proviſions, both raw and dreſſed, on a table made for that purpoſe, and by monthly or anniverſary dinners, to which are invited the family and friends of the deceaſed, who all appear in their beſt clothes, and waſh and clean themſelves by way of preparation, for three days before, during which they abſtain from lying with their wives, and from every thing eſteemed impure.

They celebrate no other feſtivals, nor pay any reſpect to the gods of the country. Being formerly ſuſpected of favouring the Chriſtian religion, they are obliged to have each an idol, or at leaſt the name of one put up in a conſpicuous and honourable place in their houſes, with a flower-pot and cenſer before them; but in their public ſchools is hung up the picture of Confucius. This ſect was formerly very numerous. Arts and ſciences were cultivated among them, and the beſt part of the nation were of that profeſſion; but the dreadful perſecution of the Chriſtians greatly weakened it, and it has loſt ground ever ſince: the extreme rigour of the imperial edicts make people cautious even of reading their books, which were formerly the delight and admiration of the nation, and held in as great eſteem as the writings of Plato and Socrates are in Europe.

SECT. VIII.

A conciſe Hiſtory of the Dutch Factory at Japan. A Deſcription of the Iſle of Deſima, to which they are confined: the Manner in which they are treated by the Japaneſe, and the Articles of their Commerce.

THE Dutch, allured by the advantageous trade of the Portugueſe, firſt landed in Japan about the year 1600, where they met with all poſſible oppoſition, and every ill office, from their European rival in commerce. Portugal was then ſubject to the king of Spain, with whom the Dutch were at war; and this war was re-kindled before the Dutch diſcovered the deſigns of the Portugueſe againſt the government of Japan, and when they aſſiſted the Japaneſe, as hath been already mentioned, in driving out their invidious rivals, and afterwards in extirpating the Romiſh religion out of that empire. After theſe events, which, however unchriſtian, ſhewed them to be the friends, or at leaſt the tools, of the Japaneſe, they enjoyed conſiderable privileges; till having built a factory and ware-houſe of hewn-ſtone, ſtronger, more lofty, and handſomer than the buildings of that country: while they were unlading one of their ſhips into their new-built ware-houſe, it is ſaid, the bottom of a large box burſt out, and, inſtead of merchants goods, appeared a braſs mortar. The Japaneſe court were now alarmed, and the Dutch received immediate orders, under pain of death, to demoliſh all their buildings, and remove from the port of Firando, where they were then ſituated, to the little iſland Deſima; which may properly enough be called the Dutch priſon in Japan.

This iſland, which is ſituated almoſt cloſe to the city of Nagaſaki, has been raiſed from the bottom of the ſea, which is there rocky, ſandy, and dry at low water. The foundation, for about two fathoms, is of free-ſtone, and the land riſes about half a fathom above high-water mark. It is joined to the town by a ſmall ſtone bridge, at the end of which is a ſtrong guard-houſe, where ſoldiers are conſtantly upon duty. On the north ſide of the iſland are two ſtrong gates, which they call water-gates, as they are never opened but for lading and unlading the Dutch ſhips. The whole iſland, which is 236 paces long, and 80 broad, is incloſed with pretty high deal boards, covered with a ſmall roof, on the top of which is planted a double row of pikes, a very trifling defence againſt an enemy. A few paces from the iſland are thirteen very high poſts, placed in the water at proper diſtances, with ſmall wooden tables at the top, upon which are written, in large Japaneſe characters, an order from the governors, ſtrictly forbidding all veſſels to approach the iſland. A broad ſtreet, with houſes on both ſides, runs acroſs the whole iſland, which, as well as the iſland itſelf, were built by ſome of the inhabitants of Nagaſaki, to whoſe heirs the Dutch pay a rent much above their value: all theſe houſes are built of wood, two ſtories high, the lowermoſt of which ſerve inſtead of ware-houſes, and in the uppermoſt the Dutch reſide. The other buildings within the town are, a houſe built with ſquare ſtone, in which are put up the imperial mandates, and the orders of the governors; three guard-houſes, one at each end, and one in the middle of the iſland; and a place where the inſtruments are kept for extinguiſhing fires. Behind the great ſtreet the company have cauſed to be erected, at their own expence, a convenient houſe for the ſale of their goods, and two ware-houſes ſtrong enough to hold out againſt fire; a large kitchen, a houſe for the deputies of the governors who are appointed to direct and regulate the trade, and a bagnio: they have alſo made a kitchen and pleaſure-garden, and ſome private gardens.

Within the ſmall compaſs of this iſland the Dutch are confined and guarded. Their ſhips which annually put into the harbour, after being thoroughly viſited by the Japaneſe, have leave to land their men upon it, to refreſh them there, while they ſtay in the harbour, which is commonly two or three months. On their ſetting ſail the Dutch reſident, with ſeven or eight men, or more, if he thinks proper, remain in the iſland; where, for fear of their ſmuggling, the Japaneſe not only take an exact inventory of all their goods and commodities, but lock them up under their own locks and ſeals. Even the cloths and ſtuffs brought over for their own uſe, muſt be delivered into the cuſtody of the ottona, till one of their own taylors cuts them out, allowing each as much as will make him a good ſuit.

After the departure of the ſhips, the Dutch reſident ſets out with a numerous retinue to pay his reſpects to the emperor, and make the uſual annual preſents; but they are attended with a train of guards and inſpectors, as if they were the profeſſed enemies of the empire. The reſident and his companions appear before the emperor crawling on their hands and knees, and as they approach bow their heads to the floor, and then crawl backwards like ſo many crabs. They are ſometimes ordered to riſe and dance for the diverſion of the ladies of the court, and others, who are concealed by the ſcreens; and alſo to ſing, to laugh, to converſe, to ſcold, &c. to which they readily ſubmit: ſuch influence has the love of gold, as to make them pay an abject and ſervile obedience to all theſe ridiculous commands. However, in other reſpects, they are treated and entertained by the emperor and his court in a very obliging manner; and at their departure preſented with ſilk gloves, in return for their preſents to the emperor and great officers of ſtate.

Upon a few other occaſions they are alſo ſuffered to leave the iſland; but they can never do it without a numerous retinue of thoſe who are to watch their conduct; with this mortifying circumſtance, that they are obliged, at a great expence, to pay thoſe who lead them about as priſoners.

The Dutch ſhips are expected in September, towards the latter end of the ſouth-weſt monſoon, which alone is proper for this navigation. The ſpy-guards, placed on the tops of the neighbouring mountains, no ſooner diſcover with their glaſſes one of their ſhips ſteering towards the harbour, than they

they ſend notice of her approach to the governors of Nagaſaki, when three perſons of the factory are ſent with the uſual attendants to meet her about two miles without the harbour, to deliver to the captain the neceſſary inſtructions from the reſident, or director of trade, with regard to his behaviour; and at the ſame time the interpreter and governor's deputies demand a liſt of the cargo and crew, with the letters on board; which laſt being carried to Nagaſaki, are firſt examined by the governor, and then delivered to the director. The ſhip follows as ſoon as poſſible, and having ſaluted every imperial guard, caſts anchor at about a muſket-ſhot from the iſland. Two guard-boats immediately board her, and mount guard; while a number of officers alſo coming on board, demand all the guns, cutlaſſes, ſwords, and powder, which are taken away, and kept in a ſtore-houſe built for that purpoſe, till their departure: but they do not now, as they did formerly, take away the rudder of the ſhip. The next day the commiſſioners of the governors, with their attendants of ſubordinate officers, interpreters, and ſoldiers, enter the ſhip, and take an exact view of all the people who belong to the Dutch on board, according to the liſt that had been given them, in which is ſet down every one's name, age, place of reſidence, and office. The ſame rules are obſerved with reſpect to the reſt of the ſhips, two, three, or four of which are annually ſent from Batavia to Japan.

It has been confidently aſſerted, that the Dutch here deny their being Chriſtians; and that, as a proof of their not being of that religion, they, on their firſt landing, trample a crucifix under their feet: but Mr. Kæmpfer aſſerts, that this is an unjuſt calumny, and maintains that they freely own their being Chriſtians; but juſtly maintain, that their ſentiments are very different from thoſe of the Portugueſe.

The time for unloading the ſhip being arrived, the water-gates of the iſland are opened in the preſence of the commiſſioners appointed by the governors and their retinue, while every corner of the veſſel is crowded with Japaneſe officers, to ſee that nothing be taken away privately. The goods are brought from the ſhips in ſmall boats, and placed before the commiſſioners, who ſet them down in writing, compare them with the liſts that have been given them, and open a bale or two of each ſort, and then order them to be locked up in the company's ware-houſes, till the time of ſale. The cheſts of private perſons are alſo examined; and if the owner does not immediately appear with the key, they, without ceremony, open them with axes. No European, or any other foreign money, nor any thing that has the figure of a croſs, a ſaint, or beads, would be ſuffered to paſs: for if any thing like theſe ſhould be found, it would occaſion a confuſion and affright among the Japaneſe, as if the whole empire was betrayed. Hence it is cuſtomary for the captain of every ſhip, upon drawing near the harbour, to oblige all on board to deliver their money, prayer-books and other books of divinity to him, that he may pack them up in an old caſk, concealed from the natives.

All who want to go on board, whether for his own private buſineſs, or in the company's, are obliged to take out a paſs-board from the commiſſioners at the water-gates, to thoſe in the ſhip; and when any one returns, he muſt take another from theſe laſt; by which means they always know how many people there are on board, or on ſhore. A paſs-board is a piece of wood, on one ſide of which is ſome writing, and on the other a ſtamp made by a hot iron.

Before the commiſſioners in the ſhip return at night with their retinue to Nagaſaki, the cabin is ſealed up in their preſence, and all the Dutchmen carefully counted over to ſee that none be wanting, which would occaſion great confuſion. Once a ſailor fell over-board in the night unobſerved, and at the review the next morning he was miſſed. Suddenly all proceedings were ſtopped, and the fear leſt it ſhould be a Romiſt prieſt, who had made his eſcape into the country, filled the Japaneſe with ſuch conſternation, that all the officers ran about, and behaved as if they had loſt their ſenſes; and ſome of the ſoldiers in the guard-ſhips, which always encompaſs thoſe of the Dutch, were already preparing to rip open their bellies, to prevent their being compelled, by an ignominious death, to atone for their careleſſneſs; when the unhappy fellow's body being found in the ſea, put an end to their fears and farther enquiries.

Whenever they are either loading or unloading the ſhips the water-gates are ſhut, by which means all communication is cut off between thoſe who ſtay on board, and thoſe that remain on ſhore. The whole cargo of the ſhips being depoſited in the ware-houſes, the goods are diſpoſed of in two or three days ſale; and what remains unſold is kept in the ware-houſes till the next year's ſale.

The Dutch ſend to Japan raw ſilk from China, Tonquin, Bengal, and Perſia; wove ſilks and other ſtuffs (provided they are not wrought with gold or ſilver) from the abovementioned and ſome other countries; woollen cloth and ſtuffs from Europe, among which are Engliſh ſerges; braſil-wood, buffalo and deer ſkins, ray ſkins, wax, and buffalo horns, from Siam and Cambodia; cordowans and tanned hides from Perſia and Bengal; pepper, powdered ſugar, ſugar-candy, cloves, and nutmegs, from Amboyna and Banda; white ſandale from Timor; camphire from Borneo and Sumatra; quickſilver, ſaffron, and cinnabar, from Bengal; lead, ſalt-petre, borax, and alum, from Siam and Bengal; muſk from Tonquin; gum-lacca from Siam; coral, amber, antimony, which they uſe in colouring their porcelain, and looking-glaſſes, from Europe: the looking-glaſſes they break, and make of them perſpective-glaſſes, ſpectacle and magnifying-glaſſes; pickled mangoes and other pickled fruit, black lead and red pencils, ſublimate mercury, files, needles, ſpectacles, large drinking-glaſſes of the fineſt ſort, counterfeit corals, ſtrange birds, and other foreign curioſities both natural and artificial.

In return, the Dutch bring from Japan a very great quantity of refined copper, ſome of a coarſer ſort, Japaneſe camphire, ſome hundred cheſts of china-ware; all ſorts of japanned cabinets, boxes, cheſts of drawers, and the like, the beſt that can be procured; umbrellos, ſkreens, and hanging-paper; rice, tea, pickled fruits, marmalades, and a great deal of gold in ſpecie.

The Dutch once made vaſt profits by this trade; but the government has ſo lowered the prices of their goods, and added to thoſe of their own, that they do not now gain above one-third of what they did formerly.

CHAP. II.

Of CHINA.

SECT. I.

Its Names, Situation, Extent, and Diviſions. Its Climates, Soil, and a general View of the Country, with reſpect to the Fertility and Appearance of the Plains and Mountains; of their Metals and other Minerals; the Springs, Rivers, Lakes, and Canals.

THE empire of China is called by the Chineſe themſelves Tchong-koué, and by the inhabitants of Indoſtan it is termed Catay: whence it is difficult to diſcover the reaſon of its obtaining the names given to it in Europe, except they were derived from Tſin, the firſt emperor, who extended his conqueſts towards the weſt; whence, perhaps, the Germans call it Tſchina; the French, Chine; the Italians, Cina; and the Engliſh and Spaniards, China.

This great empire is ſituated on the eaſtern borders of the continent of Aſia, and is bounded on the north by the celebrated wall, and in ſome parts by inacceſſible mountains, which ſeparate it from Chineſe Tartary; on the eaſt it is bounded by the Yellow Sea, which ſeparates it from the peninſula of Corea, and by the vaſt Weſtern Ocean, which lies between it and America; on the ſouth by the Chineſe Sea and the kingdom of Tonquin; and on the weſt by Tibet, from which it is ſeparated by high mountains and ſandy deſarts. It is included between 21 and 42 degrees of north latitude, and between 98 and 123 degrees of eaſt longitude from London; and is about 1450 miles in length, and 1260 in breadth.

Some modern authors, whoſe names we forbear to mention, have very injudiciouſly extended China as far as the utmoſt limits of Chineſe Tartary, and placed the northern boundaries of that empire in 55 degrees of north latitude, that is above three degrees more to the north than London; but nothing can be more abſurd, than thus to confound countries which are eſſentially and in every reſpect different; for the wild uncultivated deſarts of Tartary can never be properly termed China; nor China's fertile plains, crowded with inhabitants and rich in agriculture, ever be juſtly denominated Tartary.

China is divided into ſixteen very large provinces, fifteen of which are within the great wall, and one without. Of theſe provinces Chang-tong or Xantum, Kiang-nan or Nanking, Tche-kiang, and Fo-kien, are ſituated on the coaſts of the Yellow Sea and the Eaſtern Ocean; Petcheli or Pekin, Chanſi or Kanſi, and Chenſi or Kenſi, extend along the ſide of the great wall that ſeparates it from Tartary on the north; Se-tchuen or Suchuen, and Yun-nan or Yunam, are on the borders of the weſt and a part of the ſouth; and Quang-ſi or Quamſi, and Quang-tong or Canton, are on the remainder of the ſouthern coaſt; while Honan, Hou-quang or Huquam, Koei-tchou or Quechue, and Kiang-ſi or Kiamſi, are ſituated in the midſt, and ſurrounded by the other eleven: but Laotonge, which is without the wall, is ſituated on the moſt northern coaſt of the Yellow Sea.

Theſe are the proper bounds of the empire of China, without mentioning a great part of Tartary, which is ſubject to the emperor, and much encreaſes his power; for the Tartars are brave; and tho' the country be full of woods and ſandy deſarts, yet it produces fine horſes and furs, which are of great uſe to the Chineſe.

We have omitted the iſles of Haynan and Formoſa, half of which belong to China, with Macao, and ſome other ſmall iſlands. As to the peninſula of Corea, which lies to the north-eaſt near Japan, and the kingdoms of Tonquin and Siam, which are ſeated to the ſouth-weſt, they ſome time ago were ſo far dependent on China as to pay tribute to that crown, and their kings at their admiſſion, confirmed by its emperor.

As this country extends about twenty degrees from north to ſouth, it enjoys very different climates; for the ſouth, which lies under the tropic of Cancer, is in ſummer very hot, and has its periodical rains, like other countries under the ſame parallel. The middle of China enjoys a temperate climate and a ſerene ſky; but the north is very cold, not ſo much from its ſituation, it extending no farther than the 42d degree, but from the height of the neighbouring mountains, which are commonly covered with ſnow, and have ſuch an effect on the air, that the rivers in the north of China generally continue frozen from the middle of November to the middle of March.

The ſoil of China is alſo different, according as it is ſituated more or leſs to the ſouth; yet no parts of the country can be properly ſaid to be barren; for ſome are naturally fruitful, while others owe their fertility to the indefatigable labour of the huſbandman. The land, like all others, is divided into hills and plains; the latter of which appear ſo perfectly level, that one would imagine, ſays Le Compte, that the Chineſe, ever ſince the foundation of their monarchy, had been ſolely employed in levelling and forming them into gardens. Their manner of meliorating the ground is by letting water through it; and this is the only method by which it could be diſtributed equally, that thoſe parts which lay high might not ſuffer by drought, and the reſt be rendered uſeleſs by being continually overflowed. This is alſo the way by which they give fertility to their hills and many of their mountains; for they cut their ſides into long and level plains, riſing above each other like ſtairs, quite up to the ſummit, that the rain ſpreading equally, may be retained on theſe terraces, and not waſh down the ground with its ſeeds. Thus have they forced or rather improved Nature, by forming artificial plains where ſhe had raiſed mountains; and it muſt be confeſſed, adds the ſame pleaſing author, that a long ſeries of ſuch hills and mountains, adorned with a hundred ſuch terraces, that loſe in breadth what they gain in height, and whoſe ſoil is as fertile as that of the beſt cultivated valleys, muſt afford very delightful landſcapes. The terraces are however more eaſily formed than they could be among us, as their hills and mountains are generally leſs ſtony than ours, and their mould being light is eaſily cut and removed; and yet, in moſt provinces, it is ſo deep that a man may dig three or four hundred feet in depth before he comes to the rock.

Nature has not, however, been every where equal in the diſtribution of her favours; for ſhe has been leſs laviſh of them in the weſtern and ſouthern provinces: yet their mountains bear all the tall and ſtraight trees that are fit for building, and theſe the inhabitants, by means of the rivers and canals, ſell to the moſt diſtant provinces.

They have other mountains which produce iron, quick ſilver, copper, ſilver, and even gold. But Du Halde obſerves, that thoſe of gold and ſilver have been hitherto neglected out of policy, becauſe the public repoſe would be diſturbed by too much riches which would render the people proud and negligent of agriculture; but that ſilver mines have been always kept open in the province of Yun-nan, and that the inhabitants find gold in the ſands of the brooks and rivers.

But the moſt ſingular metal is white copper, of which ſeveral experiments have been made at Pekin, to try if it owes its whiteneſs to any mixture: but it was found that it did not, and that all mixtures, except of ſilver, diminiſh its beauty; but what detracts from its value is, its being more brittle than other copper.

They have alſo great quantities of pit-coal, which, as wood for firing is in general very ſcarce, they uſe for fuel on all occaſions.

The mountains likewiſe produce loadſtones, cinnabar, vitriol and alum. Lapis lazuli is found in ſeveral places, and alſo a kind of jaſper. The fineſt rock-cryſtal is got in the province of Fo-kien; and the artificers who live near the mountains where it is produced, are ſkilful in cutting, engraving upon it, and making it into ſeals, buttons, the figures of animals, and the like.

The mountains of this province have alſo porphyry, and quarries of fine marble of various ſorts, which if well poliſhed, would equal the beſt in Europe; but little uſe is made of it in their public buildings; for there is neither

neither palace, temple, nor any other edifice in the whole empire entirely of marble.

As to ſprings, it were to be wiſhed that they were more and better. The common water is not good, which, Le Compte obſerves, hath perhaps obliged the inhabitants, eſpecially thoſe of the ſouthern provinces, to drink it warm; but becauſe warm water is unpalatable and nauſeous, they bethought themſelves of putting ſome leaves of a tree to it, to render it more pleaſant; thoſe of tea, he adds, ſeemed to be the beſt, and ſo they frequently make uſe of it.

Among the ſprings there are ſaid to be ſeveral which ebb and flow as regular as the ſea.

If the inhabitants chance to diſcover a ſpring, it is ſurprizing to ſee how carefully they huſband it. They retain it within banks, and turn it here and there an hundred different ways, that all the country may reap the benefit of it: they divide it by drawing it by degrees, according as every one has occaſion for it; ſo that a ſmall rivulet, well managed, ſometimes gives fertility to a whole province.

The rivers of China are pretty numerous: the moſt conſiderable of theſe is the Kiam, which riſes in the province of Yun-nan, croſſes three other provinces, and having run a winding courſe of 1200 miles, diſcharges itſelf into the Eaſtern Ocean. The inhabitants have a proverb, that "The ſea has no bounds, and the Kiam no bottom;" and indeed in ſome places there is none to be found. At Nanking, where it is thirty leagues from the ſea, it is a mile and a half broad. The paſſage along it is extremely dangerous, and many ſhips are loſt. In its courſe, which is exceeding rapid, it forms a multitude of iſlands; that are of great benefit, as the bulruſhes, which are ten or twelve feet high, ſerve the neighbouring cities for fuel; and from them the emperor draws a conſiderable revenue. It is ſometimes ſo ſwelled, and its rapidity ſo much increaſed by torrents which fall from the mountains, that the ſtream carries ſome of the iſlands along with it, and greatly leſſens others, forming new ones in other places; ſo that it is ſurpriſing to ſee them change their ſituation, as if they had paſſed under water from one place to another; but this does not always happen. However, they make ſuch conſiderable changes, that the mandarines cauſe them to be meaſured every three years, in order to augment or diminiſh the duties, according to the condition in which they are found.

Another is called the Yellow River, becauſe the earth it ſweeps away with it, eſpecially in times of great rains, gives it that colour. It riſes at the extremity of the mountains that bound the province of Se-tchuen in the weſt: from thence it throws itſelf into Tartary, where it flows for ſome time on the outſide of the great wall, and re-enters China between the provinces of Chanſi and Chenſi. After that it waters the province of Honan, and then running acroſs one part of the province of Nanking, after having flowed above 600 leagues, it diſcharges itſelf into the Eaſtern Ocean, not far from the mouth of the Kiam. This river has formerly cauſed great deſolation in China, and they are ſtill obliged in certain places to confine the waters by long banks of great ſtrength. It is very broad and rapid, but of no extraordinary depth.

Beſides theſe, there are abundance of others, that are leſs famous, but more commodious for trade and commerce. There are alſo many lakes, ſome of which are of conſiderable extent, and afford a great variety of fiſh.

Though China were not naturally fruitful, the canals that are cut through it are alone ſufficient to make it ſo. But, beſides their great uſe in that reſpect, and in the way of trade, they add much to its beauty. They have generally a clear, deep, and running water, which glides ſo ſoftly that it can be ſcarcely perceived to move. There is uſually one in every province which ſerves inſtead of a road, and runs between two banks built with flat coarſe marble, the ſtones faſtened into each other in the ſame manner as our ſtrong wooden boxes are faſtened at the corners. Beſides theſe cauſeways, they have many bridges for the convenience of forming a communication with the oppoſite ſhores, ſome of three, ſome of five, and ſome of ſeven arches, the middlemoſt of which is always of an extraordinary height, that the boats may go through without lowering their maſts. Theſe arches are formed with large pieces of ſtone or marble, and the piers are ſo ſmall, that at a diſtance they ſeem to hang in the air. Theſe are frequently ſeen; and, as the canals are generally ſtraight, they appear at once ſtately and agreeable: but we ſhall give a more particular account of the bridges of China in treating on their architecture.

Each of theſe great canals runs into ſmaller ones on each ſide, which are again ſubdivided into ſmall rivulets that end at ſome great town or village, or elſe diſcharge themſelves into ſome lake that waters the adjacent country. Indeed, theſe clear and plentiful ſtreams, covered with numberleſs boats and barges, embelliſhed by fine bridges, bounded by ſuch neat and convenient banks, and equally diſtributed through fertile plains of vaſt extent, render the fields the moſt fruitful and beautiful upon earth.

The Chineſe ſay, that their country was once entirely overflowed, and that they drained off the water by cutting their uſeful canals. Suppoſing this to be true, we cannot ſufficiently admire their boldneſs and induſtry, who thus formed artificial rivers, and of a kind of ſea in a manner created thoſe fruitful plains. But it appears incredible, that men ſo ignorant of the principles of phyſicks, and the art of levelling, could bring ſuch a noble work to perfection. Yet it is certain, that theſe canals are not natural: for they are generally ſtraight, the diſtribution is performed with great equality; flood-gates are made to let in the water from the rivers, and others to let it out when the canals are too full; ſo that it cannot be doubted that the Chineſe owe theſe advantages to their own induſtry.

SECT. II.

Of the Trees, Shrubs, Plants, Flowers, and medicinal Roots; together with the four-footed Beaſts, Birds, Inſects, Reptiles, and Fiſhes of China.

THE ſoil is proper for all ſorts of fruit; for it produces pears, apples, apricots, peaches, figs, grapes of all kinds, and eſpecially excellent muſcadines. There are alſo pomegranates, walnuts, cheſnuts, and in general all that we have in Europe: but moſt of theſe fruits are not near ſo good as ours, they being wholly ſtrangers to the art of grafting, and our manner of cultivating fruit-trees. Beſides, they want a variety of each diſtinct ſort; for they have but three or four kinds of apples, ſeven or eight of pears, as many of peaches, and none of cherries but what are very indifferent.

But what makes them ſufficient amends for this defect is, their having ſeveral excellent fruits to which we are ſtrangers, particularly one which they call tſe-tſe, which grows on a wide ſpreading tree as tall as a middle-ſized walnut-tree. The leaves are large, and of a lively green, but change in autumn to an agreeable red. The fruit is about the bigneſs of a handſome apple, and their colour, when ripe, is a bright yellow. When dry, they have ſome reſemblance to a fig.

In the ſouthern provinces are other fruits that are ſtill more eſteemed by the natives. They have an excellent fruit called litchi, which is of about the ſize of a date: the ſtone is long, hard, and covered with a ſoft pulp full of moiſture, and of a delicious taſte. Over all is a rough thin ſkin: it is ſhaped like an egg; but when dried, it loſes much of its fine flavour, and becomes black and wrinkled like prunes. The Chineſe, however, preſerve it by drying, and eat it all the year round.

The longyen, or dragon's-eye, is exactly round, and grows on a tree as large as thoſe that produce walnuts. The rhind is ſmooth and grey, but as it ripens it turns yelloviſh; the pulp is white, moiſt, and inclining to the acid. This is not quite ſo agreeable as the former, but it is more wholeſome, and never occaſions any diſorder.

The ſeze is another kind of fruit thought peculiar to China. It grows in almoſt all parts of that empire, and is of ſeveral kinds. Thoſe in the ſouthern provinces taſte much like ſugar, and melt in the mouth; their rhind is clear, ſmooth, tranſparent, and of a ſhining red, eſpecially when the fruit is ripe. Some are of the ſhape of an egg, but they are uſually bigger; the ſeeds are black and flat, and the pulp being almoſt liquid, people ſuck it out at one of the ends. When they are dried like our figs, they become mealy; but in time there grows a ſort of ſugared cruſt upon them, from which they receive a moſt delicious flavour.

Thoſe

Thoſe that grow in the provinces of Chanſi and Chenſi are more firm, bigger, and may more eaſily be preſerved.

From China we have only one kind of orange cultivated in Europe; but they have ſeveral that are excellent, eſpecially one ſort which is in great eſteem; they are ſmall, and the rhind is thin, ſmooth, and very ſoft. Another kind produced in the province of Fo-kien has an admirable taſte; theſe oranges are large, and the rhind is of a beautiful red. Thoſe they have at Canton are ſtill larger, more yellow, very agreeable to the taſte, and extremely wholeſome. They conſider the juice of theſe oranges as a great pectoral, and give them to the ſick, after they have been roaſted in hot embers, cut in two, and filled with ſugar.

We ſhall omit the ananas, goyavas, cocoas, and other fruits that are not natives of China, and for which they are indebted to the Indies.

One of the moſt remarkable of their trees is that which produces peaſe; for the ſhape, colour, ſhell, and taſte, are extremely like thoſe of our peaſe. This tree is common in ſeveral provinces, and is inferior to very few in its tallneſs, the ſpreading of its branches, and the thickneſs of its trunk.

There are trees in the province of Quang-ſi which, inſtead of pith, have a ſoft pulp, of which they make flour of a pretty good taſte.

Among other trees peculiar to this country is a kind of pepper-tree, the fruit of which is different from any of the ſorts known to us. It is a kind of berry as big as a pea, and is of a greyiſh colour, with ſmall red ſtreaks. When the berries are ripe they open of themſelves, and diſcover a little ſtone as black as jet, which caſts ſo ſtrong a ſmell, that it is offenſive to the brain, for which reaſon they are gathered by intervals, the people not being able to ſtay long on the tree at a time. Having expoſed theſe grains to the ſun, they throw away the ſtone, which is too hot and ſtrong, and only uſe the rhind; which though not quite ſo agreeable as the pepper brought from the Indies, is good in ſauces. The plant that produces it is in ſome places a thick buſh, and in others a tree of a moderate height.

There are two kinds of the varniſh-tree, both of which ſeem very different from the two ſorts in Japan. One, called by the Chineſe tſichu, is of a ſmall ſize, with a whitiſh bark, and leaves like thoſe of the wild cherry-tree. The gum, which diſtils drop by drop, is like the tears of the turpentine-tree. If an inciſion be made in it, it yields a much greater quantity; but this will ſoon deſtroy the tree. This varniſh is a ſtrong poiſon, and, though inferior to that of Japan, is much eſteemed by the artificers; it takes all colours alike, and, if it be well managed, neither loſes its luſtre by the changes of the air, nor the age of the wood to which it is applied.

The other, called tongchu, ſo nearly reſembles a walnut-tree, that many have been deceived by it. It bears a nut filled with a very ſoft pulp, that contains a thickiſh oil, which they ſqueeze out and prepare for uſe, by boiling it with litharge. This, as well as the other varniſh, is ſuppoſed to have a poiſonous quality. It is often uſed not only where the work is painted, but to varniſh wood, in order to preſerve it from the bad effects of rain, and to give a luſtre to the floors of the emperor's apartments and thoſe of the grandees.

Another remarkable tree is the kouchu, which reſembles the fig-tree of Europe, both with reſpect to the wood, the branches, the leaves, and the bark: only the leaves are larger, thicker, and rougher on the upper ſide, and on the under ſide are covered with a fine down. This tree yields a milk made uſe of by the Chineſe for ſize, in gilding with leaf gold. To obtain it, they make one or more horizontal inciſions in the trunk, and into the edge of the ſlits put the edge of a ſea-ſhell, or ſome other receiver that will anſwer the ſame purpoſe, into which the milk diſtills; and when they uſe it they dip a pencil in it, and draw what figure they pleaſe upon wood, or any thing elſe, on which they afterwards lay leaf gold, which it ſo firmly cements that the gold never comes off.

The tallow-tree is very remarkable. It is as high as a large cherry-tree; the branches are crooked; the leaves ſhaped like a heart, and of a lively red; the head is round and very thick, the trunk ſhort, and the bark ſmooth. The fruit is incloſed within a rhind divided into three ſegments, which open when it is ripe, and diſcover three white kernels, each of the ſize of a ſmall nut. This mixture of white and red appears very beautiful; and being planted in line chequerwiſe, the fields where they grow reſemble, at a diſtance, a vaſt parterre covered with flower-pots. But what is more ſurpriſing, theſe kernels have all the qualities of tallow; its ſmell, colour, and conſiſtence. They alſo make candles of it, mixing only a little oil when they melt it, to make it more pliant; but the ſmell of theſe candles is much ſtronger, their ſmoak thicker, and their light dimmer than ours: but theſe defects may be probably owing to the wick; for inſtead of cotton, of which they have great plenty, they uſe a ſmall ſtick of a dry light wood, wrapped round with the inner part of a ruſh. This mixture of ruſh and wood cannot poſſibly burn ſo clear as cotton, but muſt naturally increaſe the ſmoak, and cauſe an offenſive ſmell.

The white-wax-tree is another of a very extraordinary nature. It is not ſo tall as the tallow-tree, from which it differs in the colour of the bark, which is whitiſh, and alſo in the ſhape of the leaves, which are longer than they are broad. What is remarkable, is, that a ſmall kind of worm fixes itſelf to the leaves, and forms a ſort of comb much ſmaller than a honey-comb, the wax of which is very hard and ſhining, and of far greater value than common bees-wax.

There is another tree which bears a fruit from which is drawn an excellent oil, which, when freſh, is perhaps the beſt in the whole empire. The tree has ſome diſtant reſemblance to the tea-ſhrub with reſpect to the ſhape of the leaf, and the colour of the wood, but greatly exceeds it in height and thickneſs. The berries, which are green, and of an irregular figure, contain ſeveral kernels.

There are many trees that would appear very beautiful when properly diſpoſed in gardens; for inſtead of fruit, they are almoſt all the year long laden with flowers of a florid carnation, the leaves are ſmall like thoſe of the elm, the trunk irregular, the branches crooked, and the bark ſmooth.

Among others, there is one that reſembles the ſycomore. The leaves are between eight and nine inches in diameter, faſtened to a ſtick a foot long. It has a round head, and is ſo thick ſet with cluſters of flowers, that the rays of the ſun cannot penetrate them.

The tree which produces the flowers called kuey-hoa, is very common in the ſouthern provinces; but rarely found in the northern. The leaves reſemble thoſe of the bay-tree. The flowers are ſmall, of various colours, and have a charming ſcent. There is another ſpecies proper to the maritime provinces, the flowers of which are not ſo agreeable to the ſight, they being of a duſky yellow: but they even excel the other in their delightful fragrance.

In the province of Yun-nan are found the trees which bear the caſſia fiſtula; they are pretty tall, and the pods no longer than thoſe we ſee in Europe: theſe are not compoſed of two convex ſhells, like thoſe plants of the legumenous kind; but are a ſort of hollow pipes, divided into cells, that contain a ſoft ſubſtance, no way differing from the caſſia in uſe with us.

We ſhall here forbear to treat of the banana-tree, the betel-tree, the mango-tree, the cotton-tree, and ſeveral others that alſo grow in moſt parts of the Indies.

They have moſt of the kinds of timber-trees that grow in Europe; but that which they moſt eſteem is called Nanmon. The antient palaces of the emperors have the windows, gates, beams, and pillars of this wood, which the natives imagine will never decay, and conſequently that whatever is formed of it will laſt for ever. Some have thought it a kind of cedar; but though it is very tall and ſtraight, the leaves have no reſemblance to thoſe of that tree.

No kind of wood can exceed the beauty of the tſetam, which is of a reddiſh black, and full of fine veins, which ſeem painted. It is proper for cabinets, and the very fineſt ſorts of joiners work; and what is made of it, is much eſteemed.

The iron wood, with reſpect to ſtrength and firmneſs, is inferior to none. The tree is as tall as a large oak; but differs from it in having a ſlender trunk; in the ſhape of the leaves; in the wood being of a darker colour; and more eſpecially in the weight, it being too heavy to ſwim. The anchors of their ſhips of war are made of this wood, and

the emperor's officers have the folly to pretend, that they are better than thoſe made of iron.

Among the flowering-trees is the mo-lien, which is as thick as the ſmall of one's leg. Its branches are ſlender, and covered with a red rhind with whitiſh ſpots: the leaves are few but very large, and joined to the tree by ſtalks, which ſpread ſo much towards the bottom that they ſeem to embrace the branch, and to proceed from it as out of a tube. From the bottom of theſe ſtalks proceed ſmall buds covered with down, which opening in the depth of winter become large flowers like the mountain-lily, compoſed of ſeven or eight leaves of an oval figure, and pointed. Some of theſe trees bear a white flower, others red, and others yellow. The leaves fall at the ſame time, and often before the flowers are opened.

The lamoe reſembles the bay-tree in its ſize, figure, and the ſhape of the branches, which are furniſhed with leaves that grow with ſhort ſtalks in pairs; the leaf at the end of the branch is nearly of the ſize of the common laurel, and they decreaſe in ſize in proportion to their diſtance from the end of the branch. In the depth of winter there proceeds from the bottom of the ſtalks of the leaves ſmall yellow flowers of an agreeable ſmell, not unlike that of the roſe.

The tchakoa is alſo very beautiful. Of this tree, which is an ever-green, there are four kinds that bear flowers, all of which reſemble the Spaniſh laurel with reſpect to the wood and leaves. At the place where the ſtalks of the leaves join to the branches, riſe buds of the ſize, colour, and ſhape of a hazel-nut, but are covered with a fine white hair; and theſe buds, opening in December, produce flowers which are double, and of a reddiſh colour, like ſmall roſes, joined immediately to the branches without any ſtalks. The trees of the ſecond kind are very high, and the flowers are large and red, which mixed with the green leaves have a very agreeable appearance. The flowers of the two other kinds are ſmall and whitiſh, and the middle of them is filled with ſmall filaments, that have each a yellow flat top as in common roſes, with a round piſtil in the middle.

There is another very ſingular tree that reſembles both the juniper and cypreſs-trees. The trunk is about a foot and a half in circumference, and almoſt as ſoon as it riſes out of the ground ſends forth branches, ſubdivided into many others, which at ſome diſtance from the ſtem form a cloſe green buſh, covered with a multitude of leaves, ſome like thoſe of the cypreſs-tree, and the reſt long, narrow, and ſharp, like thoſe of the juniper, diſpoſed along the boughs in rows of four, five, or ſix in number; ſo that looking upon theſe boughs at the end, they reſemble ſtars of four, five, or ſix rays, exactly covering thoſe below, ſo that the ſpaces between them appear empty and diſtinct to the bottom. The boughs covered with theſe long leaves, are found principally at the lower part of the branches; for towards the top you behold nothing but cypreſs. In ſhort, nature ſeems to have taken pleaſure in mingling theſe two ſorts of leaves in ſuch a manner, that ſome are entirely juniper, others nothing but cypreſs, and ſome half one and half the other. The bark is a greyiſh brown, in ſome places inclining a little to the red; and the wood is a reddiſh white, like that of the juniper-tree, with a little ſpice of the turpentine. The leaves, beſides the ſmell of the cypreſs-tree, are a little aromatic; but their taſte is acrid and very bitter. This tree bears ſmall green berries, a little larger than thoſe of the juniper; joined to the branches by long ſtalks, like thoſe of the leaves. Each contains two reddiſh ſeeds of the ſhape of an heart, and as hard as grape-ſtones.

There are trees of this kind that have a tall and ſlender trunk, with branches only at the top, ending in a point almoſt like the cypreſs; and there are others of the dwarf kind, that grow no higher than ſeven or eight feet. It is remarkable, that when this tree is young all the leaves are long, like thoſe of the juniper; and that when it is old, it reſembles the cypreſs.

Beſides theſe they have oaks, elms, pines, cedars, aſhes, palm-trees, and many others known in Europe.

To theſe uſeful trees may be added the reed or cane, commonly called a bamboo, which generally grows to the height of an ordinary tree; and, though knotty and hollow, is exceeding hard, and ſo ſtrong as to ſupport a great weight. It is therefore, in ſome places, uſed in building, alſo for pipes to convey water, and many other purpoſes. As it will admit of being divided into ſmall ſplinters, they make of it boxes, baſkets, and other things: and after all, when it is broken in pieces, and grown rotten, it is boiled in water till it is reduced into a kind of paſte, and then it ſerves to make paper of different kinds.

Among the various ſhrubs we ſhall firſt mention that of tea: the name of which is derived from the corrupt pronunciation of two cities in the province of Fo-kien; but in all the reſt of the empire it is called tcha. The Chineſe tea appears to be a different ſpecies from that of Japan, and therefore deſerves a particular deſcription. It is diſtinguiſhed into three ſorts: the firſt, called ſong-lo-tcha, grows on a mountain in the province of Kiung-nan, in 29 deg. 38 min. 30 ſec. latitude, and is the ſame we call green tea. The ſhrub is planted in rows, and is kept pruned to prevent its growing too high. It muſt be planted anew every four or five years, or elſe the leaf becomes thick, hard, and rough. The flower, which is in the ſhape of a roſe, is compoſed of five white leaves; and in autumn, when it drops off, there appears a berry in the form of a nut, that is a little moiſt, and has no bad taſte. In other provinces, where they ſuffer the ſhrubs to riſe to their full height, they reach to ten or twelve feet: therefore, when the branches are young and tender, they cauſe them to bend downward, in order that they may gather the leaves with the greater eaſe.

Another ſort of tea, called vou-y, or bohea, grows in the province of Fo-kien, and takes its name from a celebrated mountain in 27 deg. 47 min. 38 ſec. latitude, on which are many temples, houſes, and hermitages of the Bonzes, who, in order that it may paſs for the abode of ſuperior beings, have conveyed barks, chariots, and other things of the ſame kind up into the clefts of the ſteepeſt rocks, along the ſide of a rivulet that divides it into two, and theſe are conſidered by the vulgar as prodigies; for they imagine, that none but a power more than human could convey them up to thoſe inacceſſible places.

The ſoil of this mountain is light, whitiſh, and ſandy; and the only difference between the tea that grows upon it and the former is, that its leaves are ſhorter and more round, of a colour a little blackiſh, and yield a yellower tincture. As the taſte is agreeable, and the decoction inoffenſive to the weakeſt ſtomach, it is ſought for and uſed in every part of the empire. Of this kind there are four ſorts: the firſt is the tender leaf when ſcarcely opened. This is ſeldom expoſed to ſale, but ſerves to make preſents of, and to ſend to the emperor. It is therefore called imperial tea, and is valued at about two ſhillings in the pound. The ſecond conſiſts of leaves of a ſenſible growth, and is eſteemed a very good ſort. The remaining leaves are ſuffered to arrive at their full growth, which makes the third kind exceeding cheap. The fourth ſort is made of the flower, but thoſe who would have it muſt beſpeak it before-hand, and pay an exceſſive price for it: yet it makes a very inſipid tea, that is never uſed at the emperor's court.

There are ſeveral other kinds of tea, little different from the two principal, except what is owing to the nature of the ſoil in which the ſhrubs are planted; there are alſo ſeveral plants to which they give the name of tea, though they are not at all like it. There is, however, a third principal ſort, called by the Chineſe pou-eul-tcha, from a village in the province of Yun-nan, near which ſtands the mountain on which it grows. The leaves are longer and thicker than thoſe of the two former kinds; they roll them up, and ſell them at a good price.

Many of the mountains are covered with an admirable kind of oſiers of the thickneſs of one's finger, which creep upon the ground, and produce very long ſprigs reſembling twiſted cord. Theſe being extremely limber and very ſtrong, they not only make of them baſkets, hurdles, and a kind of mats on which the Chineſe lie in ſummer, they being very cool, but alſo ropes and cables for ſhips.

Among the fruit-bearing plants they have two ſorts of melons, different from ours, and that are very excellent. One of theſe grows in the province of Chen-ſi, and is ſmall, yellow within, and of a ſweet taſte like ſugar: theſe they eat with the rhind, as we do an apple. The other are a kind of water melons, and are very large and long: the inſide of ſome of them is white, and of others red, full of a cooling juice that has alſo the ſweetneſs of ſugar. They never

never prove offenſive to the ſtomach, and may be eaten during the greateſt heats of ſummer, without fear of a ſurfeit.

Among the ſhrubs there are but three or four kinds that bear odoriferous flowers, and among theſe the jeſſamine is the moſt agreeable. In the ſouth it riſes to a moderate height; but in the north it is no more than ſix feet high, though it be kept in a green-houſe all the winter. The flower reſembles a double jeſſamine; but the leaf is different, and very like that of a young citron tree.

There is a ſhrub that is not odoriferous, which bears a white flower as large as a double or treble roſe: it is ſucceeded by the fruit, which is in the ſhape of a peach; but it is inſipid to the taſte. In its cell are ſeveral ſeeds covered with a blackiſh ſkin.

The pionies of China are more beautiful than thoſe of Europe, and have an agreeable ſmell; but the reſt of their garden flowers are not to be compared with ours.

The lakes, however, produce many beautiful flowers, and nothing can be more agreeable than to ſee the waters thus adorned, and every year improved and renewed by the ſeed which they ſow. The great lords keep theſe flowers in little ponds, and ſometimes place them in veſſels filled with mud and water in their gardens. Among theſe the lienhoa, which reſembles a tulip, riſes two or three cubits above the ſurface of the water. Its colour is either violet or white, or part red and part white; and it has a very agreeable ſmell. It bears a fruit as big as a walnut, and the kernel which it includes is white and of a good taſte. This the phyſicians think of a nouriſhing and ſtrengthening nature, and therefore preſcribe it to thoſe who are weak. Its leaves, which are long, ſwim upon the water, and have a communication with the root by long ſtrings, which are uſed by the gardeners to wrap up their goods. The root is much eaten, eſpecially in ſummer, becauſe it is very cooling. In ſhort, there is nothing in this plant that is not uſeful; for they even make of it a kind of meal.

The cotton ſhrub of China is one of the moſt uſeful. The huſbandmen have no ſooner got in their harveſt, than they ſow cotton in the ſame fields: and then raking the earth over the ſeeds, there ſoon grows up a ſhrub about two feet high, the flowers of which appear by the middle of Auguſt. Theſe are generally yellow; but ſometimes red. This flower is ſucceeded by a ſmall button of the bigneſs of a nut, which opens in three places; and, on the fortieth day after the appearance of the flower, diſcovers three or four wrappings of cotton extremely white, and of the ſame form as the cod of the ſilk-worm; this being faſtened to the bottom pod, contains ſeeds for the following year. It is then time to get in the crop; but in fair weather they leave it to be expoſed two or three days to the heat of the ſun, which cauſing it to ſwell encreaſes the profit. As all the fibres of the cotton are ſtongly faſtened to the ſeeds they incloſe, the people uſe an engine to ſeparate them. It contains two ſmooth rollers, one of wood and the other of iron, about a foot long and an inch thick, in a manner cloſe to each other. While one hand gives motion to the firſt of theſe rollers, and the foot to the ſecond, the other hand applies the cotton, which is drawn through while the naked ſeeds remain behind. Afterwards they card and ſpin the cotton, and weaving it, convert it into callico.

The meaner ſorts of the people, who live chiefly upon vegetables, are very careful in the cultivation of their kitchen garden, and never ſuffer the earth to lie uſeleſs. Among thoſe vegetables not known in Europe, there are none worthy of notice but the petſai, which is excellent. It has been thought a kind of Roman lettuce; but it reſembles it in nothing but the firſt leaves, the height, flower, ſeed, and taſte being entirely different. Such incredible quantities of it are ſown every year, that in the months of October and November the nine gates of Pekin are crowded with waggons loaded with it. They preſerve it with ſalt, and alſo pickle it, and mix it with their rice to give it a reliſh.

In ſo large an empire the medicinal herbs and roots muſt be very numerous.

The plant named by ſome authors radix-xina, and by the natives fou-ling, is more uſed than any other by the Chineſe phyſicians. Its leaves, which are long and narrow, creep on the ground. The root, when full grown, is very thick. This plant bears a pod filled with a white pulp. In ſeveral parts of the country there is a wild ſort of it, that is alſo much uſed, and ſold at a lower price. Its good effects in ſeveral diſorders are unqueſtionable; it is uſed as a kind of panacea, and preſcribed in almoſt all diſtempers. The root is not ſo commonly uſed, but is much dearer. It is of a warm nature, and is eſteemed an excellent remedy in all diſeaſes ariſing from cold humours, and for all kinds of obſtructions.

Rhubarb grows in ſeveral places in great abundance. The leaves are long, broad, and rough to the touch; the flowers reſemble tufts in the ſhape of a bell, but are jagged at the edge; and the root, while freſh, is whitiſh within; but when dried, it aſſumes the colour it has when brought to us.

The tihoang is the root of a very beautiful plant. One would take it for a ſort of liquorice, with a legumenous flower and a crooked pod; but, on examining the leaves, the ſeed, and the taſte, it is difficult to determine to what ſpecies it belongs. It is much uſed to remove by little and little the decays of ſtrength.

The ſantſi is eſteemed a moſt valuable remedy; and among its other virtues, is efficacious in women's diſorders, and hæmorrhages of all kinds. A ſort of goat, of a greyiſh colour, is fond of feeding upon this plant, whence the blood of this animal is thought to be poſſeſſed of the ſame medicinal properties.

Of all the medicinal herbs and roots, none is held in ſuch eſteem, or is ſold at ſuch a price, as that of ginſeng; but as this is not one of the natural productions of China, but is chiefly imported from Tartary, we ſhall give a deſcription of it in treating of that extenſive country.

As for the animals, there are all the cattle found in England, though, conſidering the great extent of the country, the number of them is but ſmall; there are, however, in the mountains many wild beaſts, as rhinoceroſes, camels, buffaloes, tygers, bears, and wild boars; but there are no lions.

One of the moſt remarkable animals is a kind of camel, no higher than an ordinary horſe. He has two bunches on his back covered with long hair, that form a kind of ſaddle. The bunch before ſeems formed by the back-bone and the upper part of the ſhoulder-bone, and is not unlike the bunch which the Indian cows have on their ſhoulders; the other bunch is placed juſt before the buttocks. His legs are in proportion, not ſo long as thoſe of common camels; and his neck, which is ſhorter and thicker, is covered with thick hair as long as that of the goat. Some of theſe camels are of a yellowiſh dun-colour; others are a little upon the red, and in ſome places of an aſh-colour; but as their legs are not ſlender, like thoſe of the other camels, they ſeem, for their ſize, more fit to carry burdens.

They have ſome good horſes that are ſtrong and vigorous, but they too are ſmall; and there are alſo a particular kind of ſtags, no larger than our common dogs, which the nobility keep in their gardens for their diverſion; but they have many deer of a larger ſize.

The muſk roe-buck is another extraordinary animal. It is a kind of deer without horns, with hair of a blackiſh colour. The muſk is generated in the inward part of a bag, compoſed of a very thin ſkin covered with hair extremely fine, and ſticks round it like a kind of ſalt: there are two ſorts of this muſk, but that which is in grains is the moſt valuable. The female produces no muſk. The fleſh of ſnakes is ſaid to be the common food of this animal; for though they are of an enorrous ſize, the roe-buck eaſily kills them; becauſe he no ſooner approaches them, than they are ſo overpowered by the ſcent of the muſk, as to be unable to ſtir. However, the fleſh of the roe-buck is good to eat, and is ſerved up at the beſt tables. This is ſo well known, that whenever the peaſants go to cut wood, or make charcoal in the mountains, they ſecure themſelves from being bit by the ſnake, by carrying about them a few grains of muſk; when, if any ſnake approaches them, it is ſuddenly ſtupified, and unable to advance.

The black hogs of this country are excellent food, greatly ſuperior to the pork of Europe. Theſe are very numerous, and are much eaten by the inhabitants, who at leaſt ſeem equally fond of the fleſh of dogs and wild horſes, which are dreſſed in various manners, and ſerved up

up at the beſt tables. The vulgar are fond of horſe and dog fleſh, though theſe animals die with age or ſickneſs.

As to birds, there are parrots of all ſorts, exactly reſembling thoſe of America: they have the ſame plumage, and the ſame aptneſs to imitate the human voice; but they are not comparable in beauty to the bird called the golden hen. There is none of that ſpecies in Europe that can be compared with it. The livelineſs of the red and yellow, the plume on the head, the fine ſhadowing of the tail, the variety of colours that appear in the wings, together with the delicacy of its ſhape, have no doubt given occaſion to the epithet Golden conferred on this fowl. Beſides, the fleſh is more delicate than that of the peaſant; ſo that on every account none of the eaſtern birds would be more acceptable if brought into this country.

Among the beautiful birds the haitſing alſo deſerves notice. It is very uncommon, and is only found in the province of Chen-ſi, and in ſome parts of Tartary. It is not inferior in beauty to our fineſt falcons, and in ſtrength and ſize is much ſuperior; whence it may juſtly be called the king of the birds of prey in China and Tartary.

There are in China alſo wild and tame peacocks, fowls of all ſorts, and moſt of the birds found in Great Britain; together with bats of a prodigious ſize.

Among the flying inſects, the butterflies of a mountain in the province of Quang-tong are greatly eſteemed, and the largeſt and moſt uncommon among them are ſent to court. Their colours are extremely vivid, and moſt ſurpriſingly diverſified. In the day-time they are without motion on the trees, and conſequently are eaſily taken; but in the evening they flutter about in the ſame manner as our bats, and many of them ſeem to be almoſt as large. There are others of a ſmaller kind, much ſought after; but they are by no means comparable to the former.

In a river in the province of Hou-quang are taken a great number of tortoiſes of different ſizes, which the nobility keep in their gardens and at their pleaſure-houſes for their diverſion.

There are no ſorts of fiſh in Europe that are not to be met with in China; beſides many others of an excellent taſte quite unknown to us, a few of which we ſhall here mention.

One of theſe moſt eſteemed is the armour-fiſh, ſo called from its being caſed in a coat of hard ſharp ſcales, placed one over another, like tiles on the roof of an houſe. It weighs about forty pounds, and is an admirable fiſh, exceeding white within, and in taſte has ſome reſemblance to veal.

One of the beſt fiſhes in China is like a ſea-bream; it weighs five or ſix pounds, and is commonly ſold for little more than a farthing a pound; and for only as much more after being carried twenty leagues up the country.

In calm weather they catch another ſort of delicate fiſh, called by the Chineſe the meal-fiſh, from its extraordinary whiteneſs. The black circles of its eyes are ſurrounded with two circles reſembling rings of bright ſilver. They are found in ſuch prodigious ſhoals, that there is commonly caught of them, at one drag of the net, no leſs than four hundred weight.

The yellow-fiſh caught in the great river Yang-tſe-kiang is of an exquiſite taſte, and of a very extraordinary ſize; for ſome of them weigh 800 pounds weight. There are no fiſh in the world that eat more firm; but they are only caught at certain ſeaſons.

The golden fiſh, which are much admired, and kept by the great men in their courts and gardens, as ornaments to their palaces, are about the length of one's finger, and proportionably thick. The male is of a beautiful red from the head half way down the body, and the remaining part ſeems gilt; but in ſuch a manner, ſays Le Compte, that our beſt performances in gilding are inferior to it. It has alſo bright and ſhining ſpots about the gills. The female is white, and has the tail and ſome part of the body perfectly like ſilver; the tail of each is frequently not ſmooth and flat like thoſe of the other fiſh; but often forms a kind of tuft, and adds new beauty to this pretty creature, whoſe whole body is finely proportioned. Theſe fiſh begin now to be pretty well known in England, gentlemen keeping them in large glaſs veſſels, where they are ſeen to ſwim about, and may be obſerved at leiſure without the leaſt inconvenience. They even multiply very faſt here; and a perſon of diſtinction at Wimbleton, in Surry, has actually a fiſh-pond well ſtocked with them. They are, however, very indifferent food; for nature has beſtowed ſo many beauties on them only to charm the eye, and has conſulted their ſafety by rendering them incapable of gratifying the taſte of the luxurious.

SECT. III.

Of the Origin, the Perſons, Dreſs, Manners, and Cuſtoms of the Chineſe.

THE origin of the Chineſe empire is as obſcure as the ſource of the Nile. The vulgar hiſtory of that monarchy is not only dubious, but evidently falſe, ſince forty thouſand years are ſuppoſed to have paſſed ſince its foundation; but, according to their regular hiſtory, in which all the learned agree, China has had its kings for more than two thouſand years. It ſeems probable, that ſome of the grand-children or great-grand-children of Noah diſperſed themſelves in Aſia, and at length reached the moſt weſternly parts of China, where they lived in the beginning in families, the kings being fathers, to whom age, an abundance of flocks, herds, and other paſtoral riches, added authority. The foundation of this monarchy is ſaid to have been laid by Fohi, whoſe virtue, wiſdom, and power, added to his great age, induced the people to liſten to him as to an oracle; and as he regulated all private, as well as political and religious affairs, the ſtate ſoon became in a flouriſhing condition.

'Tis ſaid, the people then principally applied themſelves to the education of their children and to agriculture, for which they had an high eſteem. They were extremely laborious; the judges and governors were grave and ſober, and by the equity of their deciſions, gained the love and reſpect of the people; while the prince placed his higheſt felicity in rendering his ſubjects happy, and conſidered himſelf, rather as the father of a numerous family, than as the ſovereign of a great empire. Thus the Chineſe acquired ſuch reputation, that they were admired and eſteemed by all the neighbouring nations; and it is probable that they conſidered themſelves as ſuperior to all other men; an opinion which they retained, after their having ſuffered as great revolutions in morals as in politics; and even became ſo vain as to fancy that Heaven had placed them in the center of the univerſe to give laws to mankind.

As to their perſons, they are far from being ſuch groteſque figures as they repreſent themſelves in their paintings; and we may form a pretty diſtinct idea of them in general, by conſidering what they eſteem beauty. This they imagine conſiſts in having a large forehead, ſmall eyes, a ſhort noſe, a broad face, a mouth of a moderate ſize, large ears, and black hair; together with a certain ſymmetry and proportion between all the parts. As their garments are wide, and do not ſit ſo cloſe to the body as thoſe of the Europeans, they have formed no idea of the beauty reſulting from a genteel and eaſy ſhape. On the contrary, they eſteem a man well made when he is fat, bulky, and handſomely fills his chair. Their complexion, in the ſouthern parts of China, where the weather is exceſſive hot, is of an olive colour; but, in the northern provinces, they are naturally as fair as the Europeans, and, generally ſpeaking, their faces are not diſagreeable; in particular, the men of learning and young people have a fine ſkin, and a beautiful complexion; but it is remarkable, that the learned, eſpecially if they are of baſe extraction, affect to let the nails of their little fingers grow an inch long or more, from the vanity of ſhewing that they are not ſubject to mercenary labour.

As for the women, they are commonly of the middle ſize; their noſes are ſhort, their eyes little, their mouths well made, and with roſy lips; their ears are long, their hair black, and their complexion florid; their features are regular, and their countenances full of vivacity. The ſmallneſs of their feet is, in the opinion of the Chineſe, none of the leaſt charms of that ſex: therefore, when a female infant is born, the nurſes are very careful in binding her feet extremely hard, to prevent their growing; and they are ever after ſubject to this conſtraint: but whatever pain a child ſuffers from this violence offered to nature, it

is ſurpriſing that it does not appear that their health is ever impaired by it; and ſuch is the force of cuſtom, that when grown up, they are ſo far from complaining of it, that they pride themſelves in this extraordinary charm, and always affect to ſhew their feet as they walk, or rather hobble along with tottering and unſteady ſteps.

The men ſhave their heads, leaving only one lock of hair growing on the crown, and cover their heads in ſummer with a ſmall cap, in the form of a funnel, made of rattan or cane, and lined with ſattin. At the top is a tuft of hair that ſpreads over it to the very edges. This hair, which grows between the legs of a cow, is dyed of a bright red, and is allowed to be worn by all ſorts of people. But the men of letters wear a cap of the ſame form made of paſte-board, and lined and covered with ſattin, with a large tuft of the fineſt red ſilk. But in winter they wear a very warm ſort of cap bordered with ſable, ermine, or fox-ſkin, the upper part of which is covered with red ſilk, that falls round it to the edges, and as they walk flutters in the air. This border of fur is two or three inches broad, and looks very handſome. The upper part of the cap, when worn by the mandarines in their formalities, is adorned with a diamond, or ſome other precious ſtone ill cut, though ſet in gold.

Their other garments conſiſt in a long veſt, one lappet of which folds over the other, and reaches to the right ſide, where it is faſtened by five or ſix gold or ſilver buttons, at a ſmall diſtance from each other. The ſleeves, which are broad towards the ſhoulders, grow narrow by degrees towards the hand. They gird themſelves with a large ſilk ſaſh, the end of which hangs down to their knees, and in this they put their purſe, and a caſe that contains a knife, two ſmall ſticks which ſerve for a fork, and other things. Under the veſt they in ſummer wear linen drawers, which are ſometimes covered with another of taffety; but in winter they wear ſattin breeches, with cotton or raw ſilk quilted in them: in the northern provinces they are made of warm ſkins. Their ſhirts are made of different kinds of cloth, and are very wide and ſhort. In ſummer their necks are quite naked; but in winter they cover them with a neck-band of ſattin or ſable, or the ſkin of a fox; and in that ſeaſon their veſt is lined with ſheep-ſkins. People of quality line them quite through with ſable, or fine fox ſkins, with a border of ſable; and in ſpring they have them lined with ermine. Over the veſt they wear a ſurtout, with large ſhort ſleeves lined and bordered in the ſame manner.

The Chineſe of a certain rank dare not appear in public without boots, even though they walk on foot, or are carried in a ſedan. This cuſtom would ſeem leſs ridiculous was it only practiſed in winter; for their boots being of ſilk, and their boot-hoſe of a pinked ſtuff lined with cotton, a full inch thick, their legs are well defended from the cold: but in ſummer, when the heat is exceſſive, none but the Chineſe, merely for the ſake of keeping up an air of gravity, would be able to wear them. Some indeed may perhaps wear a lighter ſort; but the working people, either to avoid the inconvenience, or to ſave charges, ſcarce ever uſe them. Theſe boots have neither tops nor heels. If they go a journey on horſeback, they wear boots of neats or horſe leather, ſo well dreſſed that nothing can be more limber; and their boot-ſtockings are of ſtuff lined with cotton; they come higher than the boots, and are bordered with pluſh or velvet.

When they make a viſit of any conſequence, they wear over the veſt a long ſilk gown, commonly blue, girded about them, over which they have a black or violet coloured cloak that reaches to their knees. This is exceeding wide, and has very wide and ſhort ſleeves. They alſo wear their boots, and carry a fan in their hand. Inſtead of gloves, when the weather is cold, they make uſe of the ſleeves of their veſt, which, being very long, they draw their hands into them to keep them warm. If the perſons they viſit chance to be at home without their boots, they make them wait till they have put them on.

As they affect a ſtarched gravity in all their ways, they have a great veneration for a long beard; they therefore let theirs grow; and if they have not much, it is not, ſays Le Compte, for want of cultivation, but nature has been very ſparing to them; and there is not one among them who does not envy the Europeans, whom they conſider in this reſpect as the greateſt men in the world.

If the dreſs of which they are ſo fond appears ridiculous to us, ours does not appear leſs ſo to them; our ſhaving our beards, and, inſtead of our own hair, wearing a buſh of artificial curls on the head, appear in the higheſt degree fantaſtical and abſurd; and their ideas of gravity make them ſee nothing agreeable in our diſcovering long legs, with ſtockings drawn ſtraight, and breeches that ſit cloſe to the thigh.

But tho' perſons of quality obſerve all theſe formalities when they appear in public in the hotteſt weather, yet in private, and among their friends, they quit their bonnet, ſurtout, veſt, ſhirt, and even their favourite boots, reſerving nothing but a ſingle pair of drawers of white taffety or thin linen. This is the more extraordinary, as they are offended at our painters and engravers for repreſenting men with their arms and legs uncovered: yet in the ſouthern provinces they ſhew that they have not the leaſt degree of modeſty, and almoſt all the artificers and inferior tradeſmen go along the ſtreets with ſingle drawers, without cap, ſtockings, or ſhirt, which renders them much tanned and of a ſwarthy hue: but in the northern provinces the cold renders them, to appearance, more modeſt.

The Chineſe ladies have no leſs vanity than thoſe of other nations; for they ſpend ſeveral hours every morning in dreſſing and adorning themſelves, thinking they may be ſeen in the day, though perhaps they are not by any one but their domeſtics. Their head-dreſs conſiſts in ſeveral curls, interſperſed with little tufts of gold and ſilver flowers, and ſometimes is crowned with the figure of a fabulous bird made of copper or ſilver gilt, its extended wings embracing the upper part of the temples, and its ſpreading tail forming a plume on the middle of the head; while its neck, having a joint, moves with the leaſt motion. Ladies of quality have an ornament compoſed of ſeveral of theſe birds united ſo as to form a kind of crown.

The young ladies, however, generally wear a ſort of cap made of paſteboard covered with ſilk; the fore part riſes in a point above the forehead; and is adorned with pearls, diamonds, and other ornaments. The upper part of the head is adorned with flowers, either natural or artificial, mixed with ſmall bodkins, the ends of which ſhine with jewels. But women advanced in years, eſpecially the common ſort, are contented with a piece of ſilk wrapped ſeveral times round the head. The ladies, as well as the men, wear a veſt, which is of ſattin or cloth of gold, and over it their gowns, which are very long, cover them from head to foot; their hands are always concealed under wide ſleeves, that would almoſt draggle on the ground were they not to hold them up. The colour is either red, blue, or green; and none but ladies advanced in years wear violet or black. Their ſhoes are of ſattin, embroidered with gold, ſilver, and ſilk, and are exceeding neat.

The Chineſe in general appear mild, tractable, and humane; and have a great deal of affability in their air and manner, valuing themſelves on their being more polite and more civilized than other nations; therefore, whoever has to do with them, muſt take great care of being too warm or haſty. It is indeed difficult for a ſtranger to conform to their manners, and to conſtrain himſelf to ſubmit to a multitude of frivolous ceremonies that are extremely troubleſome, eſpecially when he finds that, under all their affected politeneſs of behaviour, they are capable of concealing the utmoſt treachery, and the moſt baſe and mercenary views. Though they are extremely revengeful, they fawn on the man they hate, and, diſſembling their anger, treat him with the utmoſt reſpect, till finding an opportunity of ruining him, they immediately ſeize it, and triumph in his deſtruction.

In ſome parts of the empire the people are ſo fond of law-ſuits, that they mortgage their lands, houſes, goods, and all they poſſeſs, for the ungenerous pleaſure of cauſing an enemy to be baſtinadoed; but it ſometimes happens that the latter, by giving a larger ſum to the villainous mandarine, has the cunning not only to eſcape the puniſhment, but to cauſe it to be inflicted on him who proſecuted the ſuit.

Intereſt is, with the greateſt part of them, the moving ſpring of all their actions. When any thing is to be gained they employ their utmoſt cunning to obtain it, artfully inſinuate themſelves into the favour of thoſe who are capable of promoting their views, and endeavour to gain their friend-

ſhip

ſhip by conſtant ſervices, with wonderful dexterity aſſuming all characters, and turning the mereſt trifles to their advantage.

When they have dealings with ſtrangers, they ſeldom fail to cheat them when it lies in their power, and even boaſt of doing ſo. A captain of an Engliſh ſhip had agreed with a Chineſe merchant for many bales of ſilk: when they were ready, the captain went with his interpreter to the houſe of the Chineſe, to examine the ſilk if it was in a right condition. They opened the firſt bale, which proved good; but the next contained nothing but decayed ſilks: upon which growing very angry, he reproached the Chineſe in the ſevereſt terms for his knavery; who, having heard him, cooly replied, "Blame, Sir, your "raſcal of an interpreter; for he told me you would not "open the bales."

Theſe low frauds are principally obſerved among the vulgar, who have a thouſand tricks to adulterate and diſguiſe what they ſell. There are ſome that have the ſecret of opening the breaſt of a capon, taking out all the fleſh, filling up the ſkin, and cloſing it again ſo dexterouſly, that it is not perceived till it comes to be eaten; and they are ſaid to counterfeit hams and gammons of bacon with ſuch art, that the deceit is not diſcovered till they are ſerved up at the table, and going to be carved, when they find nothing but a great piece of wood under a hog's ſkin. It is certain that a ſtranger will be generally cheated if he buys alone; and he has no other way of preventing it, than by employing a truſty Chineſe well acquainted with all their tricks: and indeed he will be very happy if he that buys and he that ſells do not join in the fraud, and go ſhares in the profit.

Theſe accounts of the diſhoneſty of the Chineſe in general, are ſelected from the writings of the miſſionaries who had long lived in the country, and perfectly agree with the treatment commodore Anſon received in the river of Canton, of which we ſhall here give a few inſtances. "It "were endleſs, ſays Mr. Walter, to recount all the arti"fices, extortions, and frauds, practiſed on the commo"dore and his people, by this intereſted race. The method "of buying proviſions in China being by weight, the tricks "made uſe of by the Chineſe to augment the weight of "what they ſold were almoſt incredible. One time a large "quantity of fowls and ducks being bought for the ſhip's "ſtore, the greateſt part of them preſently died: this "ſpread a general alarm on board, it being apprehended "that they had been killed by poiſon; but, on examina"tion, it appeared that it had been only owing to their "being crammed with ſtones and gravel to increaſe their "weight: the quantity thus forced into moſt of the ducks "being found to amount to ten ounces in each. The "hogs too, which were bought ready killed of the Chineſe "butchers, had water injected into them for that purpoſe; "ſo that a carcaſe hung up all night, that the water might "drain from it, had loſt above a ſtone of its weight. "And when, to avoid this cheat, the hogs were bought "alive, it was diſcovered that the Chineſe gave them ſalt "to increaſe their thirſt; and having thus excited them to "drink great quantities of water, they then took meaſures "to prevent them from diſcharging it again by urine, and "ſold the tortured animal in this inflated ſtate. When "the commodore firſt put to ſea from Macao, they prac"tiſed an artifice of another kind; for as the Chineſe "never ſcruple eating any food that dies of itſelf, they "contrived, by ſome ſecret practices, that great part of "his live ſea-ſtore ſhould die in a ſhort time after it was "put on board, hoping to make a ſecond profit of the "dead carcaſes which they expected would be thrown "over-board; and two thirds of the hogs dying before "the Centurion was out of ſight of land, many of the "Chineſe boats followed her, only to pick up the carrion. "Theſe inſtances, he adds, may ſerve as a ſpecimen of "the manners of this celebrated nation, which is often re"commended to the reſt of the world, as a pattern of all "kinds of laudable qualities."

Mr. Le Compte obſerves, that when a perſon lends them any thing he muſt have ſureties; for as for their word, thoſe who know them cannot rely upon it. Some of them have been obſerved to borrow a very ſmall ſum, with the promiſe of reſtoring the principal with great intereſt; which they punctually performed upon the day appointed, to gain the reputation of honeſt men. After that they deſired a greater ſum, which they alſo repayed without fail; and this commerce they have continued whole years together, till obtaining credit for conſiderable ſums, they diſappeared for ever.

The ſubtilty of deceiving is ſtill more extraordinary in thieves and robbers: they break through the thickeſt walls, burn gates, and make great holes in them by means of an engine, which it is ſaid fires the wood without any flame. They penetrate into the moſt private receſſes without being ſeen; and when people awake in the morning, they are amazed to find their bed without curtains and coverlets, their chamber unfurniſhed, and tables, cabinets, coffers, and plate, all carried off, without perceiving any footſteps of the thieves, but the hole in the wall.

It muſt not however be ſuppoſed that there are no honeſt men in China; there are doubtleſs many ſcattered through that great empire, and it is to be wiſhed, for the honour of human nature, there were more: but the greateſt part of the Chineſe are ſo ſelf-intereſted, that they can ſcarcely believe that any thing is undertaken without a view to intereſt.

They are in general extremely puſillanimous, and there are ſcarcely any people upon earth ſo fond of life; though there are ſome, eſpecially women, who, through anger or deſpair, procure their own death: but they ſeem even ſtill more afraid of wanting a coffin after death, and therefore frequently purchaſe one above twenty years before they want it, all the while conſidering it as the moſt valuable moveable they have in their houſe.

Yet no people upon earth are more proud of their pretended grandeur, and the pre-eminence they imagine they have a right to claim over all nations. This haughtineſs inſpires the meaneſt among them with a contempt for other countries; and they are ſo full of their own cuſtoms, manners, and maxims, that they can ſcarcely believe that there is any thing good or great out of China, though they are a little more moderate than they once were, ſince they became acquainted with the Europeans. On their firſt ſeeing them, they aſked, if there were any cities, towns, or houſes in Europe; and, on perceiving that they were acquainted with all the ſciences, they were ſtruck with aſtoniſhment, and cried, "How is it poſſible that a people ſo far remote "from us, ſhould have any wit or capacity? they have "never peruſed our books; they were never modelled by "our laws, and yet they ſpeak, diſcourſe, and reaſon "aright like us."

The miſſionaries had often the pleaſure of beholding their ſurprize and confuſion, at ſeeing a map of the world. Some of the learned deſiring one day to ſee ſuch a map, they ſought a long time for China, and at length took one of the hemiſpheres for it, containing Europe, Africa, and Aſia, ſuppoſing that America was all the reſt of the world. The prieſt left them for ſome time in their error, till one of them deſired an explanation of the names in the map, and then he cried, You ſee Europe, Africa, and Aſia; in Aſia here is Perſia, the Indies, Tartary. Where then is China? ſaid they. It is this little corner of the earth, replied the prieſt; and ſee here its bounds. Filled with aſtoniſhment, they ſtood looking at each other, ſaying in Chineſe, It is very little.

The works produced by our artiſts, as clocks, watches, mathematical inſtruments, ſtuffs, and the like, ſurprized them ſtill more, for they imagined that ingenious artificers were no where to be found but in China. They were then forced to confeſs, that we were not ſuch barbarians as they imagined; and in a joking way, ſaid, "We ſuppoſed all "other people blind, and that nature had beſtowed eyes "upon none but the Chineſe: we now ſee that this is not "univerſally true; if the Europeans do not ſee ſo clearly "as we, they have at leaſt one eye."

We ſhall now take a view of their behaviour to each other, and of that civility and politeneſs which forms ſo conſiderable a part of their character. It is not at all ſurpriſing that there ſhould be a ceremonial regulated for the court, though it is that they have eſtabliſhed very nice and exact rules in relation to the behaviour of private perſons when they have any intercourſe, either with their ſuperiors or equals; and that no ſituation can diſpenſe with their obſervance of them.

The common ſalutation is performed by joining their hands before the breaſt, moving them gently, and making a ſlight inclination of the head, ſaying, Proſperity, proſperity. On meeting a perſon to whom they owe great reſpect, they join their hands, lift them up, lower them almoſt to the earth, bowing their body very low, and crying Happineſs. If a perſon is newly arrived, they enquire, if every thing has happened well on his journey. On being aſked how they do, they anſwer, Very well, thanks to thine abundant felicity: and when they ſee a man in health, they cry, Proſperity is painted in thy face; thou haſt a happy countenance. If a perſon takes any pains to ſerve them, they ſay, Thou art too profuſe of thine heart. And if you have done them any ſervice, they cry, My thanks ſhall have no end. They have always ſuch compliments in their mouths, which they utter in an affecting tone, though they ſeldom proceed from the heart. In converſation they uſe the moſt reſpectful terms; and if they are not intimate friends, for fear of being too familiar, inſtead of ſaying, I am ſenſible of the ſervice you have done me, they cry, The ſervice the Lord has done for his meaneſt ſervant has greatly affected me. So a ſon ſpeaking to his father, will call himſelf his youngeſt ſon, though he is the eldeſt, and has children himſelf.

Nothing exceeds the reſpect ſhewn by children to their parents, and ſcholars to their maſters. They ſpeak little, and always ſtand in their preſence; and on their birth-day, and on other occaſions, they ſalute them on their knees, and with their forehead ſeveral times touch the ground.

It is remarkable that the Chineſe have ſeveral names, according to their age and rank. At their birth they receive the family name, about a month after they are born the father and mother give them a milk-name as they term it, which is commonly the name of a flower, animal, or the like. When they begin to ſtudy, they have a new name from their maſter added to that of their family, by which they are called while at ſchool. When arrived to manhood they have among their friends another name, which they preſerve, and commonly ſign at the end of their letters and other writings. In ſhort, if they attain any conſiderable office, they aſſume a name agreeable to their rank. By this they are then addreſſed, and it would be an incivility for one who was not much their ſuperior, to call them by their family name.

If two mandarines of equal rank meet in the ſtreet, they ſalute each other without leaving their chairs, by lifting up their joined hands to their head, repeating it ſeveral times till they are out of each other's ſight: but if one of them is of an inferior rank, he muſt ſtop his chair, or if on horſeback, alight, and make a profound reverence to the ſuperior mandarine.

When the governor of a city, after having gained the public approbation, is removed into another province, the people pay him the greateſt honours. The road for three leagues together has tables placed at proper diſtances, covered with ſilk, which hangs down to the ground, on which they burn incenſe, and place wax-lights, meats, fruit, and pulſe; and on other tables are wine and tea, ready for his uſe. He no ſooner appears than the people fall on their knees, and bow their heads to the ground; ſome pretend to weep; others preſenting him rice, beer, and proviſions, beſeech him to receive the laſt teſtimony of their gratitude. Thus he is ſtopped at every place; but what appears moſt extravagant is, to ſee the people every now and then draw off his boots, and give him new ones: for all the boots that have touched his legs are held in veneration by his friends, who preſerve them as a relic in their houſes: but the firſt pair that are pulled off are put in a kind of cage, over the gate of the city through which he paſſed.

When they are deſirous of honouring the governor of the city on his birth-day, the inhabitants of the greateſt diſtinction aſſemble, and go in a body to ſalute him at his palace. Beſides the common preſents, they often take a japanned box, adorned with gold flowers, in which are eight or twelve diviſions filled with different ſorts of ſweetmeats. When they have entered the hall, in which the ceremony is to be performed, they ſtand in a row and make a profound reverence; then fall on their knees, and bow their heads to the ground, unleſs the governor prevents them, which he commonly does. The principal perſon then takes a cup of beer, and lifting it up as high as he can with both hands, offers it to the mandarine, crying, "Behold the beer "hold the beer which brings happineſs. Behold the beer "that gives long life." Then another advancing, holds up ſweetmeats in the ſame manner, and reſpectfully preſenting them, ſays, "Behold the ſugar of long life." The ſame ceremonies, with the ſame wiſhes, are afterwards repeated by others.

But if a mandarine has greatly diſtinguiſhed himſelf by his equity and humanity, the literati cauſe a garment to be made of ſmall ſquares of ſattin of different colours, as yellow, red, blue, green, and black, which, on his birth-day, they carry, accompanied by inſtrumental muſic, to the outer-hall of his palace, and beſeech his preſence; when he entering, they preſent him this patchwork garment, deſiring him to put it on. The mandarine excuſes himſelf by alledging, that he is unworthy of the honour, till overcome by the importunities of the men of learning and the people who are preſent, he ſuffers them to ſtrip off his upper garment, and clothe him with that they have brought him. By theſe various colours they pretend to repreſent the different habits of all nations, and to ſignify that all the people look upon him as their father; on which account this garment is called the habit of all nations. The mandarine indeed never wears it except at this time; but it is carefully kept in the family as a mark of great honour and diſtinction, and the viceroy is always informed of the honour done him.

The ſocial entertainments of the Chineſe are conducted in ſo ceremonious a manner, that they would be inſupportable to an European. Of theſe there are two ſorts, the one common, at which there are about twelve or ſixteen diſhes, and the other extraordinary, which requires twenty-four on each table. The hall in which the feaſt is ſerved up is commonly adorned with pictures, flower-pots, and china-ware. There are as many tables as there are perſons invited, unleſs the great number of the gueſts makes it neceſſary to put two at each table. Theſe tables ſtand in a line on each ſide of the hall, oppoſite to each other: and the gueſts face each other as they ſit. The fore part of the table is adorned with embroidered ſilk; but there are neither table-cloths nor napkins: yet, being curiouſly japanned, they make a fine appearance. On the ends of each table often ſtand great diſhes with meat ready carved, piled up like a pyramid, with flowers and large citrons on the top; but theſe pyramids are not touched, and only ſerve for ornament. When he who gives the entertainment introduces the gueſts into the room, he ſalutes them one by one, and then a liquor made of rice being brought in a little cup of ſilver, porcelain, or precious wood, placed on a ſmall japanned waiter, he takes it in both his hands, and bowing to all the gueſts, advances to the front of the hall, when lifting up his eyes and hands, together with the cup, towards Heaven, he pours the liquor on the ground, to ſignify that all his poſſeſſions flow from the Lord who reigns on high. Then taking a cup of beer, he bows to the moſt conſiderable of his gueſts, and places it on the table where he is to ſit. While the gueſt returns his civility, by endeavouring to hinder him, and cauſing another cup of beer to be brought, makes as though he would carry it to the place of the maſter of the feaſt, which is always the loweſt; who, in his turn, prevents him, with the uſual terms of civility. The maſter of the houſe then brings two ſmall ivory ſticks, adorned with gold or ſilver, which ſerve in the room of forks, and places them on the table parallel to each other.

He afterwards leads the principal gueſt to his chair, which is covered with a rich carpet of flowered ſilk, and bowing low invites him to ſit. He excuſes himſelf with much ceremony from accepting ſo honourable a place; but at laſt complying, offers it to all the reſt, and they excuſing themſelves, take their places.

Four or five comedians, in rich garments, now enter the room, and bowing, ſtrike their foreheads four times againſt the ground; and then riſing, preſent to the head gueſt a book, in which are written, in letters of gold, the names of fifty or ſixty plays which they are ready to act upon the ſpot. But refuſing to chooſe one, he refers him to the ſecond, the ſecond to the third, and ſo on; but all make excuſes, and refer it to the principal gueſt, who at laſt chooſes the

the play he thinks will be moſt agreeable to the company. The comedian then ſhews the name of the play that is choſen, and each expreſſes his approbation by a nod. The ladies who are willing to ſee the play are placed in another room oppoſite to the comedians, where, through a lattice made of bamboos and a ſilk net, they ſee and hear without being perceived.

The repreſentation begins with the ſound of inſtruments, as trumpets, flutes, fifes, drums of buffalo ſkins, and baſons of braſs or ſteel. The floor is covered with a carpet, and, inſtead of ſcenes, the players come from the neighbouring rooms.

Mean while the maſter of the feaſt, kneeling, intreats his gueſts to take the cup, at which every one holds a cup in both hands, and lifts it to his forehead; then bowing very low, riſes, puts it to his mouth, and drinks ſlowly three or four times, while the maſter urges them to drink all up, which he himſelf does firſt, and then turns the cup upſide down; on ſeeing which all do ſo too. Liquor is ſerved two or three times; and, while they are drinking, a diſh of meat, cut in pieces, is placed on the table in a china diſh: for they know not how to uſe a knife. The maſter of the houſe, then, on his knee invites them to eat, and all take ſome of the meat on their plates; at every freſh diſh the ſame ceremony is repeated, and they are obliged to drink as often; however, the cups are ſmall, and they may drink as little as they pleaſe. After ſix or eight diſhes have been ſerved, they bring ſoup made of either fleſh or fiſh, and very ſmall loaves in a diſh, which they put into the ſoup and eat without ceremony. At the ſame time tea is ſerved. When the gueſts have quitted their ſticks, and done eating, they bring in beer and another diſh, and the maſter of the houſe again invites them to drink and to eat, which is repeated as often as a freſh diſh is ſerved up. But, before the fruit is ſerved, the maſter of the feaſt takes his gueſts into the garden, or ſome other place; mean while the comedians take their repaſt, and the domeſtics are employed, ſome in carrying warm water for the gueſts to waſh their hands, and others in clearing the table and preparing the deſert, which conſiſts of twenty or twenty-four diſhes of fruit, ſweetmeats, dried ducks, which are delicious food, and ſmall dainties, made of things procured from the ſea.

At length a domeſtic, kneeling to his maſter, informs him, in a low voice, that all is ready. The maſter watches till every one is ſilent, and then, with great ceremony, invites his gueſts to return to the hall. There every one takes his ſeat as before, and large cups being brought, they are frequently preſſed during the deſert to drink heartily. Mean while the play is continued, or a farce begun: but, at the beginning of the ſecond courſe, every gueſt cauſes his ſervant to bring ſeveral purſes of red paper, which contain money for the comedians and the ſervants; more or leſs being preſented according to the quality of the perſon who made the treat: but this money is never given, unleſs there be a play acted. Every domeſtic carries his purſe to his maſter, who, with ſeeming reluctance, conſents to their receiving it.

Theſe feaſts begin about the evening, and, as they laſt four or five hours, are not ended till midnight, when they ſeparate with much ceremony, and the ſervants of the gueſts walk before their maſters chairs, carrying great lanthorns of oiled paper, on which the quality and ſometimes the name of the maſters are written in large characters. The next morning each of the gueſts ſends a billet of thanks for his generous entertainment.

Such are the irkſome ceremonies required by the Chineſe politeneſs: but a politeneſs that conſiſts in ſuch inſignificant trifles, and ſuch abject ſubmiſſions, could never be generally practiſed by any nation inſpired by the love of liberty, or that had juſt ſentiments to the dignity of human nature. It will be proper however to obſerve, that their cooks have the art of ſeaſoning their meat and fiſh in ſuch a manner that they are very agreeable to the taſte; and that their ſoups are excellent.

SECT. IV.

Of their Marriages; the extravagant Authority of the Fathers in their Families; their Gaming; their Power over their Children; their Funeral Ceremonies; their Feſtivals, particularly the Feaſt of Lanterns; and the Emperor's going to plow and ſow a piece of land.

THEIR marriages are regulated by the grand principle that is the foundation of their political government; I mean the veneration and ſubmiſſion of children to their parents: for it is a maxim of their philoſophy, that kings ought to have for the empire all the tenderneſs of a father, and fathers in their families all the authority of a king. In conſequence of thoſe maxims a father lives in ſome ſort without honour or ſatisfaction if he neglects to marry all his children, and a ſon fails in the principal duty of a ſon, if he does not leave poſterity to perpetuate his family: though an elder brother inherits nothing from his father, he muſt educate and marry the younger; becauſe ſhould the family, through his fault, become extinct, his anceſtors will be deprived of the honours and duties that ought to be paid them; and becauſe in the abſence of the father, the eldeſt ſon ought to ſupply his place.

Hence the inclinations of the children are never conſulted; for the choice of the wife belongs either to the father, or to the neareſt relation of him who is to be married: but as young women are always confined to their apartments, and men are not permitted to ſee and converſe with them, marriages are brought about by the relations of the maid, or according to the deſcription given of her by old women, whoſe buſineſs it is to tranſact theſe affairs, who by preſents are engaged by the relations to give a flattering deſcription of the wit and beauty of the maid; but full credit is not given to all they ſay: and if they are found guilty of a notorious impoſition, they are puniſhed.

When by means of theſe old women every thing is ſettled, a contract is ſigned, by which the relations of the intended huſband agree to give a certain ſum, which is employed in buying new cloaths and other things for the bride; for the daughters have no fortunes. Then follow certain ceremonies, the principal of which conſiſt in ſending on both ſides to demand the name of the intended bridegroom and bride, and in making preſents to their relations of ſilk, cottons, proviſions, and fruit. The bride's relations, who determine the day of the nuptials, frequently conſult the calender for a fortunate day. Mean while the man ſends his intended bride jewels, pendants, and the like.

When the nuptial day is arrived, the bride is put into a chair magnificently adorned, and all the fortune ſhe brings is either carried with her, or follows her: among the vulgar it conſiſts of wedding cloaths, and the like, given by her father. She is accompanied by a train of hired perſons, with torches and flambeaux lighted, even at noon-day: her chair is preceded with hautboys, fifes, and drums, and followed by her relations and particular friends; a truſty ſervant keeps the key of the door belonging to the chair, with orders to give it to none but the huſband, who waits at his own door dreſſed, in order to receive her. She is no ſooner arrived, than he receives the key from the ſervant, and eagerly opening the chair, ſees her for the firſt time. Some, diſſatisfied with their lot, immediately ſhut the chair again, and ſend the maid back with her relations, chooſing rather to loſe the money they had given, than receive a diſagreeable perſon: but this ſeldom happens. The bride, on leaving the chair, goes with the bridegroom into a hall, where theymake four reverences to Tien, whom they call the ſpirit that preſides in Heaven; and having done the like to her huſband's relations, ſhe goes among the ladies who are invited, and ſpends the day with them in feaſts and diverſions, while the new-married man treats his friends in another room, and at night conſummates the nuptials.

Though according to the laws they can have but one wife, yet they are allowed to have ſeveral concubines, whom they receive into the houſe without any formality, only giving a writing to her relations, in which they promiſe to give a ſum agreed upon, and to uſe their daughter well: but they are entirely dependant on the wife, ſerve her, treat her as their miſtreſs, and all their children are conſidered as the children of the wife, and have an equal right with them to inherit their father's fortune. None but the wife has the name of mother; and if a concubine dies, her children are not obliged to go into mourning, nor to quit their offices and governments, as is cuſtomary for them to do at the death of the father, and of the lawful wife, though

though ſhe is not their mother; there are but few, however, who diſpenſe with theſe ceremonies on the death of their own mother, or are deficient in ſhowing them proper marks of tenderneſs and reſpect.

If a wife elopes from her huſband, he may ſell her, after ſhe has undergone the correction of the law: and if a man abandons his houſe and family, after three years abſence his wife may preſent a petition to the mandarines, making known her condition, who may give her leave to take another huſband; but ſhe would be ſeverely puniſhed, if ſhe married without their conſent. In particular caſes a man may divorce his wife; as for adultery, which is very uncommon, antipathy, difference of temper, jealouſy, indiſcretion, diſobedience, barrenneſs, and contagious diſeaſes: but tho' the law on theſe occaſions authorizes a divorce, it is ſeldom put in force among people of diſtinction, tho' there are examples of it among the vulgar. Yet the men are ſo extremely jealous, that they will not ſuffer their wives to ſpeak in private even to their own brothers.

Though every man is liable to be puniſhed for parting with his wife, without what is eſteemed a juſt cauſe, and tho' gaming is forbidden to people of all ranks, yet Mr. Le Compte obſerves, that theſe laws do not hinder the Chineſe from playing ſometimes till they have loſt all their eſtates, their houſes, their children, and their wives. Yet barbarous as this exceſs of inhumanity is, they even proceed ſtill farther; for when the avarice of a parent is alarmed by the number of his children, and when his poverty makes him dread his being unable to ſupply them with neceſſaries, they cruelly engage the midwives to ſtifle their poor female infants in a baſon of water, as ſoon as they are born; or expoſe thoſe helpleſs innocents by night in the ſtreets. This is ſo common in populous cities, that it was cuſtomary with the miſſionaries to ſend out every morning a number of their catechiſts, who, taking their ſeveral walks, baptized a multitude of theſe dying children.

Indeed a father while living has the power of an abſolute deſpotic tyrant, and after his death is worſhipped as a god. Let a ſon be grown ever ſo rich, and a father ever ſo poor, there is no ſubmiſſion, no point of obedience, that he cannot command, or that his ſon can refuſe. He is abſolute maſter, not only of his eſtate, but alſo of his concubines and children, who, whenever they diſpleaſe him, he may ſell to ſtrangers. If a father accuſes his ſon before a mandarine, there needs no proof of his guilt; for they cannot believe, that any father can be ſo unnatural as to bring a falſe accuſation againſt his own ſon. But ſhould a ſon be ſo inſolent as to mock his father, or arrive at ſuch a pitch of wickedneſs as to ſtrike him, it becomes the concern of the whole empire, and all the province where this ſhameful act of violence was committed is alarmed. The emperor himſelf judges the criminal. All the mandarines near the place are turned out of their poſts, eſpecially thoſe of the town where he lived, for having been ſo negligent in their inſtructions; and all the neighbours are reprimanded for neglecting, by former puniſhments, to put a ſtop to the wickedneſs of the criminal, before it arrived to ſuch a height. As to the unhappy wretch himſelf, they cut him into a thouſand pieces, burn his bones, level his houſe to the ground, and even thoſe houſes that ſtand near it, and ſet up monuments and memorials of the horrid deed.

We ſhall now treat of their funeral ceremonies, which are very remarkable. The Chineſe imagine that young people, by being witneſſes to the veneration paid to deceaſed relations, learn betimes the ſubmiſſion and obedience due to thoſe who are living. Their antient ſages, ſays Du Halde, thought that inſpiring youth with a profound veneration for their parents renders them ſubmiſſive; that this ſubmiſſion preſerves peace in families; that peace in private families produces tranquility in cities; that this tranquility prevents inſurrection in the provinces, and conſequently preſerves regularity throughout the empire: on this account they have determined what ought to be obſerved at funerals, and what honours ſhould be paid to deceaſed relations.

They dreſs the deceaſed in his beſt cloaths, with the uſual marks of his dignity; and then put him in the coffin. Thoſe made for perſons in eaſy circumſtances are formed of planks above half a foot thick, and ſo well pitched on the inſide, and japanned without, that they tranſmit no bad ſmell. The rich expend from 300 to 1000 crowns to purchaſe a coffin of precious wood finely carved and gilt.

They are prohibited from burying their dead within the walls of cities, and in inhabited places; yet are permitted to preſerve them in their houſes, where they often keep them ſeveral months and even years, and no magiſtrate can oblige them to bury them. Many, to ſhew their regard for their deceaſed fathers, keep their bodies three or four years; and, during the time of mourning, uſe no other ſeat than a ſtool covered with white ſerge, nor no other bed than a mat made of reeds. They deny themſelves the uſe of meat and ſtrong drink, and frequent no feaſts or public aſſemblies.

At firſt all the relations and friends that are invited come to pay their laſt reſpects to the deceaſed, when the coffin covered with white cloth is expoſed in the principal room, and a table placed before it, on which is an image of the deceaſed, or ſome carved work, on which his name is written, and which is ſurrounded with flowers, perfumes, and wax candles. They all proſtrate themſelves, and ſeveral times beat their foreheads againſt the floor before the table, and then place upon it candles and perfumes, which they brought with them; the particular friends of the deceaſed accompanying theſe ceremonies with tears and groans.

While they are thus employed, the eldeſt ſon, accompanied by his brothers, comes from behind a curtain that is on one ſide the coffin, and with countenances full of grief, without ſpeaking, pay them the ſame compliment of ſtriking their foreheads againſt the floor. The women are concealed behind the ſame curtain, and ſend forth frequent mournful cries. This ceremony being ended, they all riſe up, and a friend in mourning conducts the viſitors into another room, where they are entertained with tea and dried fruits, and then conducted to their ſedans. Theſe ceremonies commonly laſt ſeven days.

Thoſe who have a complete mourning habit, have their cap, veſt, gown, ſtockings, and boots, all white; but in the firſt months of mourning for a father or mother, their habit reſembles a kind of bag made of red ſackcloth; they have a ſort of cord or a piece of ſackcloth for their girdle; and their cap, which is of an odd figure, is of coarſe cloth.

The day of the funeral being at length fixed, they give notice of it to all the relations and friends of the deceaſed, who come on the day appointed. The proceſſion is begun by perſons carrying paſteboard figures repreſenting ſlaves, tygers, horſes, &c. Several companies follow, marching two and two; ſome carry flags, ſtandards, and perfuming-pans; others play mournful tunes on various muſical inſtruments. In ſome places the picture of the deceaſed is elevated above the reſt, on which is written in large golden characters his name and office. Then follows the coffin covered with a canopy in the form of a dome, made of violet-coloured ſilk, with tufts of white ſilk at four corners of a frame that has the dome in the middle; this dome is embroidered. The vehicle in which the coffin is placed is carried by 64 men; but thoſe who are unable to be at the expence, have one that requires fewer carriers. The eldeſt ſon, at the head of his brothers, together with the grandchildren, follow on foot, covered with ſackcloth, with their bodies bent as if ſinking under the weight of their grief. Afterwards proceed the other relations and friends, all in mourning, and in chairs covered with white ſtuff are the wife, daughters, concubines, and ſlaves of the deceaſed, who make the air reſound with their cries.

Near the place of burial are tables under cover, where the domeſtics prepare a repaſt, for the refreſhment of the company; and this being ended, the relations and friends ſometimes proſtrate themſelves again, beating their foreheads againſt the ground; but moſt frequently only return their thanks: upon which the ſons expreſs their civilities by dumb ſigns. If it be the funeral of a perſon of high rank, there are ſeveral apartments at the place of burial; and after the coffin is brought, a great number of the relations ſtay there for two months together, and daily join with the ſons of the deceaſed in their expreſſions of grief. When death attacks the throne, the mourning becomes general, and all public buſineſs is ſuſpended during fifty days.

The ſepulchres are built without the cities, and if poſſible upon eminences; the form is different in different provinces; but they are generally whitened and ſurrounded with little groves of pines or cypreſs.

The

The honours paid to their deceaſed anceſtors are not con-
ed to the time of mourning; they reſort every ſpring to
eir tombs, and, having plucked up the weeds that grow
out them, repeat the ceremonies obſerved at their death,
d then place proviſions and rice-beer on the tomb, which
length ſerves them to feaſt upon. They alſo every year
quent the hall of their anceſtors, which is built by every
nily, where the perſons belonging to all the branches
it, which frequently amount to an incredible num-
r, mingle together without diſtinction of rank; and
e eldeſt, though the pooreſt, has the firſt place. On a
ng table next the wall is placed the image of the moſt
inent anceſtor, or at leaſt his name, and the names of
e men, women, and children of the family, with the
e, quality, employment, and day of the deceaſe of each
rſon wrote on boards about a foot long. The richeſt
epare a feaſt, and the ſame ceremonies are uſed to the
ceaſed as if they were yet living.

The Chineſe have other ſolemn feſtivals, which they
lebrate with great pomp and expence. The firſt three
ys in the year are throughout the empire ſpent in rejoicing.
hey dreſs in their beſt cloaths, and ſend preſents to all
eir friends, after which gaming, feaſting, and comedies
ke up all their time. Ten or twelve days before are com-
itted many robberies by thoſe who, being deſtitute of money,
e reſolved to obtain ſome to enable them to join in thoſe
iverſions.

On the fifteenth of the firſt month is the feaſt of Lan-
erns, when every family, both in the city and country,
n the ſea-coaſt, or on the rivers, light up painted lanterns;
me of which are of an incredible ſize, and of different
rms. Many are compoſed of ſix panes or ſides: the
ame is of japanned wood adorned with gilding, and on
very ſquare is ſpread fine tranſparent ſilk, on which is
ainted flowers, trees, animals, and human figures. The
op is crowned with various carved work, from whence
ang ſilk ſtreamers, of different colours that fall upon the
ix corners, without hiding any part of the light or of the
ictures; for on the inſide are put lamps, and a great num-
er of wax candles, that give a brilliancy to the pictures,
nd diffuſe a ſplendor that is extremely agreeable.

Several of them repreſent objects proper to amuſe and
ivert the people. You ſee horſes galloping, ſhips ſailing,
rmies marching, and the like performed by moving pic-
ures, ſet in motion by people who lie concealed, by means
f threads which at a diſtance cannot be perceived.

What adds a new ſplendor to this feaſt are the fire-works
een in all parts of the city, which are ſaid to be extremely
ine.

Some Chineſe doctors pretend that this feſtival received
ts origin from a ſtory, which they related to M. Le Compte
n the following manner: Three thouſand five hundred and
ighty-three years ago China was governed by a prince
named Ki, the laſt emperor of the firſt race, whom heaven
had endued with qualities capable of forming an hero; but
a love of pleaſure taking poſſeſſion of his heart, ſoon tranſ-
formed him into a monſter.

Ki had an extraordinary capacity, an engaging addreſs,
great courage, and ſuch prodigious ſtrength, that he could
break iron with the force of his hands. But he became ef-
feminate, and grew weak; he exhauſted his treaſures by
building a tower embelliſhed with gems in honour to the
memory of a concubine; and filled a pool with wine for
himſelf and 3000 youths to bathe in. Theſe and many
other exceſſes induced the wiſeſt men of his court humbly
to offer him their advice; but he put them to death: he
even impriſoned one of the princes of the empire who en-
deavoured to divert the paſſions which clouded his reaſon.
At length he completed the deſtruction of himſelf and
family.

One day, in the midſt of his debaucheries, complaining to
the queen, of whom he was extravagantly fond, of the
ſhortneſs of life, "I ſhould be content, ſaid he, could I
"but make thee eternally happy; but in a few years, nay
"perhaps in a few days, death will, in ſpite of us, put an
"end to our pleaſures; and all my power will not be ſuf-
"ficient to give thee a life longer than that which the loweſt
"of my ſubjects hopes to enjoy. This thought depreſſes
"my ſpirits, and pours into my heart a bitterneſs that
"prevents my reliſhing the ſweets of life. Why
"cannot I make thee reign for ever? While there are ſtars
"that never ceaſe to ſhine, muſt thou be ſubject to death?
"thou who ſhineſt more bright on earth than the ſtars in
"the heavens."

"'Tis true, my lord, ſaid this infatuated princeſs, thou
"canſt not make thy life eternal; but thou mayſt forget
"its brevity, and live as though thou ſhouldſt never die.
"What need have we of the ſun and moon to meaſure the
"duration of life? The morning ſtar that introduces the
"day, and the evening ſhades that uſher in the night,
"continually remind thee of the beginning and the end of
"thy days; for as thoſe begin and end, ſo do ours that are
"begun advance with precipitation to their fatal cloſe.
"Come, come, let us no longer caſt our eyes on thoſe
"rolling orbs; but cure thy diſturbed imagination by build-
"ing new heavens ever enlightened, ever ſerene, ever fa-
"vourable to thy deſires, by erecting a great and magni-
"ficent palace ſhut up from the light of the ſun; then
"hang around magnificent lanterns, whoſe conſtant
"ſplendor will rival his rays. Thither tranſport whatever
"is capable of contributing to thy pleaſure. We ſhall
"both enter this new world created by thyſelf. I will be
"to thee inſtead of all things, and thou ſhalt afford me
"more pleaſure than this old world can beſtow. There
"nature, for our ſakes, ſhall be renewed; and we enjoy
"more delight than the gods. We ſhall there forget the
"viciſſitudes of day and night: with reſpect to us time
"ſhall be no more; no more ſhall it be an incumbrance;
"no more ſhall it ſhadow and overcloud our life. If thou
"wilt be always conſtant, always paſſionate, my feli-
"city will ſeem unalterable, and thine happineſs appear
"eternal."

The emperor, either from the vain hope of deceiving himſelf, or in order to pleaſe the queen, cauſed the palace to be built, and there immured both her and himſelf. He had even paſſed ſeveral months to appearance ſteeped in delights, when the people, enraged at his being thus abandoned to pleaſure, obliged one of the wiſeſt princes of the empire to declare againſt him.

The emperor, had no ſooner notice of the conſpiracy, than he appeared in public, and placed himſelf at the head of an army to puniſh the rebel; but ſoon ſeeing himſelf abandoned by the people whom he had ſo weakly deſerted, he fled. During the three remaining years of his life he wandered in diſguiſe from province to province, in perpetual danger of being diſcovered; as if Tien had reſolved to overwhelm him with continual inquietude, in order to puniſh him for that ſoft and effeminate repoſe in which he hoped to find an uninterrupted ſucceſſion of delights. In the mean time they deſtroyed the new palace, and, to preſerve the memory of this event, hung up lanterns in every quarter of the city. This cuſtom became anniverſary, and a great feſtival throughout the whole empire.

But we ought not here to omit, another feſtival, which is not, like the former, of no real advantage to the ſtate: for in a country ſo populous as China, whatever tends to the encouragement of agriculture muſt promote the happineſs and proſperity of the people. Every ſpring, after the example of the antient founders of the monarchy, the emperor goes in a ſolemn manner to plough up a few ridges of land, in order to animate the huſbandmen, by his example, in the cultivation of the earth; and in every other city but Pekin the mandarine performs the ſame ceremony.

The emperor and all his court go firſt to a place in the field appointed to make an offering to Chang-ti, one of their gods, and to beſeech him to increaſe and preſerve the fruits of the earth. This ceremony being over, the emperor attended by three princes and nine preſidents of the ſovereign courts, who are to aſſiſt him at the plough, proceeds forwards; ſeveral great men carry a valuable cheſt, which contains the grain to be ſown, while all the court aſſiſt with profound ſilence. There are alſo preſent forty or fifty antient huſbandmen, and about forty of the younger ſort. The emperor having taken the plough and ploughed ſeveral times backwards and forwards, he reſigns it to one of the princes of the blood, who ploughs in the ſame manner, as do all the reſt. After having ploughed in ſeveral places, the emperor ſows the different grain; theſe are wheat, rice, millet, beans, and a kind of millet called cao-leang; and the day following the huſbandmen finiſh the field, who are rewarded by the emperor with four pieces of dyed cotton for cloaths.

The governor of Pekin often goes to viſit this field, which is cultivated with great care; he overlooks the furrows, and if he finds a ſtalk that bears thirteen ears, it is eſteemed a good omen. He alſo goes in autumn to get in the corn, which he cauſes to be put in yellow ſacks, and depoſited in the imperial magazine; and this corn is kept for the moſt ſolemn ceremonies.

As a farther encouragement to agriculture, every year an huſbandman, moſt remarkable for his ſkill in cultivating the earth, is made a mandarine of the eighth order, by which he is intitled to wear the mandarine's habit; to viſit the governor of the city, and to ſit in his preſence; after his death his funeral obſequies are agreeable to his rank; and his title of honour is written in the hall of his anceſtors.

SECT. V.

Their Skill in Agriculture, Arts, and Manufactures, particularly the Manner of their making Paper and Ink; of their printing and binding Books; and of their making Porcelain and China-ware. Their Silk Manufactures, and Management of the Silk-worm; their Bells; their common Mechanics; the Method by which they ſtock their Fiſh-ponds; and ſeveral extraordinary Ways of catching Fiſh and wild Ducks.

THE huſbandmen apply their utmoſt attention to the cultivation of rice; they manure the land extremely, and there is no dung nor any kind of filth which they will not carefully gather for that purpoſe. They alſo take care to diſperſe in certain places the hair of hogs, or any other ſort of hair, which they imagine gives ſtrength and vigour to the land. The barbers, when they ſhave the head, are even careful in ſaving the hair, which is ſold to the farmers for about a halfpenny a pound. It is carried away in bags, and barks are often ſeen loaded with it.

They at firſt ſow their grain without order; but it has no ſooner riſen to a foot, or a foot and a half high, than they pluck it up by the roots, and plant it in lines chequerwiſe.

But before the rice is tranſplanted, they level the earth and make it ſmooth: for after having ploughed the land three or four times ſucceſſively up to the middle of the leg in water, they break the clods with the head of their mattocks; and, then, by the help of a wooden machine, on which a man ſtands upright while it is drawn by a buffalo, they ſmooth the earth; ſo that the plains ſeem more like vaſt gardens than open fields.

Though the invention of the Chineſe is inferior to that of our mechanics, their japanned works, their china-wares, and the ſilks imported from China, are a ſufficient proof of the ingenuity of the workmen, who are not leſs ſkilful in ingenious performances in coral, amber, ivory, ſhells, and ebony; their carved works, as well as their public buildings, gates of great cities, triumphal arches, bridges, and their towers, have ſomething in them great and noble; in a word, they ſucceed equally in all kinds of arts that are neceſſary for the common uſes and conveniencies of life.

The Chineſe paper is made of the bark of bamboo and other trees; but they uſe only the ſecond ſkin of the bark, which is ſoft and white. This is buried fifteen days in the mud of ſome ſtanding water, waſhed clean, and then ſpread in a dry ditch, where it is covered with lime. In a few days it is taken out again, waſhed, reduced into a kind of threads, and ſpread in the ſun to whiten and dry. It is then boiled well in a copper, and afterwards reduced by a proper machine to a ſoft paſte. They then take ſome water in which the branches of a ſhrub named koteng has been ſoaked, to render it ſizy, and mix it with the matter of which the paper is made, taking care not to put in too much or too little. The whole then appears like a thick clammy liquor, and being poured into large and deep reſervoirs, they take up with their moulds the ſurface of the liquor, which almoſt inſtantly becomes paper. The moulds or frames they make uſe of to take up this matter are long and broad, and the bottom compoſed of threads of bamboo, ſo that there are ſheets ten or twelve feet long, and ſometimes more. Afterwards they dip every ſheet of paper into allum-water, whence it is called fan paper; fan in the Chineſe tongue ſignifying allum. The allum prevents its ſinking, and gives it an agreeable luſtre. This paper is white, ſoft, and ſmooth; but is more apt to crack than that of Europe; it eaſily takes moiſture, and by degrees the worms get in it, if proper care be not taken to preſerve it. To prevent theſe inconveniencies, the books ſhould be often beaten, and expoſed to the ſun. Beſides the paper made of the bark of trees, there is ſome made of cotton, and this is the fineſt, whiteſt, and moſt uſed: beſides it is not ſubject to the inconveniencies juſt mentioned; for it will keep as well and as long as the paper made in Europe. The conſumption of paper in China is ſo great, that it is not ſurpriſing they make uſe of the bark of different trees, and alſo make it of cotton; for beſides the prodigious quantity uſed in printing, and by the learned and the ſtudents, who are almoſt innumerable, an inconceivable quantity is conſumed in private houſes; one ſide of their rooms being nothing but paper windows: on the reſt of the walls, which are of plaſter, they paſte white paper, and the cieling is made of frames covered with paper, on which various ornaments are drawn.

The invention of paper would have been comparatively of little uſe to the Chineſe, had they not at the ſame time invented a ſort of ink fit to draw their characters upon it. This is what is uſually called with us Indian-ink. There are ſeveral methods of making it; but that mentioned by father Contancin ſeems moſt eaſy to reduce to practice. The receipt he obtained from the Chineſe is as follows:

Put five or ſix lighted wicks into a veſſel filled with oil; but obſerve that the beſt oil makes the moſt ſhining black, and conſequently the moſt eſteemed and the deareſt ink. Over this veſſel place at a proper diſtance an iron cover in the ſhape of a funnel, to receive all the ſmoak: when it has received enough take it off, and with a gooſe's feather gently bruſh the ſoot from the inſide upon a dry and ſtrong ſheet of paper. The lamplack which does not fall off with bruſhing, and that ſticks faſt to the cover, is coarſer, and may be ſcraped off into a diſh, to make an ordinary ſort of ink. Having thus taken off the lampblack, beat it in a mortar, mixing with it muſk, or ſome ſweet-ſcented water, with a thin ſize made of neats leather, to unite the particles. When the lampblack is thus brought into a paſte, it is put into neat wooden moulds made to give the proper forms to the ſticks of ink; and then having ſtamped upon them characters or figures of dragons, birds, or flowers which are ſometimes gilt, they dry them in the ſun or in the wind.

'Tis ſaid that in the city Hoei-tcheou, where they make the moſt eſteemed ink, the makers have many ſmall rooms in which they keep lighted lamps all day; and that every room is diſtinguiſhed by the oil burnt in it, and conſequently by the ink made from it.

When the Chineſe write with this ink, they make uſe of a piece of poliſhed marble, in which are one or more holes proper to hold water, wherein they put one end of the ſtick, and gently rubbing it, there is in a few moments produced a fluid ink. Inſtead of a pen they uſe a hair pencil, which they hold in the hand not obliquely, but upright, as if the paper were to be pricked. The Chineſe always write from the top to the bottom, and begin their books where ours end: but their paper being very thin, it will not bear writing on both ſides.

Printing, which is but in its infancy in Europe, has been from all antiquity in uſe in China; but the manner in which it is performed is very different from ours. As we have but few letters, and thoſe capable of compoſing volumes on all ſubjects, and in every language, a few characters are ſufficient: but the Chineſe, who are ſtrangers to this admirable invention, are obliged to make uſe of a prodigious number of characters, as they have properly no letters but different marks for all the different words in their language. Inſtead therefore of making uſe of types, they cut their characters on blocks of wood. When a perſon intends to print a book, he gets it fairly written on fine tranſparent paper: then the engraver glues each leaf upon a ſmooth block of pear-tree, with the face of the letter to the wood, and then cuts away the wood, leaving only the characters; which is done in ſo exact a manner, that, when printed off, they perfectly reſemble the original, and it is difficult to diſtinguiſh what is printed from that which is written.

This manner of printing is on many accounts incommodious; it neceſſarily takes up a great deal of time in engraving, and, as the pages are worked off ſeparately, the time of

printing a volume muſt be very conſiderable; beſides, blocks of wood muſt be as numerous as the pages, and volume will be ſufficient to fill a room. On the other nd, it is attended with ſome advantages; they have no caſion for a corrector; for, provided the leaf be exactly itten, the engraver ſeldom makes any miſtakes: beſides, author is not obliged to print off more books than he an immediate occaſion for, and never runs the hazard printing a large impreſſion when the ſale is not abſolutely tain.

They uſe no printing-preſs as we do, for the paper is too t to bear it; but when once the blocks are ready, and paper cut, one man with a bruſh can print a great mber of ſheets in a day. They have two bruſhes, one rder than the other; they dip one a little in the ink, and n rub the ſurface of the block with it, ſo as to wet it ither too much nor too little; for if it was too much the aracters would be blotted, and if too little they would t print. Having thus inked the characters, they lay the eet upon the block, and then gently paſs the other bruſh er the paper, preſſing it down a little that it may imbibe e ink, which it eaſily does, as the printing-paper is not pped in allum.

The ink uſed in printing is made of lampblack, well aten and expoſed to the ſun, and then ſifted through a ry fine ſieve: it is afterwards tempered with aqua-vitæ till is of the conſiſtence of ſize, after which it is mixed with ater till it is of a proper conſiſtence. Laſtly, they add to ery ten ounces of ink about an ounce of glue, which they ſolve over the fire, and mix with the lampblack and aqua-tæ before they are tempered with water.

They print but on one ſide on account of the thinneſs d tranſparency of the paper; hence every leaf of a book folded, the fold being at the edge of the book, and the ening at the back, where they are bound together. They ver their books with a neat ſort of grey paſteboard, to hich they ſometimes add fine ſatin or flowered taffety; d ſome are covered with red brocade, on which are ld and ſilver flowers. This method of binding is very neat d convenient, but they never gild the edges, nor even lour them.

China-ware is made of a mixture of different ſorts of rth; one called pe-turtſe is white, with a greeniſh caſt, d is found in the quarries. It is very hard, and being roke into ſmall pieces with hammers, is put into mortars; d by the help of ſtone-peſtles, capped with iron, is reduced to a fine powder. Theſe peſtles are worked without eaſing, either by man's labour or by the aſſiſtance of water, the ſame manner as the hammers of paper-mills. This wder is caſt into a large veſſel filled with water, and riſkly ſtirred with a ſtrong iron ſpatula; when, after it as reſted a few minutes, there riſes on the ſurface a cream ur or five inches thick, which they take off, and pour in- another veſſel of water. Thus they agitate the water of e firſt veſſel ſeveral times, conſtantly taking off what vims on the top, till nothing remains but the groſs part, hich they take out and pound afreſh. With reſpect to hat is put into the ſecond veſſel, they wait till it has rmed at the bottom a kind of paſte; and when the water ppears clear they pour it off gently, and caſt the paſte into rge moulds, in which it is dried.

Another earth uſed as a material in the compoſition of hina-ware is a kind of chalk, of a ſomewhat glutinous nd ſoapy nature. They waſh it in river-water, to take ff a yellow earth that ſticks to its ſurface; and then break-g it, put it into a veſſel of water to diſſolve; after which ney prepare it in the ſame manner as the other.

The fineſt, lighteſt, and moſt beautiful China-ware is ade only by well incorporating together eight parts of is laſt chalk with two of the former; after which the eſſels are turned on the wheel, that is placed on a round oard, which whirls round by means of a wheel placed nder it, and is turned by the foot in much the ſame man-er as our potters make mugs, bowls, and other veſſels: me pieces of China-ware are made in moulds, and all of em paſs through a multitude of hands.

The great pieces of China-ware are made at twice, one art is lift-d upon the wheel by two or three men, in order receive its proper ſhape; and the other half, after it is rmed and almoſt dry, is joined to it and united by the me matter it is made of, moiſtened with water. When the pieces thus faſtened together are quite dry, they ſcrape and poliſh the place where they are joined with a knife, both on the inſide and out. In the ſame manner they apply handles, ſpouts, and the like.

Men, groteſque figures, animals, idols, buſts, and the like, which are hollow, are made in moulds in three, four, or more pieces; after which they are joined together, and finiſhed with tools proper to trace, hollow, and poliſh the different ſtrokes the mould had not impreſſed.

As to flowers and other ornaments that ſeem engraved, they are formed on the china by ſtamps and moulds; and relievos, ready prepared, are ſtuck on.

When they have the model of a piece of China-ware that is beſpoke, and which they cannot imitate by the wheel only, they make uſe of a kind of yellow fat clay, which they knead very much, and then apply it to the model; and when the impreſſion is taken, ſeparate the mould from the model in ſeveral pieces, which they ſuffer to dry gently. When they intend to make uſe of the model, they place it for ſome time near the fire; after which they fill it to what thickneſs is deſigned with the paſte proper for making China ware, preſſing it in all places with the hand; and then place it a moment before the fire, which looſens the mould by drying up the moiſture that united the one to the other. The ſeveral pieces thus made ſeparately, are united again in the ſame manner as the large China-veſſels; and the figure being ſuffered to grow hard, is afterwards finiſhed by tools proper for that purpoſe.

The labour of painting the China-ware is alſo divided between a great number of workmen, who do every thing by rote, aſſiſted by a very poor imagination: it is the buſineſs of one to make the coloured circle near the edge; another traces the flowers, which are painted by a third. It belongs to one to make rivers and mountains, another makes birds, flies, and other animals; but the figures of men are commonly the worſt performed.

Du Halde ſays they glaze and bake it before this part of the work is performed; and then having painted and laid on the gilding, they bake it a ſecond time.

They uſe all colours in painting China-ware; though there are ſeldom any brought to Europe but blue upon a white ground, ſometimes mixed with red and gold. Some are quite red with ſmall ſpots, others entirely blue, others of a ſhining black, others marbled, and others painted with landſcapes, mixed with almoſt all colours, and enlivened by gilding. This beautiful brittle furniture has been finely imitated in the Dreſden china, and in that made at Chelſea, Bow, and at Worceſter; ſome of which, with reſpect to the beauty of the painting, greatly exceed that made by the Chineſe.

The beſt authors have agreed, that ſilk and ſilk-worms came originally from China; from thence they paſſed to the Indians, from them to the Perſians, and from the latter to the Greeks and Romans; among whom ſilk ſtuffs, at their firſt introduction, was valued at their weight in gold.

The ſilks moſt in uſe among the Chineſe are plain and flowered gauzes, which are their ſummer wear; damaſks of all ſorts and colours, ſtriped ſattins, black Nanking ſattins, coarſe taffeties, brocades, velvets, and a great many ſorts for which the Europeans have no name. For their gold tiſſue, they do not make uſe of fine gold thread twiſted on ſilk; but cutting a long ſlip of gilt paper into ſmall ſlips, very artfully roll them about the ſilk. Theſe ſtuffs, when freſh, look very fine; but being ſoon tarniſhed by the air, and ſpoiled by wet, they are unfit for garments. None but the mandarines, and their ladies wear them; and that but ſeldom.

The Chineſe being the firſt nation that diſcovered the art of rearing ſilk-worms, and rendering their labours of ſervice to mankind, a conciſe account of the manner in which this is performed, and the ſilk produced in that country, cannot fail of being agreeable to the curious reader; and the more ſo, as the ſilk manufacture there is much greater than in any other country upon earth.

The ſilk-worm proceeds from a ſmall egg no bigger than a pin's head, and grows till it becomes of the ſize of a caterpillar, feeding all the while on mulberry-trees till it comes to its maturity; it then ceaſes to eat, and prepares for its diſſolution, by wrapping itſelf in a kind of coffin, or ſilken ball, of the ſize and ſhape of a pidgeon's egg: this

taſk

The governor of Pekin often goes to viſit this field, which is cultivated with great care; he overlooks the furrows, and if he finds a ſtalk that bears thirteen ears, it is eſteemed a good omen. The conſumption of paper in China is ſo great, that it is not ſurpriſing they make uſe of the bark of different trees, and alſo make it of cotton; for beſides the prodigious quantity uſed in printing, and by the learned and the ſtudents, who are almoſt innumerable, an inconceivable quantity is conſumed in private houſes; one ſide of their rooms being nothing but paper windows: on the reſt of the walls, which are of plaſter, they paſte white paper, and the cieling is made of frames covered with paper, on which various ornaments are drawn.

The invention of paper would have been comparatively of little uſe to the Chineſe, had they not at the ſame time invented a ſort of ink fit to draw their characters upon it. This is what is uſually called with us Indian-ink. There are ſeveral methods of making it; but that mentioned by father Contancin ſeems moſt eaſy to reduce to practice. The receipt he obtained from the Chineſe is as follows:

Put five or ſix lighted wicks into a veſſel filled with oil; but obſerve that the beſt oil makes the moſt ſhining black, and conſequently the moſt eſteemed and the deareſt ink. Over this veſſel place at a proper diſtance an iron cover in the ſhape of a funnel, to receive all the ſmoak: when it has received enough take it off, and with a gooſe's feather gently bruſh the ſoot from the inſide upon a dry and ſtrong ſheet of paper. The lamplack which does not fall off with bruſhing, and that ſticks faſt to the cover, is coarſer, and may be ſcraped off into a diſh, to make an ordinary ſort of ink. Having thus taken off the lampblack, beat it in a mortar, mixing with it muſk, or ſome ſweet-ſcented water, with a thin ſize made of neats leather, to unite the particles. When the lampblack is thus brought into a paſte, it is put into neat wooden moulds made to give the proper forms to the ſticks of ink; and then having ſtamped upon them characters or figures of dragons, birds, or flowers which are ſometimes gilt, they dry them in the ſun or in the wind.

'Tis ſaid that in the city Hoei-tcheou, where they make the moſt eſteemed ink, the makers have many ſmall rooms in which they keep lighted lamps all day; and that every room is diſtinguiſhed by the oil burnt in it, and conſequently by the ink made from it.

When the Chineſe write with this ink, they make uſe of a piece of poliſhed marble, in which are one or more holes proper to hold water, wherein they put one end of the ſtick, and gently rubbing it, there is in a few moments produced a fluid ink. Inſtead of a pen they uſe a hair pencil, which they hold in the hand not obliquely, but upright, as if the paper were to be pricked. The Chineſe always write from the top to the bottom, and begin their books where ours end: but their paper being very thin, it will not bear writing on both ſides.

Printing, which is but in its infancy in Europe, has been from all antiquity in uſe in China; but the manner in which it is performed is very different from ours. As we have but few letters, and thoſe capable of compoſing volumes on all ſubjects, and in every language, a few characters are ſufficient: but the Chineſe, who are ſtrangers to this admirable invention, are obliged to make uſe of a prodigious number of characters, as they have properly no letters but different marks for all the different words in their language. Inſtead therefore of making uſe of types, they cut their characters on blocks of wood. When a perſon intends to print a book, he gets it fairly written on fine tranſparent paper: then the engraver glues each leaf upon a ſmooth block of pear-tree, with the face of the letter to the wood, and then cuts away the wood, leaving only the characters; which is done in ſo exact a manner, that, when printed off, they perfectly reſemble the original, and it is difficult to diſtinguiſh what is printed from that which is written.

This manner of printing is on many accounts incommodious; it neceſſarily takes up a great deal of time in engraving, and, as the pages are worked off ſeparately, the time of

of printing a volume muſt be very conſiderable; beſides, the blocks of wood muſt be as numerous as the pages, and a volume will be ſufficient to fill a room. On the other hand, it is attended with ſome advantages; they have no occaſion for a corrector; for, provided the leaf be exactly written, the engraver ſeldom makes any miſtakes: beſides, the author is not obliged to print off more books than he has an immediate occaſion for, and never runs the hazard of printing a large impreſſion when the ſale is not abſolutely certain.

They uſe no printing-preſs as we do, for the paper is too ſoft to bear it; but when once the blocks are ready, and the paper cut, one man with a bruſh can print a great number of ſheets in a day. They have two bruſhes, one harder than the other; they dip one a little in the ink, and then rub the ſurface of the block with it, ſo as to wet it neither too much nor too little; for if it was too much the characters would be blotted, and if too little they would not print. Having thus inked the characters, they lay the ſheet upon the block, and then gently paſs the other bruſh over the paper, preſſing it down a little that it may imbibe the ink, which it eaſily does, as the printing-paper is not dipped in allum.

The ink uſed in printing is made of lampblack, well beaten and expoſed to the ſun, and then ſifted through a very fine ſieve: it is afterwards tempered with aqua-vitæ till it is of the conſiſtence of ſize, after which it is mixed with water till it is of a proper conſiſtence. Laſtly, they add to every ten ounces of ink about an ounce of glue, which they diſſolve over the fire, and mix with the lampblack and aqua-vitæ before they are tempered with water.

They print but on one ſide on account of the thinneſs and tranſparency of the paper; hence every leaf of a book is folded, the fold being at the edge of the book, and the opening at the back, where they are bound together. They cover their books with a neat ſort of grey paſteboard, to which they ſometimes add fine ſatin or flowered taffety; and ſome are covered with red brocade, on which are gold and ſilver flowers. This method of binding is very neat and convenient, but they never gild the edges, nor even colour them.

China-ware is made of a mixture of different ſorts of earth; one called pe-tuntſe is white, with a greeniſh caſt, and is found in the quarries. It is very hard, and being broke into ſmall pieces with hammers, is put into mortars; and by the help of ſtone-peſtles, capped with iron, is reduced into a fine powder. Theſe peſtles are worked without ceaſing, either by man's labour or by the aſſiſtance of water, in the ſame manner as the hammers of paper-mills. This powder is caſt into a large veſſel filled with water, and briſkly ſtirred with a ſtrong iron ſpatula; when, after it has reſted a few minutes, there riſes on the ſurface a cream four or five inches thick, which they take off, and pour into another veſſel of water. Thus they agitate the water of the firſt veſſel ſeveral times, conſtantly taking off what ſwims on the top, till nothing remains but the groſs part, which they take out and pound afreſh. With reſpect to what is put into the ſecond veſſel, they wait till it has formed at the bottom a kind of paſte; and when the water appears clear they pour it off gently, and caſt the paſte into large moulds, in which it is dried.

Another earth uſed as a material in the compoſition of China-ware is a kind of chalk, of a ſomewhat glutinous and ſoapy nature. They waſh it in river-water, to take off a yellow earth that ſticks to its ſurface; and then breaking it, put it into a veſſel of water to diſſolve; after which they prepare it in the ſame manner as the other.

The fineſt, lighteſt, and moſt beautiful China-ware is made only by well incorporating together eight parts of this laſt chalk with two of the former; after which the veſſels are turned on the wheel, that is placed on a round board, which whirls round by means of a wheel placed under it, and is turned by the foot in much the ſame manner as our potters make mugs, bowls, and other veſſels: ſome pieces of China-ware are made in moulds, and all of them paſs through a multitude of hands.

The great pieces of China-ware are made at twice, one part is lift-d upon the wheel by two or three men, in order to receive its proper ſhape; and the other half, after it is formed and almoſt dry, is joined to it and united by the ſame matter it is made of, moiſtened with water. When the pieces thus faſtened together are quite dry, they ſcrape and poliſh the place where they are joined with a knife, both on the inſide and out. In the ſame manner they apply handles, ſpouts, and the like.

Men, groteſque figures, animals, idols, buſts, and the like, which are hollow, are made in moulds in three, four, or more pieces; after which they are joined together, and finiſhed with tools proper to trace, hollow, and poliſh the different ſtrokes the mould had not impreſſed.

As to flowers and other ornaments that ſeem engraved, they are formed on the china by ſtamps and moulds; and relievos, ready prepared, are ſtuck on.

When they have the model of a piece of China-ware that is beſpoke, and which they cannot imitate by the wheel only, they make uſe of a kind of yellow fat clay, which they knead very much; and then apply it to the model; and when the impreſſion is taken, ſeparate the mould from the model in ſeveral pieces, which they ſuffer to dry gently. When they intend to make uſe of the model, they place it for ſome time near the fire; after which they fill it to what thickneſs is deſigned with the paſte proper for making China ware, preſſing it in all places with the hand; and then place it a moment before the fire, which looſens the mould by drying up the moiſture that united the one to the other. The ſeveral pieces thus made ſeparately, are united again in the ſame manner as the large China-veſſels; and the figure being ſuffered to grow hard, is afterwards finiſhed by tools proper for that purpoſe.

The labour of painting the China-ware is alſo divided between a great number of workmen, who do every thing by rote, aſſiſted by a very poor imagination: it is the buſineſs of one to make the coloured circle near the edge; another traces the flowers, which are painted by a third. It belongs to one to make rivers and mountains, another makes birds, flies, and other animals; but the figures of men are commonly the worſt performed.

Du Halde ſays they glaze and bake it before this part of the work is performed; and then having painted and laid on the gilding, they bake it a ſecond time.

They uſe all colours in painting China-ware; though there are ſeldom any brought to Europe but blue upon a white ground, ſometimes mixed with red and gold. Some are quite red with ſmall ſpots, others entirely blue, others of a ſhining black, others marbled, and others painted with landſcapes, mixed with almoſt all colours, and enlivened by gilding. This beautiful brittle furniture has been finely imitated in the Dreſden china, and in that made at Chelſea, Bow, and at Worceſter; ſome of which, with reſpect to the beauty of the painting, greatly exceed that made by the Chineſe.

The beſt authors have agreed, that ſilk and ſilk-worms came originally from China; from thence they paſſed to the Indians, from them to the Perſians, and from the latter to the Greeks and Romans; among whom ſilk ſtuffs, at their firſt introduction, was valued at their weight in gold.

The ſilks moſt in uſe among the Chineſe are plain and flowered gauzes, which are their ſummer wear; damaſks of all ſorts and colours, ſtriped ſattins, black Nanking ſattins, coarſe taffeties, brocades, velvets, and a great many ſorts for which the Europeans have no name. For their gold tiſſue, they do not make uſe of fine gold thread twiſted on ſilk; but cutting a long ſlip of gilt paper into ſmall ſlips, very artfully roll them about the ſilk. Theſe ſtuffs, when freſh, look very fine; but being ſoon tarniſhed by the air, and ſpoiled by wet, they are unfit for garments. None but the mandarines, and their ladies wear them; and that but ſeldom.

The Chineſe being the firſt nation that diſcovered the art of rearing ſilk-worms, and rendering their labours of ſervice to mankind, a conciſe account of the manner in which this is performed, and the ſilk produced in that country, cannot fail of being agreeable to the curious reader; and the more ſo, as the ſilk manufacture there is much greater than in any other country upon earth.

The ſilk-worm proceeds from a ſmall egg no bigger than a pin's head, and grows till it becomes of the ſize of a caterpillar, feeding all the while on mulberry-trees till it comes to its maturity; it then ceaſes to eat, and prepares for its diſſolution, by wrapping itſelf in a kind of coffin, or ſilken ball, of the ſize and ſhape of a pidgeon's egg: this

taſk

taſk is no ſooner accompliſhed, than its head ſeparates from its body, which is ſlender, of a light cheſnut colour, and covered with hard ſcaly rings; in ſhort, it is metamorphoſed into a chryſalis, and in no reſpect reſembles its original form, but remains without the leaſt ſign of life or motion: yet, if taken out of its ſepulchral caſe, it will writhe on being touched; though on opening it no ſign of an animal form is to be ſeen with the naked eye, for nothing appears within its ſcaly covering but a liquid ſubſtance. In this torpid ſtate, without limbs, or any diſtinction of head or tail, it remains, till at length it awakes to a new life, puts off the rings with which it was ſurrounded, and making a paſſage out of its ſilken ſepulchre, appears a perfect moth or butterfly, with head, legs, and wings: yet in this ſtate it never eats, but fluttering about, as if rejoiced at its reſurrection to a new and more eligible life, propagates its ſpecies; and each female having laid abundance of eggs, both the males and females die.

There are two methods of bringing up theſe curious inſects, both practiſed in China; theſe are, either ſuffering them to expatiate at full liberty on the mulberry-trees, by which they are nouriſhed, or by keeping them in rooms. As in this laſt method the fineſt ſilk is produced, we ſhall give a particular deſcription of the manner in which the Chineſe proceed.

To begin with the eggs, which are laid on large ſheets of paper, to which they firmly adhere. The females have no ſooner done laying, than thoſe eggs which ſtick together in clots are thrown away, and the ſheets hung up on a beam of the room, with the eggs inward, and the windows are opened in the front to admit the wind: but no hempen ropes muſt ever come near the worms or their eggs. After ſome days the ſheets are taken down, rolled up looſely with the eggs inwards, and then hung up again, during the ſummer and autumn.

At the end of December, or the beginning of January, the eggs are put into cold water, with a little ſalt diſſolved in it, taking care that it does not freeze, and a China-diſh put over them, that the ſheets may not ſwim. Two days after they take them out, hang them up again, and when dry roll them a little tighter, and encloſe each ſeparately, ſtanding on one end in an earthen-veſſel. Some put them into a lye made of mulberry-tree aſhes, and then lay them ſome moments in ſnow-water, or elſe hang them up three nights on a mulberry-tree to receive the ſnow or rain, if not too violent. The deſign of this is to cheriſh the internal heat in the eggs.

The time of hatching them is when the leaves of the mulberry-trees begin to open, for they are haſtened or impeded according to the different degrees of heat or cold to which they are expoſed. When they are ready to come forth, the eggs ſwell and become a little pointed.

The third day before they are hatched, the rolls of paper are taken out of the veſſel, ſtretched out, and hung up with the back-ſides towards the ſun, till they receive a kindly warmth, and then being rolled up cloſe, they are ſet upright in a veſſel in a warm place. This is repeated the next day, and the eggs change to an aſh-grey: they then put two ſheets together, and rolling them cloſe tie the ends.

The third day, towards night, the ſheets are unrolled and ſtretched on a fine mat, when the eggs appear blackiſh. If any worms are hatched they muſt be thrown away, for they would much increaſe the care and trouble of thoſe who attend them: they then roll three ſheets together, and carry them into a pretty warm place, ſheltered from the ſouth wind. The next day the people taking out the rolls and opening them, they find them full of worms like ſmall black ants. The eggs not hatched within an hour after muſt be thrown away, as muſt alſo thoſe with a flat head that are ſhrivelled and diſcoloured.

The apartment for the ſilk-worms ought to be on a dry riſing round, in a ſweet air, and free from noiſe. The rooms ſhould be ſquare, and very cloſe, for the ſake of warmth; the door ſhould be to the ſouth, and covered with a double mat, to keep out the cold; yet there ſhould be a window on every ſide, that when it is thought neceſſary the air may have a free paſſage. In opening of a window to let in a refreſhing breeze, care muſt be taken to keep out the gnats and flies. The room muſt be furniſhed with nine or ten rows of frames, about nine inches one above the other. On theſe they place ruſh hurdles, upon which the worms are fed till they are ready to ſpin; and, to preſerve a regular heat, ſtove-fires are at the corners of the room, or elſe a warming-pan is carried up and down it, but it muſt not have the leaſt flame or ſmoak. Cow-dung dried in the ſun is eſteemed the moſt proper fuel; for the worms like its ſmell. The women who attend them muſt be clean and neat, and avoid eating or handling wild ſuccory, the ſmell of which is prejudicial to the worms; which muſt be managed with great care before their firſt molting. Every day is to them a year, and has in it the four ſeaſons: the morning is ſpring, the middle of the day ſummer, the evening autumn, and the night winter. While the eggs are kept, before they are hatched, they require much cold; when firſt hatched they want as much heat; when become caterpillars they need a moderate heat; after the great molting they muſt be kept cool; when upon the decline they ſhould be warmed by degrees; and a great heat is neceſſary when they are working their cones.

The mulberry-leaves ſhould be gathered two or three days before hand, and kept in a clean place; the firſt three days they give them the tendereſt leaves cut with a ſharp knife into little threads, without bruiſing them. At the end of three or four days, when they begin to turn white, their food muſt be increaſed, but not cut ſo ſmall: and when they become blackiſh, they muſt have a greater quantity of leaves quite whole. As they turn again white, and eat with leſs appetite, they give them fewer leaves, and fewer ſtill when they grow yellow; and when they are ready to change their ſkins they give them nothing. Every molting time they muſt be treated in the ſame manner.

To render this and what follows intelligible it is neceſſary to obſerve, that when the ſilk-worm leaves its little egg, it is perfectly black; but in a few days it aſſumes a whitiſh hue, or an aſh-grey; after which its coat becoming ſullied and ragged, it caſts it off, and appears in a new habit. As it increaſes in bulk it grows whiter, but inclines a little to green; till ceaſing to feed, and ſleeping almoſt for two days, it a ſecond time diveſts itſelf of its ſkin, and appears in its third habit; when its colour, head, and whole form are ſo changed, that it ſeems another animal. It now begins to eat again, and continues to do ſo for ſome days; then changes to a bright yellow, and relapſes into its former lethargy, at the concluſion of which it once more quits its covering; and having continued feeding ſome time longer, it at length renounces feaſting and all ſociety, and builds its ſilken tomb.

But to proceed. The worms eat equally day and night: the Chineſe give them on the firſt day forty-eight meals, that is, one every half hour; the next thirty; the third day they have ſtill leſs. As cloudy and rainy weather takes away their ſtomach, juſt before their repaſt a whiſp of very dry ſtraw, the flame of which muſt be all alike, is held over the worms to free them from the cold and moiſture that benumbs them, or elſe the blinds are taken from the windows to let in the full day-light.

Eating ſo often haſtens their growth, on which the chief profit of the ſilk-worms depends. If they come to maturity in twenty-three or twenty-five days, a large ſheet of paper covered with worms, which at their firſt coming from the eggs weighs little more than a drachm, will produce twenty-five ounces of ſilk; but if not till twenty-eight days, they then yield only twenty ounces; and if they are a month or forty days in growing, they then produce but ten.

They muſt be kept extremely clean, and often removed; and when they are pretty well grown, the worms belonging to one hurdle muſt be divided into three, afterwards they muſt be placed on ſix, and ſo on to the number of twenty or more: for being full of humours, they muſt be kept at a due diſtance from each other.

The critical moment for removing them is when they are of a bright yellow and ready to ſpin; they are then put into a proper apartment prepared for them to work in. This is a large caſe or cloſet, divided all round into partitions, each with a ſhelf; there they place the ſilk-worms, who afterwards range themſelves in their proper ſituations. There ought to be room for a man to go in, and to keep a ſmall fire in the middle, juſt to yield a gentle heat, which makes the worms work more eagerly, and renders the ſilk more tranſparent. They muſt be ſurrounded with mats at a ſmall diſtance, which muſt cover the top of the place, to keep off the outward air; and becauſe they love to work in the

the dark. However, after the third day's labour the mats are taken away from one o'clock till three, but the rays of the ſun muſt not ſhine upon them. They are at this time covered with the ſheets of paper that were uſed on the hurdles.

As to the manner in which the ſilk-worm performs this work; it at firſt ſeems to labour without deſign, and forms only a kind of flue or down; this is its firſt day's employment. On the ſecond it begins to form the outſide of the cone or ball, in the midſt of the looſe ſilk or flue made the proceeding day. On the third day it is quite hid, and the reſt of his performance is concealed from our ſight. At length the cones being finiſhed in ſeven days, the worm changes its form and becomes a chryſalis; the cones are then gathered and laid in heaps, but they firſt ſet apart thoſe deſigned for propagation upon a hurdle in a cool airy place.

The next care is to kill the moths in thoſe cones which the people would not have bored. The beſt way of doing this is to fill large earthen-veſſels with cones in layers of ten pounds each, throwing in four ounces of ſalt with every layer, and covering it with large dry leaves like thoſe of the water-lily, and cloſely ſtopping the mouth of the veſſels. But in laying the cones into the veſſels they ſeparate the long, white, and glittering ones, which yield a very fine ſilk, from thoſe that are thick, dark, and of the colour of the ſkin of an onion, which produce a coarſer ſilk.

This is the method of raiſing worms in the ſpring, which is the general ſeaſon for doing it, though ſome hatch eggs in ſummer and autumn, and almoſt every month after the ſpring crop; but were all to do ſo, the mulberry-trees would ſcarce furniſh them ſufficient food. The ſilk-worms bred in ſummer are kept cool, and the windows covered with gauze to keep out the gnats. Thoſe raiſed in autumn are at firſt to be kept cool: but after their molting, and when they ſpin, they muſt be kept warmer than in the ſpring.

When the ſilk-worms are ready to ſpin, if you lay them on the top of a cup covered with paper, they will ſpin a piece of ſilk flat, thin, and round like a large wafer. Theſe are not clogged with this viſcous matter which the worms emit when long incloſed, and they are as eaſy to wind as the cods, without requiring to be wound in ſuch a hurry.

When they wind off the ſilk they firſt clear away the down, and then throwing the cones into a copper of warm water, ſtir them about with ſmall twigs bound together, and cut like bruſhes; by which means the ends of the ſilk being diſengaged catch on the twigs, and thus are drawn out, and eight, ten, or twelve of them faſtened together to a reel, which a woman turns round, and at the ſame time guides the threads, and ſubſtitutes new ones when any of them breaks, till all the ſilk is wound off.

Though the Chineſe chiefly wear ſilk, yet they are not without woolen and linen manufactures. Wool is very common and cheap, eſpecially in the provinces of Chan-ſi, Chen-ſi, and Se-tchuen, where they feed abundance of ſheep; yet the Chineſe do not make cloth. That furniſhed by the Engliſh is highly eſteemed; but being dearer than the fineſt ſilks, they buy but little of it: yet as for druggets, ſerges, and tammies, they make them very well; theſe are worn by the bonzes, and are commonly manufactured by their wives.

They make cotton cloth; and for the ſummer nettle linen for long veſts. But the cloth moſt valued, and to be found no where elſe, is made of a plant called co, found in the province Fo-kien. It is a kind of creeping ſhrub that ſpreads over the fields, with leaves much larger than the ivy; they are round and ſmooth, green within, and downy on the out ſide: the ſtems of ſome are as thick as one's finger, but very pliable and downy like the leaves. When they begin to dry they leave them to rot in water, as they do flax and hemp: the firſt ſkin is peeled off and thrown away; but the ſecond, which is more fine and delicate, they divide by the hand into very ſlender threads, and, it is ſaid, weave it without either beating or ſpinning it. This kind of linen is tranſparent and pretty fine, but ſo light and cool, that the perſon who wears it ſeems to have nothing on his back.

Among the other arts practiſed by the Chineſe we ought not to omit their being long acquainted with founding of bells. Some of theſe are of a prodigious ſize, particularly ſeveral caſt at Peking between three and four hundred years ago, each of which weigh an hundred and twenty thouſand pounds. They are eleven feet wide, forty feet round, and twelve feet high beſides the ear, which is at leaſt three feet in height: but Le Compte obſerves, that thoſe of Europe exceed them in ſound, as much as they exceed the European bells in ſize; for, inſtead of iron clappers, they ſtrike upon them with a large wooden hammer, which propably deadens the ſound. They have alſo great bells in all their cities, which are uſed to diſtinguiſh the hours of the night.

In every city there are mechanics of almoſt all ſorts; ſome work in their ſhops, others go about the ſtreets to be hired; but the greater part are employed in private families. For inſtance, if you want a ſuit of cloaths, the taylor comes to your houſe early in the morning, and returns home in the evening. He uſes no thimble, but inſtead of it ties a rag about the ball of his thumb; and he generally ſows ſtanding, only leaning againſt the table on which his work lies. The other handicrafts alſo work at the houſes of their cuſtomers, and all bring their tools along with them, even to the ſmith with his anvil and forge to make things for common uſe.

The barbers, with their ſhoulders loaded with a ſtool, their baſon, pot and fire, with a towel and clouts, give notice of their approach with a little bell; and when called, very dexterouſly on the ſpot, whether it be in the ſtreet, the middle of a ſquare, at the door of a houſe, or any where elſe, ſhave the head, ſet the eye-brows in order, clean the ears with proper inſtruments, ſtretch out the arms, and rub the ſhoulders, all for leſs than a half-penny, which they receive with many thanks, and then ring the bell again, in order to obtain another jobb. The ſhoe-makers go about in the ſame manner, and will either make ſhoes, or, for about three-pence, will ſole them ſo as to laſt a year or two, if the perſon does not walk much abroad.

It will not here be improper to mention the method by which the Chineſe ſtock their ponds and pools with fiſh. In the month of May the country people place mats and hurdles acroſs the river Yang-tſe-kiang, in the province of Kiang-ſi, leaving only room for the paſſage of the boats. Theſe hurdles ſtop the ſpawn, which, together with the water, they convey into proper veſſels, and expoſe it to ſale; after which it is carried into different provinces for the purpoſes already mentioned.

The fiſhermen, beſides nets and lines, the firſt uſed in their great fiſheries, and the latter in their ſmall, in ſeveral provinces fiſh with a kind of cormorants, which they train up as hawks are taught in Europe to catch birds. Early in the morning one may ſee on the rivers a conſiderable number of boats, and ſeveral of theſe birds ſitting at the end of each, when, at a ſignal given by ſtriking the water with an oar, they take their flight, and diſperſing over the river, watch their prey, and ſuddenly diving, ſeize the fiſh by the middle, and then riſing carry it to the boat. The fiſherman takes the bird, and holding its head downward, paſſes his hand along the neck, to make it diſcharge the ſmall fiſh it had devoured; for they are hindered from entering into the gullet by a ring put on the lower part of the neck, which, after the fiſhing is quite over, they take off, and give them ſomething to eat. When the fiſh happens to be too large for one bird, they mutually aſſiſt each other, one taking the head, another the tail, and bring it to the boat to their maſter.

They have another method of taking fiſh: for this purpoſe they have long narrow boats, on each ſide of which is nailed a long plank, two feet broad, japanned with very white ſhining varniſh, and ſlanting gently till it almoſt touches the water. In the night-time, when theſe boats are uſed, they turn them towards the moon, that the reflection may increaſe the ſplendor of the varniſh; ſo that the fiſh, which are ſporting about the boats, eaſily miſtaking the colour of the japanned planks for that of the water, frequently leap upon them, and ſometimes into the boat.

In ſome places the ſoldiers ſhoot the fiſh very dexterouſly with arrows, faſtened to the bow with a line of packthread; as well to prevent their being loſt, as to draw out the fiſh when it is ſhot. In other places, where there are great numbers in the mud, men ſtand up to the waiſt in water, and pierce them with a three forked ſpear.

To theſe extraordinary methods of fiſhing we ſhall add the manner in which they take wild ducks, which are very numerous in the lakes. They leave a number of ſhells of large calibaſhes or gourds floating in the water, and when they have a mind to catch the ducks, put on their heads one of theſe ſhells, with holes to ſee and breathe through, and then go naked into the water, or ſwim deep with their bodies, that nothing may appear above the ſurface but the calibaſh, which the ducks being accuſtomed to ſee floating, approach without fear; when the duck-hunter taking them by the feet, pulls them under the water, wrings their necks, and faſtens them to a girdle he wears for that purpoſe; thus purſuing his exerciſe, till he has got as many as he can carry, and then returns the ſhore to diſburthen himſelf of his load.

SECT. VI.

Of their Skill in the Sciences.

WERE we to take a view of the numerous libraries in China, handſomely built, finely adorned, and enriched with a prodigious collection of books; were we to conſider the multitude of the doctors and colleges eſtabliſhed in all the cities of the empire, their obſervatories, and conſtant application to watch the courſe of the ſtars; were we farther to reflect, that learning is the only path to preferment, and that for above four thouſand years none but the learned have been governors of cities and provinces, and have enjoyed all the offices about the court, we ſhould be tempted to believe that China muſt be the wiſeſt and moſt learned nation upon earth. Yet by a very ſmall acquaintance with them we ſhall ſoon be undeceived, and fully convinced that they are far from having brought any of the ſpeculative ſciences to perfection. But there are two principal obſtacles that hinder their progreſs; the firſt is, that they have nothing to excite their emulation; and the other, that they who are able to diſtinguiſh themſelves can do it only by ſtudying morality, the hiſtory and laws of their country, and by learning to write in a polite manner. By this means they obtain the degree of doctor, and are poſſeſſed of honour and credit. This is ſoon followed by their obtaining a government, and by their enjoying all the conveniences of life.

Their logic and rhetoric are without rules, imitation generally ſerving them inſtead of precept. In the firſt, they are guided only by the light of reaſon, without any aſſiſtance from art; and, in the laſt, are ſatisfied with reading the moſt eloquent pieces, and obſerving the ſtrokes moſt likely to affect the mind.

They pretend to be the inventors of muſic, and boaſt of their having formerly brought it to the higheſt perfection. They like the European muſic well enough, provided there be but one voice to accompany the ſound of ſeveral inſtruments; but as for the contraſt of different voices, of grave and acute ſounds, ſyncopes, fugues, and dièſes, they conſider them as no better than a diſagreeable confuſion; for all their concerts have no dependence on the variety of tones, or the difference of parts.

They have no muſical notes, nor any ſign to denote the diverſity of tones, the raiſing and falling of the voice, and the reſt of the variations that conſtitute harmony. They learn the tunes by the ear, and when theſe are played upon their inſtruments, or ſung by a good voice, they have ſomething in them not diſagreeable even to the ear of an European.

Du Halde obſerves, that in the year 1679, the emperor Cang-hi, who had himſelf compoſed ſome tunes, ſent for Grimaldi and Pereira, two miſſionaries, to play upon an organ and an harpſicord that they had formerly preſented him with: he greatly admired the ſweetneſs of our European airs, and ſeemed to take great pleaſure in them; then ordered his muſicians to play a Chineſe air upon their inſtruments, and at the ſame time played himſelf in a very graceful manner.

While the emperor's muſicians were playing, Pereira took his pocket-book and pricked down all the tune, and when they had made an end repeated it without miſſing one note, which ſo aſtoniſhed the emperor, that he beſtowed great encomiums upon the juſtneſs, harmony, and facility of the European muſic; but that which ſurpriſed him moſt was, that the miſſionary had learnt an air in ſo ſhort a time, that had given him and his muſicians ſo much trouble, and that by the aſſiſtance of characters he could recollect it at pleaſure.

The emperor, to be more fully perſuaded, ſung ſeveral different airs, which Pereira pricked down in his book alſo, and then repeated them with great accuracy and juſtneſs: this alſo pleaſed the emperor ſo well, that he owned the European muſic to be incomparable, and that Pereira had not his equal in the whole empire. This prince afterwards eſtabliſhed an academy of muſic, and made the moſt ſkilful perſons of that ſcience members of it.

The Chineſe have invented eight ſorts of muſical inſtruments, which they imagine have the neareſt reſemblance to the human voice; ſome are of metal, like our bells; one has ſome reſemblance to our trumpet: they have wind inſtruments of two or three ſorts, as flutes, and a kind of ſmall organ, which yields an agreeable ſound. They have alſo inſtruments with ſtrings, which are generally of ſilk, as cymbals and violins, each with only three ſtrings: they have another inſtrument with ſeven ſtrings, that is much eſteemed, and not diſagreeable when played upon by a ſkilful hand: they have alſo ſeveral kinds of drums, compoſed of ſkins, ſome of which are ſo heavy that they are obliged to place them on a piece of wood.

They are pretty well verſed in arithmetic, of which their books contain the four principal rules, addition, ſubſtraction, multiplication, and diviſion. Yet it is not by calculation that they put them in practice, for they have nothing like our figures by which they can perform the operation. This is done by an inſtrument conſiſting of a ſmall board croſſed from the bottom to the top by ten or twelve parallel rods, with a ſeparation at a ſmall diſtance from one of the ſides: upon theſe rods are ſmall ivory balls, that ſlip up and down; the two which are in the upper diviſion of each rod ſtand each for five, and five balls below for units.

In joining and ſeparating the balls they reckon as we do with counters, but with ſuch eaſe and readineſs that, Du Halde ſays, the Europeans, with the aſſiſtance of figures, are not near ſo quick as the Chineſe in caſting up the moſt conſiderable ſums.

Their geometry is very ſuperficial; however, they neither want ſkill nor exactneſs in meaſuring their land, and their method of ſurveying is eaſy and certain.

The other parts of the mathematics were unknown to the Chineſe till they were viſited by the miſſionaries. The emperor Cang-hi was never weary of ſeeing and hearing of them; on the other hand, the jeſuits being ſenſible how neceſſary it was for them to procure his protection, omitted nothing capable of exciting his curioſity.

To give him an inſight into optics, they made him a preſent of a ſemi-cylinder of a light wood, with a convex-glaſs placed in the middle of its axis; which being turned towards any object, painted the image within the tube to a great nicety.

The emperor, greatly pleaſed with ſuch an unuſual ſight, deſired to have a machine placed in his garden at Pekin, in which, without being ſeen himſelf, he might ſee every thing that paſſed in the ſtreets and neighbouring places. For this purpoſe they prepared an object-glaſs of much greater diameter, and made in the thickeſt garden-wall a window in the form of a pyramid, the baſis of which was towards the garden, and the point towards the ſtreet: at the point they fixed a convex-glaſs, oppoſite the place where there was the greateſt concourſe of people, and at the baſe made a large cloſet ſhut up cloſe on all ſides and very dark. There the emperor came with his queens to obſerve the lively images of every thing that paſſed in the ſtreets, a ſight that pleaſed him extremely; but it charmed the ladies a great deal more, ſince they could no otherwiſe behold this ſpectacle, the cuſtoms of China not allowing them to go out of the palace.

Grimaldi gave another ſurpriſing inſtance of his ſkill in optics, in the jeſuits gardens at Peking. He made upon the four walls four human figures, each of the ſame length as the wall, which was fifty feet. As he had perfectly obſerved the rules of optics, nothing was ſeen in the front but mountains, foreſts, chaces, and other things of this nature; but at a certain point they perceived the figure

of

of a man well made and well proportioned. The emperor honoured the jeſuits houſe with his preſence, and for a long time beheld theſe figures with admiration. The grandees and principal mandarines, who came in crowds, were equally ſurpriſed; but what ſtruck them moſt, was to ſee the figures ſo regular and exact upon irregular walls, that in many places had large windows and doors.

In catoptrics they preſented the emperor with teleſcopes of all ſorts, and glaſſes for diminiſhing, magnifying, and multiplying. Among other things they made him a preſent of a tube, formed like a priſm, having eight ſides, which being placed parallel with the horizon, preſented eight different ſcenes in ſo lively a manner, that they might be miſtaken for the objects themſelves. They gave him another tube, in which was a polygon-glaſs, that by its different faces collected into one image ſeveral parts of different objects; ſo that inſtead of a landſcape, woods, flocks, and other things repreſented in a picture, was diſtinctly ſeen an human face or ſome other figure. They likewiſe amuſed the emperor with the ſhadows of a magic lanthern.

Nor was perſpective forgotten. Three paintings were ſhown in the jeſuits garden at Pekin; the mandarines flocked thither out of curioſity to ſee them, and were equally ſtruck with the ſight. They could not conceive how it was poſſible on a plain cloth to repreſent porticoes, galleries, halls, viſtos, and roads, that ſeemed to extend as far as the eye could reach, and that ſo naturally that at the firſt ſight they were deceived.

In explaining ſtatics they ſhowed the emperor a machine, the principal parts of which were only four knotched wheels and an iron grapple. By the help of this machine a child without difficulty raiſed ſeveral thouſand weight, and ſtood firm againſt the efforts of twenty ſtrong men. Some pneumatic machines alſo greatly excited the emperor's curioſity. They cauſed a waggon to be made of light wood, about two feet long, in the middle of which they placed a veſſel full of live coals, and upon it an æolipile, the wind of which came through a little pipe upon a kind of wheel made like the ſails of a wind-mill. This ſmall wheel turned another, and by that means ſet the waggon in motion for two hours together. The ſame contrivance was likewiſe fixed to a little ſhip with four wheels: the æolipile was hid under the deck, and the wind proceeding out of two ſmall pipes filled the ſails, and made the ſhip wheel about a long time; the artifice being concealed, nothing was heard but a noiſe like a blaſt of wind, or like that which water makes about a veſſel.

In ſhort, they preſented the emperor repeating-watches, clocks with chimes, barometers, and thermometers, which were ſent them for that purpoſe by ſeveral European princes. All theſe different inventions, till then unknown to the Chineſe, ſomewhat lowered their natural pride, and ſo far raiſed their opinion of foreigners, that they began to look upon the Europeans as their maſters.

It ought not however to be omitted, that no nation whatever has applied more conſtantly to aſtronomy than the Chineſe, who have made obſervations in all ages, and from the earlieſt times have appointed perſons to watch the heavens night and day; and this has been one of the principal employments of the learned. Hence they have an account of an eclipſe two thouſand one hundred and fifty-five years before the birth of Chriſt: and Gaubil obſerves, that from above an hundred and twenty years before the ſame æra, they have given the number and extent of their conſtellations, what ſtars anſwered the ſolſtices and equinoxes, the declination of the ſtars, the diſtance of the tropics and the two poles. He adds, they were acquainted with the motion of the ſun and moon from weſt to eaſt, and likewiſe of the planets and fixed ſtars, though they did not determine the motion of the latter till four hundred years after Chriſt. But Le Compte obſerves, that the aſtronomers, when he was in China, were very unſkilful, and took little care to improve that ſcience; for provided their ſalary was paid, they were in no great trouble about the changes that happen in the ſky: but if an eclipſe or comet appears, they dare not be ſo negligent.

Though the Chineſe aſtronomy is of an antienter date than that of any other nation in the world; yet the ſame author obſerves, that they reaſon as abſurdly on this ſubject, as thoſe who are moſt ignorant and illiterate. They fancy that in the heavens is a dragon of a prodigious ſize, who is a profeſſed enemy to the ſun and moon, and ready at all times to eat them up. They therefore no ſooner perceive an eclipſe, than they make a terrible noiſe with their drums and braſs kettles, till the monſter being frighted, lets go his prey. Even the chief mandarines fall on their knees in a court of the palace, and frequently bow towards the ſun, ſtriking the ground with their foreheads, to expreſs their pity for that orb, or rather to beg of the dragon not to deprive the world of its light.

Thus though the learned are free from this vulgar error, and are perſuaded that eclipſes are owing to natural cauſes; yet, from the prevalence of cuſtom, they continue theſe ridiculous ceremonies, which are practiſed in the ſame manner in all parts of the empire.

The Chineſe aſtronomers every year compoſe a calendar, or almanac, at the head of which is the emperor's edict, by which all are forbid, under pain of death, to uſe or to publiſh any other calendar; and of this work ſeveral millions of copies are annually ſold.

The Chineſe year begins from the conjunction of the ſun and moon, or from the neareſt new moon to the fifteenth day of Aquarius, which, according to us, is the ſign which the ſun enters about the tenth of January, and ſtays there till the ſame day in February: from this point their ſpring begins; the fifteenth degree of Taurus is the point that determines the beginning of their ſummer; the fifteenth of Leo, their autumn; and the fifteenth of Scorpio, their winter.

They have twelve lunar months, among which ſome conſiſt of twenty-nine days and ſome of thirty; and every five years they have an intercalary month to adjuſt the lunations with the courſe of the ſun. They, like us, divide the weeks according to the order of the planets, to each of which they aſſign four conſtellations, in ſuch a manner, that after the twenty-eight, which ſucceed each other by ſeven and ſeven, they return to the firſt.

Their day, like ours, begins at midnight, and ends at the mid-night following; but they are only divided into twelve equal hours, each of which contains two of thoſe uſed by us.

The Chineſe have not neglected the art of medicine; they applied themſelves to it from the eſtabliſhment of the empire, and have many authors who treat of that ſubject; but as they have little ſkill in natural philoſophy, and particularly in anatomy, they have not made the ſame progreſs as our European phyſicians.

They ſuppoſe that the body in its muſcles, veins, and arteries, reſembles a kind of lute, or a muſical inſtrument, whoſe ſtrings have various ſounds, according as they are braced; that all theſe have a certain kind of temperament proper to themſelves by reaſon of their figure, ſituation, and various uſes; and thus the different pulſes are marks by which they can infallibly judge of their diſpoſition, in the ſame manner as a ſtring by the different degree of tenſion, or its being touched in one place or another, in a manner more ſtrong or more gentle, ſhews if it be too looſe or too much extended.

By the beating of the pulſe they pretend to know the cauſe of the diſeaſe, and in what part of the body it reſides; indeed, all their ſkilful phyſicians by this means diſcover pretty exactly the ſymptoms of diſtempers; and it is chiefly this that has rendered the Chineſe phyſicians ſo famous.

When they attend a ſick perſon they lay his arm upon a pillow, and then they place their four fingers upon the artery, ſometimes hard and ſometimes gently; they take time to examine the beating, and diſtinguiſh the differences according as the motion is more or leſs quick, full or ſlender, uniform or irregular; which they obſerve with the utmoſt attention, and afterwards, without aſking the patient, tell him where his pain lies, whether in the head, ſtomach, or belly; or whether it be the liver or ſpleen that is affected. They alſo tell when he ſhall obtain eaſe, and when the diſtemper will leave him. Indeed, the knowledge of the Chineſe phyſicians in this reſpect, is very extraordinary and ſurpriſing.

Some phyſicians when they viſit the ſick bring in their chair, or by their ſervant who follows them, a cheſt of various drawers, which are ſeparated into forty ſmall compartments well furniſhed with roots and ſimples, which they adminiſter according to the nature of the diſeaſe: theſe

these are either ſudorific, or ſerve to purify the blood and humours, to diſpel vapours, to ſtop fluxes, to ſtrengthen the ſtomach, or are gently purgative.

Others carry no cheſt, but give a preſcription, and leave the ſick at liberty to take them of him, or to buy them of the druggiſts, who are to be met with in almoſt every city. Some are above diſpenſing medicines, and theſe require more for their viſits.

The Chineſe phyſicians, after having made uſe of ſimple decoctions and reſtored health, depend very much upon their cordials to extirpate the very root of the diſeaſe; they have theſe of all ſorts, generally compoſed of herbs, leaves, fruit, dried ſeeds, and roots. Variety of ſimples are ſold in every city of the empire; one province borrows from another what it has not itſelf, and there are fairs, where nothing but medicines are ſold.

The phyſicians allow water to their patients, but order it to be boiled. They generally forbid all other food, and if the ſick perſon is extremely hungry, they allow him to take but very little; for they imagine that, while the body is indiſpoſed, the ſtomach is unfit to perform its functions, and that the digeſtion made in this condition is always pernicious.

SECT. VII.

Of their public Buildings, particularly the great Wall, which divides Tartary from China; the Pagods or Temples; the China Tower; the Triumphal Arches, the Bridges, and Roads.

THE celebrated great wall, which divides China from Tartary, excels all the fortifications attempted by the antients, it being fifteen hundred miles long, and continued through three great provinces. It is ſtrengthened by towers, in the ſame manner as the walls of the cities: the gates are fortified on the ſide of China with large forts, and where the paſſes might be more eaſily forced, they have raiſed two or three bulwarks behind each other, that each may afford a mutual defence.

As China is divided from Tartary by a chain of mountains, the wall has been carried over them. It begins at a large bulwark of ſtone, raiſed in the ſea to the eaſt of Pekin, and almoſt in the ſame latitude, it being in forty degrees two minutes. It is built like the walls of the common cities of the empire, but much wider, and conſiſts chiefly of brick, bound with ſuch ſtrong mortar, that, tho' it has laſted ſeveral centuries, it is ſtill pretty entire: it is from twenty to twenty-five feet high, and ſo broad, that five or ſix horſemen may travel a-breaſt with eaſe. Some parts of the wall are, however, only of earth, which is in particular places caſed on the outſide. This wall was raiſed above eighteen hundred years ago by the emperor Chihohamti, to prevent the incurſions of the neighbouring Tartars, and, as Le Compte obſerves, was one of the greateſt and maddeſt undertakings ever known; for though it was prudent to guard the eaſieſt avenues, nothing, he adds, could be more ridiculous than for them to carry their wall to the top of ſome precipices, which the birds can ſcarce reach with their wings, and which it is impoſſible the Tartarian horſe ſhould aſcend. If they fancied that an army might have clambered up thither, how could they imagine that ſo low a wall could be any defence? As for my part, he continues, I admire how the materials were conveyed thither. This was not done without a vaſt expence, and the loſs of more men than could have periſhed by the greateſt fury of their enemies. It is ſaid that, during the reigns of the Chineſe emperors, this wall was guarded by a million of ſoldiers; but as that part of Tartary now belongs to China, they are content with manning well the moſt dangerous and beſt fortified parts of it.

Among the fortreſſes of the kingdom there are about one thouſand of the firſt rate, the reſt ſcarcely deſerve the name. The cities are divided into three claſſes; of the firſt there are above one hundred and ſixty, of the ſecond two hundred and ſeventy, and of the third above twelve hundred, beſides near three hundred walled cities, which they omit in this calculation as not worth obſerving, tho' moſt of them are trading places, well inhabited. The villages are numberleſs, eſpecially thoſe of the ſouthern provinces; and in thoſe of Chanſi and Chenſi moſt of them are ſurrounded with walls and good ditches, with iron gates, which the country people ſhut at night, and guard in the day-time, to protect them from robbers, and from the ſoldiers, who, in ſpite of their officers, would inſult them as they paſs by.

Among the buildings moſt worthy of notice, we ought not to omit their pagods, or temples, erected by the ſuperſtition of the princes and people to their fabulous deities. Theſe are very numerous; the moſt celebrated of them are built on barren mountains, to which the induſtry of the people has given beauties denied them by nature. The channels formed in the rocks to convey the water from the heights into reſervoirs made for that purpoſe, with the gardens, groves, and grottos, formed in the rocks for ſhelter againſt the heat of the climate, render theſe ſolitudes extremely delightful. Theſe temples partly conſiſt of porticos, paved with large ſquare ſtones, and partly of halls that have a communication by long galleries, adorned with ſtatues of ſtone, and ſometimes of braſs. The roofs of theſe ſtructures ſhine with very beautiful green and yellow tiles, and the corners are embelliſhed with dragons of the ſame colours, projecting forward. Moſt of theſe pagods have a lofty tower, terminated by a dome, to which they aſcend by a winding ſtair-caſe. Under this dome is commonly a ſquare temple, which is often adorned with moſaic-work, and the walls covered with the figures of animals and monſters in relievo. Of this form are moſt of the temples, and theſe are alſo the habitations of the bonzes.

The towers erected in almoſt every city are their principal ornaments, and among theſe that of Nanking is the moſt famous. This is called the China-tower. It joins the temple of Gratitude, which is erected on a maſſive baſis, built with bricks, and ſurrounded with rails of unpoliſhed marble. The aſcent to it is by a ſtair-caſe of ten or twelve ſteps, which lead to the hall. This room, which ſerves for the temple, is a hundred feet high, and ſtands on a ſmall marble baſis, that projects two feet all round, beyond the reſt of the wall. The front is adorned with a gallery, and ſeveral pillars; the roofs, which in China are generally two, one next the top of the wall, and a narrower over that, are covered with green ſhining tiles; and on the inſide the cieling is painted, and formed of little pieces differently wrought one within the other, which the Chineſe eſteem very ornamental. Indeed, ſuch a medley of beams, joiſts, rafters, and pinions, appear extremely ſingular and ſurprizing to an European, who naturally thinks that ſuch a work muſt be very expenſive; but, in reality, all this proceeds from the ignorance of the workmen, who are unacquainted with the noble ſimplicity which renders our buildings at once ſolid and beautiful. The hall receives no light but through the doors, of which there are three very large ones on the eaſt ſide, that open into the China-tower.

This laſt ſtructure makes a part of the above temple, and is of an octagon figure, about forty feet wide, ſo that each ſide is about fifteen feet in length. A wall of the ſame form is built round it, at the diſtance of two fathoms and a half, and being of a moderate height, ſupports a roof covered with ſhining tiles, that ſeems to proceed from the tower, and forms underneath a pretty kind of gallery. The tower is nine ſtories high, each adorned with a cornice three feet above the windows, and adorned with a roof like that of the gallery, except its not projecting ſo far, and theſe, like the tower, decreaſe in breadth as they increaſe in height. The outſide of this ſtructure is encruſted with a coarſe china-ware, which has, in a great meaſure, retained its beauty, though the tower has been erected between three and four hundred years. The ſtair-caſe, which is on the inſide, is narrow, and the ſteps very high. Each ſtory has a room with a painted cieling, and in the walls of the upper rooms are ſeveral ſmall niches, with gilt idols in relievo, forming a pretty kind of inlaid work. The firſt floor is moſt lofty; but the reſt are all of an equal height, and on the top of the work is a thick pole, that ſtands upon the floor of the eighth ſtory, and reaches more than thirty feet above the roof. A kind of ſpiral line like a ſcrew winds round at ſeveral feet diſtance from the pole, and on the top is placed a golden ball, of an extraordinary magnitude. The height of the whole tower, from the ground to the ball, is above two hundred feet.

Triumphal

Triumphal arches are very numerous in every city, but many of them are unworthy of notice. Thoſe at Ningpo have generally three gates, a large one in the middle, and two ſmall ones on the ſides; the pillars, conſiſting of ſtone, make the door-poſts; the entablature is compoſed of three or four faces, generally without projection, and without any molding except the laſt, or the laſt but one, which is in the place of a frize, and on which they engrave an inſcription. The two other gates are made in the ſame manner, only proportionably leſs. Upon theſe triumphal arches, which ſeldom exceed twenty or twenty-five feet in height, are the figures of men, flowers, birds, and other ornaments, in relievo, that project ſo much, as to be almoſt ſeparated from the work.

The canals, which we have already mentioned, are, perhaps, the nobleſt works of the Chineſe, conſidering their great extent, and their being caſed on each ſide with a wall of large ſtones, and ſometimes with marble. The communication with the country is rendered extremely convenient by the bridges over the canals: theſe conſiſt of three, five, or ſeven arches, that in the middle being very high, that barks may paſs through it. Some have only one arch; as theſe are not very thick towards the top, they cannot be ſtrong, but they anſwer the purpoſe, as no waggons are ever uſed in China, and the porters who carry bales of goods paſs over theſe bridges by the help of ſtairs on each ſide, with ſteps about three inches thick. Some of the bridges have three or four great ſtones placed on the top of the piers, in the form of planks, and there are ſome of theſe ſtones eighteen feet in length.

The bridges built over the rivers are ſome of them very handſome ſtructures, and of a ſurpriſing length: of theſe there is a remarkable one at Fau-tcheou-fou, the capital of Fo-kien. The river over which it is built is half a league in breadth, and is ſeparated into ſmall arms by ſeveral iſlands, which are all united by bridges; the principal of which has above an hundred arches of white ſtone, with a baluſtrade on each ſide, handſomely carved: but there is ſtill a more extraordinary one at Suen tcheou-fou, which extends over the point of an arm of the ſea, and is two thouſand five hundred Chineſe feet in length, and twenty in breadth. It is ſupported by two hundred and fifty-two ſtrong piers, one hundred and twenty-ſix on each ſide.

A bridge two leagues and a half to the weſt of Peking was one of the fineſt ever ſeen, till a part of it was thrown down by a ſudden inundation. It was entirely of white marble, ſupported by ſeventy ſmall pillars, which were ſeparated by pannels of fine marble, on which were carved flowers, foliages, birds, and ſeveral ſorts of animals. At the eaſt end were two marble pedeſtals, one on each ſide, on which were two lions of extraordinary magnitude, under which were ſeveral others of a ſmaller ſize. At the weſt end, on two other marble pedeſtals, ſtood the figures of two children well executed.

Where bridges could not be built of ſtone, they have contrived other methods. The famous iron bridge, as it is called, is the work of a Chineſe general in former times. On each ſide of the banks of the Panho, a torrent not very wide, though exceeding deep, they have built a great gate, between two ſtone piers that are ſix or ſeven feet broad, and ſeventeen or eighteen high. From each of the piers on the eaſt ſide hang four chains by large rings, which are faſtened to the piers on the weſtern ſide, and there linked together by ſmall chains, which give it the appearance of net-work, with great meſhes. On this they have laid thick planks, faſtened together; but as they do not reach within ſome paces of the gate, on account of the bending of the chains, particularly when they are loaded, they have ſupplied that defect by a floor, ſupported by brackets. On the ſides of the planks they have ſet up little wooden pilaſters, which ſuſtain a ſmall roof of the ſame materials, the ends of which reſt on the piers.

The Chineſe have made other bridges in imitation of this, and in particular they have two or three ſupported only by thick ropes; but thoſe bridges, though ſmall, are tottering and inſecure.

In the province of Se-tchuen, they have faſtened wooden poles into the rocks of the mountains, and on thoſe have laid thick planks, and thus formed a kind of bridges, or rather roads hanging over the vallies; but theſe appear very dreadful to thoſe who are unuſed to them; yet the people of the neighbouring country paſs them on horſeback, or on their mules, without the leaſt apprehenſion of danger.

The Chineſe, extend their care to the high roads, which they render ſafe, handſome, and commodious. Theſe are commonly very broad, and often well paved, eſpecially in the ſouthern provinces, where they uſe neither waggons nor horſes. They have formed ways over the higheſt mountains, by cutting through rocks, levelling the tops of hills, and filling up the vallies. In ſome provinces the high roads are lined on each ſide with tall trees; and at proper diſtances are neat reſting places. Moſt of the mandarines, when their office is expired, on their return to their country, recommend themſelves by works of this kind. The inns too are very large and handſome; but thoſe on the leſſer roads are wretched ill contrived buildings.

We have already mentioned the canals, in deſcribing the fertility of the country; and ſhall take notice of ſome farther particulars relating to them, in Chap. IX. where we ſhall treat of the ſkill of the Chineſe in dragging their barks up their ſluices, and in conveying them from one canal to another.

SECT. VIII.

Of the Houſes of the Chineſe, and their Furniture. Of the Cities of the Chineſe in general, and a particular Deſcription of Pekin, and of the Imperial Palace in that City. The Civil Policy obſerved in the Government of the Cities.

THE houſes of the middling ſort of people are very plain, for they have no regard to any-thing but convenience. They commonly begin with erecting pillars, and placing the roof upon them; for moſt of the buildings being of wood, the foundation is ſeldom laid deeper than two feet. They ſometimes build their walls of brick or clay; but they have generally nothing more than a ground-floor, except thoſe of the merchants, which have frequently a ſtory above it, in which they depoſit their goods; In the cities almoſt all the houſes are covered with thick ridge tiles. They place the convex ſides downwards, and cover the chinks where the tiles join, by laying on others in a contrary poſition. The ſpars and joiſts are either round or ſquare; upon theſe they lay either tiles that are large, ſquare, and flat, or elſe pieces of board, or mats made of reeds, plaſtered over. When it is a little dry they lay on the tiles, and, if they can afford it, join them with roach-lime.

The vulgar, in building their walls, uſe unburnt bricks; only in front they are caſed with burnt bricks. In ſome places they are made with tempered clay; and in others of nothing but hurdles, covered with lime and earth. But the walls of the houſes of perſons of diſtinction are of ground bricks handſomely carved, or impreſſed with figures in relievo. In ſome provinces the houſes of the villages are made with earth, and the roof thatched with reeds, and ſo obtuſe that they ſeem flat.

The houſes of the wealthy are much inferior to ours, for, beſides the poorneſs of the architecture, they do not ſtudy to adorn them. One principal reaſon is, their receiving no viſits in the inner part of the houſe, but only in a kind of divan appointed for ceremonies; this is a banquetting-room, all open, that has no other ornament beſides one ſingle order of wooden columns, painted and varniſhed, which ſerve to ſupport the roof; ſo that it is not ſurpriſing that they ſhould be ſparing of ſuperfluous ornaments in apartments ſcarce ever ſeen by ſtrangers: they have, therefore, neither tapeſtry hangings, looking glaſſes, nor wrought chairs: gildings are in faſhion only in the apartments of the emperors or princes of the blood. Their beds, which are their principal ornaments, are never ſeen by ſtrangers; ſo that all their magnificence may be reduced to cabinets, tables, varniſhed ſcreens, ſome pictures, and ſeveral pieces of white ſattin, upon which are written, in large characters, ſentences of morality, and theſe are hung in different parts of the chambers. Veſſels of china-ware are both the common moveables and ornaments of every houſe; for the tables, the ſide-boards, and

the very kitchen, is filled with them. Of this ware is made the veſſels out of which they eat and drink; they have likewiſe large flower-pots of it, jars, and other veſſels for holding liquids. The pictures with which they adorn their apartments have nothing worthy of notice, but the brightneſs of the colours; for they are ignorant both of perſpective, and the proper diſpoſitions of lights and ſhades. There are a great number of painters who repreſent on the chamber walls an order of architecture, without the leaſt ſymmetry; they form bands or fillets round the rooms, at the top and bottom, and between them columns at an equal diſtance. They frequently hang up the pictures of their anceſtors, and ſometimes pieces of ſattin, on which are painted flowers, fowls, mountains, and palaces. The rooms are alſo ſometimes adorned with ſilk lanterns.

Though you are not permitted to enter the bed-chamber, yet their beds are very fine. In ſummer they have taffaty curtains, embroidered with flowers, trees, and birds, in gold and ſilk. Others have curtains of the fineſt gauze, which is ſufficient to admit the air, and yet is cloſe enough to defend them againſt the flies and gnats, which are here in tolerable in the night. In winter they make uſe of coarſe ſattin, embroidered with dragons and other figures, and the counterpane is in the ſame taſte. They do not uſe feather-beds, but their cotton quilts are very thick: their bedſteads are of joiners work, adorned with carved figures, ſome of which are very handſome.

Moſt of the cities of China reſemble each other ſo nearly, that the ſeeing of one is almoſt ſufficient to entertain a perfect idea of the reſt. They are generally ſquare, when the ground will permit, and encompaſſed by high walls, defended by towers, built as buttreſſes as convenient diſtances, and ſome have ditches either dry or wet. Within the cities are alſo other towers either round, hexagonal, or octagonal, and eight or nine ſtories high; triumphal arches in the ſtreets; tolerably handſome temples, conſecrated to their idols, or erected in honour of their heroes, and thoſe who have been of important ſervice to the ſtate. In fine, there are public buildings more remarkable for their great extent than for their magnificence. To which we may add, many large ſquares, and long ſtreets, in ſome cities very wide, and in others narrow, with houſes on each ſide, that have only a ground-floor, or one ſtory at moſt.

Having thus deſcribed the cities of China, in general, we ſhall give a particular deſcription of Pekin, or Peking the reſidence of the emperor.

Pekin, the capital of the whole empire of China, and the ordinary reſidence of the emperors, is ſituated in the 40th degree of north latitude, in a very fertile plain, 20 leagues diſtant from the great wall. Its neighbourhood to the ſea on the eaſt, and the great canal on the ſouth, afford it a communication with ſeveral fine provinces, from which it draws great part of its ſubſiſtence. It is an oblong ſquare, and is divided into two cities: that which contains the emperors palace is called the Tartar city, becauſe the houſes were given to the Tartars when the preſent family came to the throne; and they refuſing to ſuffer the Chineſe to inhabit it, forced them to live without the walls, where they in a ſhort time built a new city; which, by being joined to the other, renders the whole of an irregular form, ſix leagues in compaſs.

The walls and gates of Pekin are of a ſurpriſing height, ſo that they hide the whole city; and are ſo broad, that centinels are placed upon them on horſeback; for there are ſlopes within the city of conſiderable length, by which horſemen may aſcend the walls; and in ſeveral places there are houſes built for the guard. Upon theſe walls towers are erected within bow-ſhot of each other; and, at proper diſtances there is placed one of an extraordinary height, in which may be ſtationed a ſmall body of reſerve. The gates are neither embelliſhed with ſtatues, nor other carving, all their beauty conſiſting in their prodigious height, which at a diſtance gives them a noble appearance. Theſe are nine in number; all are well arched, and ſupport very large pavilions nine ſtories high, each ſtory having openings either of windows or port-holes; and on the loweſt ſtory is a large hall, where the officers and ſoldiers retire who come off the guard. Before each gate is an open ſpace of about three hundred and ſixty feet, which ſerves for a parade, ſurrounded by a ſemi-circular wall, equal in height and breadth to that which incloſes the city; and into this parade you enter, not at the front, but at the ſide wall, where you paſs to the gate which commands the country, and proceeding through it, turn to the right, and come to a ſecond tower which commands the city, and has a gate like the former; but the gate-way is ſo long that it grows dark in the middle. The arches of the gates are built of marble, and the reſt with large bricks, cemented with excellent mortar. The ditch is dry, but very broad and deep; and the city is as regularly defended by a ſtrong garriſon, as if the people were under the continual dread of a ſiege.

Moſt of the ſtreets are built in a direct line, the largeſt are about one hundred and twenty feet broad, and a league in length. The ſhops where they ſell ſilks and China-ware generally take up the whole ſtreet, and afford a very agreeable proſpect. Each ſhop-keeper places before his ſhop, on a ſmall kind of pedeſtal, a board about twenty feet high, painted, varniſhed, and often gilt, on which are written in large characters, the names of the ſeveral commodities he ſells. Theſe being placed on each ſide of the ſtreet, at nearly an equal diſtance from each other, have a very prety appearance; but the houſes are poorly built in front, and very low, moſt of them having only a ground floor, and none exceeding one ſtory above it.

Nothing can be more ſurpriſing than to behold the innumerable multitudes who crowd theſe ſtreets, without ſeeing one ſingle woman among them; and the confuſion occaſioned by a vaſt number of camels, horſes, mules, aſſes, chairs, waggons, and carts; without reckoning the crowds of one or two hundred men who, at a diſtance from each other, are gathered about fortune-tellers, players at cups and balls, ballad ſingers, or to hear a fellow read a comical ſtory to make them merry: or to liſten to the quack doctors, who diſtribute their medicines, and with many rhetorical flouriſhes explain their wonderful effects. Beſides, the ſtreets are always incommoded with either mud or duſt; hence both winter and ſummer are equally troubleſome to thoſe who walk abroad; for the dirt ſpoils their ſilk boots, and the duſt ſticks to their cloaths, eſpecially if they are made of ſattin, which they have a way of oiling to give it a greater luſtre. There is, indeed ſo much duſt raiſed by the multitude of horſes, that the city is conſtantly covered with a cloud of it, which gets into the houſes and penetrates into the cloſeſt cloſets; ſo that, notwithſtanding all their care, their goods are full of it. Indeed they ſtrive to alleviate this inconvenience by continually ſprinkling the ſtreets, but ſtill there is ſo much left as is prejudicial both to health and cleanlineſs.

Of all the buildings in this great city the moſt remarkable is the imperial palace, the grandeur of which does not conſiſt ſo much in the nobleneſs and elegance of the architecture, as in the multitude of its buildings, courts, and gardens, all regularly diſpoſed; for within the walls are not only the emperor's houſe, but a little town, inhabited by the officers of the court and a multitude of artificers employed and kept by the emperor; but the houſes of the courtiers and artificers are low and ill contrived.

The inner palace contains nine courts built in one line, without mentioning the wings which contain the kitchens, ſtables, and other offices. The arches through which you paſs from one to the other are of marble, and over each is a large ſquare building, in a kind of Gothic taſte, for the timbers of the roof projecting from the wall are formed by other pieces of wood into a kind of cornice, that has a pretty appearance at a diſtance. The ſides of each court are joined by ſmaller apartments or galleries; but on coming to the emperor's lodgings, the porticoes, ſupported by ſtately pillars, the gilt roofs, the carved work, varniſh, gilding, and painting of the halls, the marble ſteps by which you aſcend to them, and more particularly the great number of different pieces of architecture of which they conſiſt, appear extremely ſplendid. The whole is covered with ſhining tiles of ſuch a beautiful yellow, that at a diſtance they ſeem as bright as if they were gilt. Another roof, as ſplendid as the former, ſprings from the wall and ranges round the buildings, ſupported by a multitude of beams, joiſts, and ſpars, japanned with gold flowers on a green ground. The terraces on which the apartments are built,

ontribute to give them an air of grandeur; they are fifteen eet high, cased with white marble, and adorned with alluſtrades of pretty good workmanſhip, open only at the teps, placed on each ſide, and in the middle and corners f the front; but the aſcent in the middle is only a ſlope f marble, with neither ſteps nor landing-place. No perſon is permitted to paſs this way into the apartments; the mperor alone is carried through in his covered chair, on days of ceremony.

The hall appointed for ceremonies has on the platform before it large brazen veſſels, in which perfumes are burnt during any ceremony; and alſo candleſticks, in the ſhape of birds, large enough to hold flambeaux. This hall is about one hundred and thirty feet in length, and almoſt ſquare; the ceiling is carved, japanned green, and adorned with gilt dragons. The pillars that ſupport the roof are at the bottom 6 or 7 feet in circumference, incruſted with a kind of paſte, and japanned red. The pavement is in part covered with an ordinary ſort of carpets, in imitation of thoſe of Turky; but the walls are deſtitute of all ornaments, they are well whitened, but have neither tapeſtry, paintings, looking-glaſſes, nor ſconces. In the middle of this room is a throne, under a lofty alcove, very neat, but neither rich nor magnificent. There are other leſſer halls, concealed by the former; one of them is a pretty circular room, with windows all round, and is adorned with japanned work of various colours; the other is of an oblong form.

On viewing theſe buildings the different pieces of architecture dazzle the eyes of the beholder, but the imperfect notion the Chineſe have entertained of all the arts, is ſhewn by the moſt unpardonable faults. The ornaments are not only irregular and puerile, but the apartments are ill contrived, and want that connection which forms the beauty and convenience of the European palaces, and cannot fail of diſguſting all who have the leaſt ſkill in architecture.

The guards at the gates and the avenues have no other arms but their ſcymitars. The whole palace was formerly inhabited by eunuchs, whoſe power and inſolence at length grew to ſuch a height, that they became inſupportable to the princes of the empire; but the laſt emperors deſcended from Tartary have ſo humbled them, that the youngeſt are obliged to ſerve as pages, while the taſk of the others is to ſweep the rooms and keep them clean; and for the leaſt fault they are ſeverely puniſhed.

The emperor's houſe is the only one in Pekin that deſerves the name of a palace; the others are extremely mean, and none of thoſe of the grandees exceed one ſtory high; however, the many rooms for themſelves and their ſervants make ſome amends for their want of magnificence. The Chineſe nobility, like thoſe of other nations, are fond of making a ſplendid appearance; but, with reſpect to their houſes, they are curbed by the cuſtoms of their country. Le Compte obſerves, that while he was at Pekin, one of the principal mandarines cauſed a houſe to be erected for himſelf, that was more lofty and magnificent than the reſt; for this ſuppoſed crime he was accuſed before the emperor; when, being afraid of the conſequence, he pulled it down while the affair was under examination.

Among the moſt remarkable buildings is the imperial obſervatory, of which ſome of the miſſionaries have been extremely laviſh in their praiſes. Le Compte ſays he conceived an high idea from their deſcriptions of this famous place, but was much diſappointed on ſeeing it. In going to it he and his friends entered a court of moderate extent, where they were ſhewn the dwelling-houſe of thoſe who have the care of the obſervatory; then aſcending a narrow ſtair-caſe, they reached the top of a ſquare tower, joined on the inſides to the walls of Pekin, and raiſed ten or twelve feet above the bulwarks. Upon this platform the Chineſe aſtronomers had placed their inſtruments, which, though but few, took up the whole ſpace; but Father Verbieſt, having thought them uſeleſs, had prevailed on the emperor to pull them down, and to have new ones ſet up of his own contriving: the old ones were therefore in a hall near the tower, buried in duſt and oblivion. Le Compte ſaw them through a window ſecured with iron bars, and they appeared large and well caſt; he had, however, an opportunity of examining more narrowly a celeſtial globe, of about three feet diameter, left in a bye court; when he found that it was of a form inclining to an oval, divided with little exactneſs, and the whole work very coarſe. The Chineſe would never have been perſuaded to leave theſe old inſtruments, and make uſe of thoſe ſet up by the prieſt, which are infinitely ſuperior to them, without the expreſs orders of the emperor; for they are more fond of the moſt defective pieces of antiquity, than of the moſt noble improvements.

But to return to the deſcription of Pekin in general. All the riches and merchandize of the empire are continually pouring into this city. It is uſual to be carried in a chair, or more commonly to ride through the ſtreets, and chairs and hackney horſes are eaſily procured. For a ſhilling or fifteen-pence one may hire a horſe or mule for a whole day; and, as all the ſtreets are filled by great crowds of people, the owner often leads his beaſt by the bridle, in order to make way. Theſe people know exactly the ſtreet and houſe where every conſiderable perſon lives: there is alſo a book which gives an account of the place of reſidence of every one who has a public employment.

All the great ſtreets, which are drawn by a line from one gate to another, have ſeveral guards both for day and night; the ſoldiers walk with their ſwords by their ſides and whips in their hands, in order to chaſtiſe thoſe who raiſe any diſturbance; and they have power to take into cuſtody whomever they find quarrelling.

The little ſtreets, which extend into the greater, have gates in the manner of a lattice, which do not prevent ſeeing all that paſs along; they are guarded by the ſoldiers placed over againſt them in the great ſtreet; and there are others on duty in the middle of moſt of thoſe ſmall ſtreets. The lattice-gates are ſhut at night by the guard, and are ſeldom opened except to perſons who are well known, who carry a lanthern in their hand, and are able to give a good account of the motives of their appearing in the ſtreets, as that they were going to fetch a phyſician, or the like.

At the firſt ſtroke given by the watch on a great bell, a ſoldier or two comes and goes from one guard to the other, and as they walk along continually play on a ſort of rattle; the guard muſt alſo anſwer every call of the centinel on duty. The governor himſelf is obliged ſometimes to walk round the town, when his preſence is leaſt expected; and alſo the officers who keep guard on the walls, where they beat the hour on large drums of braſs, and ſend ſubalterns to examine the quarters that belong to their reſpective gates: the leaſt neglect is puniſhed the next day, and the officer is broke.

This exact diſcipline, which prevents all nocturnal aſſemblies, is expenſive to the emperor, for a great number of ſoldiers are kept intirely to take care of the cities; they are all foot, and have large pay. Beſides their watching night and day, it is their duty to ſee that every perſon cleans the ſtreet before his door; that it is ſwept every day, and in dry weather watered morning and night; and that the dirt be taken away after rain. The ſtreets being very wide, one of their chief employments is to labour at keeping the middle of the ſtreets clean, for the convenience of paſſengers: after they have taken up the dirt, they level the ground; for the city is not paved.

To preſerve order in the cities, they are divided into wards, each of which has a principal, who takes care of a certain number of houſes, and is anſwerable for every thing that happens within his diſtrict; and if any tumult ſhould be raiſed, and the mandarine not be immediately informed of it, he would be ſeverely puniſhed.

Maſters of families are equally reſponſible for the conduct of their children and ſervants, and perſons in authority are eſteemed guilty when thoſe who ſhould pay them obedience and reſpect have committed a crime; even the very neighbours themſelves are obliged to lend their mutual aſſiſtance, whenever any misfortune happens, or any crime is committed.

If a quarrel happens among the populace, and they come to blows, they take care to ſhed no blood; and therefore if they chance to have any weapon of ſteel in their hands, they lay it aſide, and uſe only their fiſts. They frequently put an end to their conteſts by complaining to the mandarine, who ſitting in his chair of ſtate, ſurrounded by his inferior officers, coolly hears both parties plead their cauſe; after which he ſentences the culpable perſon to be baſtinadoed in his preſence, and ſometimes both together.

There

There are common proſtitutes in China as well as in other countries; but as they naturally cauſe diſturbances, they are not permitted to live within the walls of the city. The houſes they inhabit are of a particular kind, and ſeveral of them lodge together, generally under the management of a man, who is anſwerable for any diſorder they ſhall occaſion: yet, notwithſtanding this, lewd women are ſcarcely tolerated; for ſome governors of cities will not permit them to live within their diſtrict.

A good guard is always kept at the gates of every city, who examine all paſſengers that enter in; eſpecially if any ſingularity renders them ſuſpected; ſo that if their countenance, air, or accent, raiſes a ſuſpicion of their being ſtrangers, they are immediately ſtopped, and notice ſent to the mandarine. It is one of their principal maxims, which they believe greatly contributes to good government, that foreigners ought not to be ſuffered to ſettle in the empire; for, beſides their hatred and contempt of other nations, they are perſuaded people of different countries would introduce a diverſity of manners and cuſtoms, which would gradually bring on perſonal quarrels, that would end in parties, and proceed to rebellions fatal to the tranquillity of the empire.

SECT. IX.

Of the Chineſe Junks and Barks, with their Method of raiſing the Barks up the Torrents of the Sluices of the Canals; of their hauling them from one Canal to another; and the Manner in which they ſail down the Cataracts of the Rivers. Of their Floats, and of the Mariners Compaſs uſed by the Chineſe.

THE Chineſe junks are in every reſpect inferior to our ſhips, few carrying more than from two hundred and fifty to three hundred tons, and are properly only wide barks, about eighty or ninety feet in length, with two maſts. The fore part is not made with a beak-head, but is ſplit and riſes up in the manner of two wings or horns, which has an odd appearance. The ſtern is ſplit in the midde, in order to afford ſhelter for the rudder in a high ſea. This rudder, which is about five or ſix feet broad, may eaſily be raiſed or lowered by means of a cable that is faſtened to it from the ſtern. Theſe veſſels have neither mizen-maſt, bow-ſprit, nor ſcuttle, but only a main-maſt and fore-maſt; to which they ſometimes add a top-maſt, that is of little uſe. Their main-maſt and fore-maſt are placed very near each other, and their proportion is commonly as two to three; and the height of their main-maſt is uſually two-thirds of the whole length of the veſſel.

Their maſts, ſails, and rigging are extremely rude; for their maſts are made of trees no otherwiſe faſhioned than by barking them, and lopping off their branches. Each maſt has only two ſhrouds of twiſted rattan, which are often both ſhifted to the weather ſide; and the halyard, when the yard is up, ſerves inſtead of a third ſhroud. The ſails are of mat, ſtrengthened every three feet by an horizontal rib of bamboo; they run up the maſt with hoops, and when they are lowered down, fold upon the deck.

Theſe veſſels are not caulked with pitch and tar, but with a particular kind of gum, mixed with lime and the threads of raſped bamboo, and, by means of a well or two at the bottom of the hold, they keep the veſſel pretty dry, by drawing out the water in buckets; for they are unacquainted with the uſe of pumps. Their anchors are not made of iron, like ours, but of iron-wood; and they pretend that they are much more ſerviceable than thoſe of iron, becauſe they will not bend: however, the two ends are commonly tipt with iron. Theſe veſſels are very indifferent ſailers, though they hold much more wind than ours, becauſe of the ſtiffneſs of the ſails, which do not yield to the gale.

The traders carry no cannon, and appear utterly incapable of reſiſting any European armed veſſel. Nor is the ſtate provided with ſhips of conſiderable force, or of a better conſtruction, to protect their merchant-men; for at Canton, where their principal naval power is doubtleſs ſtationed, commodore Anſon ſaw no more than four men of war junks, of about three hundred tons burthen, of the make already deſcribed, and mounted with only eight or ten guns, the largeſt of which did not exceed a four pounder.

The barks appointed to carry the mandarines into the provinces, are flat-bottomed; they are of three ſorts, and ſome of them are very large and neat, being painted, gilt, embelliſhed with dragons, and japanned both within and without. Thoſe of the middle ſize are moſt in uſe, and are about twenty-four feet long, ſixteen broad, and nine in depth from the deck. Beſides the cabbin of the maſter of the bark, who has his family, his kitchen, two rooms, one before and another behind, there is a hall about ſix or ſeven feet high, and eleven broad; an antichamber, two or three other rooms, and a by-place without ornaments, which form the mandarine's apartment, and are all upon the ſame deck. It is all coloured with red and white japan, and adorned with carved work, painting, and gilding upon the cieling, and on the ſides; the tables and chairs are japanned with red and black; the hall has windows on each ſide, which may be taken away at pleaſure. Inſtead of glaſs they make uſe of very thin oyſter-ſhells, or fine ſilk glazed with tranſparent wax, and adorned with painted trees, flowers, and a variety of figures. The deck is ſurrounded with galleries, through which the ſailors paſs and repaſs, without incommoding the paſſengers. This apartment is covered with a kind of platform, open on all ſides, and upon it ſit four or five muſicians, who make a harmony that can raviſh no ears but thoſe of a Chineſe. The hold is divided into ſeveral apartments that contain the baggage. The ſails, as in the other veſſels, are made of mats.

To force on the great barks, they alſo make uſe of long thick poles, or elſe of oars of ſeveral ſhapes. Theſe are commonly poles, with a broad end, and a hole in the middle to receive the pegs fixed on the ſides of the bark: there are others that are never taken out of the water, but are moved to the right and left, and reſemble the motion of a fiſh's tail. When the winds are contrary, or they are obliged to go againſt a rapid ſtream, they are drawn along with ropes, which are generally formed of canes made into threads.

The bark that carries a great mandarine, has always a ſmall and light one appointed to go before, to give notice, that all things neceſſary may be prepared in the paſſage; and he is always followed by ſeveral others, one of which contains his kitchin, eatables, and cooks, and another is full of ſoldiers. All theſe barks have their rowers, and, in caſe of neceſſity, are alſo drawn with ropes along the bank, by a number of men that are ſupplied by the mandarines of each city, and are changed every day.

When a number of mandarines go together, which is often the caſe, they ſpend their time very agreeably; they viſit each other almoſt every day, without being troubled with ridiculous ceremonies, and mutually treat each other. This ſociety appears the more agreeable from its not being forced and conſtrained as in other places, by the incumbrances of nice ceremonies, nor ſubject to thoſe ſuſpicions that a free correſpondence would infalibly create, were they to act with ſuch freedom in the cities.

There are an infinite number of barks belonging to private perſons, and ſome that are very convenient, are let out to learned or wealthy men who have a mind to travel; others that are of a larger ſize are uſed by the merchants in commerce: beſides, there are a prodigious multitude of other barks, in which whole families reſide, and have no other habitation. In the ſmalleſt ſort of theſe, where there are no cabbins, they uſe thin mats about five feet ſquare, which they ſet up in the form of an arched roof, to defend them from the rain and heat of the ſun.

Some of the barks reſemble a kind of gallies, and are proper for ſailing on the rivers, ſea coaſts, and among the iſlands. Theſe are as long as our trading ſhips of three hundred and fifty tons, but they draw only two feet water; their oars are of a great length, and do not lie a-croſs the ſides of the bark, like thoſe in Europe, but are ſupported on the outſide, almoſt in a parallel line to the body of the veſſel; hence the oars are eaſily moved, and they go very ſwiftly.

The merchants who trade in timber and ſalt are eſteemed the richeſt in all China. Theſe merchants cauſe the timber to be cut down in the mountains, when being ſawed into beams, planks,

planks, and boards; it is brought to the ſide of the rivers; they then bore holes in the ends of the pieces, and faſtening them together, form floats five feet high, ten broad, and of any length, there being ſome that extend half a league. The ſeveral parts of the raft thus joined, move eaſily any way, like the links of a chain, and are guarded by four or five men on the fore part with poles and oars; while others, placed at equal diſtances along the ſides, help to conduct it. Upon theſe rafts they build from ſpace to ſpace booths or houſes, covered with boards or mats, where they dreſs their proviſions, ſtow their moveables, and take their reſt. In the different cities at which they touch they ſell theſe houſes along with their timber. They float above ſix hundred leagues when they convey the timber to Pekin.

If the Chineſe, as it is affirmed, be the firſt inventors of the mariner's compaſs, they have hitherto made little advantage of that admirable diſcovery, but ſteer their courſe by a card of a very ſimple make. The rim of the box is divided only into twenty-four points, inſtead of thirty-two and is placed upon a bed of ſand. They direct the head of the ſhip to the rhumb they deſign to ſteer upon, by the help of a ſilken thread, which divides the ſurface of the card into two equal parts. For inſtance, to ſail ſouth-eaſt, they put this rhumb parallel to the keel of the ſhip, and then turn the veſſel till the needle point to north-weſt, marked on the rim. The needle of the largeſt compaſs is about three inches long, one end of which has a kind of flower de luce, and the other a trident. The Chineſe are ſo abſurdly ſuperſtitious as even to worſhip the compaſs, to offer it incenſe, and place meat before it.

Though the Europeans greatly exceed the Chineſe in the art of navigation in the open ſea, yet upon rivers and canals they have a particular ſkill that we are not maſters of. In the canals are ſluices made to retain the water, and theſe they are able to aſcend and deſcend, which cannot be done without great art and conſiderable danger. One of theſe ſlucies is called by the Chineſe The queen and miſtreſs of heaven, on account of its extraordinary height; and yet up this great fall of water the barks are drawn by four or five hundred watermen, or more if required, many of whom haul by a great number of ropes faſtened to the prow, while others labour at capſtans placed upon the walls of the canal. When the ropes are all faſtened they begin to haul up the ſluice leiſurely by the ſound of the baſon, on which they at firſt ſtrike ſlowly, till near half of the bark is raiſed above the upper channel; and then beating faſter on the baſon, all the watermen haul together, and at one pull mount the veſſel up and ſecure it in the dead water, between the ſides of the canal and the current.

The barks deſcend this fall with more ſpeed and eaſe, but with much greater danger. To prevent any accident men on each ſide hold ropes faſtened to the bark, and give them way or hold them tight as they ſee occaſion. There are others in the veſſel with long poles to keep her in the middle of the canal. As ſoon as ſhe has got down into the lower ſtream, the ropes are let go, and ſhe ſhoots forward with the ſwiftneſs of an arrow ſhot from a bow.

Le Compte obſerves, that in ſome places where the waters of two canals have no communication with each other, they make the barks paſs from the one to the other up a ſlope fifteen feet high: for at the end of the upper canal they have built a double glacis or ſloping bank of free-ſtone. When the bark is in the lower channel, they, by the help of capſtans, hoiſt it up the firſt glacis, till being raiſed to the top it falls by its own weight down the ſecond glacis into the water of the upper channel, where it ſcuds away with great ſwiftneſs for ſome time. After the ſame manner they cauſe it to deſcend from the higher to the lower canal. Le Compte expreſſes his ſurprize, that theſe barks, which are commonly very long and heavy laden, eſcape being broke in the middle, when poiſed in the air upon this acute angle; yet he never heard of any ill accident of that kind: all the precautions taken by the people when they do not chooſe to go aſhore is to tie themſelves faſt to ſomething on board, for fear of being thrown down or toſſed out of the veſſel.

Beſides the ſteep water-falls in the canals, there are certain rivers that flow with prodigious rapidity acroſs abundance of rocks, for the ſpace of ſeventy or eighty leagues together, forming a moſt rapid and dangerous current.

In the province of Fo-kien there is a river in which the cataracts are continual, and the people ſail eight or ten days in perpetual danger of periſhing, the torrents being broken by a thouſand points of rock that ſcarce leave breadth ſufficient for the paſſage of the barks. There are nothing but turnings and windings, while the contrary currents daſhing againſt each other, hurry the bark along with ſurpriſing velocity. You are always within two feet of ſhelves, that in avoiding one you fall foul upon another, unleſs ſecured by the ſurpriſing ſkill of the pilot. No people in the world, except the Chineſe, are capable of undertaking ſuch voyages; yet, notwithſtanding all their addreſs, ſcarcely a day paſſes in which ſome veſſel is not loſt, and it is a wonder that they do not all periſh.

The barks they make uſe of are built with very thin light timber, that they may be more eaſily managed, and are divided into five or ſix apartments, ſeparated by ſtrong partitions; ſo that when they ſtrike upon a rock only one diviſion is filled with water, while the other parts remaining dry afford time to ſtop the leak. To check the rapidity of the motion where the water is not too deep, ſix ſeamen, three on each ſide, hold a long pole againſt the bottom, and by means of a ſmall rope give way by little and little; or one end being faſtened to the bark, and the other twined round the pole, it ſlips leiſurely; and by a continual rubbing, ſlackens the motion of the veſſel: ſo that if the torrent be ever ſo rapid, yet, if it be even and uniform, you float with the ſame ſlowneſs as if you were on the calmeſt canal.

When the ſtream winds and turns they have recourſe to a double rudder, ſhaped like an oar, forty or fifty feet long, one at the head and the other at the ſtern. All depends on plying theſe two great rudders: the reciprocal jerks they give the bark to drive it on or turn it into the current, to ſhun the rocks, or cut a torrent, and to purſue a fall of water, without running headlong with it, whirl it about a thouſand different ways. It is not navigation, ſays Le Compte, it is a manage, for no managed horſe labours more under the hands of a riding-maſter, than the bark does under thoſe of the Chineſe mariners; ſo that when caſt away, it is not ſo much for want of ſkill as ſtrength: for did each of them, inſtead of eight men, carry fifteen, all the violence of the torrents would not be able to hurry them away.

SECT. X.

In what Manner the preſent Tartarian Family aſcended the Throne of China. The Authority amd Power of the Emperor, his Revenue, and Forces. The Pomp in which he appears whenever he goes out of the Palace; and when he goes to make his Offerings at the Temple of Tien.

NOTWITHSTANDING the great antiquity and power of the Chineſe empire, it was ſubdued by a foreign power but little more than a hundred and twenty years ago, when the king of Tartary made himſelf maſter of that crown. This conqueſt, through the various factions which divided the court and the empire, was made with ſurpriſing facility. The greateſt part of the imperial army was then employed near the great wall in repulſing the king of the Manchews, a nation of the Eaſtern Tartars. That prince, in order to revenge the injuſtice which his ſubjects had received in their trade with the Chineſe merchants, and the little regard the court had ſhewn to his complaints, had entered into Leao-tong at the head of a formidable army, and begun a war that laſted ſeveral years, with various ſucceſs on both ſides.

Mean while the emperor Tſong-tching lived in tranquillity in his capital, while the unjuſt puniſhments he had inflicted on one of his principal miniſters, his exceſſive ſeverity, and his war with the Tartars, which prevented his eaſing the people by leſſening their taxes, created a multitude of malecontents, not only in the provinces, but in the capital.

At this juncture a Chineſe in the province of Se-tchuen named Li-cong-tſe, a bold and enterpriſing man, put himſelf at the head of a conſiderable number of rebels; and his army increaſing daily, he ſoon took ſeveral large towns, conquered ſome of the provinces, and gained the affection

of the people by eaſing them of their taxes, by removing ſeveral magiſtrates, and placing in their ſtead others in whom he could confide, whom he ordered to treat his ſubjects with mildneſs; but on the other hand, he plundered every city that oppoſed him, and gave the plunder to his ſoldiers.

Having enriched himſelf with the ſpoils of the delightful province of Ho-nan, he entered into that of Chen-ſi, and there aſſumed the title of emperor, under the name of Tien-chun, which ſignifies obedient to heaven, in order to perſuade the people that he was appointed by heaven to deliver them from the cruelty and oppreſſion of the miniſters.

The rebel heard of the factions and diviſions which ſubſiſted among the mandarines; he was informed that moſt of the troops had been ſent to the frontiers of Tartary; and that ſeveral of the chief officers who remained at Pekin, prevailed on by his bribes, had conſented to receive him. Upon this intelligence he privately ſent many of his beſt ſoldiers, diſguiſed like merchants, into that city, and gave them money to ſet up ſhops, that they might be ready to join him when he ſhould appear before the walls.

The ſucceſs anſwered his expectation; for, on his marching to Pekin, one of the gates was opened to him, and he entered the city in triumph, meeting only with a faint reſiſtance from a few of the emperor's ſoldiers, which he immediately revenged by a cruel ſlaughter of the citizens. He now marched directly to the palace, and had forced the wall by which it is ſurrounded, before the emperor was informed of his having entered the city. That unfortunate monarch, then finding that he was betrayed, would have marched out againſt him with ſix hundred guards, who ſtill remained with him; but he had no ſooner made this propoſal, than they all abandoned him: then dreading his falling into the hands of his enemies, as the greateſt of all evils, he retired into a garden with his only daughter; and having wrote with his blood theſe words on the border of his veſt, "My ſubjects have baſely forſaken me. Spend "thy rage on my body, but ſpare my people;" he firſt ſtabbed the princeſs his daughter, and then hanged himſelf on a tree.

The chief colao, the queens, and the moſt faithful eunuchs followed his example, and ſlew themſelves. The emperor's body, after a long ſearch, was brought before the tyrant, ſeated on a throne; who, after treating it with indignity, cauſed two of the emperor's children and all his miniſters to be beheaded, but his eldeſt ſon eſcaped by flight.

After his death all ſubmited to the uſurper, who, in order to eſtabliſh himſelf on the throne, put ſeveral of the chief mandarines to death, and exacted ſeveral conſiderable ſums from others. There was none but Ou-ſan-guey, general of the forces on the frontiers of Tartary, who refuſed to acknowledge him emperor. This general had a father called Ou, who then lived at Pekin, whom the emperor ſent for, and gave orders that he ſhould follow him. He immediately put himſelf at the head of a conſiderable army, in order to reduce the Chineſe general, who had retired into one of the towns in the province of Leao-tong. After he had for ſome time carried on the ſiege, he ordered the general's father to be brought before the walls loaded with irons, and threatened the general, that if he refuſed immediately to ſubmit and ſurrender the place to him, he would cut his father's throat before his face.

But Ou-ſan-guey, preferring the good of his country to his duty and filial tenderneſs, ſuffered his father to be thus murdered, while the old man highly extolling the fidelity of his ſon, ſubmitted with an heroic courage to the rage and fury of the tyrant.

This cruelty provoked the general to ſeek for revenge; but knowing that it would be difficult for him long to reſiſt the efforts of the uſurper, he applied to the king of Tartary, with whom he had been at war, and not only concluded a peace with him, but prevailed on him to march againſt the uſurper with all his forces.

Tſong-te, the Tartarian prince, influenced more by ambition than by the bribes offered by the Chineſe general, willingly accepted the propoſal, and the very ſame day appeared at the head of eighty thouſand men. The uſurper, being informed of this union, did not dare to encounter two ſuch great generals; but retiring in haſte to Pekin, loaded ſeveral chariots with the moſt valuable goods he found in the palace, and then ſetting it on fire, fled into the province of Chen-ſi, where he concealed himſelf with ſuch care, that the place of his retreat could never be found; though part of the plunder he carried off fell into the hands of the Tartarian ſoldiers. This revolution happened in the year 1644.

The young prince, being conducted to Pekin, was received with great acclamations of joy; for the people looking upon him as their deliverer, nothing was heard on all ſides but "Long live the emperor! may he live ten thou-"ſand years."

The exaſperated Ou-ſan-guey found too late the error he had committed, in ſending for the Tartars to chaſtiſe the tyrant, and would ſometimes ſay, That he had brought lions to drive away dogs. He, however, received the dignity of king from the hands of Chun-tchi, with the title of peace-maker of the weſt, and the town of Si-ngan-fou was aſſigned him for his reſidence.

Though Chun-tchi aſcended the throne at Pekin with ſuch applauſe, yet the ſouthern provinces took up arms againſt him, and ſeveral of the grandſons of the preceding emperor aſpiring to the throne periſhed. The Tartars, though ſometimes defeated, maintained their footing in China againſt all who oppoſed them. At length a Chineſe leader, of a moſt cruel and ſanguinary diſpoſition, ravaged the weſtern provinces, and the ſtorm of his fury fell on the province of Se-tchuen. He behaved with humanity to none but his ſoldiers, whom he treated with great familiarity. He put to death the king of the capital of the above province, and for every trifling fault committed by a ſingle man, murdered all who lived in the ſame ſtreet; five thouſand eunuchs were ſlain becauſe one of them had not given him the title of emperor: having called fifteen thouſand literati to an examination, they were no ſooner aſſembled than he cauſed them all to be aſſaſſinated, under the pretence that by their ſophiſms they incited the people to rebel. Upon his leaving the city of Tchin-tou-fou he cauſed all the inhabitants to be brought out in chains, and maſſacred in the fields. He ordered all his ſoldiers to kill their women, becauſe they were only troubleſome in war, and ſet them an example by cutting the throats of three thouſand of his own, reſerving only twenty to wait on his three queens. In ſhort, he burnt the capital of Se-tchuen, and ſeveral other towns. But as he was preparing to engage the Tartars, he was told that five warriors were ſeen upon the hills at ſome diſtance, he immediately went to reconnoitre them, without putting on his breaſt-plate; and no ſooner came in ſight of them than he was ſhot through the heart with an arrow. His army then diſperſed, and the people receiving the Tartars as their deliverers, joyfully ſubmitted to their yoke.

There were yet, however, four provinces in the ſouth under the government of the Chineſe; againſt which the court ſent three different armies. The next year died Amavan, uncle and tutor to the emperor, who then took the government into his own hands, though he was but fourteen years of age; and after a ſeries of ſucceſſes and diſappointments, at length became ſovereign of all China.

Chun-tchi ſoon gained the love of the Chineſe. Inſtead of imitating the Chineſe emperors, by ſhutting himſelf up in his palace, he began his reign with ſhewing himſelf in public, and giving free acceſs to his perſon. As he was ſenſible the Tartars were much inferior to the Chineſe in number, he obliged the Chineſe to cut off their hair, leaving only one lock on the crown of the head, and to change their habits to thoſe of the Tartars, that it might not be diſcovered how few they were in compariſon of the Chineſe. All the Chineſe ſoldiers who inliſted among his troops were alſo obliged to appear like the Tartars. But what contributed ſtill more to the eſtabliſhment of the Tartarian family, was his employing the Chineſe both in civil and military affairs; he advanced the moſt popular of the grandees to be viceroys and governors of provinces; remitted one-third of the taxes; governed the Chineſe by their own laws; and, inſtead of changing their language, he would not even ſuffer a Chineſe to learn the Tartarian tongue without a particular licence.

Thus he united the Chineſe and Tartars into one nation; and by this union the latter ſeem rather to have ſubmitted

to

to the laws of the former, than to have impoſed any upon them. In reality, Tartary is become ſubject to China, which ſtill holds the ſeat of empire, and has the ſupreme courts of juſtice. Thither flows all the wealth of the united kingdoms; and there all honours are conferred. Thus China has gained a great addition of ſtrength from Tartary, and has now no enemy to fear. Their northern neighbours are under the ſame ſovereign, who keeps them in ſuch ſubjection, that they are no longer able to diſturb the repoſe of the empire. Many of the petty kings of Tartary are no more than his viceroys, and the emperor has forts and garriſons throughout their whole country. In ſhort, Tartary, inſtead of becoming the ſeat of government, is the place of baniſhment for the guilty, who are ſent thither with their families to people thoſe vaſt deſarts, that the children who are born there may become accuſtomed to hardſhips, and loſe the ſoftneſs and puſillanimity of the Chineſe, in the rougher temper and manners of the Tartars.

The emperor has an abſolute authority, and the reſpect paid him is a kind of adoration; his commands are as readily and as ſtrictly obeyed as if they came from heaven, nor are any admitted to ſpeak to him but on their knees; not even his elder brother, unleſs it be at his command. None, except the lords who attend him, are allowed to ſtand in his preſence; but when they ſpeak to him, they put only one knee to the ground.

The officers receive the ſame honours when they repreſent the emperor's perſon, and give his orders, either as mandarines of the preſence or as envoys. His governors alſo receive the ſame honours when they adminiſter juſtice, becauſe they are his repreſentatives. Indeed ſuch reſpect is paid to the emperor, that the princes of the blood, and all the the grandees of the court, not only kneel before him, but before his chair, his throne, his cloaths, and every thing made for his particular uſe.

Perſons of the higheſt rank are not allowed to ride on horſeback or to paſs in a chaiſe before the gates of his palace, but are obliged to alight at a place appointed for that purpoſe. If the emperor falls dangerouſly ill it creates a general alarm, the mandarines aſſemble in one of the courts of the palace, and paſs whole days and knights without regard to the inclemency of the air or the rigour of the ſeaſon, imploring heaven on their bended knees to reſtore his health.

Yellow is the imperial colour, and none muſt wear it but the emperor and thoſe who attend his perſon. His veſt is adorned with dragons that have five claws: this is his coat of arms, and nobody elſe muſt bear them. He has the diſpoſal of the lives and fortunes of his ſubjects, nor can any criminal ſuffer death till he has confirmed the ſentence.

The princes of the blood are allowed a palace and a court, and have a revenue agreeable to their rank. They are obliged to live at court, but have not the leaſt degree of power. The emperor alone diſpoſes of all places in the empire. He nominates the viceroys and governors, and diſplaces them at his pleaſure. He chooſes which of his ſons he pleaſes for his ſucceſſor; and if he prefers to the eldeſt one of more diſtinguiſhed merit, his name becomes immortal.

In order to preſerve their reputation, the emperors are continually inquiring into the ſtate of the empire, affecting a kind of paternal care for their people; particularly when any of the provinces are afflicted with calamities, the emperor ſhuts himſelf up in his palace, abſtains from all pleaſures, and publiſhes decrees to eaſe ſuch provinces of their uſual taxes.

The ſeals of the empire are conſiderable enſigns of the imperial authority, and are applied to authorize all public acts. The emperor's ſeal is near eight inches ſquare, and is a very fine jaſper; a precious ſtone ſo highly eſteemed in China, that none but the emperor is allowed to uſe it. The honorary ſeals given to the princes of the blood are of gold; thoſe of the viceroy, great mandarines, or magiſtrates of the firſt order are of ſilver; while thoſe of the inferior mandarines are either of braſs or lead, and are either larger or ſmaller, according to the dignity of thoſe magiſtrates.

Theſe ſeals are carried before the mandarines when they perform any ceremony, or viſit perſons to whom they would ſhew reſpect; they are then depoſited in a gold box, placed upon a kind of litter, ſupported by two men, who walk before the chair of the mandarine.

The revenues of the emperor are amazingly great; but it is not eaſy to give an exact account of them, becauſe the annual tribute is paid partly in money and partly in commodities; it particularly ariſes from the produce of their lands, as rice, wheat, and millet: from ſalt, ſilks, ſtuffs, linen, cotton, with innumerable other articles. All theſe, together with the cuſtoms and forfeited eſtates, annually amount to above twenty-one millions ſterling.

The troops he conſtantly keeps in pay amount to above ſeven hundred and ſeventy thouſand ſoldiers; theſe are ſtationed near the great wall, and other fortified places; a part of theſe alſo compoſe his guards, and thoſe of the mandarines, whom they eſcort on their journeys, and at night keep watch about their barks or at their inns. The emperor likewiſe maintains near five hundred and ſixty-five thouſand horſes to remount his cavalry, and for the uſe of the poſts and couriers who convey his orders, and thoſe of the tribunals, into the provinces.

The emperor enjoys the right of making peace and war, and he may conclude treaties upon what conditions he pleaſes, provided they are not diſhonourable to the empire.

It might be imagined that this unlimited power would often occaſion very unfortunate events; this has been ſometimes the caſe, but not often, for ſo many proviſions have been made by the laws, that a prince muſt be wholly inſenſible to his own reputation and intereſt, who continues to make an unjuſt uſe of his authority. If he has any regard to his reputation, there are ſeveral things which muſt induce him to govern with juſtice, and not from the dictates of paſſion. The old law-givers, from the firſt foundation of the government, made it a ſtanding maxim, that kings are the fathers of their people; whence in all ages the emperor has been called the great father: a title which he is taught to preſer before all others. This idea of the prince is ſo deeply imprinted in the minds of the people, and of the mandarines, that whenever they make any panegyrick in the emperor's praiſe, they always take notice of his affection to the people. Their teachers and philoſophers repreſent in their books the ſtate as a large family, and therefore if the prince loſes ſight of this maxim, though he may be a good warrior, an able politician, and a very learned man, yet he will meet with little eſteem from the people.

Every mandarine may tell the emperor his faults, provided it be done with all that ſubmiſion and humility that is agreeable to the veneration and profound reſpect which is his due. Here the mandarine, who obſerves any thing in the emperor's conduct inconſiſtent with the conſtitution of the empire, draws up a requeſt, where, having expreſſed his profound reſpect for his imperial majeſty, he moſt humbly beſeeches him to reflect upon the ancient laws and good examples of the great princes his predeceſſors, and then takes notice in what inſtances he apprehends the emperor has deviated from them. This requeſt lies upon a table among many other petitions that are daily preſented, and which the emperor is obliged to read. If upon this he does not change his conduct, he is again admoniſhed as often as the mandarine's zeal and courage will permit him to do it; for they cannot, without great danger, venture to expoſe themſelves to his reſentment.

Beſides the manner in which their hiſtories are wrote, is alone ſufficient to keep within bounds any prince who has the leaſt regard for his fame. A certain number of men, who are choſen on account of their learning and impartiality, remark with all poſſible exactneſs not only all the prince's actions, but even his words; and each of theſe perſons takes minutes of every thing that paſſes, without communicating his obſervations to the others, and puts the papers, containing his remarks, through a chink into an office ſet apart for that purpoſe.

The emperor's virtues and vices are ſet down in thoſe papers with impartiality. *In ſuch an affair*, ſay they, *the prince ſtopped the ſword of juſtice, and had the partiality to invalidate the ſentence paſſed by the magiſtrates. On ſuch a day the puniſhment he inflicted on a perſon was rather the effect of his paſſion, than the reſult of juſtice.* Or elſe, *At ſuch a time, notwithſtanding the commendations given him by his flatterers, he was ſo far from being puffed up, that his words were tem-*

pered

pered with all poſſible ſweetneſs and humility. He gave ſuch and ſuch marks of his love to his people.

Thus they ſet down every thing that occurs in his adminiſtration; but that neither fear on the one hand, nor hope on the other, may biaſs them to be partial in the account they give of the emperor, this office is never opened during the prince's life, or while any of his family ſit on the throne. When the crown paſſes into another line, which often happens, all theſe looſe memoirs are gathered together, and after having compared them, they from thence compoſe the hiſtory of that emperor; and if he has acted wiſely, propoſe him as an example to poſterity, or if he has been negligent of his duty, and acted inconſiſtently with the good of the people, expoſe him to the cenſure of the public.

The emperor has two ſovereign councils; one, called the extraordinary council, is only compoſed of princes of the blood; the other, called the council in ordinary, has, beſides the princes, ſeveral miniſters of ſtate, named Colaos who examine all ſtate-affairs, and make their report to the emperor, by whom they are finally determined.

On particular days the mandarines go in their proper habits to ſalute the emperor, when, if he does not appear himſelf, they pay their reverence to his throne, which is the ſame as if done to himſelf in perſon. While they wait for the ſignal to enter the court before the hall in which the throne is placed, they all ſit on cuſhions before the ſouth gate of the palace. The court is paved with brick and is as clean as a room, and the cuſhions are different according to the degree of the mandarine. Thoſe who have a right to uſe them, for all have not, diſtinguiſh them in the ſummer time by coloured ſilks, but the difference of the degree is chiefly ſhewn in the middle of the cuſhion. In the winter they uſe ſkins for the ſame purpoſe, which are diſtinguiſhed by their value. In this multitude, among whom one might expect nothing but confuſion and diſorder, every thing is admirably regulated according to the moſt exact order; for as all know their places there are no diſputes about precedence.

When the emperor goes out of his palace he is attended by a great number of the lords of his court, who make a very pompous proceſſion. The princes of the blood and the lords lead the van on horſeback, followed by the colaos or miniſters of ſtate, and the great mandarines; who ride cloſe to the houſes on both ſides, leaving the middle of the ſtreet clear; theſe are followed by four-and-twenty ſtandards of yellow ſilk, embroidered with dragons of gold; then appear twenty-four umbrellas of the ſame colour, and as many curious and rich fans; the horſe-guards come next, dreſſed in yellow, wearing a kind of helmet on their head, and carrying a javelin or half pike gilt, on the top of which is either a ſun, a creſcent, or the head of ſome animal. The emperor's chair, which is very magnificent, is carried by twelve footmen dreſſed in the ſame colour. A troop of trumpeters and muſicians, playing on all ſorts of inſtruments, accompany the emperor; and the proceſſion is cloſed by a multitude of footmen and pages.

The pomp with which he goes to make his offerings in the temple of Tien is ſtill more extraordinary. The proceſſion begins with twenty-four drums ranked in two files, and twenty-four trumpets formed of a wood greatly eſteemed by the Chineſe. They are about three feet long, and about eight inches in diameter at the end, adorned with circles of gold. After them follow twenty-four men in a line armed with red ſtaves ſeven or eight feet long, varniſhed and adorned with gilt foliages. Next to theſe are a hundred ſoldiers carrying halberts, the iron part of which terminates in a creſcent. Then follow an hundred men with red maces ornamented with flowers, and gilt at the end. Then advance four hundred very fine lanterns; four hundred flambeaux made of wood, which burn a long time and yield a very great light; two hundred men with ſpears, ſome adorned with tufts of ſilk of various colours, others with the tails of foxes, leopards, and other animals: twenty-four banners, on which are painted the ſigns of the zodiack, which the Chineſe divide into twelve parts: fifty-ſix other banners, whereon are repreſented the fifty-ſix conſtellations, to which the Chineſe reduce all the ſtars: two hundred fans, on which are painted various figures of dragons, birds, and other animals, theſe are ſupported by long gilt ſticks; twenty-four umbrellas richly adorned, and a beaufet ſupported by the officers of the kitchen, and furniſhed with gold utenſils, ſuch as ewers, baſons, &c. Then appears the emperor on horſeback richly dreſſed, and on each ſide is held a magnificent umbrella, large enough to ſhade both him and his horſe; he is ſurrounded with ten led horſes; theſe are always white, with the ſaddles and bridles enriched with gold and jewels; and alſo by a hundred ſpearmen, and pages of the bed-chamber.

After them the princes of the blood, the reguloes, the chief mandarines, and the lords of the court appear in the ſame order, and in their proper habits, together with five hundred young gentlemen belonging to the palace richly clad, followed by a thouſand footmen in red gowns bordered with flowers, and ſtars of gold and ſilver; immediately after thirty-ſix men carry an open chair, followed by another that is much larger and cloſe, ſupported by a hundred and twenty chairmen; then appear four large waggons, two of which are drawn by elephants, and two by horſes covered with embroidered houſings; every chariot and chair is followed by a company of fifty men to guard it. This proceſſion is cloſed by two thouſand mandarines of letters, and two thouſand mandarines of arms, or officers of war, richly dreſſed in their proper habits. The ſame order is always invariably obſerved.

Such is the power and grandeur of this great monarch, who is the ſoul that gives motion to the whole empire, and preſerves all ranks in a proper ſubordination.

SECT. XI.

Of the Nobility.

NONE but thoſe who belong to the reigning family have any title of diſtinction: theſe poſſeſs the rank of princes, in whoſe favour five honorary degrees of nobility are eſtabliſhed, much like thoſe of dukes, marquiſſes, earls, viſcounts, and barons in Europe. Theſe titles are granted to the children of the emperor, and to thoſe to whom he gives his daughters in marriage, who have revenues aſſigned them equal to their dignity, but not the leaſt power. When the founder of the preſent Tartarian family was ſettled on the throne, he conferred on his brothers, who were very numerous, and had contributed by their valour to the conqueſt of many countries, ſeveral titles of honour, to which the Europeans have given the appellation of reguloes or princes of the firſt, ſecond, and third rank, and it was then determined, that from among the children of every regulo one ſhould always be choſen to ſucceed his father in the ſame dignity.

The emperor alſo creates others of an inferior ſort, which are beſtowed on ſuch of the other children as are moſt worthy. But though thoſe of the fourth and fifth ranks are above the greateſt mandarine in the empire, they have nothing to diſtinguiſh themſelves from the mandarines, either in their habits or equipage, except their wearing the yellow girdle, which is common to all the princes of the blood as well thoſe that poſſeſs dignities, as thoſe who have none, but the latter hide it, and are aſhamed to let it be ſeen, when their circumſtances will not permit them to have an equipage ſuitable to their birth.

The princes of the royal blood are allowed a palace and a court with officers, and a revenue ſuitable to their rank; but have not the leaſt authority over the people. All the princes live at court, and have houſes and lands, beſides the revenue they receive from the emperor.

Theſe princes, beſides one lawful wife, have generally three others, on whom the emperor beſtows titles, and whoſe children take place next to thoſe of the lawful wife, and are more reſpected than thoſe of their concubines, of whom they may have as many as they pleaſe. They have alſo two ſorts of ſervants, the one ſlaves, and the other Chineſe or Tartars, whom the emperor beſtows upon them; the latter are part of their retinue, and among theſe are conſiderable mandarines, and even viceroys, who are entirely ſubject to their will; and after their death become ſubject to their children.

Yet

Yet theſe princes have no other employment than making their appearance every morning at the emperor's palace, and aſſiſting at public ceremonies: after which they return home, and have nothing to do but to govern their families; for they are not permitted to viſit each other, or even to lodge out of the city without leave.

But the family eſteemed the moſt noble in all China is that of the celebrated Confucius, of whom we ſhall give ſome account in treating of the religion of the Chineſe. The honours conferred on that great man have been continued in a direct line for two thouſand years in the perſon of one of his nephews, who is called, The nephew of the Great or the Wiſe Man.

The emperor ſometimes beſtows titles of honour upon perſons of diſtinguiſhed merit, and gives them for five, ſix, or more generations, in proportion to the ſervices they have done the public. Sometimes, when a perſon has diſtinguiſhed himſelf in an extraordinary manner, the emperor not only beſtows on him theſe titles, but by diſtinct patents extends them to the father and mother, the grandfather and the grandmother of him he has honoured: or rather he beſtows on each a particular title of honour in acknowledgment of the care they have taken in the education of a man of ſuch diſtinguiſhed merit. All his relations are ſo proud of the dignity, that they cauſe it to be written in ſeveral parts of their houſes, and even upon the lanterns that are carried before them when they walk in the evening, which infallibly procures them great reſpect.

Hence it is evident, that except the family of Confucius, and the princes related to the reigning family, no perſon in China is noble, any farther than his merit is rewarded by the emperor; for every one is of the rank of which he judges him worthy, and all the reſt are numbered among the vulgar.

The mandarines, who are the governors of provinces and cities, and, according to their different ranks, enjoy all the poſts under the government, are choſen for their proficiency in learning. But the children even of thoſe who enjoy the higheſt offices under the emperor, are in danger of ſinking to the rank of the vulgar, and are often obliged to follow the meaneſt profeſſions. It is true, the ſon of a mandarine may ſucceed to his father's wealth, but not to his dignity or reputation: he muſt riſe by the ſame ſteps as thoſe by which his father roſe; and, by applying himſelf to ſtudy, be like him advanced for his learning.

SECT. XII.

Of the different Tribunals, the Mandarines, the Honours that are paid them, their Power, and their Offices: the civil Regulations for the Adminiſtration of Juſtice, and the Puniſhments inflicted on the Guilty.

THERE are at Pekin ſix ſovereign courts, whoſe authority extends over all the provinces of China, each of which has different matters under its juriſdiction.

The firſt ſupreme court, called the tribunal of the mandarines, preſides over all the mandarines, watches over their conduct, and examines their good and bad qualities, that they may be rewarded or degraded by the emperor according to their deſerts.

The ſecond, called the royal treaſury, has the care of the treaſure, expences, and revenues of the emperor, and of raiſing the ſupplies.

The third ſupreme court, named the tribunal of rights, hath the ſuperintendance of all ceremonies, of arts and ſciences, of the imperial muſic, and its officers, and examines thoſe who are candidates for degrees.

The fourth ſupreme court, called the tribunal of arms, has the management of the ſoldiery of the whole empire, and of all the fortreſſes, arſenals, and magazines of arms, and in general of every thing neceſſary for the defence and ſecurity of the empire.

To the fifth ſupreme court belongs the examination of criminals, in order to judge and ſentence them as the laws require.

The ſixth and laſt ſupreme court, called the tribunal of public works, has the inſpection of all public buildings, and the palaces of the emperor, princes of the blood and viceroys. It has likewiſe the ſuperintendance of the triumphal arches, towers, bridges, rivers, canals, lakes, ſtreets, and highways.

Each of theſe courts is divided into ſeveral offices, the principal of which is managed by a preſident and two aſſiſtants, who have the final inſpection of all that comes under the notice of that court, and the reſt are under-officers, conſiſting of a preſident and ſeveral counſellors, all ſubject to the preſident of the principal office.

As there might be reaſon to apprehend that bodies inveſted with ſuch power would gradually weaken the imperial authority, the laws have prevented this inconvenience, by making it neceſſary for each of theſe courts to have the aſſiſtance of another to put its deciſions in execution: as for inſtance, the army is ſubject to the fourth ſupreme court, which is that of war, but the payment of the troops belongs to the ſecond; and the arms, tents, and waggons come under the cognizance of the ſixth court; ſo that no military enterprize can be put in execution without the concurrence of theſe different courts.

To prevent the unjuſt and iniquitous practices that might take place in any of theſe courts, there is an officer in each, who attends to all their proceedings, and, though he is not of the council, is preſent at all their aſſemblies. His office obliges him to give private information to the emperor of the faults committed by the mandarines, not only in the adminiſtration of public affairs, but in their private conduct: they even admoniſh the emperor himſelf when he ſtands in need of it. Theſe public cenſors are extremely dreaded, and the very princes of the blood ſtand in awe of them.

The mandarines are nominated by the emperor, and conſiſt of all on whom he beſtows any authority in the provinces. They are governed by two general officers, on whom all the reſt depend. One is the viceroy of a ſingle province, and the other has two, and ſometimes three provinces ſubject to him. They are both at the head of a ſupreme tribunal in the province where all important affairs are decided, and to them the emperor ſends his orders, while they take care to tranſmit them to all the cities in their diſtrict.

The cities are of three different orders, and have alſo their governors and ſeveral mandarines who adminiſter juſtice. There are likewiſe mandarines that have the care of the poſts, with the royal inns and barks in their diſtrict. Others have the inſpection of the army; others take care of the rivers; others overſee the repairing of the high-roads, and the employment of others is to viſit the ſea-coaſts. They have alſo power to puniſh criminals, and are a kind of ſubſtitutes of the ſix ſupreme tribunals of the court.

All the mandarines are extremely fond of the enſigns of their office, by which they are diſtinguiſhed not only from the common people, but from all others of the learned, eſpecially thoſe of an inferior rank. This mark of their dignity conſiſts in a piece of ſquare ſtuff, which they wear upon their breaſts, and is richly embroidered with a device peculiar to their office. Some have a dragon with four claws, others an eagle or a ſun; and the mandarines of arms bear lions, tigers, leopards, &c.

There is an abſolute dependence between the ſeveral powers which govern the empire. The moſt inconſiderable mandarine regulates every thing within the extent of his diſtrict, but depends on other mandarines, whoſe power is greater, but are dependent on the general officers of every province, as theſe latter are on the tribunals of the imperial city, and the preſidents of the ſupreme courts, who keep all other mandarines in awe, while they themſelves tremble before the emperor, in whom reſides the imperial power.

The eaſe with which a ſingle mandarine governs the people is ſurprizing; he only publiſhes his orders on a ſmall piece of paper ſealed with his ſeal, and fixed up in places where the ſtreets croſs, and he is inſtantly obeyed. This proceeds from the extraordinary veneration paid him by the people. He ſeldom appears in public without a majeſtic train; he is richly dreſſed, and is carried in ſummer by four men in an open gilded chair, which in winter is covered with ſilk, and is attended by all the officers of his tribunal, ſome carrying whips, others long ſtaves or iron chains, the noiſe of which make the people tremble, for

they are naturally timorous, and know that they cannot eſcape correction if they venture to diſobey his commands. Hence whenever he appears, the people in the ſtreets ſhow their reſpect, not by bowing, which would be thought a culpable familiarity, but by retiring on one ſide, ſtanding upright with their arms hanging down; and in this poſture, which they eſteem the moſt reſpectful, they ſtand till the mandarine has paſſed by.

Nothing can equal the oſtentatious parade with which a viceroy appears in public; for as the Chineſe are ever fond of ſhew, it is not very ſurpriſing that ſo great an officer ſhould appear with all poſſible pomp.

Firſt advance two men beating upon copper baſons, to give notice of his approach; then come eight enſign-bearers, having on their enſigns the viceroy's title of honour in large characters. Theſe are followed by fourteen ſtandard-bearers, on whoſe ſtandards are the ſymbols of his office, as the dragon, phœnix, flying tortoiſe, and other animals. Then advance ſix officers, each bearing a board raiſed high, on which is written, in large golden characters, the particular qualities of this mandarine; two others bear, the one a large umbrella of yellow ſilk three heights above one another, and the other the caſe in which the umbrella is kept. Then come two archers on horſeback, at the head of the chief guards: the guards armed with large hooks adorned with ſilk fringe: two other files of armed men, ſome bearing maces with long handles, and others having maces in the form of a ſerpent. Other guards bear ſharp axes, and ſome are armed with ſcythes fixed ſtraight to the poles. Other ſoldiers carry halberds; then come two porters loaded with an handſome cheſt, containing the ſeal of his office: two men beating on kettles: two officers, each with a cane to keep the crowd at a diſtance: two men-bearers, with gilt maces in the form of dragons, and many officers of juſtice; ſome armed with whips, or flat ſtaves, to give the baſtinado: others carrying chains, whips, cutlaſſes, and hangers: then come two ſtandard-bearers and the captain who commands the company. Theſe precede the viceroy, who is carried in his chair, ſurrounded by pages and footmen, with an officer near him holding up a large fan in the form of a ſcreen. He is followed by ſeveral guards, ſome carrying maces, and others long handled ſabres; after which come ſeveral enſigns and cornets, with many domeſtics on horſeback, each bearing ſomething belonging to the viceroy.

When he travels in the night-time, inſtead of flambeaux he has ſeveral large lanterns, on which are written the titles and quality of the viceroy, to inſpire every one with the reverence which is due.

As the mandarines of cities and towns are appointed to protect the people, they muſt always be ready to hear their complaints. In an urgent affair they go to the mandarine's palace, and beat upon a kind of kettle-drum, which is ſometimes on the ſide of the hall of juſtice, but generally out of the palace, that the people may beat upon it both by night and day. At this ſignal the mandarine, though ever ſo buſy, is obliged immediately to grant the audience that is demanded; but whoever gives the alarm, unleſs there is ſome notorious act of injuſtice, is ſure to receive the baſtinado.

One of the principal offices of the mandarines is to inſtruct the people as the repreſentatives of the emperor, who is conſidered as their common father; and therefore, on the firſt and fifteenth of every month, they aſſemble the people, and give them a kind of ſermon on all the ſocial and relative duties.

To prevent commotions among the people when they groan under oppreſſion, the leaſt diſturbance which happens in a province is imputed to the viceroy, and if it is not immediately appeaſed, he is almoſt ſure of loſing his office.

The laws preſcribe, that no perſon ſhall enjoy the office of mandarine of the people, either in the city where he was born, or even in the province where his family has been uſed to reſide; and generally he does not poſſeſs the ſame office many years in the ſame place before he is removed. By this means he cannot contract any friendſhip with the people of the country, ſo as to render him partial, and not being acquainted with the mandarines that govern with him, he has the leſs reaſon to ſhew them favour. If he receives an employment in a province joining to his own, he muſt live at leaſt fifty leagues from it. This is becauſe he ſhould ſolely purſue the public good: if he exerciſed an office in his own country, he might be troubled with the ſolicitations of his neighbours and friends, and would probably be biaſſed in his judgment, and do injuſtice to other perſons; or might be influenced by a principle of revenge againſt thoſe who had injured him or his relations.

This niceneſs they carry ſo far, that they will not allow a ſon, a brother, or a nephew to be a ſubordinate mandarine where his father, brother, or uncle are ſuperior mandarines, leſt they ſhould favour each other, and either tolerate or wink at their faults; and beſides, it would be very hard for a father or a brother to draw up an accuſation againſt his ſon or his brother.

Every three years a general review is made of all the mandarines of the empire, when every ſuperior mandarine enquires into the conduct of the inferior, and gives notes to every one containing praiſes or cenſures. For inſtance, the chief mandarine of a city of the third order has under him three or four petty mandarines, to whom he gives notes, and ſends them to a mandarine of a city of the ſecond order on whom he depends: the latter, who has under him ſeveral mandarines who govern cities of the third order, examines theſe notes, and either agrees to what is inſerted, or adds other circumſtances according to his knowledge. When the mandarine of the city of the ſecond order has received the notes from all the mandarines of the cities of the third order, he gives his note to them, and ſends a catalogue of all the mandarines in his diſtrict to the general mandarines of the province, who reſide at the capital. This catalogue paſſes through their hands to the viceroy's, who, having examined it in private, and afterwards with the four general mandarines, ſends it to court with his own remarks, that the chief tribunal may be fully acquainted with the conduct of all the mandarines of the empire, in order that they may be rewarded or puniſhed according to their deſerts.

In giving the above-mentioned notes they write under their name and title of their mandarinate, that he is greedy of money, too ſevere in his puniſhments, or is too old to perform his office; that another is proud, of a capricious temper, &c.

When all the notes are arrived at Pekin, the chief tribunal examines them, and ſends them back to the viceroy, after ſetting down the reward or puniſhment appointed for each mandarine. Thoſe who have bad notes are deprived of their offices, and thoſe who are commended are raiſed to a ſuperior mandarinate.

But as the general officers might be bribed by the governors of the cities, and thus connive at the injuſtice of thoſe who oppreſs the people, the emperor from time to time ſends inſpectors into the provinces, who go into the cities and into the tribunals, while the mandarines give audience, and ſecretly enquire of the people how they behave in their offices; and if he finds any irregularity, he diſcovers the enſigns of his dignity, declaring himſelf the emperor's envoy: he then immediately brings to trial the guilty mandarines, and puniſhes them as the laws require; or, if the injuſtice be not notorious, ſends his informations to court, that they may determine what is to be done.

Theſe inſpectors of provinces are ſuppoſed to be poſſeſſed of the greateſt integrity; yet as they may be tempted to enrich themſelves at the expence of the guilty, whoſe injuſtice they may overlook, to keep them upon their guard, the emperor, when they leaſt think of it, goes into certain provinces in perſon, in order to hear the juſt complaints of the people againſt their governors; and thoſe viſits make the mandarines tremble.

In one thouſand ſix hundred and eighty-nine the emperor Cang-hi took a journey into the ſouthern provinces, and rode on horſeback, followed by his guards and about three thouſand gentlemen. The people met him in the cities with ſtandards, flags, canopies, and umbrellas. At the diſtance of every twenty paces they erected in the ſtreets triumphal arches covered with the fineſt ſtuffs, and adorned with feſtoons, ribbons, and tufts of ſilks, under which he paſſed. This great prince, being once at ſome diſtance from his attendants, perceived an old man, who wept bitterly, and aſked him the reaſon. Sir, replied the man, who did not know him, I had but one child, in whom I placed

placed all my happineſs, and with whom I truſted the care of my family, but a Tartarian mandarine has taken him from me, ſo that I am deprived of all ſuccour, and probably ſhall be ſo as long as I live; for how can a poor man, like me, oblige the governor to do him juſtice? This is not ſo difficult as you imagine, replied the emperor, get up behind me, and guide me to his houſe: the man obeyed without ceremony, and in about two hours time they arrived at the palace of the mandarine, who did not expect this viſit. The guards and a great company of the emperor's attendants, after having long ſearched for him, overtook him at the mandarine's, and, without knowing what was the matter, ſoon ſurrounded the houſe; and others entered with the emperor, who having found the mandarine guilty of the violence of which he was accuſed, had his head cut off on the ſpot: then turning towards the afflicted father, "To make you amends, ſaid he, I be-"ſtow upon you the office of the guilty perſon, who is put "to death; take care to fill his place with greater mode-"ration, and let his crime and puniſhment make you "fearful in your turn of becoming a dreadful example to "others."

In ſhort, nothing could exceed the order eſtabliſhed by the Chineſe law, if the mandarines ſtrictly conformed to them; but this is far from being the caſe; for they are not very ſcrupulous in violating the laws of juſtice and humanity in order to ſerve their private intereſt. There are no artifices to which the inferior officers have not recourſe to deceive the ſuperior mandarines; and among the latter ſome endeavour to impoſe upon the ſupreme tribunals of the court, and even to miſlead the emperor himſelf. Indeed they ſo artfully cloak their paſſions, and affect in their memorials ſuch an air of diſintereſtedneſs, that it is very difficult for the prince to avoid being deceived.

Beſides, as their ſalaries are not always ſufficient to maintain their pomp and luxury, the acts of injuſtice they commit, provided they are ſecret, are attended with no hazard. Miniſters of ſtate and the chief preſidents of the ſupreme courts ſometimes privately extort money from the viceroys of provinces, and thoſe again, to indemnify themſelves, oppreſs the ſubordinate officers, and theſe laſt reimburſe themſelves by their exactions upon the people. No crimes, when they are diſcovered, paſs unpuniſhed in China; the baſtinado is the common puniſhment for ſlight faults, and the number of blows is proportioned to the nature of the offence: when theſe do not exceed twenty, it is eſteemed a fatherly correction, and is not infamous. The emperor himſelf ſometimes commands it to be inflicted on great perſons, and afterwards ſees and treats them as uſual.

A ſmall matter will incur this correction, as foul language, or fighting with the fiſts; for if theſe things reach the mandarine's ears, he immediately cauſes them to be baſtinadoed; which being done, they muſt kneel before him, bow their bodies three times to the earth, and thank him for the care he takes of their education.

This puniſhment is performed with a ſplit bamboo, which is a wood that is hard, ſtrong, and heavy: the lower part is as broad as one's hand, and the upper ſmooth and ſmall that it may be eaſily managed. The criminal is laid down with his face to the ground, his drawers are pulled over his heels, and the ſtripes are given over his bare poſteriors.

A mandarine may cauſe this puniſhment to be inflicted wherever he is; it is ſufficient for one of the poor vulgar not to diſmount from his horſe when a mandarine paſſes by, or to croſs the ſtreet in his preſence, to receive five or ſix blows by his order, which is performed with ſuch expedition, that it is often done before thoſe who are preſent perceive any thing of the matter. Maſters uſe the ſame correction to their ſcholars, fathers to their children, and noblemen to puniſh their domeſtics, only the battoon is leſs.

Captain Hamilton obſerves, that he knew an Engliſh gentleman who underwent the chaſtiſement of the bamboo; and upon this occaſion mentions a diverting incident, which he ſays, he was told, happened at Amoy, where he himſelf was preſent, and where the Engliſh traded before they removed to Canton.

A mandarine, ſays he, going in his chair, with his uſual retinue, met a ſailor with a keg of arrack under his arm. Every body went off the ſtreet but the jolly ſailor, who had been taſting his arrack; yet was ſo mannerly as to walk aſide, and give the mandarine the middle of the ſtreet; but one of the retinue gave the ſailor a box on the ear, and had almoſt ſhoved him down keg and all. The ſailor damned him for a ſon of a whore, and aſking what he meant by it, gave the aggreſſor a box on the ear in return. The poor ſeaman was ſoon overpowered by the retinue; but the mandarine ordered them to do him no harm, till he had ſent for the Engliſh linguiſt, who ſoon came. The mandarine told the linguiſt what had happened, and bid him aſk the ſailor why he gave him that affront? The ſailor ſwore that the mandarine had affronted him, in allowing his ſervants to beat him while he was walking down the ſtreet civilly, with his keg of ſamſhew under his arm; and that he would box the mandarine, or any of his gang, for a Spaniſh dollar; and with that put his hand in his pocket and pulled out a dollar.

The mandarine ordered the linguiſt to tell him what the ſailor ſaid, and why he pulled out his money. The linguiſt having told him, the mandarine laughed immoderately; and, after he had compoſed himſelf, aſked if the ſailor would ſtand to his challenge, who ſwore he would. The mandarine had a Tartar in his retinue famous for boxing, at which he had won many prizes, and called for him to try his ſkill on the Engliſhman. The Tartar was a luſty man, and the ſailor ſhort, but well ſet. The Tartar promiſed an eaſy conqueſt, and to the combat they went. The Tartar was uſed to kick high at the belly, but at the firſt kick the ſailor had him on his back. Aſhamed of the foil he had received, the Tartar attacked him again; but he again tripped up his heels. He then deſired to have a fair bout at boxing, without tripping, which Jack agreed to; and with his head battered the Tartar's face and breaſt with ſuch force, that, to uſe Mr. Hamilton's words, he was forced to yield to Old England. The mandarine was ſo pleaſed with the bravery and dexterity of the ſeaman, that he made him a preſent of ten tayals of ſilver.

The wooden collar is a more infamous puniſhment. This is compoſed of two pieces of wood hollowed in the middle for the neck, and when it is put on the perſon can neither ſee his feet nor put his hand to his mouth; but is obliged to be fed by ſome other perſon. This diſagreeable load he carries day and night: it is lighter or heavier according to the nature of the offence; ſome weigh two hundred pounds and ſome are three feet ſquare and five or ſick inches thick; the common ſort weigh fifty or ſixty pounds.

When theſe two pieces of wood are in the preſence of the mandarine joined about the criminal's neck, they paſte on each ſide two long ſlips of paper, on which they fix a ſeal, that the two pieces may not be ſeparated without its being perceived: then they write in large characters the crime for which the puniſhment is inflicted, and the time it is to laſt. For inſtance, if it be a thief, a ſeditious perſon, a gameſter, or a diſturber of the peace of families, he muſt wear it three months. They are generally expoſed in ſome public place; but the criminals find various ways to eaſe themſelves, ſome walk in company with their relations and friends, who ſupport the four corners that it may not gall their ſhoulders; others have a chair to ſupport the four corners, and ſo ſit tolerably eaſy; and ſome kneel down, and placing the edge of the collar on the ground, amuſe themſelves with viewing the people as they paſs.

At the expiration of the time of puniſhment, the criminal is brought back to the mandarine, who having exhorted him to behave better for the future releaſes him from the collar; and to take his leave of him, orders him twenty ſtrokes with the battoon; for the Chineſe never inflict any puniſhment, except a pecuniary one, which is not preceded and ſucceeded by the baſtinado.

There are ſome crimes for which the criminals are marked on the cheek with a Chineſe character, ſignifying their crime. There are others for which they are ſentenced to draw the imperial barks; and there are others for which they are condemned to baniſhment.

There are three ways of puniſhing with death, the moſt honourable of which is, in their opinion, ſtrangling, which is frequently done by a bow-ſtring. In ſome places they put a cord of ſeven or eight feet long, with a running knot, round the criminal's neck. Two ſervants belonging to the

the tribunal draw it hard at each end, then looſe it a moment, and drawing it again the ſecond time, kill the criminal.

Another kind of puniſhment is extremely cruel: this is inflicted on rebels and traitors, on a ſon who ſtrikes his father, and on mercileſs robbers; and is called cutting in ten thouſand pieces. The executioner faſtens the criminal to a poſt, then fleaing the ſkin of his head, pulls it over his eyes, and afterwards mangles him by cutting pieces from all parts of his body; and when he is weary of this barbarous exerciſe, he delivers him to the cruelty of the populace. But this cruel death is very ſeldom inflicted, for thoſe who rob, deterred by this puniſhment, never murder.

The other is beheading, which is for crimes of great enormity, as murder, and is looked upon as very ſhameful, becauſe the head, which is the principal part of man, is ſeparated from the body; and becauſe in dying they do not preſerve the human form as entire as it was when they received it from their parents. The party condemned to ſuffer this puniſhment is not, on the day of execution, expoſed on a ſcaffold, but being made to kneel in ſome public place, with his hands tied behind him, a perſon holds him ſo faſt that he cannot move, while the executioner coming behind, takes off his head at one ſtroke, and at the ſame time lays him on his back with ſuch dexterity, that not a drop of blood falls on his cloaths, which on that occaſion are generally better than ordinary: for his relations and friends, though aſhamed to own him in thoſe unhappy circumſtances, uſually ſend him new cloaths, and cauſe proviſions and drink to be offered him by the way.

The executioner is commonly a ſoldier; and his office is ſo far from being ſcandalous, that at Pekin he accompanies the criminal girt with a ſaſh of yellow ſilk, and his cutlaſs is wrapped in ſilk of the ſame colour, to ſhew that he is veſted with the emperor's authority.

Thoſe who ſuffer this death are alſo ſentenced to be deprived of common burial, which in China is a moſt terrible infamy; the executioner, therefore, after having ſtripped the body, throws it into the next ditch.

The Chineſe, being perſuaded that ſuch as are beheaded muſt have been diſobedient to their parents, and that this ſeparation of the members is a judgment that befals them for that crime, ſometimes buy the bodies of their parents or relations at a great price from the executioner, and ſow on the head again with abundance of lamentations, to atone in ſome meaſure for their diſobedience. The executioner, by thus ſelling the body, runs the hazard of being ſeverely puniſhed, unleſs he bribes the mandarine or the informer pretty high; and on this account the body often coſts the relations ſix hundred or a thouſand crowns.

The ordinary torture cuſtomary in China to oblige criminals to make a confeſſion is extremely painful, and is inflicted on the feet and hands: for the feet they make uſe of an inſtrument which conſiſts of three pieces of wood, one of which is fixed, and the two others move and turn upon it. The feet of the criminal being put in this machine are ſqueezed ſo violently, that they make the anklebone flat. They place pieces of wood between the criminal's fingers, and tying them very hard with cords, leave them for ſome time in this torment.

The Chineſe have remedies to diminiſh the ſenſe of pain; and they are ſaid to have others, after the torture, ſo efficacious as to heal the criminal, who in a few days recovers the uſe of his limbs.

SECT. XIII.

Of the Religions in China, particularly the ancient Religion of the Chineſe; of that of Confucius; of the Sects of Taoſſee and of Fo; and of the Jews and Mahometans ſettled in China.

IT appears from the claſſical books of the Chineſe, that they formerly worſhipped the Supreme Being, as the Lord and Sovereign of all things, under the name of Changti, or ſupreme emperor, and Tien, which ſignifies the ſpirit which preſides in heaven. They likewiſe paid a ſubordinate adoration to inferior ſpirits depending on the Supreme Being, and who in their opinion preſide over cities, mountains, rivers, and the like.

They maintained that, for the preſervation of regularity and purity of manners, thoſe who command ſhould imitate the conduct of Tien, in treating their inferiors as their children, and thoſe who obey ought to conſider their ſuperiors as their fathers.

It appears from one of their ancient books, that this Tien, the object of public worſhip, is the principle of all things, the father of the people, independent, almighty, omniſcient; to whom the ſecrets of the heart are fully known, and who watches over the conduct of the univerſe; who is holy without partiality, a rewarder of virtue, puniſhing wickedneſs, and raiſing up and caſting down the kings of the earth according to his pleaſure: that public calamities are exhortations for the reformation of manners; and that the end of theſe evils is followed by mercy and goodneſs.

In times of public calamity the princes were not ſatisfied with only addreſſing their vows to Tien, and offering ſacrifices, but carefully applied themſelves to diſcover the ſecret faults which had drawn down the puniſhment from the Supreme Lord; they examined if they were not too expenſive in their habits, too luxurious, or too fond of magnificence and ſplendor.

A work called the Chuking often mentions a maſter who preſides over the government of his dominions; who has an abſolute empire over the deſigns of mankind, and conducts them to wiſe and juſt ends; who rewards and puniſhes man by other men, without any abridgment of their liberty. This perſuaſion was ſo common, that princes, naturally jealous of their own honour, never attributed the ſucceſs of their government to themſelves, but referred it to the Supreme Governor of the univerſe.

It is alſo ſaid in the ſame work, that Changti ſees from the higheſt heavens what is done here below: that he makes uſe of our parents to beſtow upon us the material part of our frame; but that he himſelf gives an underſtanding mind capable of reflection, which alone raiſes us above the rank of brutes: that to offer an acceptable ſacrifice, it is not ſufficient for the emperor, to whom that office belongs, to join the prieſthood to the royal dignity: but that he ſhould be upright and penitent, and before the ſacrifice acknowledge his faults with faſting and tears: that Changti's councils and deſigns are unfathomable: that we ought not to believe that he is too exalted to attend to what is done below; for he himſelf examines all our actions, and has ſet a tribunal in our own conſciences, by which we ſhall be judged.

Fohi, who was one of the heads of the colony which came to ſettle in this part of the eaſt, and is acknowledged to be the founder of the Chineſe monarchy, gave public marks of his profound veneration for the Supreme Being. He kept in a park ſix ſorts of animals to ſerve as victims in his ſacrifices, which he ſolemnly offered twice a-year at the two ſolſtices, when all the people left their employments, and joined with the prince in obſerving theſe feſtivals.

Chinnong, Fohi's ſucceſſor, added to theſe ſacrifices two offerings at the equinoxes; that in the ſpring to implore a bleſſing on the fruits of the earth, and that in autumn after the harveſt was over, to offer the firſt fruits to Changti. This prince cultivated a field with his own hand, and made a ſolemn offering of both the corn and the fruit.

Hoangti, who aſcended the throne after Chinnong's death, fearing leſt bad weather ſhould hinder him from offering the uſual ſacrifices in the open air, erected a large temple, in which they might be offered in all ſeaſons, and wherein he himſelf inſtructed the people in their principal duties. His ſucceſſors generally followed his example; and it appears from the Chineſe books, that for the ſpace of two thouſand years the nation acknowledged, reverenced, and honoured with ſacrifices the Supreme Being and Sovereign Lord of the univerſe.

At length the troubles which aroſe in the empire, the civil wars by which it was divided, and the corruption of manners which became almoſt univerſal, had very near ſuppreſſed the ancient doctrine, when Confucius aroſe, and revived it, by giving freſh reputation to the ancient books.

He made a collection of the moſt excellent maxims of the ancients, which he followed himſelf, and taught to the people. He preached up a ſevere morality, and endeavoured to prevail upon men to contemn riches and worldly pleaſures, and to eſteem temperance, juſtice, and other virtues: he ſtrove to inſpire them with ſuch magnanimity as to be proof againſt the frowns of princes, and with a ſincerity incapable of the leaſt diſguiſe. What is moſt to be admired, was his preaching more by his example than by his words, whence he reaped conſiderable fruits from his labours; kings were governed by his counſels, and the people reverenced him as a ſaint. Yet he frequently met with reverſes of fortune, which obliged him to travel from province to province, and was often reduced to ſuch extremities, that he was in danger of ſtarving.

Yet, far from being diſcouraged, he was never weary of inſtructing thoſe who loved virtue. Among the many diſciples that put themſelves under his tuition, he taught ſome to reaſon juſtly, and to expreſs themſelves eloquently in public: he inſtructed others to form a juſt idea of a good government; but thoſe for whom he had a more particular kindneſs he taught to govern themſelves well, to improve their minds by meditation, and to purify their hearts by virtue. Human nature, ſaid he, came from heaven moſt pure and perfect, but it has been corrupted by ignorance, the paſſions, and evil examples. It is our duty to re-inſtate it, and give it its primitive beauty. In order to be perfect, we muſt re-aſcend to the point from whence we have deſcended; obey heaven, and follow the orders of the Sovereign Ruler; love your neighbour as yourſelf; never ſuffer your ſenſes to be the guide of your conduct; but in all things liſten to reaſon; it will inſtruct you to think well, to ſpeak diſcreetly, and to act aright.

He ſent ſix hundred of his diſciples into different places of the empire to reform the manners of the people, and uſed frequently to ſay, It is in the Weſt where the true ſaint is found. This ſentence was ſo imprinted in the minds of the learned, that ſixty-five years after the birth of our Saviour, the emperor Mimti ſent ambaſſadors into the Weſt, with ſtrict orders to continue their journey till they ſhould meet this ſaint.

It is ſaid that about that time St. Thomas preached in the Indies, and therefore if theſe mandarines had followed his orders, China might, perhaps, have had the benefit of receiving inſtruction from that apoſtle; but the dangers of the ſea made them ſtop at the firſt iſland, where they found the idol Fo, and learning the ſuperſtitions of the country, they, at their return, propagated idolatry throughout the empire.

But to return to Confucius, who ſeems to have carried the religion of nature as far as unaſſiſted reaſon could reach. Though after his death he was revered by the greateſt part of the nation as a ſaint, as a meſſenger inſpired and ſent by heaven to inſtruct mankind, and almoſt as a god; yet very early interpreters aroſe, who explained away the ſimplicity and purity of his doctrine, and, by introducing idle diſtinctions and ſuperſtitious obſervances, by wreſting his meaning and giving falſe interpretations of the antient books, they deſtroyed the worſhip due to the Supreme Being, and formed a ſyſtem of religion and philoſophy equally impious and abſurd. This is now the religion of the learned, who, while they pay homage to the memory of Confucius, are far from following his precepts or imitating the innocence and ſanctity of his life. The emperors have even ordered, that the literati ſhould annually celebrate a feſtival to his honour.

The evening before this feſtival a butcher comes and kills a hog, and the ſervants of the tribunals bring rice-beer, fruit, flowers, and herbs, which they ſet on a table, on which are placed wax-candles and cenſers. The next day the governors and the ſeveral orders of the learned repair, with drums beating and hautboys ſounding, to the hall of the feaſt, where the maſter of the ceremonies commands them ſometimes to bend forwards, ſometimes to kneel and bow their heads to the earth, and ſometimes to riſe and ſtand on their feet.

The ceremony begins with the chief mandarine's taking ſeparately meat, rice-beer, and pulſe, which he preſents before the tables of Confucius, the muſic playing all the while to verſes ſung in honour of that great philoſopher. Afterwards they repeat his elogium, which are ſeldom more than eight or ten lines, in praiſe of his wiſdom, knowledge, and good morals. The ceremony is concluded with repeated bows and reverences at the ſound of flutes and hautboys, and reciprocal compliments among the mandarines. At length they bury the blood and hair of the animal they have offered; and burn, in token of joy, a large piece of ſilk faſtened to the end of a pike, and hanging to the earth in the manner of a ſtreamer. The formula is the ſame throughout all the cities of the empire; and theſe honours, which are, in effect, paid to Confucius, inſpire the doctors with great emulation. They afterwards go into the ſecond hall to pay certain honours to the ancient governors of cities and provinces, who are famous for having behaved well in their employments; and then paſs into a third hall, where the names of citizens, celebrated for their virtues and talents, are exhibited, and there perform ſeveral other ceremonies.

The author of the ſect of Taoſſee was born two years before Confucius, his name was Laokiun, and his diſciples pretend that he did not come into the world till forty years after his conception. His books, which are ſtill extant, are ſuppoſed to be much diſguiſed by his followers; though there ſtill remain many ſentiments worthy of a moral philoſopher. Among the ſentences that are often repeated is one, where, ſpeaking of the production of the world, he ſays, "Tao or Reaſon hath produced one, "one hath produced two, two hath produced three, and "three hath produced all things."

His morality is not unlike that of the Epicureans. It conſiſts in avoiding vehement deſires, and ſuch paſſions as diſturb the peace and tranquillity of the ſoul, and according to his diſciples the wiſe man ſhould paſs his life free from ſolicitude and uneaſineſs, and never reflect on what is paſt, nor anxiouſly ſearch into futurity.

Thoſe who belong to this ſect affect a calm which they ſay ſuſpends all the functions of the ſoul, and as this tranquillity might be diſturbed by the thoughts of death, they boaſt of having invented a liquor that has the power of rendering them immortal. They pretend to be verſed in magic, and that by the aſſiſtance of the demons they invoke, they can ſucceed in their deſires.

In the reign of the emperor Tchintſong theſe impoſtors, during a dark night, fixed a book on the principal gate of the imperial city, filled with characters and magical forms of invoking dæmons, and gave out that this book had fallen from heaven. The credulous prince went on foot with great veneration to fetch it, and having received it with deep humility carried it in triumph into the palace, and incloſed it in a gold box, where it was carefully preſerved.

Thoſe of this ſect ſacrifice to the ſpirit of darkneſs a hog, a fiſh, and a bird; they drive a ſtake into the earth, and trace upon paper an odd kind of figures, accompanying the ſtroke of their pencil with frightful grimaces and horrible cries. They practiſe divination, and pretend to heal diſeaſes, and to drive away dæmons. The ſucceſſors of the head of this ſect are honoured with the dignity of chief mandarines, and reſide in a town of the province of Kiang-ſi, where they have a magnificent palace, to which a great number of people flock from the neighbouring provinces, to procure remedies for their diſeaſes, or to learn their deſtiny, and what is to happen during the remainder of their lives; they there receive a billet filled with magical characters, and return home well ſatisfied without complaining of the ſum they pay for this ſingular favour.

We ſhall now give an account of the ſect of Fo, or Foë. The ambaſſadors ſent to the Weſt, as already mentioned, having tranſported the idol Fo into China, and with it a corruption of the fables with which the Indian books are filled, that religion ſpread through the empire.

Fo lived and died in India, where he was firſt worſhipped as a god, and his doctrines ſpread through all the Eaſt. The Chineſe call his prieſts Hochang, the Tartars, Lamas; the Siameſe, Talapoins, and the Japaneſe, Bonzes. His diſciples did not fail to diſperſe a great number of fables after his death, and eaſily perſuaded the ſimple and credulous, that their maſter had been born eight thouſand times; that his ſoul had ſucceſſively paſt through different animals, and that he had appeared in the figure of and ape, a dragon, an elephant, &c. Thus this pre-

tended god was worſhipped under the ſhape of various animals, and the Chineſe built ſeveral temples to many different idols.

The bonzes of China ſay, there is a great difference between good and evil, and that after death the good will be rewarded and the wicked puniſhed; that man ought not to kill any living creature, or take what belongs to others, not to be guilty of impurity, to forbear lying, and to drink no wine. But eſpecially they muſt be kind to the bonzes, procure them the neceſſaries of life, build them monaſteries and temples, that by their prayers and penances the ſins of the people may be expiated. At the funeral obſequies of your relations, ſay they, burn gilt and ſilver paper, and garments made of ſilk, and theſe in the other world ſhall be changed into gold, ſilver, and rich habits: by this means your departed relations will enjoy every thing neceſſary, and be able to reconcile the eighteen guardians of the infernal regions, who, without theſe bribes, would be inexorable. If you neglect theſe commands you muſt expect nothing after death but to become a prey to the moſt cruel torments; while your ſoul, by a long ſucceſſion of tranſmigrations, ſhall paſs into the vileſt animals, and you appear in the form of a mule, a horſe, a dog, a rat, or ſome more contemptible creature.

The many Chineſe, who believe the doctrine of the tranſmigration of ſouls, are dupes of the bonzes, who find this opinion of great uſe in raiſing charitable contributions, and enlarging the revenues; and from this they find means to practiſe many frauds upon the people. Le Compte ſays, that two of thoſe bonzes ſeeing in the yard of a rich peaſant two or three large ducks, proſtrated themſelves on their faces before the door, and ſighed and wept bitterly. The good woman ſeeing them from her chamber window, came down to learn the cauſe of their grief. We know, ſaid they, that the ſouls of our fathers have paſſed into the bodies of thoſe creatures, and our fear leſt you ſhould kill them, will certainly make us die with grief. I own, ſaid the woman, we intended to ſell them, but ſince they are your fathers, I promiſe to keep them. This was not what the bonzes wanted. But, continued they, perhaps your huſband will not be ſo charitable, and then if any accident ſhould happen to them, you may be ſure it will kill us. At length, after a long diſcourſe, the good woman was ſo far moved with their pretended grief, that ſhe committed the ducks to their care. They took them with great reſpect, proſtrated themſelves before them twenty times; but that very evening made a feaſt of them for ſome of their ſociety.

As they cannot trick people every day in this manner, they endeavored to get money from them, by doing public acts of penance, for which they are highly eſteemed by the people, who ſhew them much pity and compaſſion: ſome drag after them a long iron chain faſtened to the neck or legs; crying at every door, thus we expiate your faults, and ſure this deſerves an alms. Others in publick places beat their head againſt a ſtone till they are almoſt covered with blood. They have ſeveral other acts of penances, but that which follows appears moſt extraordinary.

One day, ſays the laſt mentioned author, I met in the middle of a town a young bonze, whoſe genteel and modeſt look might excite any one's compaſſion. He ſtood upright in a kind of a ſedan, the inſide of which was full of nails with their points ſticking towards him, ſo that he could not move without being wounded. Two fellows carried him from houſe to houſe, while he endeavoured to move the compaſſion of the people, by telling them he was ſhut up in that chair for the good of their ſouls, and was reſolved never to leave it till they had bought all the nails, which amounted to above two thouſand, at ſix-pence apiece; but that the very ſmalleſt of them would bring incomparable bleſſings on them and their families. That by buying them they would do an action of diſtinguiſhed virtue, ſince theſe alms were not beſtowed on the bonzes, to whom they might find other opportunities of being charitable, but on the god Fo, to whom they were going to build a temple.

As I then happened to paſs by, he told me the ſame ſtory, upon which I exhorted him to leave his priſon and go to the temple of the true God in order to be inſtructed in heavenly truths; but he calmly replied, he was much obliged to me for my good advice, and would ſtill be more ſo if I would buy a dozen of his nails, which would certainly procure me a good journey. Here, hold your hand, ſaid he, and take theſe upon the faith of a bonze, they are the very beſt in my ſedan, for they prick me the moſt, yet you ſhall have them at the ſame rate as the others. He ſpoke theſe words in ſuch a manner as would on any other occaſion have made me laugh, but his blindneſs filled me with compaſſion, and I left him.

Some of theſe wretches are ſo far from being penitents that they are guilty of the moſt deteſtable crimes and horrid murders. The wiſeſt part of the people are upon their guard againſt them, and ſome of the magiſtrates look upon them with an eye of ſuſpicion. A governor of a town paſſing through the highway with his train, and ſeeing a great company of people, had the curioſity to ſend in order to know the occaſion of this aſſembly. The bonzes were ſolemnizing an extraordinary feſtival, and had ſet a machine upon a ſtage, at the top of which a young man looked over a ſmall rail that ſurrounded the machine. His arms and his body were concealed, and nothing ſeemed at liberty but his eyes, which he rolled about as if diſtracted. Below the machine an old bonze ſtood on the ſtage, who told the people that the young man was going to ſacrifice himſelf by plunging headlong into a deep river which ran by the ſide of the road. He cannot die, added the bonze, if he would, becauſe at the bottom of the river he will be received by charitable ſpirits, who will give him a kind reception. This is the greateſt happineſs that can befal him; an hundred perſons have deſired to ſacrifice themſelves in his ſtead, but on account of his zeal and other virtues we preferred him before the reſt.

The mandarine obſerved that the young man had great courage, but he wondered that he himſelf did not tell the people of his reſolution; and bid him come down that he might talk with him. The bonze was confounded and ſtrove to hinder it, proteſting the whole ſacrifice would be ineffectual if he ſpoke a word, and that for his part he could not anſwer for the miſchief it might bring upon the whole province. As for the miſchief, replied the mandarine, I will be anſwerable for that, and then ordered the young man to come down, but he gave no other anſwer than by his frightful looks, and various diſtortions, his eyes rolling as if they would ſtart out of his head. You may from hence, ſaid the bonze, judge of the violence you offer him by this command; he is already almoſt diſtracted, and if you inſiſt upon his coming down you will make him die with grief. Upon this the mandarine ordered ſome of his retinue to go up and bring him down. They found him tied and bound on every ſide, with a gag in his mouth, and they had no ſooner untied him, and taken out the gag, than he cried out aloud, O my Lord, revenge me of thoſe aſſaſſins who are going to drown me! I am a ſtudent, and was going to the court at Pekin to aſſiſt at the examinations, but yeſterday a company of bonzes ſeized upon me by violence, and early this morning bound me to this machine, and took from me the power of crying out or complaining; for this evening they intended to drown me, and were reſolved to accompliſh their curſed ceremonies at the expence of my life.

He no ſooner began to ſpeak than the bonzes moved off, but the officers of juſtice, who attended the governor, ſtopped ſeveral of them. He who had juſt before pretended that the young man could not be drowned was immediately thrown into the river, where he inſtantly periſhed, and the others were carried to priſon, and afterwards received the puniſhment they deſerved.

Theſe wretches to preſerve their ſect purchaſe children of ſeven or eight years old, inſtruct them in their myſteries, and make them young bonzes; but they are generally very ignorant, and there are few who underſtand the doctrines they profeſs.

The bonzes are of different degrees; for beſides thoſe employed in collecting alms, a ſmall number of them gain the knowledge of books, ſpeak politely, and employ themſelves in viſiting the learned, and inſinuating themſelves into the favour of the mandarines. Though they have not a regular hierarchy, they have their ſuperiors, whom they call great bonzes, and this rank adds to the reputation they have acquired by their age, gravity, meekneſs, and hypocriſy.

In every province are certain mountains on which are idol temples that have greater credit than the reſt. The people go far in pilgrimage to them, and when they are at the foot of thoſe mountains proſtrate themſelves at every ſtep they take in aſcending. Thoſe who cannot go on pilgrimage, deſire ſome of their friends to purchaſe a large printed ſheet of the bonzes. In the middle of the ſheet is the figure of the god Fo, and upon his garment and round about it are a multitude of ſmall circles. The devotees alſo hang on their necks, and round their arms, a kind of bracelet compoſed of an hundred beads, and eight large ones. On the top is one of an extraordinary ſize. When they turn theſe beads upon their fingers, they pronounce theſe myſterious words, O mi to Fo, the ſignification of which they themſelves do not underſtand. They make above an hundred genuflexions, and then draw one of theſe red circles upon the paper. From time to time they invite the bonzes to come to the temple to pray and to authenticate by their ſeal the number of circles they have drawn. This they carry in a pompous manner to funerals in a ſmall box ſealed up by the bonzes, and call it a paſſport for travelling from this life to the next. This paſſport coſts them a conſiderable ſum; but they ſay they ought not to complain of the expence, becauſe they are ſure of a happy journey.

In ſome cities are ſeveral ſocieties of ladies, who are commonly of a good family, and advanced in years, and conſequently have money to diſpoſe of. They are ſuperiors of the ſociety in turns, and it is generally at the ſuperior's houſe that the aſſemblies are held. Whenever they meet, a bonze pretty well advanced in years is preſident of the aſſembly, and ſings hymns to the god Fo, the devotees join in the concert, and after having ſeveral times cried O mi to Fo, and beaten ſome ſmall kettles, they ſit down to table and regale themſelves.

On ſolemn days they adorn the houſe with idols placed in order by the bonzes, and with groteſque paintings repreſent the torments of hell. The prayers and feaſt laſt ſeven days, during which their principal care is to prepare and conſecrate treaſures for the other world. For this purpoſe they build an apartment with paper painted and gilt, containing every part of a perfect houſe: this they fill with a great number of paſteboard boxes, painted and varniſhed, in which are repreſented ingots of gold and ſilver, made of gilt paper. Of theſe there are ſeveral hundreds deſigned to redeem them from the dreadful puniſhments which the king of the infernal regions inflicts on thoſe who have nothing to give him; and a number of them by themſelves, to bribe his officers, the reſt, as well as the houſe, are for lodging, boarding, and buying ſome office in the other world. All theſe little boxes are faſtened by padlocks of paper, and then ſhutting the doors of the paper houſe, they ſecure it with locks of the ſame ſubſtance. When the perſon who has been at the expence happens to die, they burn the houſe with much ceremony, and afterwards both the keys of the houſe and of the little cheſts, that the good woman in the other world may be able to open them, and take out the gold and ſilver after the paper is turned into thoſe metals.

All that has been hitherto mentioned relates only to the exterior doctrine of Fo, but as to the interior very few of the bonzes themſelves are capable of underſtanding its myſteries. They teach that a vacuum or nothing is the beginning and end of all things; that from this nothing all things were produced, and to it ſhall return; and that all beings, both animate and inanimate, differ from each other only in their form and qualities. In order to live happily we muſt continually ſtrive, ſay they, by meditation and frequent victories over ourſelves, to become like this principle, and to that purpoſe muſt accuſtom ourſelves to do nothing, to wiſh for nothing, and to think of nothing. The nearer a man approaches to the nature of a ſtone, or the trunk of a tree, the greater is his perfection. In ſhort it is in indolence and in inactivity, and in a ceſſation of all deſires, and annihilation of all the faculties of the ſoul, that virtue and happineſs conſiſt. When a man has once attained this ſtate, all his tranſmigrations are at an end, he has nothing to fear, becauſe properly he is nothing, or, if he is any thing, he is happy.

The greateſt part of the learned, and particularly the diſciples of Confucius, have warmly attacked this doctrine, proving that this apathy, or rather monſtrous ſtupidity, overturned all morality; that man is raiſed above other beings only by his thinking and reaſoning faculties, and by his application to the knowledge and practice of virtue; that to aſpire after this foolish inactivity is renouncing the moſt eſſential duties, aboliſhing the neceſſary relation of father and ſon, huſband and wife, prince and ſubject; and that if this doctrine was followed it would reduce all the members of the ſtate to a condition much inferior to that of the brutes.

Though the mandarines are men of letters, and deteſt the idols of Fo and Tao, yet when there is a great drought, too much rain, or the country is ravaged by locuſts, they endeavour to pleaſe the people by having recourſe to thoſe idols, and do not omit paying ſolemn viſits to the temples, which, contrary to their cuſtom, they perform on foot, ſometimes negligently dreſſed, and their ſhoes made of ſtraw. They are accompanied by the ſubordinate mandarines and principal perſons of the city; but on their arrival at the temple, they only light up two or three ſmall ſticks of incenſe, and then ſitting down, drink tea, ſmoak, and having ſpent an hour or two in chatting, retire.

Thus they treat the image with little ceremony; but if the favour they want be too long delayed, they ſometimes cauſe the idol to be well cudgelled. In the province of Chan-ſi, an idol being long addreſſed in vain to ſend rain, they became exaſperated at its obſtinacy, and it was beat to peices by order of the officers; but afterwards having wet weather they made another image, which they might eaſily do, as they are made of clay, or a kind of mortar, and taking it in triumph to the temple, placed it in the room of the idol they had deſtroyed, and preſented their offerings before it.

The viceroy of a province acted with little leſs ceremony; for being exaſperated at the idol's paying no regard to his reiterated prayers, he ſent an inferior mandarine to tell the image from him, that if there was no rain by ſuch a day he would drive it out of the city, and level its temple with the ground. The viceroy intending to keep his word, forbad the people to carry their offerings to the idol, ordered the temple to be ſhut up, and the gates ſecured. This was immediately done, but the rain falling a few days after, the viceroy's anger was appeaſed, and the ſenſeleſs image permitted to be worſhipped as before.

Indeed there are no marks of contempt, which, on theſe occaſions, both the mandarines and the people do not ſhew to theſe impotent gods. Le Compte obſerves, that they ſometimes addreſs them in the moſt rude and reproachful terms, crying, "Thou dog of a ſpirit, we give thee "a lodging in a magnificent temple; we gild thee; we "preſent thee food; we offer thee incenſe; yet after "all thou art ſo ungrateful as to refuſe to grant our re"queſts." Then tying the image with cords they pluck it down, and drag it along the ſtreets through all the mud, to puniſh it for all the expence of incenſe they have thrown away upon it; but if, in the mean time, they obtain their requeſts, they inſtantly, with much ceremony, waſh the idol clean, carry it back, and replace it in the niche where it ſtood before: then falling down before it, apologize for what they have done. "Indeed, ſay "they, we were a little too haſty, and thou wert too long "in beſtowing thy favours. Why doſt thou bring this "treatment on thyſelf? But what is done cannot be help"ed; let us therefore think of it no more: if thou wilt "forget what is paſt, we will once more cover thee with "gold."

How amazingly ſtupid! How unworthy is this conduct of rational beings! What abſurd, what contemptible ideas do they entertain of the pretended gods to whom they offer up their adorations! But when reaſon is laid aſide, man ceaſes to be rational.

We ſhall now mention two other foreign religions, of a very different nature, that have long been tolerated in China.

At Kay-fong-fu, the capital of Ho-nan, is a ſynagogue of Jews, who have been ſettled many centuries in China: they were viſited in the year 1704, by a miſſionary named Cozani, who had a long conference with them. They ſhewed him their religious books, and permitted him to enter the moſt ſecret place of the ſynagogue, reſerved only for the ruler, who never goes into it, but with the moſt profound

found reverence. In the midſt of the ſynagogue was a very handſome pulpit, which ſtood very high, and had a cuſhion richly embroidered; there they every Saturday read in the book of the Pentateuch. There was alſo a tablet, on which was written the emperor's name; but there were no ſtatues or images. There were likewiſe a cenſer, a long table, and ſome candleſticks. On ſeveral other tables were thirteen tabernacles, in the form of an ark, with curtains before them; twelve repreſented the tribes of Iſrael, and the thirteenth Moſes, whoſe Pentateuch was ſhut up in each of them. On leaving the ſynagogue Cozani entered a large ſaloon, in which were only a great number of cenſers; and they told him, this was the place in which they honoured the great men of their law. From thence he was conducted to the hall of gueſts, in order to diſcourſe with them; and here, on comparing his Bible with their Pentateuch, he found both the chronology and the deſcents of the patriarchs, with their ages, exactly agree. This ſynagogue looks to the weſt, to which they turn whenever they pray to God, whom they worſhip under the names of Creator of all things, and Governor of the univerſe. They call the law the law of Iſrael, the ancient law, and the law of God. Cozani prevailed on the ruler to let the curtains of one of the tabernacles be undrawn, and to unfold one of the books, they being written on long pieces of parchment and rolled round a piece of wood. The character was very diſtinct and clear; but one of the books having narrowly eſcaped an inundation when the Yellow river overflowed its banks, it happened to get wet, and ſome of the characters being half effaced, the Jews cauſed the above-mentioned twelve copies to be tranſcribed from it. They want ſeveral books of the Old Teſtament, and ſome they are not at all acquainted with.

Cozani was ſurprized to find that their ancient rabbies had blended ſeveral ridiculous tales with the facts related in Scripture; for beſides the Bible they have ſeveral other books, compoſed by the antient rabbies: ſome of theſe, which contain the moſt extravagant ſtories, comprehend their ritual and the ceremoneis they now uſe.

They ſtill retain ſome of the ceremonies of the Old Teſtament; in particular they practiſe circumciſion, and obſerve the ſeventh day, the feaſt of unleavened bread, and of the paſchal lamb. They make no fires, nor dreſs any proviſion on their ſabbaths; and whenever they read the Bible in their ſynagogue, they cover their face with a tranſparent veil, in memory of Moſes, who deſcended from the mountain with his face covered: they alſo abſtain from blood, and cut the veins of the animals they kill that it may all flow out.

Yet, notwithſtanding this, they pay the ſame honours to Confucius as the Chineſe literati. They join with them in the ceremonies performed in the halls of their great men, pay the honours due to their anceſtors in the hall contiguous to the ſynagogue, and offer them the fleſh of animals, except ſwine, with ſweet-meats and incenſe, proſtrating themſelves on the earth. They uſed only cenſers, without either inſcriptions or images, in the houſes and halls of their anceſtors. When Cozani ſpoke to them of the life and actions of the Meſſiah, they ſeemed greatly ſurprized, and ſaid that they had never heard of any Jeſus, except the ſon of Sirach mentioned in their Bible; they alſo told him, that their anceſtors firſt appeared in the empire of China, in the dynaſty of Han, which began two hundred and ſix years before the birth of Chriſt, and ended two hundred and twenty after the Chriſtian æra. There were once many families of them, but they are now greatly reduced.

There are alſo many Mahometans, who have been ſettled above ſix hundred years in ſeveral provinces, where they have their moſques, and are never diſturbed, becauſe they live peaceably without oppoſing the cuſtoms or religion of the country.

SECT. XIV.

Of the Money, Weights, Meaſures, and Trade of China.

SILVER and copper are the only metals current in China in purchaſing neceſſaries and in trade. Gold is not conſidered there as money, but is like precious ſtones in Europe; for it is bought like other merchandize, and the Europeans draw conſiderable profit from this article of commerce.

Even ſilver is not coined, but is cut into great or ſmall pieces as occaſion requires; its value being determined by the weight, and not by the image of the prince. The Chineſe generally carry with them a pair of ſmall ſcales in a Japan caſe, not unlike the Roman balance: they are compoſed of a ſmall plate, an ivory or ebony beam, and a ſliding weight. The beam, which is divided into ſmall parts, upon three different faces, is ſuſpended by a ſtring of ſilk at one of its ends, that they may eaſily weigh all ſorts of weight. Theſe ſcales are very exact, for the thouſandth part of a crown piece will ſenſibly turn the ſcale.

Their ſilver is not equally fine, but is divided into an hundred parts, juſt as we account twenty-four carats to be the fineſt gold. Eighty is reckoned the baſeſt alloy, and will not paſs without augmenting the weight in proportion to the value of the commodity; but that from ninety to one hundred, which is the fineſt ſort, paſſes currently.

The Chineſe are very ſkilful in forming a judgment by the ſight of the fineneſs of the ſilver, and are ſeldom deceived. The difficulty lies in purchaſing ſmall matters; for ſometimes they are forced to put it in the fire, and beat it thin with a hammer, that they may the more eaſily cut it into little pieces, and give the price agreed upon; whence they are always longer in making the payment than the purchaſe.

They are ſenſible that it would be more convenient to have money coined of a determined value, but they are afraid that it would be a temptation to clippers and coiners; whereas there is now no danger, becauſe they cut the ſilver as they have occaſion to pay for what they buy.

Copper money is the only ſort that has any character ſtamped upon it; but it has not the impreſſion of the emperor's head, it being deemed diſreſpectful to the majeſty of that prince for his image to be perpetually paſſing through the hands of tradeſmen and the dregs of the people. The inſcriptions on this coin are generally the pompous titles given by the emperor to the different years of his reign: as *The ſupremely peaceful*; *The eternally ſhining*; *The glorious*. Theſe little pieces are of uſe in buying things of ſmall price. It is in little round pieces, with a ſquare hole in the middle, which they put on ſtrings by hundreds and ſometimes a thouſand on one ſtring. The metal is neither pure nor beaten, and ſix of the pieces are worth about a half-penny.

Theſe ſmall pieces have always been the current money of China, and the curious preſerve ſome that were coined in the firſt dynaſties of the empire, and have either paſſed from family to family, or have been found in the ruins of houſes and cities.

It is eaſy to judge, that if the ſilver was coined in China as well as the copper, it would be greatly debaſed, ſince their ſmall pieces of copper are often counterfeited. Thoſe who follow this trade mark the counterfeit coin with the ſame characters that are ſeen upon the true; but the metal they uſe is of a baſer ſort, and the weight leſs. If they happen to be diſcovered the crime is capital, but ſome princes have been contented with cutting off the hand of the offenders, and others with ſending them into baniſhment.

There were antiently much ſmaller pieces of money, which are now no longer in uſe; but thoſe who happen to get any of them into their poſſeſſion, beat them with a hammer till they are as broad as the current coin, and putting them upon a ſtring among the reſt they paſs unperceived by the merchant: nay ſome, it is ſaid, have gone ſo far as to cut paſteboard in the ſame form and to mix them with the reſt upon a ſtring, and the deceit is not diſcovered till the pieces are taken off.

Mr. Hamilton, in his New Account of the Eaſt Indies obſerves, that though theſe are the only coin, accounts are kept in tayals, macies, and condereens; ten condereens to a macie, and ten macies to a tayal; and that the value of the ſmall braſs coin above-mentioned often riſes, and falls.

For the better underſtanding the value of money, it muſt be obſerved, that the Chineſe divide their pound into ſixteen leang or ounces; the leang into ten parts, called tſien; the tſien into ten fuen, and the fuen into ten li of

wer. The beam of the Chineſe ſcales carries theſe di-
ſions no farther; and yet in relation to gold and ſilver of
conſiderable weight, the diviſions extend in the ſame
cimal proportions to imperceptible parts; on which ac-
unt it is ſcarce poſſible to convey a juſt idea of them in
ur language; they divide the li into ten wha; the wha
to ten ſe; the ſe into ten ſou; the ſou into ten tchin;
e tchin, which ſignifies a grain of ſand, into ten ya; the
into ten miau; the miau into ten mo; the mo into ten
um; and the tſium into ten ſun.

Meaſures are ſaid to have been invented as early as the
ign of the third emperor. A grain of millet was taken
determine the dimenſions of a line, or tenth part of an
ch; and ten inches to a foot: but theſe grains being of
oval form, the various ways of ranging them have occa-
oned a diverſity in the meaſures of different provinces.

At preſent there are three ſorts of meaſures: 1. The foot
the palace is to the Paris foot, as ninety-ſeven and a
lf to an hundred of the feet uſed in the tribunal of the
athematics. 2. The foot of the tribunal of public works,
ed by workmen, is ſhorter by one line than the Paris
ot. 3. The taylors foot, which is alſo uſed by the
ercers, is ſeven lines larger than that of the tribunal of
blic works.

The firſt being the meaſure conſtantly uſed by the miſ-
onaries in ſurveying the empire, Thomas, the Jeſuit,
und a degree to be two hundred lies, or Chineſe furlongs,
ch conſiſting of one hundred and eighty Chineſe fathoms
ten feet.

We ſhall now take a view of the trade of China, where
e riches peculiar to each province, and the facility of
nveying merchandize by means of the rivers and canals,
ve always rendered the domeſtic trade of the empire ex-
emely flouriſhing and immenſely great. Du Halde ſays,
at it is much greater than that of all Europe. "That
might be, ſays the baron De Monteſquieu in his Spirit
of Laws, if our foreign trade did not augment our in-
land commerce. Europe carries on the trade and na-
vigation of the other three parts of the world; as France,
England, and Holland, do nearly that of Europe."

As to its foreign trade, if compared to this, it is very
conſiderable, for by ſea they never paſs the Streights of
nda, their fartheſt voyage that way being to Bata-
; on the ſide of Malacca it never extends beyond
chen; and the limits of their navigation northwards is
pan.

They commonly ſail to this laſt country in June or July
fartheſt; but firſt carry goods to Camboya, or Siam,
d freight themſelves there with ſuch as are in requeſt
Japan, making two hundred per cent. by the voyage.
they ſail directly thither from the ports of Canton,
mouy, or Ning-po, they export ginſeng, birthwort,
ubarb, mirabolans, buffelo and cow hides, areca bark,
d white ſugar; gaining by the laſt ſometimes a thouſand
r cent. All ſorts of ſilk, chiefly ſattins, taffeties, and
maſks of different colours, but principally black; ſilk
ings for inſtruments, eagle and ſandal wood, which is
much requeſt among the Japaneſe for perfumes, as they
equently offer incenſe to their idols, and European cloths
d camblets.

The Chineſe traders in return bring from Japan pearls,
which they ſometimes gain a thouſand per cent. fine
pper in bars, alſo wrought copper, as ſcales, baſons,
afing-diſhes, incenſe-pans, &c. flowered paper, beau-
ful porcelain, Japan cabinets, and other goods; gold,
hich is very fine, and a certain metal called tombac, by
hich they gain fifty or ſixty per cent. at Batavia.

They carry to Manila a great deal of ſilk, particularly
riped and flowered ſattin of different colours, embroidery,
rpets, cuſhions, night-gowns, tea, China-ware, Japan
orks, drugs, &c. by which they generally gain fifty
r cent. and bring back only piaſters. The trade they
oſt regularly carry on is that to Batavia, to which they
rry fine green tea, China-ware, leaf-gold, and gold
read made of gilt paper. Some of this is ſold by hand
ſmall ſcanes, and is dear, becauſe covered with the
neſt gold; but that brought by the Chineſe to Batavia
ſold only by weight, and is made up in parcels, with
rge hanks of red ſilk put in to ſet off the colour of the
id and increaſe the weight of the parcels. This the
utch ſell to the Malayans for great profit. Toutenack,

a metal between tin and iron, that yields an hundred, and ſometimes an hundred and fifty per cent, drugs, particularly rhubarb, copper veſſels, as large as kettles, chafing-diſhes, baſons, &c.

From Batavia they import ſilver in piaſters, nutmegs, cloves, pepper, and other ſpices; tortoiſe ſhells, of which the Chineſe make very neat toys, as ſnuff-boxes, after the faſhion of thoſe in Europe; pipes, knife-handles, cups, boxes, and combs; ſandal wood and black wood for making cabinet work, and Brazil wood for dying; agate ſtones ready cut, yellow amber, and European cloth, which they afterwards ſell at Japan.

This is the principal foreign trade carried on by the Chineſe; they ſometimes ſail to Achen, Malacca, Ihor, Potana, Ligor, Cochin-china &c. The trade they carry on at Ihor is the moſt eaſy and gainful; from thence they export cinnamon, pepper, birds-neſts, rice, camphire, rattan, torches made of the leaves of certain trees which burn like pitch, gold, tin, &c.

As for the trade carried on by the Europeans in China, they have the liberty of ſcarce any port but that of Canton; nor do they ſail up the river as far as that city, but caſt anchor at Hoang-pou, about four leagues below it, where the river is crowded by a multitude of veſſels; but there is no trading to advantage with any thing but ſilver in China, where conſiderable profit may be made by purchaſing gold with it.

The gold bought at Canton comes partly from the provinces of China, and partly from foreign countries, as Japan, Cochin-china, and other places. The goods purchaſed there of the Chineſe are ſilks, japaned works, and in much greater quantities all the different ſorts of tea drank in Europe; and China-ware, hanging paper, fans, drugs, &c.

We ſhall conclude this deſcription of China with an extract of the character given of the Chineſe by the ingenious author of Commodore Anſon's Voyage round the World; which we chooſe to inſert here, both on account of our thinking it extremely juſt, and as it will ſerve as a ſummary of the whole, and, in one view, afford a juſt idea of that people. After which we ſhall deſcribe the iſles of Formoſa and Hainan, which are in part under the ſubjection of China, and are the only iſlands ſubject to that empire that are worthy of a particular deſcription.

"That the Chineſe are a very ingenious and induſtrious "people, is ſufficiently evinced from the great number of "curious manufactures which are eſtabliſhed amongſt "them, and which are eagerly ſought for by the moſt "diſtant nations; but though ſkill in the handicraft arts "ſeems to be the moſt valuable qualification of this peo-"ple, yet their talents therein are but of a ſecond rate "kind; for they are much outdone by the Japaneſe in "thoſe manufactures which are common to both coun-"tries; and they are in numerous inſtances incapable of "rivalling the mechanic dexterity of the Europeans. In-"deed, their principal excellency ſeems to be in imitation; "and they accordingly labour under that poverty of genius "which conſtantly attends all ſervile imitators. This is "moſt conſpicuous in works which require great truth "and accuracy; as in clocks, watches, fire-arms, &c. "for in all theſe, though they can copy the different parts, "and can form ſome reſemblance of the whole; yet they "never could arrive at ſuch a juſtneſs in their fabrick, as "was neceſſary to produce the deſired effect. If we paſs "from thoſe employed in manufactures to artiſts of a ſu-"perior claſs, as painters, ſtatuaries, &c. in theſe mat-"ters they ſeem to be ſtill more defective; their painters, "though very numerous, and in great eſteem, rarely ſuc-"ceeding in the drawing or colouring of human figures, "or in the grouping of large compoſitions; and though "in flowers and birds their performances are much more "admired, yet even in theſe ſome part of the merit is "rather to be imputed to the native brightneſs and excel-"lency of the colours, than to the ſkill of the painter; "ſince it is very unuſual to ſee the light and ſhade juſtly "and naturally handled, or to find that eaſe and grace in "the drawing which are to be met with in the works of "European artiſts. In ſhort, there is a ſtiffneſs and mi-"nuteneſs in moſt of the Chineſe productions, which are "extremely diſpleaſing: and it may perhaps be truly "aſſerted, that theſe defects in their arts are entirely owing

" to the peculiar turn of the people, amongſt whom no-
" thing great or ſpirited is to be met with.

" If we next examine the Chineſe literature, (taking
" our accounts from the writers who have endeavoured to
" repreſent it in the moſt favourable light) we ſhall find,
" that on this head their obſtinacy and abſurdity are moſt
" wonderful; ſince though, for many ages, they have
" been ſurrounded by nations to whom the uſe of letters
" was familiar, yet they, the Chineſe alone, have hither-
" to neglected to avail themſelves of that almoſt divine
" invention, and have continued to adhere to the rude
" and inartificial method of repreſenting words by arbi-
" trary marks; a method which neceſſarily renders the
" number of their characters too great for human memory
" to manage, makes writing to be an art that requires
" prodigious application, and in which no man can be
" otherwiſe than partially ſkilled; whilſt all reading and
" underſtanding of what is written is attended with in-
" finite obſcurity and confuſion, as the connection between
" theſe marks, and the words they repreſent, cannot be
" retained in books, but muſt be delivered down from age
" to age by oral tradition: and how uncertain this muſt
" prove in ſuch a complicated ſubject, is ſufficiently ob-
" vious to thoſe who have attended to the variation which
" all verbal relations undergo when they are tranſmitted
" through three or four hands only. Hence it is eaſy to
" conclude, that the hiſtory and inventions of paſt ages,
" recorded by theſe perplexed ſymbols, muſt frequently
" prove unintelligible; and conſequently the learning and
" boaſted antiquity of the nation, muſt in numerous in-
" ſtances, be extremely problematical.

" However, we are told by many of the miſſionaries,
" that though the ſkill of the Chineſe in ſcience is con-
" feſſedly much inferior to that of the Europeans, yet the
" morality and juſtice taught and practiſed by them are
" moſt exemplary: ſo that, from the deſcription given by
" ſome of theſe good fathers, one ſhould be induced to
" believe, that the whole empire was a well governed
" affectionate family, where the only conteſts were who
" ſhould exert the moſt humanity and ſocial virtue. But
" the behaviour of the magiſtrates, merchants, and trades-
" men at Canton, ſufficiently refutes theſe jeſuitical fic-
" tions. Beſides, as to their theories of morality, if we may
" judge from the ſpecimens exhibited in the works of the
" miſſionaries, we ſhall find them frequently employed in
" recommending a ridiculous attachment to certain frivo-
" lous points, inſtead of diſcuſſing the proper criterion of
" human actions, and regulating the general conduct of
" mankind to one another, on reaſonable and equitable
" principles. Indeed, the only pretenſion of the Chineſe
" to a more refined morality than their neighbours, is
" founded not on their integrity or beneficence, but ſolely
" on the affected evenneſs of their demeanor, and their
" conſtant attention to ſuppreſs all ſymptoms of paſſion
" and violence. But it muſt be conſidered, that hypo-
" criſy and fraud are often not leſs miſchievous to the ge-
" neral intereſts of mankind, than impetuoſity and vehe-
" mence of temper: ſince theſe, though uſually liable to
" the imputation of imprudence, do not exclude ſincerity,
" benevolence, reſolution, nor many other laudable quali-
" ties. And perhaps, if this matter was examined to the
" bottom, it would appear, that the calm and patient turn
" of the Chineſe, in which they ſo much value themſelves,
" and which diſtinguiſhes the nation from all others, is
" in reality the ſource of the moſt exceptionable part of
" their character: for it has been often obſerved by thoſe
" who have attended to the nature of mankind, that it is
" difficult to curb the more robuſt and violent paſſions,
" without augmenting, at the ſame time, the force of the
" ſelfiſh ones: ſo that the timidity, diſſimulation, and diſ-
" honeſty of the Chineſe may, in ſome ſort, be owing to
" the compoſure and external decency ſo univerſally pre-
" vailing in that empire.

" Thus much for the general diſpoſition of the people:
" but I cannot diſmiſs this ſubject without adding a few
" words about the Chineſe government, that too having
" been the ſubject of boundleſs panegyric. And, on this
" head, I muſt obſerve, that the favourable accounts often
" given of their prudent regulations for the adminiſtration
" of their domeſtic affairs, are ſufficiently confuted by their
" tranſactions with commodore Anſon; as we have ſeen
" that their magiſtrates are corrupt, their people thievi-
" and their tribunals venal and abounding with artifice
" Nor is the conſtitution of the empire, or the general or-
" ders of the ſtate, leſs liable to exception; ſince that form
" of government, which does not in the firſt place provide
" for the ſecurity of the public againſt the enterprizes of
" foreign powers, is certainly a moſt defective inſtitution.
" and yet this populous, this rich and extenſive country
" ſo pompouſly celebrated for its refined wiſdom and po-
" licy, was conquered about an age ſince by a handful of
" Tartars; and even now, through the cowardice of the
" inhabitants, and the want of proper military regulations
" it continues expoſed, not only to the attempts of any
" potent ſtate, but to the ravages of every petty in-
" vader."

SECT. XV.

Of the Iſland of FORMOSA.

Its Situation, Climate, Vegetables, and Animals. The Treachery of the Chineſe. A Deſcription of the Part poſſeſſed by the Nation, and of the Perſons, Dreſs, Manners, and Cuſtoms of the Natives under their Subjection. Of the Settlement made there by the Japaneſe, afterwards by the Dutch, and at length by the Chineſe, who obliged the latter to leave the Iſland.

THE iſland of Formoſa is ſituated to the eaſt of China, near the province of Fo-kien, and is divided into two parts by a chain of mountains, which runs through the middle, beginning at the ſouth coaſt and ending at the north. That part of the iſland which lies to the weſt of the mountains belongs to the Chineſe, and is ſituated between 22 degrees 8 minutes and 25 degrees 20 minutes north latitude.

The word Formoſa ſignifies beautiful, and the iſland well deſerves the name, it being a very fine country. The air is pure and always ſerene, and that part poſſeſſed by the Chineſe produces plenty of corn, rice, and other grain, and is watered by many rivers that deſcend from the mountains; but the water is not very good. Moſt of the fruits that grow in the Indies are to be found here, as oranges, papayas, goyavas, ananas, bananas, cocoes, &c. Beſides peaches and apricots, pomegranates, grapes, figs, chesnuts, and other European fruits. The inhabitants also cultivate a kind of water-melons, much larger than thoſe of Europe: ſome of theſe conſiſt of a white and others of a red pulp, and contain a cool luſcious juice, very grateful to the Chineſe. Sugar and tobacco grow here extremely well, and all the trees in that ſide of the iſland are ſo agreeably ranged, that when the rice is, as uſual, tranſplanted in lines and ſquares, the whole ſouthern part reſembles a vaſt garden.

There are no tygers, leopards, bears, wolves, nor wild boars to be met with here as in China. Horſes, ſheep, goats, and even hogs are very ſcarce; but deer and aſſes are ſeen in herds. They have abundance of oxen, which, for want of mules and aſſes ſerve for common riding, and being diſciplined betimes, go as good a pace as the beſt horſes in the country. There are but few birds, the moſt common are the pheaſants, but thoſe the fowlers will ſcarce ſuffer to multiply.

The inhabitants of the eaſtern part of the iſland are deſcribed by the Chineſe as barbarians; yet they acknowledge that they are chaſt, of a ſweet and gentle diſpoſition, loving and mutually aſſiſting each other; diſintereſted and ſetting little or no value on their gold and ſilver, of which they are ſaid to have ſeveral mines. But with theſe good qualities they are like other uncivilized nations, extremely revengeful. They are ſaid to live without any regular laws, and to eat only fiſh and the fleſh of beaſts, without ſhewing any ſigns of worſhip or religion.

The Chineſe knowing there were gold mines in the iſland before they conquered it, and being unable to find any in that part under their ſubjection, would not venture to croſs the mountains; but ſent a ſmall ſhip to the eaſtern parts, where they made no doubt they ſhould find them. They met with an hoſpitable reception from the inhabitants, who generouſly offered them lodgings, proviſions, and aſſiſtance; but gave them no information concerning the

the mines, possibly through jealousy of their power. After eight days search, they discovered only some ingots in the cottages, on which these innocent people seemed to set but little value.

The friendly natives having assisted them to equip their vessel in order for their return, the Chinese, whose avarice was inflamed at the sight of these ingots, invited their benefactors to a great entertainment, and having made them all drunk, cut their throats, and sailed away with the ingots. The news of this cruel act of more than savage ingratitude, was no sooner spread through the eastern part of the island, than the inhabitants took up arms, and made an irruption into the western part, where, without mercy, they put man, woman, and child to the sword, and set fire to their dwellings. Since that time the two parts of the island have been almost continually at war.

The lands possessed by the Chinese in the isle of Formosa, are divided into three subordinate governments that depend upon the capital of the island, and each of these governments has its particular magistrates, subject to the governor of the capital: and the governor himself is subject to the viceroy of the province of Fo-kien.

The capital, which is called Tai-ouan-fou, is very populous, and equal to most of the great cities of China. Every thing that can be desired may there be had in great plenty, not only what the island itself furnishes, but China and India cloths, varnish, China-ware, silk, and the several manufactures of Europe: there are but few mulberry-trees in the island, and consequently but little silk is made in the country. The emperor keeps there a garrison, consisting of a thousand men for the security of the settlement, and no Chinese can remove thither with his family without a passport.

Almost all the streets of the capital are drawn in a line, and covered seven or eight months in the year to defend the people from the heat of the sun. They are from thirty to forty feet in breadth, and some of them are near three miles long. Almost all of them are lined with shops of China-ware, silk, and other commodities in admirable order, in which the Chinese excel, and it would be exceeding pleasant to walk in them, were they better paved, and less crowded by passengers.

The houses are all thatched, and generally built of clay and bamboo; however, the disagreeable meanness of these buildings is concealed by the tents that cover the streets, so that nothing is to be seen but the shops.

This city has neither walls, or any other kind of fortifications, for the Tartars do not love to confine their courage within a rampart, but chuse to fight on horseback in the open field.

The harbour is sheltered from every wind; but the entrance into it becomes every day more difficult. There were formerly two entrances into it, but one of them is choaked up with sand, and the other, which has a rocky bottom, is not above nine or ten feet deep at high water.

The Chinese have three cities and many villages under their subjection; but their government and manners being the same as in China, we shall not tire the reader with a repetition of them. Those of the natives who are subject to the Chinese, are divided into forty-five towns, or plantations, thirty-six in the north, and nine in the southern part. The towns of the north are very populous, and the houses but little different from those of China; but those in the south are only a heap of round cottages made of clay and bamboo, in the form of a funnel inverted, and thatched at the top. They are from fifteen to forty feet in diameter, and some of them are separated by partitions; but in these huts are neither tables, chairs, benches, beds, nor any other furniture. Their beds are the fresh leaves of a particular tree, very common in the country, which they gather, and spread upon the ground, or on a board in their cottages, and there lie down to sleep. In the middle of the house is a kind of stove raised two or three feet from the ground where they dress their victuals.

They are very slovenly at their meals, using neither dishes, plates, spoons, knives nor forks, but place what is provided upon a piece of board or mat, and use their fingers to eat with. They eat flesh half raw, and the less it is roasted the better they like it.

Their common food is rice, millet, and any game they can take, which they either do, by killing them with their arrows, darts, and javelins, or overtake them by running, for they are so swift as to outstrip horses in their full speed, which the Chinese attribute to the custom of binding their loins and knees exceeding right, till they are fourteen or fifteen years of age. They hurl their javelins seventy or eighty paces with the utmost exactness; and, though their bows and arrows are very ordinary ones, they kill pheasants flying.

The persons of the original inhabitants are not at all like their neighbours the Chinese. They are of a low stature, and have a large head, and high forehead, a wide mouth, high cheek bones, and a short flat chin, with very little beard. Their neck is small and long, their body short and square, and their arms and legs long, small, and ill-shaped.

Their whole apparel is a single piece of cloth two or three feet long, tied round the waste, and reaching down to the knees. Yet pride, which takes deep root in the human heart, is here indulged even in nakedness, and gives these people more pain and trouble than those who are more civilized feel, to procure the richest habits; for some of them imprint grotesque figures of trees, animals, flowers, &c. on their skin. But this privilege, which is allowed only to such as excel in running and hunting, costs them dear, and puts them to such violent pain, that the operation might endanger their lives was the whole to be performed at once; they therefore employ several months, and sometimes a whole year about it. However, all persons are at liberty to wear in their ears rings, and on their heads and necks coronets, and necklaces, consisting of several rows of small grains of different colours. These coronets are terminated with a plume of cocks or pheasants feathers; they also blacken their teeth, and wear bracelets above their elbows, and on their wrists. If we imagine a man with an olive complection, a fine slender shape, with his hair hanging negligently on his shoulders, and adorned with those fantastical ornaments, with no other garments but a piece of cloth round his waste, and at the same time armed with a bow and arrows, we shall have a just idea of a beau of the south part of the isle of Formosa.

In the north part of the island, where the climate is cooler, they cover themselves with the skins of the deer they kill in hunting, and make them into a sort of coats without sleeves. They wear a bonnet in the form of a cylinder, made of the stalks of Banana leaves, which they adorn with coronets placed one above another, and tied with fillets and bands of different colours, having on the top a plume like those before mentioned.

When a man is desirous of marrying, he goes several days successively with music to the door of the house where the object of his affections resides, and if he be agreeable to her she goes out to meet him, and then they settle the terms between themselves; after which they speak to their parents, and desire them to prepare the wedding feast. This is made at the house of the bride's father, and there the bridegroom continues. Hence they place their good fortune, not in having boys, but girls, who procure them sons-in-law to be the props of their old age.

Though the islanders in this division are entirely subject to the Chinese, they still preserve some remains of their ancient government. Every town makes choice of three or four old men, most distinguished for their probity, to be their judges; these determine all differences, and if any one refuses to submit to their decision, he is instantly driven out of the town, without the least hope of ever returning, and no other town will receive him.

To regulate the tribute which they pay in grain, deer, skins, and other things easily procured in the island, there is in every town a Chinese who understands the language; and is interpreter to the mandarines; but instead of preventing these poor people from being oppressed, they behave like petty tyrants, and exercise the patience, not only of them, but of the mandarines themselves, who are forced to continue them in their employments to avoid greater inconveniences. There were formerly twelve towns in the south under subjection to the Chinese; but three of them revolted, drove out the interpreter, and united themselves to those of the eastern part of the island.

The

The Chineſe themſelves acknowledge, that amongſt theſe people there is no cheating, robbing, or quarrelling, except with their interpreters, and that they practice all the duties of equity and benevolence. Whatever is given to any of them, they will not receive till thoſe who ſhared the labour, partake of the wages.

In the year 1620, a Japaneſe ſquadron coming near Formoſa, the commander was ſo pleaſed with the view of the country, that he reſolved to ſettle a colony in the iſland, and therefore left ſome of his men on ſhore with orders to get information of every thing neceſſary to the execution of his deſign. Soon after a Dutch veſſel was forced by a ſtorm into the ſame harbour, and found the Japaneſe in no condition to oppoſe them. They thought the country extremely beautiful, and well ſituated for commerce, and therefore pretending to want refreſhments, and to be under a neceſſity of refitting their veſſel, which was damaged by the ſtorm, they ſtayed on ſhore; and ſome of them made an excurſion into the country, in order to view it more narrowly, which having done, they returned on board, and began to refit the veſſel. They now deſired the Japaneſe, whom they were unwilling to offend, for fear of injuring their trade to Japan, to allow them to build a houſe on the brink of the iſland at one of the entrances into the harbour, which they alledged would be of uſe to them in going and coming to Japan. The Japaneſe at firſt denied their requeſt; but the Dutch preſſing them to give their conſent, and aſſuring them they deſired no more ground than what could be encompaſſed with an ox's hide, the Japaneſe at laſt agreed to their requeſt.

The Dutch then taking a large hide, cut it into ſmall thongs, and tying them together, encompaſſed a ſpacious piece of land. The Japaneſe were at firſt a little vexed at this artifice; but were ſoon pacified, and laughing at the ſtratagem, ſuffered the Dutch to built a fort, to which they gave the name of the caſtle of Zealand. This fort gave the Dutch the command of the harbour, and made them maſters of the only paſſage by which large veſſels could enter it. The Japaneſe, either diſguſted at the new fort, or not finding their account in ſtaying in the iſland, ſoon after quitted it, and returned home. The Dutch, by this means, became ſole maſters of Formoſa; for the inhabitants were unable to oppoſe them. They therefore ſtrengthened themſelves by building a fortification, conſiſting of four half baſtions on the other ſide of the harbour, oppoſite to the fort of Zealand.

China was at this time all in a flame; the king of the Tartars was ſeated on the throne, and ſeveral of the provinces oppoſed him by a vigorous war, which was carried on with various ſucceſs, till at length one of the Chineſe generals being defeated, and driven out of China, he turned his views towards Formoſa, reſolving to drive the Dutch from thence, and erect a new kingdom there. The Dutch who apprehended no danger, had neglected to ſtrengthen themſelves with ſupplies of men from their other ſettlements, and there were only eleven of them to defend the fort and harbour of Formoſa, the reſt of the garriſon being compoſed of Indians, and of the inhabitants of the country. Notwithſtanding the great inequality of forces, the Dutch reſolved to defend themſelves, which they did with the utmoſt bravery. The Chineſe general entered the harbour with a fleet compoſed of nine hundred ſail, and landed part of his men, in order to attack the fort of Zealand both by ſea and land. The ſiege laſted four months, in which the Dutch defended themſelves with their great guns with more ſucceſs than they themſelves had expected. The Chineſe general was enraged at meeting ſuch oppoſition from a handful of Europeans againſt a numerous army: and as the Chineſe had not the uſe of cannon, he had no hopes of reducing them, but by famine, which would require a long time, and in the mean while they might be relieved by ſhips from Batavia, or by thoſe that trade to Japan. He therefore reſolved to make uſe of his utmoſt efforts againſt the Dutch, who had four ſhips in the harbour, and had put on board each of them one of their own men, with ſome Indians, to guard it, the other ſeven Dutchmen remaining in the fort of Zealand.

The Chineſe general finding no other method of injuring the Dutch, turned a few of his veſſels into fire-ſhips, and having the advantage of a high wind drove them upon the Dutch ſhips, and burnt three of them. Having thus ſucceeded in this attempt, he ſummoned the Dutch to ſurrender, offering them leave to depart with all their effects, and threatning if they refuſed to allow them no quarter. The Dutch, having now only one ſhip left, gladly accepted the offer, and having put on board all their effects, delivered the place into the hands of the Chineſe, and departed. Some years after the Chineſe in Formoſa, taking advantage of a general amneſty, ſubmitted to the emperor; this happened in the year 1683, and this iſland has ever ſince been ſubject to the Tartarian princes ſeated on the throne of China.

SECT. XVI.

Of the Iſland of HAINAN.

Its Situation, Extent, and Climate. Its Soil, Minerals, Vegetables, and Animals. Of the Perſons, Dreſs, Manners, and Cuſtoms of thoſe of the Natives who have preſerved their Freedom; and of the Government of that Part of the Iſland, which is ſubject to the Chineſe.

HAINAN, which ſignifies South of the ſea, is a large iſland, bounded on the north by the province of Quang-ſi, which, in clear weather, may be ſeen from the coaſt; on the eaſt, by the Chineſe ſea; on the ſouth by the coaſt of Cochin-china, and on the weſt by part of that kingdom, and part of the province of Quang-tong.

Its greateſt length, from eaſt to weſt, is between ſixty and ſeventy leagues, and its breadth from north to ſouth between forty and fifty, containing near one hundred and ſixty leagues in circuit. The climate on the northern part is very unhealthful, chiefly on account of the water, for the inhabitants are obliged to boil in the morning all they propoſe to drink in the day.

The ſoil of that part of the iſland is a plain that reaches from the ſea-ſide about fifteen leagues into the country; but the ſouthern and eaſtern parts are very mountainous: yet there are ſome vallies in the center of the iſland, which are well cultivated, and produce two crops of rice every year; but the mountains for the greateſt part are barren. In the midſt of the iſland are gold mines, and in the northern part mines of lapis-lazuli.

Among the trees of the iſland are thoſe which yield dragon's blood, and many others of different ſorts, which, on an inciſion made in the bark, yield a white juice, which, as it hardens, turns red, but has not the conſiſtence of gum: this matter being thrown into the fire burns ſlowly, and diffuſes a ſmell weaker, but more agreeable than incenſe. Among the other trees are thoſe called by the Europeans eagle-wood, and roſe, or violet-wood, which is thus named, on account of its ſcent. There is alſo a yellow wood that is very fine, and in a manner incorruptible. Columns made of it are ſold at a high price, and are kept for the ſole uſe of the emperor.

The iſland not only produces the various fruits that grow in China, but ſugar, tobacco, cotton, and indigo; they have alſo areca nuts and rattan canes.

Among the animals is a remarkable kind of large black apes, that very much reſemble the human ſpecies, and have features well made; but theſe are very ſcarce. There are others that are grey and very ugly. All ſorts of game are very plentiful, particularly deer, hares, and a kind of wild boars.

The partridges and quails are inferior to thoſe of Europe; but ſnipes, teal, and all ſorts of water fowl, are very good. The woodcocks here are epcellent, and turtle-doves, and wood-pigeons, are in great plenty.

There are likewiſe ſeveral ſorts of curious birds, ſome of which are of the ſize of a linnet, with feathers of a beautiful red, and others of a bright gold colour: theſe two ſorts of birds are always together. There are ravens with white rings about the neck, ſtarlings, with a little moon on their bills, and a bird of the ſhape and ſize of a black-bird, but is of a deep blue, with yellow ears about half an inch long. Theſe birds talk and whiſtle to perfection.

In the iſland are alſo found ſnakes of a monſtrous ſize, but ſo timorous, that they are frighted at the leaſt noiſe, and

and are far from being dangerous, as the natives travel barefoot both by day and night through the plains and thick woods without being hurt.

This iſland is ſubject to China, except the middle part, where the natives have retired to the mountains, and live independent of the mandarines. They formerly traded with the Chineſe, with whom they exchanged gold, which they dig out of their mines, China-wood, and Calamba-wood, for other commodities, which brought immenſe profits to the mandarines: but theſe iſlanders ſcarce ever appear unleſs it be to ſurprize ſome of the neighbouring villages; yet they are ſuch cowards, and ſo ill diſciplined, that it is ſaid fifty Chineſe would defeat ſome hundreds of them. However, a part of them pay tribute to the emperor, and are ſuffered to poſſeſs villages on the plain. Many others, particularly in the eaſt and ſouthern parts of the iſland, are in the ſervice of the Chineſe; theſe keep their ſheep and till their lands, but they are generally deformed, very ſhort and of a rediſh complexion.

Both the men and women wear their hair in a ring on the forehead, and on their heads a hat made of ſtraw or rattan, and tied under their chin. The men wear only a piece of calicoe, which is either black or of a deep blue, and covers them from the waiſt to the knees. The women wear a kind of waiſtcoat of the ſame ſtuff, and alſo paint their faces from their eyes downwards with blue ſtreaks made of Indigo. Both ſexes wear gold and ſilver ear-rings, with pendants made in the form of a pear and well wrought.

Their arms are bows and arrows, in the uſe of which they are not very ſkilful. They have alſo a kind of hanger, which they carry in a little baſket faſtened to their girdle behind. This is the only inſtrument they uſe for doing their carpenters work and clearing their way through the foreſts.

This iſland is in the diſtrict of the province of Quang-tong. Its capital, which is named Kiun-tcheou, is built on a promontory, and ſhips lie at anchor under its walls. 'Tis governed by two forts of mandarines: thoſe of the mandarines of learning, and thoſe of arms. There are three cities of the ſecond order, and ten of the third; all of them near the ſea-ſide, and under the juriſdiction of the capital.

In the north of the iſland is the port to which the barks of Canton reſort. It is formed by a wide river, the entrance of which is defended by two ſmall forts; though it has but ten or twelve feet water. The capital is ſituated within two leages of this port, and between them is a large plain, in which are many Chineſe ſepulchres. In the ſouth part of the iſland is a fine port at the bottom of a great bay, where there is near twenty feet water: by the ſhore of this port are abundance of maritime plants and madrepores of all kinds.

CHAP. III.

Of KOREA.

SECT. I.

Of the Situation, Extent, Climate, and Soil of Korea. Its Vegetables and Animals. The Dreſs, Manners, and Cuſtoms of the Koreans. Their Houſes deſcribed, and their Hoſpitality to Travellers.

THOUGH the kingdom of Korea, or Corea, be only tributary to China, yet as it is ſituated on the eaſtern extremity of Aſia, we ſhall give a deſcription of it before we treat of that part of Tartary that is immediately ſubject to the emperor.

Korea is called both by the Chineſe and the natives Kaoli; and is a peninſula of Aſia, that extends from about the thirty-fourth to the forty-third degree of north latitude, being about four hundred and fifty miles in length from north to ſouth, and two hundred and twenty-five in breadth from eaſt to weſt. It is bounded on the north by the country of the Manchew Tartars: on the weſt by the province of Leao-tong and the Yellow ſea; on the eaſt it is bounded by the ſea of Corea, which ſeparates it from Japan; and on the ſouth by the ocean. The coaſts being incloſed with rocks and ſands, ſtrangers cannot approach them without danger.

On the north are long and high mountains, where the cold is ſo intenſe, that the rice and the cotton-plant will not grow. The poor people there feed on barley, while the rich have meal brought from the ſouth. The mountains are, during the winter, covered with deep ſnow, and the people in order to walk upon it, wear pieces of boards under their feet, to prevent their ſinking.

The moſt conſiderable rivers of Korea are the Yalou and the Towmen, both of which riſe in the ſame mountain, which is one of the higheſt in the world. One of them flows to the eaſt, and the other towards the weſt. They are both pretty deep, and moderately rapid; and the water is very good.

All the ſouthern part of the country is extremely fertile, and produces all the neceſſaries of life, eſpecially rice, wheat, millet and other ſorts of grain. The ginſeng, a root ſo highly eſteemed by the Chineſe for its medicinal virtues, is alſo found here, though not in ſuch quantities as in the country of the Manchews. They have alſo tobacco, hemp, and cotton; and moſt of the trees found in the northern parts of China.

They have plenty of horned cattle, which they uſe in tilling the land. They have alſo ſwine, dogs, and cats; of the wild kind, there are tygers, bears, wolves and ſables, deer, foxes, and many others. The rivers are often peſtered with alligators or crocodiles, and the land with abundance of ſnakes and other venomous creatures.

The country abounds with fowl, and there are plenty of herons, woodcocks, pheaſants, pigeons, ſwans, geeſe, ducks, and all ſorts of poultry; with eagles, ſtorks, kites, magpyes, daws, and lapwings; beſides ſome ſorts unknown in Europe.

Korea is divided into eight provinces, containing three hundred and ſixty cities and towns, with many forts and caſtles on the mountains.

The Koreans are generally well ſhaped, and of a mild and tractable diſpoſition; they are lovers of learning, and fond of muſic and dancing. The northern provinces produce the ſtouteſt men and the beſt ſoldiers, but they are ſaid to be in general very effeminate, and poſſeſſed of little courage: they are even not aſhamed of cowardice, and lament the misfortune of thoſe who are obliged to fight. They are terrified at the ſight of blood, and fly whenever they meet with it. They are alſo much afraid of the ſick, particularly of thoſe who have contagious diſeaſes, whom they remove into little ſtraw hovels in the midſt of the fields, where their friends look after them, and give notice to paſſengers to keep at a diſtance; but when the ſick have the misfortune to have no friends, others will rather ſuffer them to die for want of attendance than come near them. When a town or village is infected with the plague, the avenues to it are ſhut up with hedges of briars, and ſome are placed on the tops of the infected houſes, that people may know them. Though many medicinal plants grow in the country, the people are unacquainted with them, and moſt of the phyſicians are employed by the grandees; ſo that the poor, who are unable to be at the expence of having recourſe to them, apply to a ſet of people whom they eſteem conjurors.

Adultery and theft are but little known amongſt them, and they have ſuch little reaſon to be ſuſpicious, that it is not uſual for them to ſhut their doors at night. Indeed

the revolutions of government have made them deviate a little from their primitive innocence, yet they may ſtill be conſidered as a pattern to other nations.

Their dreſs is a gown with long and wide ſleeves, a high ſquare fur cap, with a girdle about their loins, and boots of leather, linen, or ſattin. The quality uſually dreſs in purple-coloured ſilk, and the literati are diſtinguiſhed by wearing two feathers in their caps. The cloth worn by perſons of diſtinction on public occaſions, is made of gold and ſilver brocade; however, the poor wear only ſkins and cloth made of cotton or hemp. Their arms are croſs-bows and long ſabres.

The houſes of the Koreans of quality make a ſtately appearance, but thoſe of the common ſort are mean, nor are they allowed to build as they pleaſe, for no man muſt cover his houſe with tiles without leave; on which account they are generally thatched with ſtraw or reeds. Theſe houſes are ſmall, conſiſting of one ſtory and a garret over it, in which they lay up their proviſions; but they have ſeldom more furniture than is abſolutely neceſſary. They are built with wooden poſts fixed in the ground, and the ſpaces between filled up with ſtone to the firſt ſtory. The reſt of the ſtructure is of wood, plaſtered without, and covered on the inſide with white paper; the floors are vaulted, and in winter they make a fire underneath, ſo that they are always as warm as if in a ſtove.

The nobility have always an apartment in the front of the houſe in which they receive their friends and divert themſelves; and there is generally before their houſes a large ſquare with a fountain, or a fiſh-pond, and a garden with covered walks. Tradeſmen and the chief citizens have generally a ware-houſe adjoining to the building in which they dwell; and there they treat their friends with arrack and tobacco, for there are few of either ſex but what ſmoak. The children of four or five years of age are alſo fond of ſmoaking. The women's apartment is in the moſt retired part of the houſe, where none muſt approach them. Some wives, however, are allowed the liberty of ſeeing people and going to feaſts, but they ſit by themſelves facing their huſbands.

In the country are abundance of houſes for pleaſure, to which the Koreans reſort to ſee women dance, ſing, and play upon muſical inſtruments. In ſummer they enjoy this recreation under the cool ſhade of a pleaſant grove. They have no inns for the entertainment of paſſengers, but he who travels ſits down at night near the pales of the firſt houſe to which he comes. Thoſe within ſoon bring him boiled rice, and dreſs meat for his ſupper. He may ſtop at as many houſes as he pleaſes; but in the great road to Sior there are houſes where thoſe who travel on public affairs have lodging and diet, at the expence of the public.

SECT. II.

Of their Marriages, the Education of their Children, and their Mourning at the death of a Parent. Of their Language, and different Manners of Writing.

KINDRED are not permitted to marry within the fourth degree. As the girls are married at eight or ten years of age, they are never courted by their future huſbands. They no ſooner change their ſtate, than they remove to their father-in-law's houſe, where they reſide till they have learned to get their living, or to govern their family. The marriage-ceremony is very ſimple: the man only mounts his horſe, and riding about the town, attended by his friends, at laſt ſtops at the bride's door, where he is received by her relations, who ſoon after conduct her to his houſe, where the marriage is conſummated without any other ceremony.

A man has the liberty of keeping as many women abroad as he can maintain, and may at any time repair to them without ſcandal; yet none lives with him but his wife. Noblemen indeed have two or three women beſides in the houſe, but they have nothing to do with the management of the family. The Coreans uſe their wives little better than ſlaves; and though a woman has borne her huſband many children, he may put her away on the ſlighteſt pretence whenever he pleaſes and take another: but what is ſtill more unjuſt, he can compel her to take and maintain the children.

Parents are indeed very indulgent to their offspring, and in return are much reſpected by them; but the caſe is very different with the ſlaves, who ſhew but little regard for their children, becauſe they know they will be taken from them as ſoon as they are able to work. If a freeman lies with a female ſlave their children are ſlaves, and thoſe whoſe father and mother are both ſlaves are the property of the mother's maſter.

The nobility and freemen in general are very careful of the education of their children, and put them while young to learn to read and write. The maſters uſe no rigour in their manner of teaching, but manage all by fair means. They inſpire their ſcholars with emulation by giving them an high idea of learning, and mentioning the worth of thoſe of their anceſtors, who by ſtudy have acquired great wealth. By ſuch exhortations they make them improve in expounding the writings they give them to read, in which all their learning conſiſts. There are beſides in every town a houſe where the nobility, according to ancient cuſtom, aſſemble the youth to make them read the hiſtory of their country and the trials of thoſe who have ſuffered death for their crimes.

Aſſemblies are alſo annually held in two or three towns of each province, to which the youth aſſemble to get employments either by the pen or ſword.

The governors of towns ſend thither able deputies to examine them, and chooſe the beſt qualified; and, according to the report made to them, write to the king, who beſtows employments on thoſe who are eſteemed worthy of them. The old officers, who have had only civil or military commiſſions, at this time endeavour to increaſe their revenue by obtaining both; but their aſpiring to theſe honours is often attended with ruin from the preſents they make, and the treats they give to obtain votes.

When a freeman dies his children mourn three years, during which time they are incapable of any employment; and thoſe who enjoy any poſts are obliged to quit them: it is not even lawful for them to lie with their wives; and ſhould they have any children born during the mourning they would be accounted illegitimate. The mourning-robe is a long hempen cloak, without any thing under it but what is made of ſackcloth. On their caps, which are of green reeds interwoven, they wear a hempen cord inſtead of a hatband. They never go without a great cane or ſtick in their hand, which ſerves to diſtinguiſh who they are in mourning for; the cane denoting the father, and the ſtick the mother. During the whole time of mourning they never waſh, and conſequently appear extremely naſty. As ſoon as any one dies his kindred run about the ſtreets ſhrieking and tearing their hair. They take particular care to bury him honourably in ſome part of a mountain choſen by a fortune-teller. Every corpſe is incloſed in two coffins, each of which is two or three fingers thick; theſe are put one within the other, and painted and adorned according to the ability of the perſon who purchaſes them. They generally bury their dead in ſpring and autumn. Such as die in ſummer are placed in a thatched hut raiſed on four ſtakes, till the rice harveſt is over. When they intend to bury them they bring them back to the houſe, and ſet out at break of day with the body, the bearers ſinging and keeping time as they go, while the relations and friends of the deceaſed make the air reſound with their cries. Three days after the latter return to the grave, where they make ſome offerings, and eating all together are very merry. The great men have ſepulchres of ſtone, on which are cut their names, qualifications, and employments; but the common people have only graves five or ſix feet deep. Every full moon they cut down the graſs that grows on the grave, and offer new rice upon it, that being their greateſt feſtival next to the beginning of the new year.

The children having performed this duty to their parents, the eldeſt ſons take poſſeſſion of the houſe, with all the lands belonging to it; and the reſt is divided among the ſons, the daughters being ſaid to have no ſhare on account of their having no fortunes to give their huſbands, except their cloaths. When a father is fourſcore years of age he declares himſelf incapable of managing his eſtate, and reſigns it up to his children; upon which the eldeſt taking

taking poſſeſſion, builds a houſe at the common expence for his father and mother, where he lodges with them, and ſupports them, treating them with the greateſt reſpect.

Their language is very copious, and their way of writing and arithmetic are very hard to learn. They have three ſorts of writing. The firſt conſiſts of large broad ſtrokes, like that of China, and is uſed in printing: The ſecond is a kind of running hand uſed by the great men and governors, in anſwering petitions. The third, which is a ruder ſcrawl, is uſed by women, and the common people; it being eaſier to write in this character than in the other two, names and things never before heard of.

All theſe kinds of writings are performed with a hair pencil. They have abundance of old books, both printed and manuſcript, which are preſerved with the utmoſt care. Copies of them are depoſited in ſeveral towns, that in caſe of fire they may not all be deſtroyed. They print from blocks of wood, like the Chineſe; and keep their account of time by moons.

SECT. III.

The Reſpect paid to the Chineſe Ambaſſadors, who come to receive the Tribute. The Power of the King, and the Form of the Government. His Revenue, Military Officers and Soldiers, with the Puniſhments inflicted on Criminals.

AS Korea is tributary to the eaſtern Tartars, who conquered it before they ſubdued China, an ambaſſador comes three times a year to receive the tribute which the people pay in ginſeng. The king, with his whole court, goes out to meet him, and waits upon him to his lodging. This ambaſſador is treated with ſuch extraordinary reſpect that he ſeems to be more honoured than the king himſelf. He is preceded by muſicians, dancers, and vaulters, who endeavour to divert him, and during the whole time he remains at court, all the ſtreets from his lodging to the palace, are lined with ſoldiers, ſtanding within ten or twelve feet of each other. Two or three men have no other employment than to pick up notes thrown out of the ambaſſador's window, in order to be carried to the king, who is ſolicitous to know whatever he is doing, and ſtudies every poſſible method of pleaſing this officer, that he may make a favourable report of him to the emperor of China.

The king of Corea has however an abſolute authority over his own ſubjects. None of them have any property in the lands, and the revenues of the nobles ariſe out of thoſe eſtates they hold of his majeſty during pleaſure, and from the number of their ſlaves. The chief officers by ſea and land compoſe the king's council, and meet every day at court, but they muſt wait till their advice is aſked before they give it, and till they are appointed to manage any buſineſs, muſt not interfere in it. Theſe have the firſt places about the king, which they enjoy till fourſcore years of age, provided their behaviour is unexceptionable. The ſame is practiſed in the inferior employments at court, which no man quits unleſs it be to riſe. The governors of places, and ſubaltern officers, are removed every three years, but ſeldom ſerve out their time; they being frequently caſhiered for miſdemeanors on the accuſation of the ſpies kept by the king in all parts of his dominions.

When his majeſty goes abroad he is attended by all the nobles of his court, who wear their reſpective badges, conſiſting of a piece of embroidery before and behind, on a garment of black ſilk with a very broad ſcarf; a great body of ſoldiers following. He is preceded by a body of foot and horſe, ſome carrying colours and banners, others playing on warlike inſtruments: They are followed by the life-guards, compoſed of the principal citizens. The king is in the middle, carried under a rich gold canopy. When he paſſes by the great men, or ſoldiers, they muſt turn their backs to him without offering to look, or ſo much as cough. Juſt before him goes a ſecretary of ſtate, or ſome great officer, with a little box: into this he puts all the petitions and memorials, which private perſons either preſent on the end of a cane, or hang along the walls, or pales; ſo that they cannot ſee who prefers them. Theſe, which are brought him by men appointed to gather them, are laid before the king, on his return to the palace; and whatever he orders relating thereto, is immediately put in execution. All the windows and doors of the houſes in the ſtreets, through which his majeſty paſſes, are ſhut, and no perſon whatever dares preſume to open them.

The king keeps a large number of ſoldiers, whoſe chief buſineſs is to guard his perſon when he goes abroad. The provinces are likewiſe obliged to ſend all their freemen, once in ſeven years by turns, to guard him for two months.

Every province has a general, with four or five officers under him; every one of whom is governor of ſome town or ſtrong hold; inſomuch that there is not a village, where a corporal commands, but has under him tithing men, or officers over ten men. Theſe corporals are obliged once a year to deliver to their captains a liſt of what people are under their juriſdiction.

Their cavalry wear cuiraſſes, head-pieces, bows and arrows, ſwords, and whips, with ſmall iron points. The foot likewiſe wear a corſelet, a head-piece, a ſword, and half pike. The officers carry nothing but bows and arrows. Every town, in its turn, is obliged to furniſh a number of religious men, to guard and maintain, at their own expence, the forts and caſtles which are ſituate in narrow paſſes, or on the ſides of the mountains. Theſe are eſteemed the beſt ſoldiers; they obey officers choſen out of their own body, and obſerve the ſame diſcipline as the other troops. Thoſe turned of ſixty are rendered incapable of duty, and their children ſupply their places.

The far greateſt part of Korea being incompaſſed by the ſea, every town is obliged to fit out and maintain a ſhip. Theſe have generally two maſts, and about thirty oars, to each of which there are five or ſix men. They carry ſome ſmall pieces of cannon, and alſo artificial fireworks. Every province has its admiral, who once a year takes a view of theſe veſſels, and gives an account of what he obſerves to the high admiral, who is ſometimes preſent at theſe reviews. If, when he is preſent, any of the admirals, or officers under them, commits a fault he is puniſhed with baniſhment or death.

The revenue for the ſupport of the king's houſhold and his forces ariſes out of the duties paid for every thing produced in the country, or brought by ſea. In all towns and villages there are ſtore-houſes for the fruits of the earth, which the farmers of the revenues take upon the ſpot in harveſt time. Thoſe who have employments under the government receive their ſalaries out of the revenues of the place where they reſide, and what is raiſed in the other parts of the country is aſſigned for the payment of the ſea and land forces.

Juſtice is ſeverely adminiſtered among the Koreans; whoever rebels againſt the king is deſtroyed with all his race; a proceeding equally contrary to juſtice, and ſhocking to humanity: his houſes are thrown down, and no man dares ever rebuild them: all his goods are forfeited, and ſometimes given to private perſons. Nothing can ſave the man from puniſhment, who endeavours to intercede for the guilty, or to expoſtulate on the cruelty of this ſentence.

If a woman murders her huſband ſhe is buried alive up to the ſhoulders in a high way, and an ax being laid by her ſide, all paſſengers, who are not noblemen, are obliged to give her a ſtroke upon the head till ſhe expires. The judges of the town, where this crime is committed, are ſuſpended from the execution of their office, and the place being deprived of a governor is made ſubordinate to another town, or at beſt only a private gentleman is left to command in it. The ſame penalty is inflicted on ſuch towns as mutiny againſt their governor, or ſend falſe complaints againſt him to court.

It is lawful for a man to kill his wife for adultery, or any other heinous crime, on proving the fact. But if the woman thus killed was the ſlave of another perſon, he muſt give three times her value to her owner. Slaves who murder their maſters are cruelly tormented, till they expire; but they think it no crime for a maſter to kill his own ſlave upon a ſlight provocation.

Murderers

Murderers are punished in the following manner. After they have long trampled upon the criminal, they pour vinegar, in which they have washed the putrified carcase of the person murdered, through a funnel down his throat, and when he is full, beat him on the belly with cudgels till he bursts.

Robbers are trampled to death.

If a single man be found in bed with a married woman he is stripped till he has nothing upon him but a pair of drawers, then daubing his face with lime, they run an arrow through each ear, and fasten a little drum on his back, which is beat through the streets, in order to expose the offender, whose punishment ends with his receiving forty or fifty strokes with a cudgel on his bare posteriors; but the woman receives them with drawers on. The men are so jealous that they seldom allow their best friends to see their wives.

If a married man be caught lying with another man's wife, he is to suffer death. This chiefly happens among people of rank. The criminal's father, if living, or else his nearest relation, is obliged to be the executioner; but the offender is to chuse his death. The man generally desires to be run through the back, and the woman to have her throat cut.

Those who, at an appointed time, do not pay their debts are beaten twice or thrice a month on the shin-bones, which is continued till they find means to discharge them; but if they die before they satisfy the creditor, their nearest relations must pay it for them, or suffer the same punishment.

The slightest punishment in this country is being bastinadoed on the buttocks, or calves of the legs, which they consider as no disgrace, it being so very common, that they are often liable to it for speaking a word amiss.

When a person is bastinadoed on the shin-bones, they tie the criminal's feet together on a small bench four fingers broad, and laying another under his hams, which are bound to it, they strike on the shins with a sort of lath of oak, or alder, two inches broad, about the thickness of a crown-piece, and as long as a man's arm. They are not to give above thirty strokes at one time, and two or three hours after they repeat them, till the whole number be complete according to the sentence.

When they are to be beaten on the calves of the legs, it is done with wands as thick as a man's thumb. This punishment is inflicted upon women and servants, and while it lasts the criminals make such lamentations as are very painful to the spectators.

When an offender is to be bastinadoed on the soles of the feet he is seated on the ground, and his feet being bound together by the great toes, are placed on a piece of wood, and beat with a cudgel, as big as a mans's arm, and three or four feet long.

The bastinado on the posteriors is thus performed: the men being stripped are laid with their faces to the ground, the women have a pair of wet drawers left on, and in this posture they beat them with a larger and longer lath than that beforementioned. An hundred strokes are equivalent to death, and many die before they receive fifty.

SECT. IV.

Of the Religion of the Koreans, and of their Priests, Monastics, and Nuns.

THE Koreans appear to have very little religion. The people at their festivals repair to the temple, where every one lights a piece of sweet wood, and putting it into a vessel, place it before the idol, and making a low bow, depart. This appears to be all the religious worship they pay to their gods. They are of opinion that the virtuous shall be rewarded, and the wicked punished, but as they have no religious mysteries, nor preaching, they are free from all disputes about matters of faith; and ignorance and uniformity of sentiment is preserved throughout the kingdom.

The priests offer perfumes before the idols twice a day; and on festivals, they all make a noise with their kettles, basons, and drums.

The temples and monasteries erected by the contributions of the people, are very numerous, and are generally built on mountains. Some of these houses of retirement contain five or six hundred religious, and within the liberties of some towns there are at least four thousand of them. They are divided into companies of ten, twenty, and sometimes thirty. The eldest governs, and if any one neglects his duty, he has the power of ordering the others to punish him with twenty or thirty strokes on the posteriors; but if he is guilty of any heinous offence, they deliver him up to the governor of the town to which they belong. As every man is at liberty to embrace a religious life, Korea swarms with those of this profession, which they are the more ready to embrace, as they may quit it whenever they please. However, these monastics are generally held in as little esteem as the slaves, on account of the taxes they are obliged to pay, and the work they are forced to perform.

Their superiors are highly esteemed, especially when they are men of some learning; for they are considered as grandees, and being called the king's religious men, wear the badge of their order over their cloaths. They pay their visits on horseback, shave both their heads and beards, are forbid to converse with women, and to eat any thing that had life. The breach of these rules is punished with seventy or eighty strokes on the buttocks, and with being banished the monastery. When they are first shaved they impress a mark on their arm, which never wears off. The inferior priests work for their living, or follow some trade, but some of them spend their time in begging, yet all of them have a small allowance from the governor. They educate children in their houses, teaching them to read and write, and if any of the boys consent to be shaved, they retain them in their service, and receive what they earn, but when their master dies they become free, and heir to all his goods, and therefore they are obliged to mourn for him as if he had been a father.

There is another sort of religious men, who, like the former, abstain from flesh, but are not shaven, and are allowed to marry.

'Tis remarkable, that they have a tradition that mankind had originally only one language; and that the design of building a tower to ascend up into the heavens, caused the confusion of tongues.

The nobles frequent the monasteries to divert themselves, either with the common women they find there, or with others they take with them, for they are delightfully situated: they all afford the finest prospects, and have very beautiful gardens, so that they seem rather to be pleasure-houses than buildings formed for the service of the temples.

In the city of Sior are two convents of religious women, one of maids of quality, and the other of those of the inferior sort. These religious women are all shaved, and observe the same rules as the men. They are maintained by the king and the nobles; and are not confined for life, but have leave to marry.

SECT. V.

Of the Trade of the Koreans.

THE Koreans have scarce any trade but with the Japanese, and the people of the island of Ceuxima, who have a storehouse in the south part of the town of Pousang. They supply Korea with pepper, fragrant wood, allum, buffaloes horns, goats, and buck-skins, and, in exchange, take the produce and manufactures of the country. The Koreans also carry on some trade with the northern ports of China in linnen and cotton cloth; but it is attended with great expence from their being obliged to travel many leagues on horseback. None but the rich merchants of Sior trade to Pekin, and they are always three months at least on the road.

There is only one sort of weight and measure used throughout the kingdom, but it is very much abused by the traders, notwithstanding all the precautions of the governors. They have no money, but pieces called cashes, which only pass on the frontiers of China. They pass silver by weight, in small ingots, like those brought from Japan.

They cast accounts with little sticks, as some other nations do with counters: but have very little knowledge in arithmetic.

CHAP.

CHAP. IV.

Of EASTERN TARTARY; or, the Country of the MANCHEWS.

SECT. I.

Of Tartary in general, and particularly of Eaſtern Tartary. Its ſituation, Extent, and Climate. The Province of Mugden and its Capital deſcribed. The Road formed for the Emperor of China from Pekin to that City, and the Manner in which that Prince amuſes himſelf with hunting in his Journeys.

WE ſhall now proceed farther to the north, and view the deſart regions of Tartary, a country of vaſt extent, which taken in its utmoſt limits, reaches from the Eaſtern Ocean to the Caſpian Sea; and from Korea, China, and the two Bockarias, to Siberia and Ruſſia; including all the middle part of Aſia. This prodigious extent of country, inhabtied by Tartars of different denominations, and different manners, is ſituated between the fifty-fifth and one hundred and forty-firſt degrees of longitude from London, and between the thirty-ſeventh and fifty-fifth degrees of latitude. Whence it is three thouſand ſix hundred miles in length, and nine hundred and ſixty in breadth; but in the narroweſt part it is not above three hundred and thirty miles broad.

Above half of this extenſive country either belongs to the emperor of China, or is tributary, or at leaſt under the protection of that monarch; and a very conſiderable part of Weſtern Tartary has been conquered by the Ruſſians. We ſhall here only treat of the former; and in the deſcriptions of thoſe deſolate countries, which afford little entertainment to the reader, ſhall be as conciſe as poſſible.

The country of the Manchew Tartars is ſituated in the north of Laotong, the moſt eaſtern province of China, and from ſouth to north extends from the forty-firſt to the fifty-third degree of north latitude; from weſt to eaſt from about the one hundred and fourth degree of longitude from London to the Eaſtern Ocean: and is bounded on the north by the great river Saghalian-ula, on the ſouth by the province of Laotong and Corea, on the eaſt by the Eaſtern Ocean, and on the weſt by the territory of the Mongals.

Though the extent of this country is ſo very large it was always thinly peopled, eſpecially ſince the emperors of China drew many of its inhabitants to Pekin. The air, notwithſtanding its ſituation, is extremely cold, and the country mountainous and full of foreſts. The Tartars chiefly inhabit the banks of the rivers, where they build their huts, and divide their lives between hunting and fiſhing; for as they have plenty of game and fiſh the inhabitants of a great part of this country ſeek no other ſubſiſtence.

As this was the country from which the preſent emperors of China received their origin, it is intirely under the Chineſe government, and is divided into three provinces, Mugden, Kirin-ula and Tſitſikar.

The province of Mugden is about two hundred and ſeventy miles long, and one hundred and twenty-five broad. It is incloſed by a wooden paliſado ſeven or eight feet high, more fit to mark its bounds, and exclude petty robbers, than to prevent the entrance of an army. The gates are as weak as the reſt of this trifling fortification, and are only defended by a few ſoldiers. The land is in general very good, and produces plenty of wheat, millet, roots, and cotton. The inhabitants feed numbers of oxen and ſheep, which laſt are ſeldom ſeen in China. They have alſo plenty of apples, pears, nuts, filberts, and cheſnuts, even in their foreſts.

The capital of the country is alſo named Mugden. The Manchews conſider it as the metropolis of their particular nation; and therefore ſince their poſſeſſion of China have not only adorned it with ſeveral public edifices, and ſtored it with magazines, but have ſettled here the ſame ſovereign tribunals as thoſe of Pekin, except the firſt and chief, which is called Ly-pou; theſe conſiſt only of the natives, and all their public acts are written in the Manchew language, which is extremely copious.

This city is alſo the reſidence of a Tartarian general, who keeps there his lieutenant generals, and a conſiderable body of ſoldiers. Near the gates of the city are two burying-places of the firſt princes of the reigning family; theſe are built according to the Chineſe architecture, and ſeveral Manchew mandarines are appointed to take care of them; and, at particular times, to perform the ſame ceremonies there as if the princes were ſtill living.

The city of Fong-whang-ching is the moſt populous, and has a very conſiderable trade from its being in a manner the key of the kingdom of Korea. This has drawn thither a great number of Chineſe merchants, who have handſome houſes in the ſuburbs. The principal merchandize is paper, made of cotton, which is very ſtrong and durable, but neither very white nor tranſparent.

From Pekin to Mugden, which is by the Chineſe called Shing-yang, a road has been made, near eleven hundred miles in length, for the emperor and his retinue, when he viſits his Tartarian dominions. It is about ten feet broad, and as ſtrait and even as poſſible. On the ſides run a ſort of little cauſeways, a foot high, exactly even, and parallel. This road, eſpecially in fine weather, is as clean as a threſhing floor, men being appointed for that purpoſe. Another road is made for the emperor at his return. In theſe roads they have endeavoured to level mountains; and have built bridges over torrents. When he approaches, theſe are lined on the ſides with mats painted with animals, that have the ſame effect as the tapeſtry with which the ſtreets are hung when proceſſions are made.

But in theſe journies the emperor and his nobles uſually quit theſe roads, and as they paſs along ſpend their time in hunting, which is thus performed: three thouſand of the emperors guards, with their captains and the lords of the court, all armed with bows, arrows, and darts, diſperſe themſelves on every ſide, and form a circle at leaſt three miles in diameter: then approaching ſtep by ſtep, without breaking their order, they reduce this great circle to one of about three hundred paces in diameter; when all the beaſts ſurrounded in the firſt are taken in the laſt; for the men draw up ſo cloſe as to leave no room for them to eſcape, and keep up ſo briſk a chace, that the poor creatures, ſpent with running, are eaſily killed, or lie down at the hunter's feet. Verbieſt, a miſſionary, who attended the emperor in one of theſe expeditions, ſaw two or three hundred wild horſes thus taken in leſs than a day; beſides a great number of wolves and foxes killed. Another time he ſaw above a thouſand deer thus incloſed, and ſeveral bears, wild boars, and above ſixty tygers ſlain.

SECT. II.

Of the Province of Kirin-ula: its Extent and Climate. The Face of the Country. The Manner in which the Emperor's Soldiers ſearch for the valuable Root Ginſeng. Of the Yupi Tartars, their Dreſs, Manners, and Way of Life. Of the Kecheng Tartars.

THE ſecond province, called Kirin-ula, is bounded on the weſt by the paliſado of Laotong, on the eaſt by the Eaſtern Ocean, on the ſouth by the kingdom of Korea, and on the north by the great river Saghalian-ula, and is ſeven hundred and fifty miles long and ſix hundred broad; yet this extenſive province is ſo thinly peopled that it has only three cities, which are very ill built, and incompaſſed with mud walls.

This country extends to the fifty-third degree north latitude, and is exceeding cold, and the winter begins much earlier than with us, the rivers being frequently frozen over in September. This is by ſome attributed to the extenſive woods with which the land is covered. The

country to the north of Mugden riſes in ſteep mountains, then ſinks into deep vallies, and is ſometimes ſpread out into deſart plains, where the traveller for ſeveral days meets no human being, nor any friendly cottage. The hills, particularly towards the eaſt, are covered with huge oaks, and foreſts uncut for ages paſt. Indeed the whole country appears like a wilderneſs, and nothing is ſeen all around but hills, vales, and the dens of bears, tygers, and other ſavage beaſts; ſcarce a houſe is ſeen except ſome pitiful huts by the ſides of the rivers and torrents: yet in the ſouthern parts the eye of the traveller is ſometimes delighted by his unexpectedly finding, amidſt theſe deſart tracts, a fine valley watered with rivulets, whoſe banks are enamelled with a variety of flowers, like thoſe in the gardens of Europe, particularly roſes and yellow lillies of the moſt lively colours.

The inhabitants raiſe oats, which, though ſcarce in China, are here ſo plentiful as to be given to the horſes; but they have little wheat and rice. The plant moſt eſteemed is the ginſeng, or jingſeng, called by the Manchews the queen of plants. It is highly prized for its virtues in curing ſeveral diſeaſes, and particularly all decays of ſtrength proceeding from exceſſive labour of body or mind. Hence it has ever been the principal riches of Eaſtern Tartary; and is ſo much valued, that at Pekin an ounce of it ſells for ſeven times its weight in ſilver.

The Chineſe uſe to go into this country among the crowds of mandarines and ſoldiers continually paſſing and repaſſing, and then getting the ginſeng return with it to Pekin; but in 1709 the emperor, chuſing that the Manchews ſhould reap this advantage, ordered one thouſand of his Tartarian ſoldiers, encamped without the great wall, to go and gather all the ginſeng they could find, on condition that each ſhould preſent him two ounces of the beſt, and take an equal weight of fine ſilver for the remainder; and thus the emperor that year procured twenty thouſand pound weight of it for leſs than a fourth part of the price at which it is ſold at Pekin.

The herbaliſts ſent on this expedition undergo great hardſhips. On beginning their ſearch they quit their horſes, and carry neither tent nor bed with them, nor any other food but a bag of parched millet; and at night lodge upon the ground, either under a tree or in a ſlight hut formed with boughs. The officers who encamp at a diſtance, in places that afford paſture for their cattle, inform themſelves of their diligence by perſons they from time to time ſend to them with beef or the game they kill. Their chief danger is from wild beaſts, eſpecially tygers, againſt which they are obliged to be continually on their guard. If after the ſignal for the return of the troop any one be miſſing, they conclude that he is devoured; and, after having ſought him a day or two, remove to another place, and continue their ſearch with the ſame ardour as before. This fatigue and danger is in a manner inevitable, the plant only growing on the ſides of mountains covered with woods, among the clefts of the rocks, or on the high banks of rivers.

The gingſeng is eaſily diſtinguiſhed from the other plants by which it is ſurrounded, frequently by a cluſter of round fruit of a red colour, ſupported by ſtalks that ſhoot above the branches.

The root alone is uſed in medicine, and has this remarkable quality, that it ſhews the number of its years by the remains of the branches it has ſent forth. Its age enhances its value, for the largeſt and firmeſt of theſe roots are the beſt.

The river Uſuri, which falls into the Saghalian, is the fineſt in the country, both for its clearneſs and the length of courſe. The Yupi Tartars live in villages on its banks, and its fiſh ſerve the inhabitants both for food and raiment. Theſe Tartars are ſkilled in dreſſing ſkins, which they dye of three or four colours, and ſew them ſo neatly that one would imagine they made uſe of ſilk, till on ripping a ſtitch or two is ſeen an exceeding fine thong, cut out of a very thin hide. They wear the ſame dreſs as the Manchews and Chineſe; only the bottom of their long robes has commonly a red or green border, on a white or grey ground. The women alſo hang little bells or ſmall pieces of braſs coin at the bottom of their mantles, which, by their gingling, give notice of their approach. Their hair, which is parted into ſeveral treſſes, falls upon their ſhoulders, and is covered with rings, bits of looking-glaſs, and other baubles, which they eſteem as jewels.

Their manner of life is no leſs extraordinary. They ſpend all the ſummer in fiſhing, and lay up one part of what they catch to make oil for their lamps; another part ſerves for their daily food; and the reſt, which they dry in the ſun without ſalting, is laid up for their winter proviſions, and of this both the men and beaſts feed when the rivers are frozen. Theſe people ſeem to have great ſtrength and vigour, and yet the animals uſed for food are very ſcarce and extremely ill taſted. When the rivers are frozen they travel upon them in ſledges drawn by dogs, which on that account are highly valued.

The miſſionaries, in paſſing through the province of Kirin-ula, met a lady of Uſuria coming from Pekin, where her huſband, who had been general in chief of this nation, was lately dead; ſhe told them, that ſhe had an hundred dogs for her ſledges, one uſed to the road went before, and was followed by thoſe in harneſs to the end of the ſtage, where they were relieved by others from the ſpare pack. She aſſured them, that ſhe had often run an hundred Chineſe furlongs, or ten leagues, without reſting. Inſtead of bringing the miſſionaries tea, which is cuſtomary among the Chineſe and Tartars, her attendants ſerved up ſmall pieces of ſturgeon upon a neat rattan ſalver.

This lady, who underſtood Chineſe, had a very different air and manner from theſe Yupi Tartars, who are generally of a peaceable diſpoſition, but heavy, unpoliſhed, and without the leaſt tincture of learning, or any public religious worſhip; the Chineſe idols themſelves not having as yet been introduced among them. This the Jeſuits attribute to the poorneſs of the country; and the Bonzes not being willing to enter a place where the people ſow neither wheat nor rice, but only a little tobacco near each village on the banks of the river. All the reſt of their country is covered with a thick and almoſt impenetrable wood; whence they are annoyed with a cloud of muſketoes, which they are obliged to drive away with ſmoke.

Almoſt all the kinds of fiſh taken in theſe rivers are to be found in Europe, but no European river can furniſh ſuch quantities of ſturgeon. This is the principal fiſhery of the nation; they call the ſturgeon the king of fiſhes, and eat certain parts of it raw, in order to partake of the virtues they attribute to it. Next to the ſturgeon they highly prize a fiſh that is unknown to us, but is one of the moſt delicious that can be eaten: it is almoſt of the ſhape and ſize of a ſmall tunny, but the fleſh is intirely red: it is however very ſcarce, and the miſſionaries could never meet with it above once or twice. They have ſmall boats formed of the bark of trees, ſo well ſewed as to keep out the water. The natives commonly ſpear the large fiſh, and take thoſe that are ſmall in nets.

The language of the Upi Tartars ſeems to be a mixture of that of the Manchews, their neighbours on the ſouth and weſt, and that of the Kecheng Tartars on the north and eaſt. They have no king or ſovereign, but every company chuſes its own chief, whom they obey much like the Indians in America.

The ſame muſt be ſaid of the country of the Kecheng Tartars, which extends one hundred and fifty leagues along the Saghalian-ula to the ocean: in all which ſpace nothing is to be ſeen but ordinary villages, moſtly ſeated on the banks of that great river. They do not ſhave their heads like the ſubjects of the empire of China, but wear their hair tied behind. Thoſe who live at the mouth of the river are frequently viſited by boats from the iſlands, which are very numerous near the entrance, where it is near three leagues over, and every where deep and navigable, ſo that the largeſt veſſels may ſail up it at leaſt five hundred leagues.

Beyond the Saghalian-ula is only a few villages inhabited by the Kecheng Tartars; and the reſt of the country, being wild and deſart, is only frequented by ſable hunters. It is croſſed by a chain of mountains, and is watered by ſeveral rivers. The Tuhura-pira ſprings from another chain of mountains in the fifty-fifth degree of north latitude, and is the point whence the rivers flow contrary-ways: thus the Udi-pira directs its courſe towards the Northern ſea, and belongs to the Ruſſians, while the Silimfi-pira paſſes ſouthward into the country of the Kecheng Tartars.

But the river moſt celebrated in the hiſtory of the Manchews is the Songari-ula, which abounds with fiſh, and is arge, deep, and navigable, without danger throughout its hole courſe; it being but moderately rapid, even at its onfluence with the Saghalian-ula.

The mountain whence it ſprings is the higheſt in all aſtern Tartary, and may be ſeen at a vaſt diſtance, one alf of it covered with woods, and all the upper-part white ith ſand, whence the Chineſe imagine that it is always overed with ſnow. On the top are five exceeding high ocks, that reſemble ſo many broken pyramids, and are ontinually wet with the fogs and vapours peculiar to this ountry. Between them is a ſteep lake, whence flow the ream from which the Songari takes its riſe.

SECT. III.

Of the Province of Tſitſikar, and the Cities of Tſitſikar, Saghalian-ula, and Merghen. Of the Solon Tartars, who are expert at hunting Sables, of the Pearl Fiſheries on the Coaſt, and of the Language of the Manchews.

THE third province of Eaſtern Tartary is that of Tſitſikar, which is bounded on the weſt and on the de of Ruſſian Tartary by two rivers, both of which fall nto the Saghalian-ula. The capital of this province is lſo named Tſitſikar, and is ſituated in forty-ſeven degrees wenty four minutes north latitude, near the Nonni-ula, conſiderable river that falls into the Songari, and is inloſed by a ſtrong palliſado that is not very high, but is ined with a pretty good rampart. The garriſon chiefly conſiſts of Tartars; but moſt of the inhabitants are Chineſe, who are ſettled there for the ſake of trade, or have een baniſhed thither for their crimes. The houſes of both ations are without the paliſado, which incloſes little beides the tribunals and the palace of the Tartarian general: hey are built of earth, ranged into pretty wide ſtreets, nd are all incloſed by a mud wall.

The juriſdiction of the government of Tſitſikar extends ver the new cities of Merghen and Saghalian-ula. Merhen, which is about forty leagues from Tſitſikar, is uch thinner of people than that city, and is incloſed with a ſimple wall. The lands belonging to the two laſt ities are ſandy and barren, but thoſe of the Saghalian-ula ield good crops of wheat.

The city of Saghalian-ula ſtands on the ſouth ſide of he river Saghalian, and is as populous and as rich in commodities as Tſitſikar. The lands about it have ſeveral Manchew villages and large foreſts in which ſables are unted.

The ſkins of the ſables caught in this country are highly teemed by the Tartars for their wear and ſervice. The olon Tartars who hunt them are more robuſt, brave, nd ſkilful than the other inhabitants of theſe parts; and ven their women, who ride on horſeback, draw the bow nd hunt ſtags and other game. Many of theſe Tartars eſide at Nierghi, a conſiderable town not far from Tſitſikar and Merghen. The miſſionaries ſaw them ſet ut from thence, on the firſt of October, to hunt ſables, when they were clothed in ſhort ſtraight jackets made of wolf ſkins, with a cap of the ſame, and their bows hung croſs their ſhoulders. They had ſome horſes loaded with acks of millet, and with long mantles of fox and tyger kins, in which they wrap themſelves againſt the cold, eſpecially in the night. Their dogs being trained to he exerciſe, climb well, and are acquainted with all the viles of the ſables. Neither the ſeverity of winter, which ere freezes the greateſt rivers, nor their fear of the tygers, with which they are frequently obliged to combat, or the eath of their companions, can deter them from annually eturning to this painful and dangerous exerciſe, which hey would certainly never do, if all their wealth did not conſiſt in the furs they obtained. The fineſt ſkins are for he emperor, who pays a fixed price for a certain number f them. The others are very dear even in that country, nd alſo extremely ſcarce, they being immediately bought p by the mandarines of thoſe parts and the merchants of Tſitſikar.

In ſome of the rivers which fall into the Saghalian-ula are conſiderable pearl-fiſheries, which are carried on without much art. For as the water of theſe rivers is but ſhallow, they throw themſelves in without fear, and taking the firſt oyſters they can find, return with them on ſhore. The pearls are highly valued by the Tartars, and the emperor has ſeveral ſtrings of them, a hundred or more on each. Theſe pearls are very large, and exactly alike, but they are choſe out of many thouſands.

The language of the Manchew Tartars is very different from that of the Chineſe, and there is not a Tartar of this country who does not think it the moſt elegant and copious in the world. They have the advantage too of the Chineſe in having an alphabet, by which they can with eaſe expreſs their thoughts in writing; in which they commonly uſe an hair pencil, though ſome make uſe of a kind of pen made of bamboo, cut almoſt like thoſe uſed by us.

SECT. IV.

Of the Iſlands that lie to the Eaſt of the Country of the Manchews, particularly of the Land of Jeſo, and other of the Kurilſki Iſlands that extend in a Chain from the North of Japan to the Southern Promontory of the Peninſula of Kamtſchatka.

OPPOSITE to the mouth of the Saghalian-ula, which falls into the ſea at the point of a large bay, in fifty-two degrees fifty minutes north latitude, is a great inhabited iſland, which extends four degrees thirty minutes from the north-eaſt to the ſouth-weſt; but its produce and the manners of the people are yet unknown.

On the weſt ſide of it, near the main land, are many ſmall iſlands; and between the fifty-fourth and fifty-fifth degrees of latitude lie the Shantar iſlands, the moſt conſiderable of which is Shantarſkoy, which abounds not only in wood, but in many different animals, particularly foxes, ſables, ermines, and bears. The principal fowl are ſwans, ducks, and geeſe. Several ſorts of fiſh are found in the bay, and different kinds of berries in the fields.

The reſt of the iſles on this coaſt are very inconſiderable, except the Kurilſki iſlands, which extend north-eaſt from Japan, and reach to the moſt ſouthern promontory of Kamtſchatka. The exact number of theſe iſlands is unknown, but they are ſuppoſed to amount to twenty-two; yet by the account of captain Spanberg, a Ruſſian, who ſailed from Kamtſchatka to Japan, there appears to be many more. The iſlands lying neareſt to Japan, and conſequently in a more favourable climate, are the moſt fruitful, and abound with trees of various kinds, among which are lemons, bamboo, Spaniſh canes or reeds, and poiſonous herbs, whoſe roots are as yellow as ſaffron, and as thick as rhubarb, and are well known to the inhabitants of the fartheſt Kurilſki iſland, who formerly purchaſed them of the natives, in order to poiſon their arrows with the juice.

The firſt of theſe iſlands which is almoſt circular, and extends from the forty-firſt to the forty-ſecond degree of latitude, is divided from Japan by a ſmall channel leſs than twenty miles broad, and by one ſtill narrower it is ſeparated from the ſouth-eaſt of Eaſtern Tartary. In this iſland, which is named Matma, the Japaneſe have a ſtrong guard at the ſouth-weſt point, probably to defend the country from the Chineſe and Koreans. Not far from thence, upon the ſhore of the channel which ſeparates Matma from Japan, is a Japaneſe city, of the ſame name with the iſland, where are kept muſkets, cannon, and ammunition for its defence, and where was lately built new fortifications. Moſt of the Japaneſe ſettlements upon this iſland were made by people baniſhed thither. The channel between the iſland and Japan is extremely dangerous, on account of the rocky capes projecting into it from both ſides, and from the rapidity of the flood at ebb and flow.

This iſland and Kunatir, which is ſeparated from it only by a ſmall channel, together with two others, named Eturpu and Urupe, according to the new diſcoveries made by the Ruſſians, conſtitute the land of Jeſo, or Jedſo, which has been ſo variouſly laid down in the European maps.

Upon the iſland of Kunatir are great numbers of pine, larch, and fir-trees; but there is a ſcarcity of good water. There are here wild animals in abundance, particularly bears, whoſe ſkins are uſed by the inhabitants for cloaths.

The

The natives alſo wear long ſilk cloaths, like the Chineſe, and have long beards; but pay little regard to cleanlineſs. They feed on fiſh and whales fat, and lie upon the ſkins of wild goats, of which there is great plenty in the iſland. Though they live near Japan, they acknowledge no ſovereign. The Japaneſe come to them every year in their ſmall craft, bringing all ſorts of iron-ware, copper pots, japanned waiters and bowls, leaf tobacco, and ſilk and cotton ſtuffs, which they exchange with them for the ſkins of foxes and whales fat. The natives of Kunatir bid the Ruſſians who come thither beware of the inhabitants of the iſland of Matma, becauſe they had cannon; aſking them, at the ſame time, whether they came from the north, and if they were thoſe who are famous for their armies, and able to wage war with and conquer every nation.

The Eturpu and the Urupe iſlands are ſituated next to Kunatir, and are called by Spanberg the Green and Orange Iſlands. The natives, who call themſelves Keek-Kuriles, reſemble thoſe of Kunatir. There is ſafe anchoring in the mouths of the rivers for large ſhips, particularly in the iſland Eturpu. To theſe two iſlands Japan ſilk, cotton ſtuffs, and utenſils, are brought by the natives of Kunatir, who purchaſe them from the inhabitants of Matmar. On the other hand, the natives of Eturpu and Urupe make cloth of nettles, which they ſell to the Japaneſe: they alſo ſell to them all ſorts of furs, which they have among themſelves, and which are alſo brought to them from the iſlands near Kamtſchatka; likewiſe dry fiſh and whale's fat, and theſe are ſaid to be carried to Japan.

Of the other iſlands we find nothing remarkable, till we come near to Kamtſchatka, except that the uninhabited iſland named Araumakutan has ſome burning mountains: we ſhall therefore only deſcribe the two neareſt to that peninſula. Theſe are Schumtſchu and Paromuſir.

The former of theſe iſlands is divided from the northern extremity of Kamtſchatka by a channel fifteen verſts, or Ruſſian miles, in breadth, and is ſituated within the fifty-firſt degree of north latitude, extending in length from the north-eaſt to the ſouth-eaſt fifty verſts, and in breadth about thirty. Schumtſchu is full of mountains, from which and the ſmall lakes and marſhes, flow many little rivers into the ſea. In ſome of theſe are found different kinds of ſalmon and other fiſh, but not in ſuch plenty as to furniſh the inhabitants with proviſions for winter.

Paromuſir is twice as large as Schumtſchu, from which it is ſeparated by a channel not two miles broad; but no veſſel can lie in it without danger, there being no good anchorage, and the ſhore is ſteep and rocky. This iſland is alſo mountainous, and has as many lakes and rivulets as the other; but on both is no other wood than the ſlaneck and ernick, which are uſed by the inhabitants for fuel; and they build their huts with different kinds of trees, which they find thrown on the ſhore by the waves from America and Japan. Between the inhabitants of theſe two iſlands, and thoſe neareſt Japan, a commerce was formerly eſtabliſhed, when thoſe of the remote iſlands brought to them all ſorts of varniſhed wooden-ware, ſcymitars, ſilver rings, which they wear in their ears, and cotton cloth; and from them they chiefly took in return eagles feathers, which were uſed in pluming their arrows.

Both theſe iſlands are ſubject to frequent and terrible earthquakes.

For this account of the Kuriliſki iſlands we are obliged to the Hiſtory of Kamtſchatka, tranſlated from the Ruſſian tongue by James Grieve, M. D. a work of ſingular merit, which contains many important diſcoveries and many entertaining particulars.

CHAP. V.

Of the Country of the MONGOLS and KALKAS.

SECT. I.

Of the Country of the MONGOLS.

Its Situation and Extent. The Climate, Soil, and Animals. The Perſons and Dreſs of the Inhabitants. Their Tents, Food, Manners, Cuſtoms, Government, Trade, and Religion.

THE country of the Mongals, Mongols, or Monguls, called by ſome of our European geographers Mongalia, is divided into ſeveral different tribes of Tartars; but we ſhall here only treat of the Mongols, properly ſo called, and of the Kalka Mongols. The territories of the former are bounded on the eaſt by the country of the Manchews, on the ſouth by the wall of China, on the weſt by the deſart of Kobi and the country of the Kalkas, from which it is ſeparated by the limits fixed by the emperor of China, and on the north by the Kalkas and part of Eaſtern Tartary. This is a country of very great extent, it being ſituated between the thirty-eighth and forty-ſeventh degrees of latitude, and between the eighty-eighth and one hundred and forty-ſecond degree of eaſt longitude from London; ſo that it is three hundred leagues in length from eaſt to weſt, and about two hundred in breadth from north to ſouth.

This part of Tartary has been the ſcene of the moſt extraordinary actions, for here the great empire of Jenghiz-Khan and his ſucceſſors had its riſe and ſeat: here were founded the empires of Kitay and Kara-kitay: here all the riches of Southern Aſia were carried and diſſipated; and here many populous cities flouriſhed, of which there are now ſcarce any remains, and in them the arts and ſciences were once cultivated.

The country inhabited by theſe Tartars is extremely cold, even in the places under the ſame latitude as France; for in winter the ground is frozen eight or nine months together, which Gerbillon attributes to its elevated ſituation, there being a continual deſcent from Tartary towards China, which fully appears from the rapid courſe of the rivers; this is doubtleſs the principal reaſon, though, as he juſtly obſerves, other circumſtances may contribute to it, as the great quantity of ſalt and ſalt-petre mixed with the ſand in the country of the Mongols and in the territories of the Kalkas, the great number of mountains covered with wood, and the immenſe ſpace of deſart and uncultivated land that reaches from the North Sea to the borders of China.

The country is in general unfit for tillage; but there are ſome fertile ſpots, which to all appearance would richly reward the labour of the huſbandman; and, at the ſame time, afford the moſt beautiful landſcapes. Here are mines of excellent tin, with large foreſts of fine timber, which is ſent even to Pekin for the uſe of building; hence the river which runs to that city is generally in a manner covered with large rafts of fir wood.

The inhabitants wander from place to place with their flocks, encamping where they find moſt convenience for themſelves and cattle: in ſummer they commonly chooſe the open country near ſome lake or river; or for want of theſe, encamp about ſome wells: but in winter they retire to the ſides of the hills and mountains, or behind ſome eminence, where they may be ſheltered from the north wind; and at that time the ſnow ſupplies them with water.

Agriculture is not only neglected by them, but even condemned as uſeleſs; for when the miſſionaries aſked the natives, why they would not at leaſt cultivate ſome little herb-gardens, they replied, "Herbs are for the beaſts of "the field, and the beaſts for men."

There are ſeveral medicinal plants in this country, and particularly rhubarb.

Their tame cattle conſiſt of camels, horſes, cows, and ſheep, whoſe tails are about two feet long, and near as much in compaſs, commonly weighing between ten and eleven pounds, and each is almoſt one entire piece of fat; the

the bone being no larger than that of other ſheep: but theſe are not peculiar to Tartary, they being found in many other countries. The natives breed no beaſts but what eat graſs.

In this country are hares, pheaſants, and all the ſorts of game common in Europe. The deer, which multiply exceedingly in the deſarts and foreſts, differ in colour, ſize, and in the ſhape of their horns; but ſome of them reſemble thoſe of Europe.

The ſtag-call is a diverſion that has been much admired by ſome of the emperors of China when they came into this country, and is thus performed: the huntſmen taking ſome ſtags heads repair into the foreſt before ſun-riſe, and counterfeit the cry of the hind; upon which the largeſt ſtags advance near the place where they hear the cry, and ſtopping, look around, till at length perceiving the ſtags heads they tear up the ground with their horns, and inſtantly run forwards; but are immediately ſhot by ſome who lie in ambuſh.

Yellow goats appear in the plains, but are ſeldom ſeen except in large herds; they are extremely ſwift, and of the ſhape and ſize of common goats; but their hair is yellow, and not ſo ſmooth.

Wild mules appear in ſmall herds, but are not like the tame ones, nor can be brought to carry burdens; their fleſh is very different and of an agreeable taſte, and the Tartars, who feed much upon it, are of opinion that it is as nouriſhing as the wild boar's. This laſt animal, which frequents both the woods and plains, is traced by the earth it turns up to come at the roots on which it feeds.

The wild dromedary and horſe reſemble the tame; the latter is ſo fleet, that the ſwifteſt hunters can ſeldom reach it with their arrows. Theſe wild horſes appear in large herds, and when they meet with thoſe that are tame, ſurround and drive them away.

There are here a kind of elks bigger than the largeſt ox; but they are found only in particular diſtricts and in boggy grounds in which they delight, and where they are moſt eaſily killed, their great weight hindering their flight.

The chalon, or chelaſon, is about the ſize of a wolf, and ſeems a kind of linx. The ſkin is much valued at Peking, where they make uſe of it for their upper garment. It has long ſoft hair of a greyiſh colour.

The tygers are the fierceſt of all the animals of Tartary: their howling alone ſtrikes terror into thoſe who are unuſed to it. Thoſe of this country are very large and nimble: their ſkins are commonly of a fallow red, and ſtriped with black liſts. Though theſe animals are ſo fierce, they ſeem in great fear when they find themſelves ſurrounded by the hunters preſenting their ſpears; and while the deer driven along fly from ſide to ſide, in order to eſcape, the tyger ſquats on his tail, in the ſpot where he firſt ſees his enemies, and for a long time bears the barking of the dogs and the blows he receives from blunted arrows; but at length, thoroughly provoked, he ſprings forward with ſuch rapidity, that he ſeems to make but one leap to the hunters on whom his eyes are fixed; but thoſe who are near them are ready with their ſpears pointed, and plunge them into his belly the moment he offers to ſeize one of their companions; and indeed the emperor's hunters are ſo quick, that an accident very ſeldom happens.

The intrepidity of the Tartarian horſes when encountering the tygers is very ſurpriſing, and yet this only proceeds from uſe; for they are at firſt as fearful of them as other horſes. The Mongols are very expert in training them, and have a great number of every colour. They are particularly dexterous at catching them when running, with a cord made into a ſlip-knot; and they are alſo very expert in breaking of them: they likewiſe underſtand their diſtempers, but generally uſe ſuch remedies as would be far from agreeing with our horſes. They prefer ſtrength and hardineſs to largeneſs and beauty. The Tartarian horſes are indeed not ſmall, but rather of a middle ſize, and amongſt ſuch vaſt numbers many are found as large and handſome as the European.

The paus are a kind of leopards, with whitiſh ſkins, adorned with red and black ſpots; but they have the head and eyes of a tyger, though they are not ſo big, and have a different cry.

There are plenty of ſquirrels, foxes, and a creature as ſmall as an ermine, of whoſe ſkins mantles are made at Peking to keep out the cold. There are a kind of land rats, very common in ſome of the territories of the Kalkas; theſe live in companies, and dig in the earth a range of as many little holes as there are males among them, one of whom always keeps watch, but flies under ground at any one's approach: yet they cannot eaſily eſcape the hunters, who, on diſcovering the place where they burrow, ſurround it, and opening the earth in two or three places, throw in flaming ſtraw to frighten them out, and thus great numbers are taken.

In ſome of the rivers is found an amphibious creature reſembling the otter; but the fleſh is tender, and almoſt as delicious as that of the roe-buck.

In the plains of Grand Tartary are a great number of birds of extraordinary beauty, particularly a kind of heron, found in the country of the Mongols towards the frontiers of China. It is all over white except the wings, tail, and beak, which are of a very fine red; the fleſh is very delicate, and in ſome meaſure reſembles that of the woodcock.

The fiſhery of the Mongols is inconſiderable, for their rivers do not abound with fiſh like thoſe of the Manchews.

As to the rational inhabitants, they are of a middle ſize, but ſtrongly made, their faces are very large, their complexion ſun-burnt, their eyes black and full, and their noſes flat. They have very little beard, and yet their black hair is as ſtrong as that of a horſe; but they cut it pretty cloſe to the head, and preſerve only a tuft at the top, which they ſuffer to grow the natural length.

They wear very large ſhirts and drawers made of calicoe; and their habits, which are alſo made of calicoe, or ſome other ſlight ſtuff, reach as low as their ancles, and are lined with ſheep ſkins. Sometimes they wear entire garments of lamb and ſheep ſkins, with the wool next the body; and this is indeed their uſual cloathing: theſe garments they faſten about their limbs with great leather ſtraps. They have very large boots made of Ruſſia leather, and ſmall round bonnets, with a border of fur four fingers broad. The women dreſs in much the ſame manner, only their garments are longer, their boots generally red, and their bonnets flat and adorned with ſome little ornaments.

Though they know how to dreſs and whiten theſe ſkins, as alſo thoſe of wild goats and deer, which ſerve the rich for under garments in the ſpring; yet as ſoon as you come near them they ſmell ſo ſtrong, that they go under the name of ſtinking Tartars, and their very tents are extremely offenſive.

Their arms conſiſt of a bow and arrows, the ſabre, and pike; and they always go to war on horſeback.

They live in tents, or little moveable houſes, a number of which are frequently placed together in a valley, and reſemble a village. Each tent is a ſort of cage, made of a circular form of pretty ſmall ſticks, and are about thirteen or fourteen feet in diameter. Some are greater and others leſs; but they are generally of about this ſize. In the middle the tent is about eight or nine feet high; and the roof begins at about four feet from the ground, and ends in a point like the top of a round tower or a pigeon-houſe. Theſe tents are covered with different pieces of felt, made of wool preſſed and matted together. When they make a fire they take away a piece of ſtuff from the top of the tent, directly over the place where the fire is to be lighted. They are warm enough while the fire laſts, but ſoon grow cold; and in winter the Mongols would, without care, freeze in their beds. To leſſen this, and other inconveniences, their tent-door is very narrow, and ſo low that they cannot enter in, without ſtooping.

Gerbillon, a French miſſionary, who entered one of theſe tents, ſaw upon the fire three or four pieces of fleſh, but of what kind he could not tell; however, the ſight of it turned his ſtomach. The whole furniture was three or four boards, on which they lie, with a piece of the ſame felt with which the tent was covered, that ſerved both for bed and coverlet; a bench, a ſorry preſs, and a few wooden diſhes.

Their diet is very ſimple; in ſummer they feed on milk, uſing indifferently that of cows, mares, ewes, goats, and camels. Their drink is water boiled with the worſt ſort of Chineſe tea, in which they put cream, butter, or milk. They alſo draw a ſpirituous liquor from ſour milk, eſpe-

cially mares, which is diſtilled after fermentation; into this ſour milk the rich put mutton while it is fermenting. With this ſpirituous liquor they are fond of being intoxicated. They alſo ſmoak a great deal of tobacco.

They eat their fleſh almoſt raw, and, as they do not underſtand tillage, they eat with it neither bread nor rice.

In ſhort, they are naſty and ſlovenly both in their food, their tents, and cloaths, and unpoliſhed in their manners; living amongſt the dung of their cattle, which ſerves them for fewel; for in great part of their country not a tree nor a buſh is to be found. They are excellent in horſemanſhip and hunting, and very dexterous in drawing the bow, either on foot or on horſeback; and therefore prefer grazing and hunting to the fatigue of tilling the land.

The utmoſt ambition of the Mongols is to preſerve the rank of their families. They value things only for their uſe, having no great regard to their ſcarceneſs or their beauty. They are naturally of an eaſy chearful temper, always diſpoſed to laughter, and never depreſſed by care and melancholy. Indeed they find little occaſion for inquietude; for they have neither lords to pleaſe, nor enemies to fear; they know none of the perplexities that attend the management of difficult affairs; and have no buſineſs to tranſact, nor any conſtraint put upon their deſires. Their ſole employment is attending their herds and flocks, and their principal diverſion is hunting, fiſhing, and other bodily exerciſes, at which they are very expert.

Though the Mongols, the Kalkas, and other Tartars, are diſtinguiſhed into different nations, yet they have all one language, called the Mongul tongue: they have ſeveral dialects indeed, but they underſtand each other. We are informed by Regis that the characters upon the monuments of the ancient Mongols are the ſame with thoſe now in uſe; but differ from the Manchew. They have not the leaſt reſemblance to the writing of the Chineſe, and are no more difficult to learn than the Roman. They are written on tables with an iron pencil, and therefore among the Mongols a book is a great rarity. In order to pleaſe them, one of the emperors had a tranſlation of ſome of their authors printed at Peking. The chief book among them is the Chineſe Kalendar, engraved in Mongol characters.

As to the government of the Mongols, they are divided into forty-nine ki, or ſtandards, each of which has a ſeparate tract of country, and a particular prince or leader. Every prince is obliged to keep within the bounds of his own dominions; for neither he nor his ſubjects are permitted to paſs with their flocks and herds into thoſe of another, ſince that would be eſteemed an act of hoſtility; but in their own territories they encamp where they pleaſe, and where they find it moſt convenient on account of water and paſture.

Their princes have a politeneſs that diſtinguiſhes them from their ſubjects, who, notwithſtanding their calling themſelves their ſlaves, are not treated with ſeverity, but have free acceſs to them on the ſlighteſt occaſions. This familiarity, however, does not diminiſh their reſpect; for they are taught from their infancy, that they are born to obey, and their maſters to command.

Though polygamy be not forbidden, the Mongols have uſually but one wife.

They burn their dead, and then inter the aſhes on ſome eminence, piling a heap of ſtones over the grave, on which they place a number of little flags or ſtandards.

With reſpect to commerce, the Chineſe reſort to thoſe of the Mongols, who are ſituated near that empire, bringing them ordinary bohea tea, rice, tobacco, coarſe cotton cloth, and other ordinary ſtuffs, with ſeveral ſorts of houſhold utenſils; and as the Mongols are not acquainted with the uſe of money, they give cattle in exchange for theſe commodities.

The Mongols are ſaid to be worſhippers of the idol Fo, and pay an implicit obedience to their lamas, or prieſts, to whom they preſent the beſt things they have. Theſe prieſts are commonly ignorant; and thoſe of them are eſteemed very learned who can read the ſacred books in the language of Tibet. They are indeed the only perſons capable of giving inſtructions to their countrymen; but they find it more for their advantage to go from tent to tent, repeating certain prayers, for which they have a ſalary, and to practiſe phyſic, in which they pretend to have great ſkill. The Mongols therefore wanting maſters, very few of them have an opportunity of learning to write or even to read. Several of the lamas themſelves ſcarce underſtand their prayers which they ſing in a ſolemn, yet harmonious manner. The people often kneel bare-headed before them, and do not riſe till they have laid their hands upon them. They do not believe the tranſmigration of the ſoul into brutes, and therefore eat fleſh; but though they have large flocks of tame cattle, they moſtly feed on the wild beaſts they take in hunting.

The Mongols are remarkably devout, and almoſt every one of them wears a ſtring of beads about his neck, on which he repeats his prayers. There is ſcarce a Mongol prince but has a temple, though he has no other houſe in his territory. Gerbillon ſaw the ruins of one of them at about two hundred and fifty leagues from Peking: and, notwithſtanding the diſtance, it was erected by Chineſe workmen hired on purpoſe; and the tiles, which were enamelled with yellow, were brought from that city.

One of the Mongol princes, well verſed in the hiſtory of his anceſtors, informed Gerbillon, that in the reign of the emperor Cublay there came lamas into the country of the Mongols, and planted their religion: and that they were men of learning and irreproachable lives. Gerbillon thinks it probable that thoſe lamas were Chriſtian monaſtics, who came from Syria and Armenia, and preached Chriſtianity both to the Mongols and Chineſe; but that the communication with their countries being afterwards cut off, the bonzes blended their ſuperſtitions with the cuſtoms introduced by theſe monks, and by degrees introduced the religion of Fo. This, he ſays, is the more probable, as theſe lamas have many ceremonies and cuſtoms like thoſe obſerved among Chriſtians. They have holy water, a ſinging ſervice, and pray for the dead; they uſe beads, and wear a mitre and cap like biſhops. Not to mention their grand lama, to whom they pay a veneration at leaſt as great as is paid by the Roman church to their ſovereign pontiff.

At the head of theſe Mongol lamas is a deputy, under the delay-lama of Tibet, and is called the Khutukta.

SECT. II.

Of the KALKA MONGOLS.

The Rivers on which they dwell. Their Government and Religion.

OF all the Mongol nations that depend on the emperor of China, the moſt celebrated, as well as the moſt numerous, are the Kalkas, who obtained their name from the river Kalka. They extend above two hundred leagues along the country, from eaſt to weſt, on the banks of the fineſt rivers in this part of Tartary. They dwell beyond the Mongols, and have the Kalmucks on the weſt; and from north to ſouth extend from the fiftieth and fifty-firſt degree of latitude to the ſouthern extremity of the great deſart of Kobi, which belongs to them, and affords fine paſtures, woods, ſprings, and rivulets; though in ſome parts it is quite bare, without trees, graſs, or water, except ſome ponds and marſhes made by the rains and a few wells, the water of which is very bad.

The river Kalka is not much frequented by the Kalkas, though they take their name from it. It flows from a famous mountain called Siolki, ſixty-four leagues from Tſitſikar, and runs into a lake called Puir. The other rivers are,

The Kerlon, which is almoſt every where fordable; it is about ſixty feet in breadth, and waſhes the richeſt paſtures in all Tartary. The waters of this river are good, and abound with trout and other fiſh.

The Tula runs from eaſt to weſt, and in moſt places is larger, deeper, and more rapid than the Kerlon. It has more woods and finer meadows, and on its north ſide are mountains covered with large firs that afford at a diſtance an agreeable proſpect. This river, having joined the Orgon, which comes from the ſouth-weſt, runs towards the north,

north, and after increaſing its ſtream by the addition of others rivers, as the Selinga, at length falls into the Paykal, which belongs to the Ruſſians, and is the greateſt lake in all Tartary.

The waters of the Twi, which are clear and wholeſome, after a long courſe through fertile plains, ſinks into the ground near a ſmall lake, and appear no more.

The Selinga iſſues from a lake called by the Mongols, Koſo, and proceeding from ſouth to north, through very fertile plains, is enlarged by many rivers on both ſides, and at length diſcharges itſelf into the lake Paykal. Its waters are very good and light, but have few fiſh.

The river Siba has its ſpring in the mountains towards the frontiers of the Kalmucks, and running eaſt-north-eaſt loſes itſelf north of the deſart of Kobi.

The Dſanmuran has its ſource in the mountains which croſs the deſart of Kobi, and running ſouth-eaſt falls into the Whangho on the frontiers of Tibet. Two petty khans of the Mongols, under the protection of the emperor of China, reſide on its banks.

The river Argun riſes in a lake of the country of the Mongols, and having purſued its courſe towards the north-eaſt, runs above one hundred leagues, and at length falls into the great river Sagalian-ula.

The perſons, manners, cuſtoms, and way of life of the Kalkas, are nearly the ſame as thoſe of the Mongols; but the Kalkas pay obedience to one khan, who was once the great khan or emperor of all the Mongols. Indeed ſince the Manchews have given emperors to China, the khan is fallen from his antient grandeur; yet he is ſtill very powerful, as he can eaſily bring into the field an army of ſixty thouſand horſe; and though he puts himſelf under the protection of the emperor of China, inſtead of paying him tribute, he annually receives from that emperor preſents of ſkins.

The Kalkas, as well as the Mongols, have a high prieſt called the khutucktu at the head of their religion; but he is not ſubject to the delay-lama. This prince of the lamas dwells in tents, in the largeſt of which he ſits on a kind of altar, and receives the homage of many nations, without returning the ſalute of any perſon whatever. All conſider him as ſomething more than man, and pay him the ſame kind of adoration as to Fo himſelf. The people are ſo infatuated, that they believe he knows all things, and can abſolutely diſpoſe of the favours of Fo. Regis, who ſaw the perſon who then aſſumed this character, was told, that he had already been born fourteen times, and would be born again when his preſent time was expired. The miſſionaries pretend, that they reproached him, in the preſence of ſeveral Mongol princes, for being the object of a fooliſh idolatry, and threatened him with the judgments of God and eternal torments; but he heard all with great coolneſs, and continued to receive the adorations that were offered to him.

The high opinion the Mongols entertained of him at that time drew crowds of people to Iben-pira, where he had reſided near twenty years. The place reſembled a large city formed of tents, and the hurry was much greater there than any where elſe in that part of Tartary. The Ruſſians of Selinghinſhoy traded thither; there were alſo bonzes from Indoſtan, Pegu, Tibet, and China; Tartars from the remoteſt countries, with multitudes of lamas of all ranks: for they are of different degrees, though they all acknowledge as their chief the great lama of Tibet.

Bentinck obſerves, that this khutucktu was formerly ſent by the dalay-lama to the Mongols and Kalmucks of the north to keep up his authority in thoſe parts, on account of their being too remote from his uſual place of reſidence; but this deputy having once taſted the ſweets of ſpiritual command, made bold to ſet up for himſelf, which he did with ſuch addreſs, that ſome time after ſcarce any mention was made among the Mongols of the dalay-lama; and the authority of the khutucktu became ſo well eſtabliſhed, that whoever dared to doubt of his divinity would be held in abhorrence by all that nation.

The court of China had indeed a great hand in this new apotheoſis, in order to divide the Mongols from the Kalmucks, and therefore under-hand ſupported the khutucktu againſt the dalay-lama.

Whenever the khutucktu removes his camp he is ſurrounded by a great number of lamas and armed Mongols, who flock from all parts with their families to meet him on the road, and receive his benediction, on paying the fees. None but the heads of tribes, and other perſons of diſtinction, dare preſume to approach him. He gives them his benediction by applying his hand ſhut upon their forehead, in which he holds a ſtring of beads.

The vulgar are perſuaded, that he grows old as the moon declines, and young again with the new moon. At the ſacred cermonies he appears at the ſound of inſtruments, that reſemble trumpets and cymbals, in a magnificent pavilion, covered with China velvet, and open in front. He is ſeated croſs-legged, after the Tartar faſhion, upon a large velvet cuſhion, having on each ſide a figure repreſenting an idol. The lamas of diſtinction are ſeated on both ſides on cuſhions, from the place where he ſits to the entrance of the pavilion, each reading in a book they hold in their hands.

The khutucktu is no ſooner ſeated than the inſtruments of muſic ceaſe, and all the people aſſembling before the pavilion proſtrate themſelves on the earth, uttering exclamations in honour of the divinity and in praiſe of the khutucktu. Some lamas afterwards bring cenſers of oderiferous herbs, and offer incenſe firſt to the idols, then to the khutucptu, and laſtly to the people. Afterwards laying the cenſers at the khutucktu's feet, they bring China-bowls with liquors and ſweet-meats, ſeven of which they ſet before each repreſentation of their god, and ſeven others before the khutucktu, who taſtes them; and having eaten a little, cauſes the reſt to be diſtributed among the heads of the tribes who are preſent, and then retires with the ſound of inſtruments into his tent.

The khutucktu, to preſerve his independency on the dalay-lama, makes preſents of furs to the emperor of China's favourites; and as the court at Peking finds that the khutucktu and his lamas, are neceſſary to keep the Mongols of the Weſt in their duty, they take care to treat him on all occaſions with marks of great reſpect. The khutucktu alſo ſtrives to cultivate a friendſhip with the Ruſſians, by favouring the ſubjects of Ruſſia in their little quarrels that ſometimes happen between them and the Mongols on the frontiers.

CHAP.

CHAP. VI.

Of SIBERIA.

SECT. I.

Of Siberia in general. Its Situation, Extent, Climate, and Face of the Country, particularly of the Eaſtern Part. Its principal Rivers and Minerals with a Deſcription of a very remarble Kind of Ivory found in the Banks of the Rivers.

ON the north of the countries laſt deſcribed is Siberia, a region of prodigious extent, that reaches from the river Saghalian-ula, which bounds it on the ſouth, in the latitude of fifty-five degrees, to the Frozen Sea, which bounds it in the north; and on the weſt is parted from Ruſſia by the mountains of Werkhotauria, which form a chain that may be conſidered as a branch of Mount Caucaſus: theſe commence to the ſouthward, and ſeparate Aſia from Europe quite to the Frozen Sea. From theſe mountains, which are in about fifty-eight degrees of eaſt longitude, Siberia extends to the Eaſtern Ocean, which in ſome places waſhes the coaſt in one hundred and forty-eight degrees of eaſt longitude from London; but farther north the country ſtretches out (according to the late diſcoveries made by the Ruſſians) above forty degrees farther to the eaſt, as if to meet the new diſcovered coaſt of America, which is found to reach almoſt to Siberia. In ſhort, this vaſt country is above three thouſand miles in length from eaſt to weſt, and about ſeven hundred and fifty miles in breadth from north to ſouth. But it is extremely cold and barren, and every where thinly peopled. A very accurate deſcription of a region ſo widely extended, and ſo little known to the Ruſſians themſelves, cannot be juſtly expected. We have, however, made uſe of the lateſt and beſt diſcoveries; and have not only conſulted the account of this country given by Mr. Strahlenberg, a Swediſh officer, who was thirteen years captive in thoſe parts, but the late journey into Siberia by the Abbé Chappe d'Auteroche, for obſerving the tranſit of Venus over the ſun, and the curious and judicious diſcoveries and obſervations made by ſome of the learned of Ruſſia on the nations near the coaſt of the Eaſtern ocean, which have been lately examined with great attention, particularly by Mr. Steller and Mr. Kraſheneninicoff, who have given a judicious deſcription of the peninſula of Kamtſchatka.

The face of the country, eſpecially towards the north-weſt, is as diſagreeable as can be imagined, it being covered with large and almoſt impenetrable woods, with high and frozen mountains covered with everlaſting ſnow, and with fens, lakes, and marſhes. The climate is therefore in general cold, but more moderate in the ſouthern part, and where the lands do not riſe a conſiderable height above the level of the ſea, which is frequently the caſe even of extenſive plains. To theſe dreary countries the czars of Muſcovy ſend the great men who are ſo unhappy as to diſpleaſe them; and hither Peter the Great, in particular, ſent many of the brave Swedes who had the misfortune to be taken priſoners by that monarch. Theſe ſet up ſchools, and introduced the arts and ſciences amidſt nations of ſavages.

The horrors of part of theſe ſolitary regions have been deſcribed in very ſtrong and lively colours by the Abbé Chappe d'Auteroche. The chain of mountains called Werkhotauria, which form the weſtern boundary of Siberia, are, ſays he, no higher than from fifty to eighty fathoms; but the declivity is very ſteep, and the ſummit is covered with pine, fir, and birch trees. The road over theſe mountains is very frightful, and by night extremely dangerous; for ſhould the ſledge in which the traveller is ſeated deviate ever ſo little from the beaten tract, he will inevitably be buried in a gulph of ſnow; which, when the Abbé paſſed this way, was ready to melt, and yet the talleſt firs were ſo loaded with it as to bend under the weight. Every where upon the ground it was ſeven feet thick, and there was no ſign of the returning ſpring, not ſo much as by the flight of a bird; for the very pyes and crows, which abound through all Ruſſia, abandon theſe horrid deſarts, where nature herſelf ſeems benumbed, and it is only by the traces of the ſledge that the country is known to be inhabited. The gloom of deſolation ſpreads on every ſide, and the horrid ſilence is never broken but by the outcries and complaints of thoſe that ſuffer from the perils of the way.

The inhabitants are ſhut up in their huts nine months in the year; for the ſnow falls on the mountains in the beginning of September, and ſuch a quantity ſoon deſcends as to leave upon them ſcarce any traces of a habitation. It ſeldom begins to thaw there till the middle of April; but this happens ſomewhat ſooner in the plains, yet it does not entirely diſappear till the end of May; ſo that the ſeverity of winter is ſuſpended only three months. The Abbé croſſed theſe mountains, which extend forty-five leagues in breadth from eaſt to weſt, and then deſcending into a large plain, found the climate ſo much altered, that in ſome places the ſnow ſcarcely covered the ſurface of the ground; the thaw was already begun on the rivers, and on the tenth of the ſame month the ice broke.

In this country are ſeveral rivers of prodigious extent, the principal of which are the Oby, the Jeniſai, and the Lena.

The Oby iſſues from the lake Altin, in Calmuc Tartary, and running north, is joined by the Irtiſh, and at length, after traverſing a tract of above two thouſand miles, it diſcharges itſelf into a bay of the Frozen Sea. This river abounds in fiſh; it is navigable almoſt to its ſource; and, through a great part of its courſe, is between five and ſix hundred yards broad.

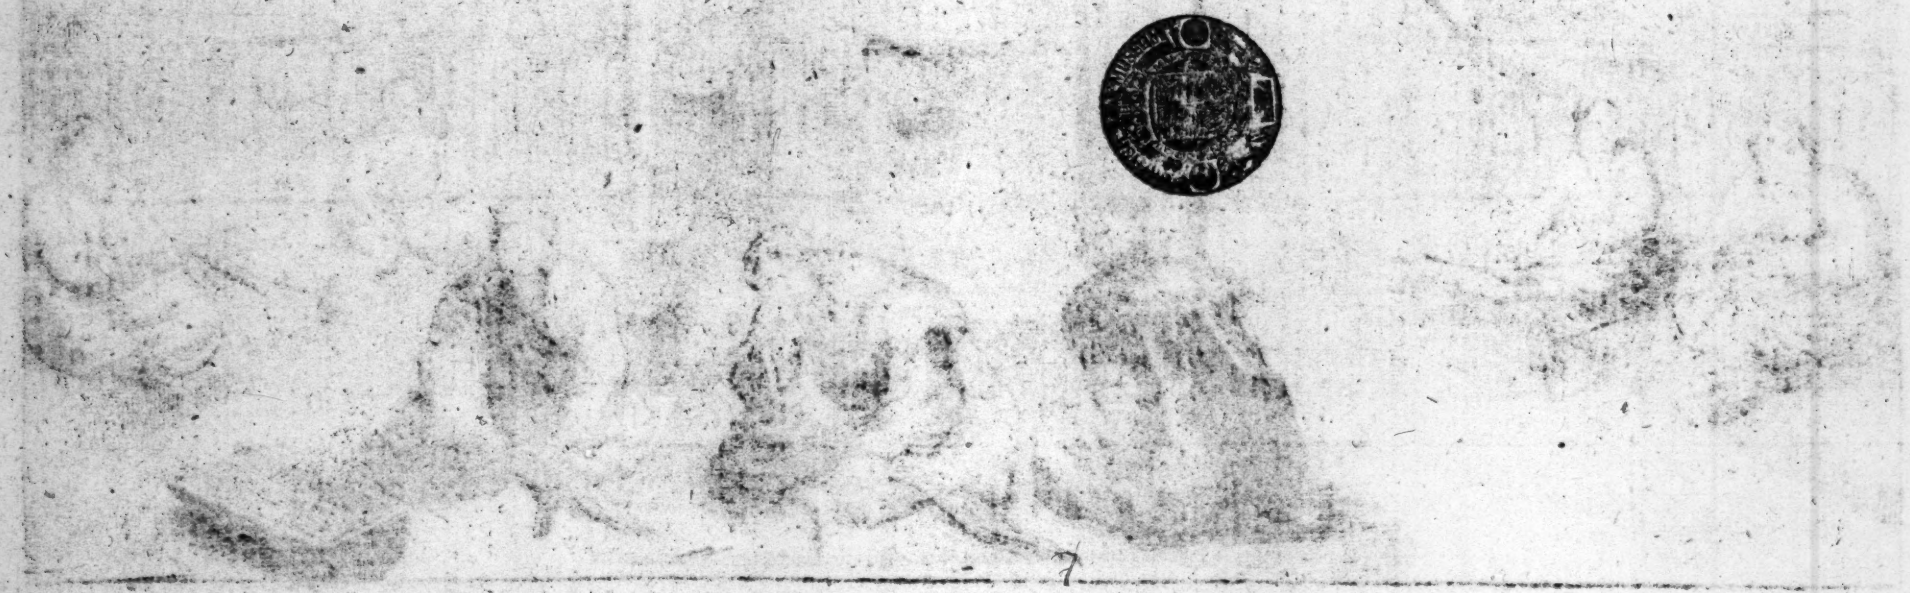
The Jeniſai, or Jeniſkoi, is a very large river, which towards its mouth overflows its banks every ſpring for ſeveral miles. It has its courſe from ſome lakes near the mountains ſouth of Siberia, and, after running a courſe of ſixteen hundred miles, forms a large lake or bay, which contains ſeveral iſlands, and at length falls into the Frozen Ocean to the eaſt of the Oby.

The Lena is a large river on the eaſtern part of Siberia. It iſſues from the north ſide of the lake Baikal, and, after traverſing a vaſt tract of country, divides itſelf into five branches, three of which continue their courſe to the weſtward, and the other two to the eaſtward; after which they all fall into the Frozen Sea.

In this country are mines of gold, ſilver, copper, and excellent iron; alſo jaſper, lapis lazuli, and loadſtones.

But the moſt ſurpriſing production of Siberia is a kind of large teeth, found near the mouths of the rivers Oby, Jeniſai, and Lena; and alſo in the banks of many other rivers. They are of different ſizes; Mr. Strahlenberg ſays, he has ſeen ſome of them above four Ruſſian ells long, and at the thickeſt part nine inches in diameter. They reſemble elephants teeth, only are ſomewhat more crooked; and, on being cut, can only be diſtinguiſhed from ivory by their being ſomewhat more yellow, which only happens when they have lain a pretty while expoſed to the air. Sometimes they are brown, and ſometimes of a bluiſh black, which proceeds from the ſame cauſe; and then if they are ſawed into thin leaves, and poliſhed, you may obſerve upon them landſcapes, in which appear trees, men, and beaſts; and the more they are decayed, the greater variety or figures are found upon them. They make of them ſnuff-boxes, combs, and a thouſand other things that are uſually made of ivory; thin leaves, made of the part that is not quite mouldered way, ſerve to inlay and cover ſmall boxes and little cabinets; and a conſiderable number, which are white, are carried into China, where they are ſold at a good price.

Many are the conjectures that have been formed in relation to theſe bones; ſome ſuppoſe them to be the real elephants teeth that have lain there ever ſince the general deluge; others imagine them to be the teeth of the ſea-horſe,



Inside View of a Winter Hutt of the Kamptschadales.

horſe, or other amphibious animals that may have come from Greenland, and been driven up the rivers; and, at the fall of the waters, left in the mud.

In ſhort, Siberia has many animals unknown in Europe, and is inhabited by many different nations, that have different manners, cuſtoms, languages, and religions. We ſhall now therefore be more particular, and give a more perfect deſcription of theſe extenſive regions, beginning at the Eaſt.

SECT. II.

Of KAMTSCHATKA.

Of its Situation, Extent, Climate, burning Mountains, and Minerals.

WE are now entering upon the dominions of Ruſſia, and ſhall give a particular deſcription of the great peninſula of Kamtſchatka, which forms the boundary of Aſia to the north-eaſt, and extends from north to ſouth about ſeven degrees thirty minutes. The ſouthern part of this peninſula is ſituated in fifty-one degrees north latitude, and its longitude from Peterſbourg is found, by the beſt obſervations made upon the ſpot, to be one hundred and twelve degrees eaſt of Peterſbourg, and conſequently in the longitude of one hundred and forty-three degrees ſixteen minutes eaſt of London. The figure of this peninſula is ſomewhat elliptical. It is bounded on the eaſt by the Eaſtern Ocean, which ſeparates it from America; on the weſt by the Penſchinſka, which begins near the ſouthern point of the Cape of Kamtſchatka, and runs northward between the weſtern coaſt of Kamtſchatka and the coaſt of Ochotſkoy above one thouſand verſts, or Ruſſian miles. A range of hills extend from north to ſouth through the peninſula, dividing the country into two almoſt equal parts, and from theſe hills others extend to the ſea, between which are the courſes of the rivers.

The Ruſſians give the name of Kamtſchatka to the whole peninſula, though among the inhabitants it has no general appellation; but every part of the country receives its name from the natives, or ſomething remarkable obſerved in it; and even the Ruſſian Coſſacks ſettled there underſtand by Kamtſchatka, only the country ſituated near the river of that name, and diſtinguiſh the other parts of the country by the following appellations:

The ſouthern part is called the Kuriſki Country, from the Kuriles its inhabitants.

What is termed The Coaſt, extends along the weſtern ſhore from the Bolſcheretſki, or the Great River, to the Teghil.

Awatſcha extends from the Bolſcheretſki to Fort Awatſcha, by the Bay of St. Peter and Paul, on the Eaſtern Coaſt.

Koreka is thus named from the Koreki, its inhabitants, and extends from the north of the Kamtſchatka to the Teghil.

Ukoi is the Eaſtern Coaſt from the river Ukoi.

Teghil is the Weſtern Coaſt from the river Teghil.

The principal rivers are the Kamtſchatka, the Great River, the Awatſcha, and the Teghil, on all which the Ruſſians have ſettlements.

There are alſo ſeveral lakes of conſiderable extent.

In this country the time of harveſt and winter take up above half the year, for the ſpring and ſummer ſcarcely laſt four months; the trees uſually begin to bud at the end of June, and ſome of them begin to drop their leaves in Auguſt. The winter is however moderate and conſtant, and the froſts are neither extremely ſevere, nor the thaws ſudden. The weather in ſpring is pleaſanter than in ſummer, for though it ſometimes rains, yet there are now and then fine clear days. But the force of the ſun reflected from the ſnow in this ſeaſon is ſo very great, that the inhabitants are as ſwarthy as the Indians, and have their eyes ſpoiled by it. To prevent theſe inconveniences as much as poſſible, they generally wear ſomething over their face filled with ſmall holes or nets of black hair, to leſſen the number of the rays that would otherwiſe fall upon their eyes. This is owing to the great winds, which drive the ſnow ſo cloſe, that it is almoſt as hard and ſolid as ice; and, inſtead of allowing the rays of the ſun to penetrate it, reflects them with prodigious force on the delicate and ſenſible nerves of the retina.

The weather in ſummer is generally diſagreeable, and for the moſt part rainy and cold, owing to the neighbouring mountains being covered with perpetual ſnow. In places diſtant from the ſea the weather is very different, it being fine and clear from April to the middle of June: the rain does not begin till after the ſummer ſolſtice, and continues till the end of Auguſt.

In the winter are deep ſnows, but ſeldom high winds; and when theſe happen, they are of ſhort continuance. The weather is generally clear and agreeable in autumn, except at the end of September, when there are uſually ſtorms; and as the rivers have a very ſwift current, they are ſeldom frozen over before the beginning of November.

There are three burning mountains in Kamtſchatka, which for many years have thrown out a continual ſmoke, but do not often burſt into flames. The mountain of Kamtſchatka, which riſes from two rows of hills ſomewhat in the form of a ſugar-loaf to a very great height, uſually throws out aſhes twice or thrice a year, ſometimes in ſuch quantities, that for three hundred verſts round the earth is covered with them: the laſt conflagration began on the 25th of September, in the year 1737, and continued burning a week with ſuch violence, that the mountain appeared to thoſe who were fiſhing at ſea like one red hot rock, and the flames that burſt through ſeveral openings with a terrible noiſe, reſembled rivers of fire. From the inſide of the mountain were heard thunderings, cracking, and blowing like the blaſt of the ſtrongeſt bellows, ſhaking all the neighbouring country: the nights were moſt terrible; but at laſt the conflagration ended, by the mountain's caſting out a prodigious quantity of cynders and aſhes, among which were poreous ſtones and glaſs of various colours. The country is alſo very ſubject to earthquakes, which ſometimes produce dreadful effects.

There are likewiſe ſeveral hot ſprings, and ſome rivers that never freeze.

Copper and iron ores have been found in ſeveral places, and native ſulphur is gathered in different parts of the country: the ſulphur brought from Olontoſki, where it drops from the rocks, is fine and pellucid. On the mountains are ſometimes found ſmall cryſtals of a bright red; yellow pellucid ſtones, like corals, and ſemi-pellucid ones that are whitiſh are found near the ſprings of ſome of the rivers; and near Tomſkoy are plenty of hyacinths.

SECT. III.

Of the Vegetables and Animals of Kamtſchatka, particularly of the Glutton, the Manati, or Sea-Cow, Seals, Sea-Cats, and Sea-Beavers.

THE moſt uſeful wood is that of a kind of cedar, white poplar, and larch tree, which are uſed both in building houſes and ſhips. There are alſo the juniper, the pine tree, and many birch trees, which, upon the banks of a ſmall river named the Biſtroy, are ſo large, that captain Sponburg built a ſloop with their wood, in which he made ſeveral diſtant voyages at ſea; but the people in general make little uſe of them, except for building ſledges. They have alſo the ſervice-tree, the cherry-laurel, and the dog-briar. Among the ſhrubs and plants are the honey-ſuckle, cranberries, wortle-berries, barberries, bramble-berries, and bilberries.

Among the plants which ſerve for food is the ſhelmina: its root is blackiſh without and white within, and from it grow two or three ſtalks of about the height of a man; the leaves grow on long branches all over the ſtalk, their upper part is green and ſmooth, and underneath they are rough, and have reddiſh veins. At the top of the plant is a flower, like that of the ſervice-tree. The root, ſtalk, and leaves are very aſtringent; but both the Ruſſians and Kamtſchadales eat them in the ſpring, and preſerve the root for the winter, when they pound and boil it with water for a kind of gruel. It reſembles in taſte the piſtacho-nut.

The utchichley has leaves like hemp; but the flowers reſemble thoſe of the ragwort. The leaves being dried

and boiled with fiſh, give the broth the ſame taſte as if the fleſh of the wild goat was boiled in it: they fry the root in the fat of ſeals, and eſteem it very delicate food.

Biſtort grows in plenty both on the hills and in the valleys; they eat it either freſh or dried, and pounded with caviar. It is not ſo aſtringent as that in Europe, but is juicy, and has the taſte of a nut.

The kotkonia grows in great plenty on the banks of the rivers. Its root is as thick as one's finger, black on the outſide, and white within. Two or more ſtalks ariſe from it of the thickneſs of a gooſe quill, and about ten inches high. On the top three oval leaves ſpread like a ſtar, from the center of which riſes a ſhort ſtalk, which ſupports the flower. The cup conſiſts of three oblong green leaves, and the flower of as many white ones. In the midſt of the flower is the piſtil, which is of a yellow colour. The fruit, when ripe, is ſoft, fleſhy, as big as a walnut, and of an agreeable taſte like a good apple. The fruit muſt be eaten as ſoon as gathered, for it ſpoils if kept one night. The root is eaten by the Kamtſchadales, both freſh and dried, with caviar.

Barley and oats have been ſowed in this country, and yielded very good crops; but cabbages and lettuces never grow to any head; and peas continue in flower till late in the harveſt without yielding pods: but turneps and radiſhes grow very well.

They have ſeveral medicinal plants, which they uſe with ſucceſs in ſeveral diſeaſes. But we ought not to omit the zgate, which contains a poiſon of prodigious ſtrength; for with the juice, ſqueezed from the root of this plant, they anoint the points of their darts and arrows, which renders the wounds they give incurable, unleſs the poiſon be immediately ſucked out: if this be neglected, the wound turns blue and ſwells, and the patient dies within two days. Whales of the largeſt ſize, on being ſlightly wounded with a poiſoned weapon, are unable to bear the ſea; but ſoon throw themſelves on ſhore, where they expire in great agonies, making a moſt terrible bellowing.

On the ſea-ſhore grows a whitiſh plant reſembling wheat, of which they make mats of different colours: theſe ſerve for coverings and curtains, and alſo for cloaks. They alſo make baſkets and bags of it of different ſorts. It likewiſe ſerves for thatch. The natives mow it down with a ſcythe, formed of a ſhoulder-blade of a whale, which they bring to a good edge by grinding it upon a ſtone.

A plant grows in the marſhes reſembling the cyperoides, which they dreſs with a double-toothed comb of bone, and then uſe it inſtead of linen to wrap up their children in the room of ſwaddling cloaths. It ſupplies the place of ſtockings, by being rolled about the legs; and, from the opinion that its warmth promotes fruitfulneſs, the women wrap it round their bodies. On their ſolemn feſtivals they bind garlands of it round the heads and necks of their idols.

But no plant is of more general uſe than nettles, of which they make thread and form their nets for fiſhing.

The graſs grows here above the height of a man, and ſo faſt, that it may be mowed thrice in a ſummer. This makes but a coarſe ſort of hay; yet the cattle are large and fat, and have plenty of milk, both in ſummer and winter.

Beſides theſe plants the Kamtſchadales have many others, to all which they give names; and are ſo well acquainted with their ſeveral properties, with the different degrees of virtue they derive from the various ſoils and ſituations in which they grow; with the proper times of gathering the ſeveral fruits and other produce, as is ſurpriſing in ſuch a nation of barbarians: hence they have this advantage above other people, that they can every where find food and medicine; and, from their knowledge and experience, are in little danger from the noxious plants.

The domeſtic animals of Kamtſchatka are cows, horſes, rein-deer, and dogs.

The riches of the country conſiſt in furs, for the wild beaſts are very numerous; among theſe are the rein-deer, wild and tame, ſables, foxes, hares, ermines, marmottas, weazels, &c. Among the foxes are moſt of the different ſpecies found in other places, as the black, red, fiery, blue-breaſted, or marked with a black croſs, the cheſnut, black cheſnut, and ſometimes white foxes. The moſt valuable foxes are the moſt cunning, as the blue-breaſted, the black cheſnut, and the fiery coloured; ſo that the Kamtſchadales, and even the Ruſſians, find great difficulty in catching them. The ſables of this country excel thoſe found in any other place, both in largeneſs, thickneſs of hair, and brightneſs. Their furs are ſold at a great price in China, and few of them are brought into Ruſſia. The inhabitants eſteem the fleſh very delicious eating. Theſe animals are in greater plenty here than in any other country in the known world.

As the large ſpecies of marmottas abound every where in Kamtſchatka, their ſkins are uſed by the Koreki for cloaths, and eſteemed no diſagreeable dreſs, they being both light and warm, and at a diſtance their back reſemble the ſpotted feathers of birds. When theſe animals eat, they ſit upon their hind legs like ſquirrels, and hold their food, which is cedar-nuts, berries, and roots, with their fore-feet. They are pretty to look at, and make a loud whiſtling noiſe.

People do not think it worth their while to hunt ermines, common marmottas, or weazels, except they meet with them by chance; but there is an animal of the weazle kind, called the glutton, which has a fine fur, ſo highly eſteemed, that when they deſcribe a man richly dreſſed, they ſay he is cloathed with the fur of the gluttor. The women place the white paws of this animal in their hair, and eſteem them very ornamental. Theſe creatures are ſurpriſingly dexterous in killing of deer; they climb up a tree, carrying with them ſome of the moſs the deer are uſed to eat. This they drop from the tree; and if the deer ſtops to eat it, they throw themſelves down upon his back, and faſtening between the horns, tear out his eyes, and put him to ſuch pain, that he ſtrikes his head againſt the trees, either to eaſe himſelf or deſtroy his enemy, till he falls to the ground. No ſooner is he brought down than the glutton takes off his fleſh from the bones, and hides it in the earth, to prevent its being ſeized by any other animal. They deſtroy horſes in the ſame manner; yet are eaſily tamed, and taught to play ſeveral tricks. They are ſaid to eat to ſuch exceſs, as to be obliged to relieve themſelves by ſqueezing their bodies between two trees, in order to unburthen their bellies of this unſufferable load; but thoſe who are tamed are not ſo voracious.

Bears and wolves are ſo exceeding numerous, that they fill the fields and woods like cattle; the bears during the ſummer, and the wolves during the winter. The bears are neither large nor fierce, and never attack any man, except they find him aſleep, and then they ſeldom kill him; but uſually tear the ſcalp from the back part of the head: but when fiercer than ordinary, they will tear off ſome of the fleſhy parts, but not eat them. It is remarkable, that theſe bears will not hurt women, but go about with them like tame animals, eſpecially when they gather berries. Indeed they ſometimes eat the berries the women have gathered, which is the only injury they receive from them.

In the ſeaſon, when the fiſh come in vaſt ſhoals into the rivers, the bears come down from the mountains and ſettle in places proper for catching them; when they take ſuch quantities, that they only eat the heads, neglecting the bodies; and when the fiſh have retired back to the ſea, they are glad to eat what they formerly deſpiſed. It is not unuſual for them to ſteal fiſh from the fiſhing-huts of the Coſſacks, though a woman is always left to watch them; but they never hurt her.

The Kamtſchadales eſteem the fleſh and fat of the bears their moſt delicious food; of their ſkins they make their beds and coverings, caps, gloves, and dogs collars. Sometimes they faſten them to the ſoles of their feet, to prevent their ſliding on the ice, and with their ſhoulder-blade-bones made ſharp they cut graſs. In ſummer they uſe the guts to cover their faces to keep off the ſun.

The wolves reſemble thoſe in other places, and their furs are much eſteemed for cloaths; but by their cunning and fierceneſs they do the inhabitants more injury than their furs are worth; for they not only kill the wild deer, but herds of the tame, though they are always guarded.

The deer and ſtone-rams are the moſt uſeful of all the animals in this country, their ſkins being moſt uſed in cloathing. The deer live in moſſy places, and the wild rams upon the moſt lofty mountains: theſe reſemble goats, but their hair is like that of the deer. The horns of thoſe that are of full age weigh each from twenty-five to thirty

pounds; they run with great ſwiftneſs, throwing their twiſted horns back upon their ſhoulders, ſpringing over the rocks, and ſkipping along the narrow ridges of the precipices. The fat upon their haunches equals that of the deer, and the fleſh is moſt delicious food. Cloaths made of their ſkins are very warm. Of the horns are made ſpoons, ladles, and other utenſils; and when the Kamtſchadales travel, they ſtick an entire horn in their girdles, which ſerves for a bottle.

The dogs of this country reſemble the village dogs of Europe, and are white, black, ſpotted, or grey, like the wolves; but brown or other colours are very rare: theſe dogs are eſteemed ſwifter and longer-lived than thoſe of other countries, which may be attributed to their food. In the ſpring they run at liberty, feeding upon what they get in the fields, where they ſcratch up the ground for mice, and catch fiſh in the rivers. The Kamtſchadales call them home in October, and they are tied up till they loſe much of their fat, in order that they may be lighter for the road; when nothing is to be heard night nor day but their howling. In the winter they are fed with fiſh-bones and opana, which is thus prepared: they pour water into a large trough, into which they throw ſome ladlefulls of rotten fiſh, prepared in pits for that purpoſe, adding ſome fiſh-bones, and heating the whole with red-hot ſtones till the fiſh and bones are boiled. They are fed only at night, which makes them ſleep well; but they never give them any in the day when they are to travel, becauſe it would render them heavy and lazy; though if they are ever ſo hungry, they will not eat bread.

Dogs are abſolutely neceſſary in Kamtſchatka for drawing the ſledges over the ſnow; for had they plenty of horſes, they could ſeldom be uſed in winter, on account of the great depth of the ſnow and the number of hills and rivers. Beſides, in the greateſt ſtorm, when a man cannot ſee the path, or even keep his eyes open, they ſeldom miſs their way; and if they ſhould, they ſoon find it again by their ſmell.

Thoſe bred to hunt the deer, ſables, foxes, and wild rams, are ſometimes fed with jackdaws, which are thought to make their ſcent the ſtronger in ſmelling out birds and wild beaſts. Their ſkins are alſo uſed for cloaths, particularly thoſe of the white dogs, with which all their garments are trimmed.

There are three ſorts of rats, thoſe in the huts, where they run about without fear, and live upon offals; another ſort live in the fields, and, like the drones among the bees, ſteal their food from the third kind, which alſo live in the fields, woods, and high mountains, in a kind of community, having very neat neſts, which are large, and divided into different apartments ſpread with graſs; in ſome of which they ſtore up roots of ſeveral kinds, which they gather with great labour in ſummer, and lay up againſt winter; dragging them out in dry ſun-ſhiny weather, in order to dry them. All the ſummer they live upon berries and ſuch other food as they can find, never touching their winter-proviſions while any is to be procured in the fields.

Theſe change their habitations, and ſometimes they all leave Kamtſchatka, which the Kamtſchadales imagine forebodes a rainy ſeaſon, and a bad year for hunting; but when they return, they expect a fine one, and a good year for the chace, and therefore expreſſes are ſent to all parts with the good news.

They always depart in the ſpring; firſt aſſembling in great numbers. They ſteer their courſe due weſt, croſſing rivers, lakes, and even arms of the ſea; and when they reach the ſhore, ſpent with fatigue, they lie as if dead upon the banks, till recovering their ſtrength, they again purſue their march. They have nothing to fear on the land; their greateſt danger is, leſt ſome ravenous fiſh ſhould devour them. The Kamtſchadales, on finding them weak on the banks, give them any aſſiſtance in their power. From the river Pengin they march ſouthward, and about the middle of July uſually reach Ochotſka and Judoma. Their troop is ſometimes ſo numerous, that travellers are obliged to wait two hours for their paſſing by. They uſually return to Kamtſchatka about the month of October. It is extremely ſurpriſing that ſuch ſmall animals are able to paſs over ſuch an immenſe tract of land; and nothing can be more admirable than the order and regularity they obſerve in their march.

The amphibious animals of Kamtſchatka are of many different kinds. The manati, or ſea-cow, never comes upon the ſhore, but lives conſtantly in the water. Though this animal has the name of ſea-cow, it reſembles the cow only in its ſnout, and has neither horns, ſtraight ears, nor hoofs. It is an animal like a ſeal, only it is incomparably larger; it being about twenty-eight feet long, and ſome of them weigh eight thouſand pounds. Its ſkin is black and thick like the bark of an aged oak, and ſo tough and hard, that it can ſcarcely be cut with an ax. Its head is ſmall in proportion to its body, and falls off from the neck to the ſnout, which is white and rough, with white whiſkers about nine inches long. Inſtead of teeth, it has two flat white bones, one above, the other below. Its noſtrils, which are near the end of the ſnout, are within rough and hairy. Its eyes, which are placed nearly in a line with the noſtrils, are black, and no larger than thoſe of a ſheep, which is remarkable in a creature of ſo monſtrous a ſize. It has neither eye-brows nor eye-laſhes, and its ears are only ſmall openings; its neck can ſcarcely be diſcovered, the head and body being ſo cloſely joined: but there are ſome vertebræ which enable it to turn its head, and to hang it down in feeding like a cow. The body is round like that of a ſeal, and the female has two teats on her breaſt. The tail is thick and a little bent towards the end, and has ſome reſemblance to the fins of a fiſh. It has two fins under its neck, about twenty-one inches long; theſe it uſes like hands, with which it ſwims, and takes hold of the rocks with ſuch force, that, on its being dragged from thence with hooks, it will leave the ſkin behind: theſe fins are ſometimes divided in two, but this ſeems to be only accidental.

Theſe animals in calm weather ſwim in droves near the mouths of the rivers; and though the dams oblige their young to ſwim before them, they are covered on all ſides by the reſt of the herd, and conſtantly ſwim in the middle. They live in families, conſiſting of a male, a female, ſome half grown, and one ſmall calf. They bring forth in harveſt, and never have above one at a time.

They are almoſt continually eating; and, as they ſeldom lift their heads above the water, any one may go among them in boats, and carry off what he pleaſes: they feed upon ſeveral ſorts of ſea-weed, and have their backs and ſides above water, upon which flocks of crows ſettle to pick off the vermin they find there.

They are caught with great iron hooks, ſomewhat reſembling the fluke of a ſmall anchor. Theſe are carried by a man in a boat, with three or four rowers; who, on his coming among the herd, ſtrikes the hook into one of them; then about thirty men upon the ſhore, who hold one end of the rope that is faſtened to the hook, draw the manati towards the land; while thoſe in the boat ſtab and cut the animal till it dies. When one of them ſtruggles to clear himſelf of the hook, thoſe of the herd that are neareſt come to his aſſiſtance; ſome frequently overſet the boat by getting under it; and others ſtrive to remove the hook by ſtriking it with their tails, which ſometimes ſucceeds. The male and female have ſuch an affection for each other, that when one of them has in vain uſed every method in its power to give aſſiſtance, it follows the body, after it is killed, to the very ſhore; and has ſometimes been obſerved to remain by it two or three days.

Their fleſh, when thoroughly boiled, has a good taſte, and reſembles that of beef; the fat of the young eats like that of pork, and the lean like veal.

The number of ſeals in the ſeas and lakes of Kamtſchatka is ſo great, that all the iſlands and ſand-banks are covered with them. There are reckoned four ſorts of this animal, the largeſt of which is caught from the fifty-ſixth to the ſixty-fourth degree of north latitude, and differs from the others only in its bulk, which exceeds that of a large ox. The ſecond ſpecies, which is of the ſize of a yearling bullock, has a ſkin ſomewhat like that of a tyger; it having ſpots of an equal ſize on the back, with a white and yelloviſh belly; but the young are as white as ſnow. The third ſort is leſs than the former, and has a yelloviſh ſkin, with large cherry-coloured circles. The fourth is of a whitiſh colour. No animal has a more diſagreeable cry than that of

of the ſeals, and their noiſe is inceſſant. When the tide goes out, they lie upon dry rocks, and in play puſh one another into the water; but they no ſooner begin to be angry, than they wound each other with their teeth.

There are different ways of killing them: on ſhore, they ſurpriſe them aſleep, and diſpatch them with clubs: in the rivers they ſhoot them with guns, taking care to hit the head; for a hundred bullets in any other part would have no effect, as they all lodge in the fat with which the body is covered. When they find them aſleep with their ſnout upon the ice, they drive a knife through it, faſtened to a long thong, by which they drag out the animal.

Of the ſkins of the larger ſort they make ſoles for their ſhoes, and by joining ſeveral of them together, make boats of different ſizes, ſome of which are ſo large as to carry thirty men; theſe are lighter and ſwifter than thoſe made of wood. The natives eſteem the fat ſuch a delicacy, that they have it at every feaſt: it alſo ſerves for making candles. They dry the fleſh in the ſun, or boil it when freſh; but when they have great quantities, they bake and ſmoke it: for this purpoſe they dig a large pit, and pave the bottom with ſtones; then filling it with wood, light it below, and continue to add fuel till it is as hot as an oven. Afterwards taking out all the aſhes, and laying a layer of green poplar wood at the bottom, they put another of ſeal's fleſh or fat, each ſeparately, and thus alternately wood and fleſh till the pit be filled: then they cover it with graſs and earth to keep in the heat; and ſome hours after taking out the fat and fleſh, they lay it up for the winter. It is ſaid, that when the fleſh and fat is thus prepared, it taſtes much better than when boiled, and will keep a whole year without ſpoiling.

Sea-horſes only appear in the moſt northerly parts of Kamtſchatka; their teeth are what is called fiſh-bone, and their price depends on their ſize and weight: the deareſt weigh about twenty pounds each; but they are ſeldom ſo large, and commonly weigh about five or ſix pounds.

In ſpring and in September are caught the ſea-cats, which are thus called at Kamtſchatka, from long hairs ſtanding out on both ſides of the mouth like thoſe of cats. Dampier, who ſaw them in the South Sea, has deſcribed them under the name of ſea-bears. The largeſt weigh about eight thouſand weight. Moſt of the females taken in ſpring are pregnant; and thoſe that are near the time of bringing forth their young, are immediately opened, and the young ones ſkinned. They breed on the neighbouring coaſt of America, where they nurſe their young three months, and then return with them at the end of the ſummer. The females give ſuck with two teats placed between their hinder-legs; but they have ſeldom more than one at a time. The young ſee when they are whelped. Their eyes are as large as thoſe of an ox, and they have thirty-two teeth, beſides two tuſks on each ſide, which begin to appear the fourth day after their birth. At firſt their colour is a dark blue, but in four or five days grey hairs begin to appear, and in a month's time their belly is black and grey. The male is larger and blacker than the female, which turns almoſt blue as ſhe grows up, and has only grey ſpots between her four legs.

The male and female are ſo different in their form and ſtrength, that they ſeem different animals: and beſides, the former are fierce, and the latter mild and fearful. The male has from eight to fifty females, of whom he is ſo jealous, that he will not allow any other to come near them: and though many thouſands lie on the ſhore, every family lives apart, the male with his females, young ones, and thoſe of a year old that have not yet attached themſelves to any male; ſo that the family ſometimes conſiſts of one hundred and twenty. Thoſe that are old, or have no miſtreſs, live by themſelves, and ſome lie aſleep a whole month without nouriſhment: theſe are fiercer than any of the reſt. They attack all that paſs by, and will rather die than retire. On ſeeing a man approach them, ſome ruſh upon him, and others lie ready to ſupport them. They bite the ſtones that are thrown at them, and ruſh with redoubled violence on him that throws them. Even if you ſtrike out their teeth with ſtones, or put out their eyes, they will not fly; and indeed they dare not, for every ſtep they meet a new enemy; ſo that if the ſea-cat could ſave himſelf from man, his own brethren would deſtroy him; for if any one ſeems to be driven back ever ſo little, others approach to prevent his running; and if he appears to deſign it, fall upon him. Sometimes they are ſeen fighting for a mile together, and then one may paſs them without the leaſt danger. If two fall upon one, others advance to ſupport the weakeſt; for they will not allow of an unequal combat. While theſe battles continue, thoſe that are ſwimming in the ſea raiſe their heads and look at the combatants, and at length come and increaſe the number.

When only two of them fight, the battle frequently laſts an hour; ſometimes they reſt, lying by each other, then both riſe at once and renew the engagement. When fighting they hold up their heads, and turn them aſide, to eſcape a blow; for while their ſtrength is equal, they fight only with their fore-paws; but one of them no ſooner becomes weak, than the other ſeizing him with his teeth, throws him on the ground. The lookers on then come to the aſſiſtance of the vanquiſhed.

Their moſt bloody battles are on account of their females, when one endeavours to carry off the miſtreſs of another, or his young females. They alſo quarrel when one comes too near the place of another.

Though the male is fond of his young, both they and the large females fear him extremely. If a man endeavours to take a young one, the male defends it, and allows the female to eſcape with the young one; but if ſhe drops it out of her mouth, the male leaves his enemy, and ſeizing upon her with his teeth, beats her againſt the ſtones till ſhe lies down as if dead; but ſhe no ſooner recovers, than crawling to his feet, ſhe licks and waſhes them with her tears that flow in abundance; while the male ſtalking about, gnaſhes his teeth, and toſſes his head like a bear.

They ſwim exceeding faſt: and when they happen to be wounded at ſea, ſeize the boats of the fiſhers with their teeth, and drag them along ſo ſwiftly, that they ſeem to fly and not to ſwim upon the water. The boat is by this means frequently overſet, and the people drowned.

The ſea-beavers reſemble the others only in their downy hair; they are as large as the ſea-cats; their head reſembles that of the bear, and their ſhape the ſeal: their teeth are ſmall; their fore-feet are longer than thoſe behind; their tail is flat, ſhort, and ſharp towards the point; and their hair thick and black: but that of the old ones turns grey. This animal is ſo peaceable, that it never makes any reſiſtance, and only endeavours to eſcape by flight. The females are fond of their young, and carry thoſe that cannot ſwim upon their belly, holding them with their fore-feet, and ſwimming on their back. When purſued by the fiſhermen, they never quit their young till the laſt extremity; and ſhould they happen to ſlip out of their paws, they inſtantly return to take them up again; therefore the fiſhers endeavour to kill or catch the young, as the moſt effectual method of taking their dams.

There are a great number of birds at Kamtſchatka, but the natives are not ſkilled in catching them. Sea-fowl appear in great plenty about the coaſt of the Eaſtern Ocean. Among theſe are the puffins, which are ſomewhat ſmaller than a tame duck: the head and neck are of a blueiſh black, the back is alſo black, the belly and all below white; its bill and legs are red, and its feet webbed. Another ſpecies of them is all black, but has two yellowiſh white tufts, which lie upon its head like locks of hair.

The cormorants here are of two kinds, and about the ſize of a gooſe; they have a ſtraight reddiſh bill, about five inches long, and four noſtrils. Their eyes are black, their legs are covered with hair to the knees, and their toes are of a blueiſh colour, and are webbed; their tails are eight inches long, and their wings extend above a fathom. They are ſometimes ſpeckled. They fly ſlow when hungry; but when full, cannot riſe from the ground: and having eat too much, they eaſe their ſtomachs by throwing it up.

The natives have a ſingular way of catching them: they faſten a hook to a long cord, baiting it with a whole fiſh, and then throw it into the ſea: the cormorants gathering about it in flocks quarrel for the prize, till it is ſwallowed by the ſtrongeſt, which is then drawn aſhore.

There are other cormorants that frequent the rivers, and have a forked tail like that of a ſwallow.

The

The glupiſha are of the ſize of the river-cormorants, and are found on high ſteep places upon the rocky iſlands. Their colours are grey, white, and black. They are perhaps called glupiſha, or fooliſh, from their frequently flying into the boats. Their bills are crooked and yellowiſh; their eyes are as large as thoſe of an owl; and they are often ſpotted with white.

There are great plenty in Kamtſchatka of a fowl called urile, and by ſome writers the ſea-raven. It is of the ſize of a common gooſe, with a long neck and ſmall head: the feathers on the body are black, but thoſe of the thighs are white, and long white feathers like hairs are ſcattered on its neck. It has a red membrane round the eyes, a ſtraight bill, black above and reddiſh below, and its feet are black and webbed. It feeds upon fiſh, which it ſwallows whole; and in the night-time theſe fowls ſtand in rows upon the edges of the cliſts, from which they frequently fall in their ſleep into the water.

Swans are very common here both in ſummer and winter; the natives hunt them with dogs when they are moulting, and kill them with clubs.

There are ſeveral kinds of geeſe which come to Kamtſchatka in May, and depart in October. There are likewiſe many kinds of ducks.

In this country are alſo many widgeons, partridges, ſnipes, larks, cuckows, ſwallows, ravens, magpyes, crows, hawks, and eagles.

As to the fiſhes, whales frequently come cloſe to the very ſhore, perhaps to rub off the ſhell-fiſh which adhere to their bodies, and are very troubleſome to them. Theſe whales are from ſeven to fifteen fathoms in length. The Kamtſchadales obtain many advantages from the whales: they make ſhoe-ſoles and ſtraps of the ſkin; they eat the fleſh and fat, and the laſt they alſo burn; they make nets of the beard, and alſo ſew their boats with it; they form a kind of ſledge out of the lower jaw, and likewiſe make of it knife-handles and rings. Of the inteſtines they make veſſels, of the nerves they make ropes, and of the vertebræ feats. The moſt delicate pieces of the whale are the tongue and the fins.

There are alſo a large kind of ſalmon, cod, ſkate, red fiſh, the humpback turbot, herring, lampreys, and many other ſorts, which come from the ſea in ſuch numbers, that they frequently ſtop the courſe of the rivers, and cauſe them to overflow their banks; and when the waters retire, a ſurpriſing quantity of dead fiſh remain on the ſhore, which cauſe an intolerable ſtench.

SECT. IV.

Of the Natives of Kamtſchatka. Their Perſons, Dreſs, Huts, Manners, and Cuſtoms; particularly their Marriages, the Birth of their Children, their Diſeaſes, and Treatment of the Dead. Their Entertainments, and their Manner of travelling in Sledges drawn by Dogs.

THE natives are divided into three different people, the Kamtſchadales, who live upon the ſouth ſide of the peninſula of Kamtſchatka; the Koreki, who inhabit the northern parts on the coaſt of the Penſchinſka Sea, and along the ſhore of the Eaſtern Ocean, almoſt to the river Anadir; and the Kuriles, who inhabit the ſecond Kurilſkoy iſland, and the other iſlands that extend ſouthward to thoſe of Japan. The Koreki are again divided into two nations, one called the fixed Koreki, and the other the Rein-deer Koreki; the former living near the rivers like the Kamtſchadales, and the other wandering with their herds. Their languages are different, and they cannot underſtand each other. The inhabitants of Kamtſchatka have three languages, that of the Kamtſchadales, the Koreki, and the Kuriles, each of which has different dialects.

The Kamtſchadales, like the Mongol Tartars, are of a ſmall ſtature and ſwarthy: they have black hair, a broad face, a ſharp noſe, with hollow eyes, and ſmall and thin eyebrows, and their arms and legs are ſlender. Though in their appearance they reſemble the other inhabitants of Siberia; yet the faces of the Kamtſchadales are ſhorter than thoſe of the other Siberians, their cheeks are more ſwelling, their mouths are large, and their ſhoulders broad, particularly thoſe who inhabit the ſea coaſt.

Their cloaths are generally made of the ſkins of deer, dogs, and ſeveral other land and ſea animals, and even of the ſkins of birds; and it is not unuſual with them to uſe thoſe of different animals in the ſame garment. They commonly wear two coats, the under coat with the hairy ſide inwards, and the upper with the hair outwards: for theſe laſt they chooſe black, white, or ſpeckled ſkins. The ſkirts of ſome are of an equal length, and thoſe of others are long behind and in the form of a train. The ſleeves of the upper coat are very long, ſo as to hang below the knee; and it has a hood, which, in bad weather, they put over their heads. They border their coat with white dog ſkin, and upon their backs ſew ſmall ſhreds of different coloured ſkins or ſilk.

Theſe garments are worn both by men and women; but the latter commonly wear at home in the houſe a waiſtcoat and drawers ſewed together. The houſhold habit of the men is a leather girdle, with a bag before and a leathern girdle behind. Their feet and legs are covered with different ſorts of ſkins. During the rains of ſummer they wear ſeal-ſkins, with the hair outwards, but they are generally covered with the ſkin of the legs of rein-deer. They wear caps, and in ſummer a kind of hats of birch-bark tied about their heads; and the Kuriles have caps of plaited graſs: however, round the Ruſſian ſettlements the antient dreſs is laid aſide, and the women wear ſhifts, ruffles, caps, waiſtcoats, and ribbons. They even do all their work in mittens; and though they formerly never waſhed their faces, they now uſe white and red paint.

But ſtill the diſtant inhabitants never waſh their hands and face, nor cut their nails. They eat out of the ſame diſh as the dogs, and yet never waſh it; and every thing about them ſtinks of fiſh. They never comb their heads, but both men and women plait their hair in two locks, binding the ends with ſmall cords; and when any hair ſtarts out, they faſten it cloſe with thread: by this means they are ſo exceſſive louſy, that they can ſcrape off the vermin, which they are ſo naſty as to eat.

Their manners are extremely unpoliſhed, for they never uſe any civil ſalutation, never take off their caps, nor bow to each other, and their diſcourſe betrays the moſt ſtupid ignorance; yet upon many occaſions they appear curious and inquiſitive.

They live under ground, where they build their huts in the following manner: having dug a hole about five feet deep, and of a breadth and length in proportion to the number of perſons deſigned to live in it, they fix at the corners four pieces of timber, upon which they place beams, and upon them form their roof or ceiling, only leaving in the middle an opening, which ſerves both for a window and chimney. This building they cover with graſs and earth, ſo that it reſembles a round hillock. The room below is an oblong ſquare, and the fire-place is in one of the long ſides. Round theſe huts they make benches, on which each family lies ſeparately; but there are no benches on the ſide oppoſite to the fire, for there they place their kitchen furniture, and dreſs victuals for themſelves and dogs. In ſome huts inſtead of benches the place is floored with wood, and covered with mats; the walls are alſo adorned with mats. Theſe huts are entered by ladders, which are commonly placed near the hearth; ſo that when there is a good fire, the ladder becomes ſo hot, and the ſmoke ſo thick, that any one not inured to it would be ſuffocated; but they find no difficulty in going in and out: and though they only fix their toes on the ſteps of the ladder, they mount like ſquirrels.

The Kamtſchadales live all the winter in theſe huts, and in ſummer have others, which ſerve them alſo for warehouſes. Theſe are thus made: nine pillars, about four yards long, or more, are fixed in the ground, and bound together with beams laid over them: upon theſe they form a floor, and from thence raiſe a ſharp roof, riſing from each ſide up to a point in the middle, and thatched with graſs. On each ſide there is a door oppoſite to each other.

Theſe ſummer huts thus placed high above the ground, are more convenient in ſummer than thoſe formed beneath it, on account of the frequent rains, which would ſpoil all their fiſh, were it not preſerved in ſuch places; and if they were not ſo high, the wild beaſts would plunder them; for, notwithſtanding all their care, the bears ſometimes climb up, and force their way into theſe ſtore-houſes,

eſpecially in the time of harveſt, when the fiſh and berries grow ſcarce. Theſe are built round their winter habitations.

The ſouthern Kamtſchadales generally build their villages in thick woods, at a conſiderable diſtance from the ſea, and their ſummer habitations near the mouths of the rivers; but thoſe who dwell on the banks of the Eaſtern Ocean and the Penſchinſka ſea build their villages near the ſhore. Their houſhold furniture conſiſts in diſhes, troughs, bowls, and cans.

When a Kamtſchadale intends to marry, he ſeeks for a bride in ſome of the neighbouring villages, ſeldom in his own; and when he has found one to his mind, he immediately ſignifies his intention to the parents; at the ſame time deſiring, that he may have the liberty of ſerving them for ſome time. After this time is expired, he deſires that he may have liberty to ſeize his bride; which, if he has pleaſed the parents, is immediately granted: but if he has not, he is diſmiſſed with a preſent for his ſervices.

As the whole ceremony of marriage conſiſts in his ſtripping the young woman naked, they ſtrive to render this as difficult as poſſible; ſhe has two or three different coats, and is ſwathed round with fiſh-nets and ſtraps; and all the women of the village are obliged to protect her. The man therefore watches for an opportunity of finding her alone, or with but few women in her company; and as ſoon as he has found it, ruſhes upon her, and begins to pull off her ſtraps, nets and cloaths. But he does not always find this an eaſy taſk; for though the young woman makes but a faint reſiſtance, the women that are generally in her company fall upon him without mercy, beating him, dragging him by the hair, ſcratching his face, and uſing every other method they can deviſe in order to prevent his accompliſhing his deſign.

If he ſucceeds in his attempt, he immediately runs from her; and the bride, as a proof of her being conquered, calls him back with a ſoft and feeble voice; and thus the marriage is concluded. The ſame night he goes to bed to her, and the next day carries her home. Some time after the bride and bridegroom return to the bride's relations, where the marriage feaſt is celebrated.

This ceremony only relates to the marriage of a virgin, for with a widow the agreement of the parties is ſufficient; but the man muſt not take her to himſelf before her ſins are done away. This can only be accompliſhed by a ſtranger's once lying with her; but as this taking off of ſin is conſidered by the Kamtſchadales as extremely diſhonourable for the man, it was formerly difficult to procure one to undertake it; but ſince the Coſſacks came among them, the poor widows are in no diſtreſs for ſtrangers to take away their ſins.

Marriage is only prohibited between father and daughter, mother and ſon. A Kamtſchadale has frequently three wives; but with every maid he is obliged to undergo the above ceremony. The women are far from being jealous, for the wives live together in perfect harmony.

When the women go abroad they veil their faces; and if they meet a man, and cannot get out of the way, turn their backs to him till he has paſſed by.

They have commonly very eaſy labours: they are delivered upon their knees in the preſence of all the people of the village, without diſtinction of age or ſex. The child is wiped with tow, and the navel-ſtring tied with thread made of nettles, and then cut with a knife of flint. The infant, inſtead of being ſwathed in cloaths, is wrapt in tow. The mother, or neareſt relation, generally performs the office of midwife.

Some women, to promote conception, eat the navel-ſtring of the child; and others, for the ſame purpoſe, eat ſpiders: ſome, on the contrary, endeavour by medicines to procure abortion; but though this is a capital crime, yet when a woman bears twins, they are obliged to deſtroy one of them, as alſo a child born in ſtormy weather; though the laſt may be averted by certain incantations. How amazing is it that the barbarous cuſtom of people's deſtroying their own offſpring ſhould be publickly allowed in many nations! How aſtoniſhing is it that parental affection ever ſuffered ſuch cruel cuſtoms to take place!

The Kamtſchadales imagine that the diſeaſes with which they are afflicted are brought upon them by the ſpirits that inhabit particular groves, for their preſuming to cut any of them down. Their principal diſorders are the ſcurvy, jaundice, the venereal diſeaſe, boils, palſey, and cancer, which they endeavour to cure by charms and incantations; but yet they do not neglect the uſe of herbs and roots. The boils are eſteemed the moſt dangerous, and cauſe the death of numbers. Theſe are often two, and ſometimes three inches over, and on their breaking, they open in forty or fifty little holes. It is eſteemed very dangerous when no matter proceeds from theſe openings. They uſe raw hare ſkins to bring on a ſuppuration, and thoſe that recover are ſometimes confined, ſix and ſometimes ten weeks to their bed. The palſy, cancer, and venereal diſeaſe, are thought incurable; and they ſay the laſt was never heard of before the arrival of the Ruſſians. They have alſo another diſeaſe, called the ſuſhutch, which is a kind of ſcab that encompaſſes the body under the ribs like a girdle; when this does not ſuppurate and fall off, it is mortal; and they aſſert that every one has it once in his life.

Inſtead of burying the dead, the Kamtſchadales drag the corpſe out of the hut with a ſtrap faſtened round the neck, and then deliver it for food to their dogs. For this cuſtom, ſo ſhocking to humanity, and ſo contrary to the practice of all other nations, they give the following reaſons: that thoſe who are devoured by dogs will be drawn in ſledges by fine dogs in the other world; and that the corpſe is thus uſed near the hut, that the evil ſpirits, who are the occaſion of the perſon's death, may be ſatisfied with the miſchief they have done. However, it is not unuſual when one has died in the hut to remove to another place, and only leave the corpſe behind.

All the cloaths of the deceaſed are thrown away, not from their imagining that they ſhall have them in the other world, but from the opinion that whoever wears them will come to an untimely end. This ſuperſtition particularly prevails among the Kuriles of the Lopatka, who would not touch any thing that belonged to the dead, though they had ever ſo great an inclination for it.

After the body has been thus devoured, they uſe the following purification: they go to a wood and cut ſome rods, with which they make a ring, and creeping through it twice, carry it back to the wood, and throw it towards the weſt. Beſides, thoſe who dragged out the body muſt catch two birds, one of which they eat with the whole family, and the other they burn. Before this purification they dare not enter any other hut, nor will any body elſe enter theirs: it is therefore performed immediately, and in commemoration of the dead the whole family dine upon a fiſh, and burn the fins in the fire.

When a Kamtſchadale ſeeks the friendſhip of another, he invites him to his hut, which is made very hot for his reception; and he no ſooner enters, than they both ſtrip themſelves naked. The maſter of the hut then ſets before his gueſt great plenty of his beſt proviſions; and, while he is eating, throws water upon red-hot ſtones, till the heat of the place becomes inſupportable. The ſtranger ſtrives to bear it, and to eat up all the victuals, while the maſter of the hut endeavours to oblige him to complain of the heat, and to deſiſt from eating. He himſelf eats nothing, but is allowed even to leave the hut, though the viſitor is not ſuffered to ſtir till he confeſſes that he is overcome. They uſually eat ſo much at theſe feaſts, that for two or three days they can ſcarcely move, or bear the ſight of victuals. At length the viſitor being unable to eat any more, purchaſes his diſmiſſion with preſents of cloaths, dogs, or whatever the maſter of the hut likes; and, in return, receives others of no value. But if the man who has obtained this advantage over his friend does not ſoon return the viſit, the gueſt pays him another, and then it is his turn to make him ſuch preſents as he is able; and if he makes him none, it is conſidered as the greateſt affront, the man himſelf will be his enemy, and nobody elſe will live in friendſhip with him.

Sometimes one village entertains another, either upon account of a wedding, or their having had great ſucceſs in hunting or fiſhing. The maſter of the hut endeavours to make his gueſts ſick with eating, and ſometimes gives them a liquor made of a large muſhroom, prepared with the juice of epilobium or French willow, which intoxicates them in ſo ſtrange a manner, that they commit a thouſand extravagan-

extravagancies; and if the doſe be too large, it ſometimes proves fatal; and thoſe who are thus intoxicated die raving mad.

The women never uſe it, for all their mirth conſiſts in jeſting and ſinging; inſtead of dancing they ſpread a mat in the middle of the room, and kneel upon it oppoſite to each other, holding a little tow in each hand. At firſt they begin to ſing very low, giving a gentle motion to their hands, but by degrees raiſe their voice and increaſe their motion till they are fatigued and out of breath. With this uncouth entertainment the Kamtſchadales appear highly delighted.

The women, who have generally clear and agreeable voices, compoſe their love ſongs, in which they declare their affection to their lovers, their grief, their fondneſs, and other paſſions; but though they have an inclination to muſic, they have no muſical inſtrument except a flute, upon which they play very poorly.

A ſtranger no ſooner comes to Kamtſchatka than they give him a new name, and at their entertainments mimic all his actions. They have alſo profeſſed buffoons, but their wit is intolerably indecent and obſcene. They ſometimes ſmoke and tell ſtories with their friends.

They travel in ſledges drawn by four dogs, driving them with a crooked ſtick four feet long, or a whip of different coloured thongs. They ſit upon the right ſide of the ſledge, with their feet hanging down; and it would be thought a diſgrace for any one to ſit in it, or to have a perſon to drive them, nobody doing this but the women. A man is obliged to keep an exact ballance to prevent his being overturned, which would be very dangerous, as the dogs never ſtop till they come to a houſe, and in going down ſteep hills run with all their force: therefore, in deſcending great declivities, they unyoke all the dogs except one, and lead them gently down. They alſo walk up every ſteep aſcent; for it is as much as the dogs can do to drag up the empty ſledge. Upon a tolerable road they can travel with the ſledge, filled with proviſions and the driver, about thirty verſts a day; and in ſpring, when the ſnow is hard, and ſplinters of bone are fixed to the ſledge, they can travel without any load one hundred and fifty verſts.

There is no travelling with dogs after a deep ſnow, till a path be made, which is performed by a man going before with ſnow ſhoes. Theſe are made of two thin boards ſeparated in the middle, and bound together with thongs; the fore part is bent up a little, and a place made to ſlip in the foot, to which the ſhoe is tied with thongs.

If a company of travellers is ſurprized by a ſtorm, they dig a place of ſhelter under the ſnow, and cover the entrance with wood or brambles. They however ſeldom make theſe temporary huts, but more commonly hide themſelves in caves or hol es of the earth, wrapping themſelves in their furs; and when thus covered they move with great caution, leſt they ſhould throw off the ſnow, which keeps them perfectly warm; they muſt only have the convenience of a breathing-place: but if their cloaths are hard girt about them, the cold is inſufferable.

SECT. V.

Of the Arts practiſed among the Kamtſchadales.

THE men, beſides hunting and fiſhing, all underſtand the art of weaving nets, making ſledges and boats, building their huts, dreſſing their proviſions, and forming their furniture and warlike inſtruments.

The women, on the contrary, are the only curriers, dyers, taylors, and ſhoemakers, for they dreſs and dye the ſkins; make all the coats, ſhoes, and ſtockings, and are alſo employed in curing the ſick.

The ſkins of the beavers, deer, dogs, and ſeals uſed for cloathing are all thus prepared: taking one of theſe, they firſt wet and ſpread it out, and with ſtones fixed in wood ſcrape off all the pieces of fat or veins that remained after flaying; then rubbing it over with caviar, roll it up and tread it till it begins to ſtick: afterwards ſcraping it again, they proceed as before till the ſkin is ſoft and clean. Thoſe they want to prepare without the hair, they firſt uſe in the ſame manner, then hang them in the ſmoke for a week, and afterwards, to fetch off the hair, ſoak them in water. At laſt they rub them with caviar, and by frequent treading, and ſcraping them with ſtones, render them ſoft and clean.

The deer and dog-ſkins uſed for cloathing are dyed with alder-bark cut and rubbed very ſmall: but the ſeal-ſkins uſed either for cloathing, ſhoes, or ſtraps for binding their ſledges, they dye in a particular manner. Having firſt cleaned off the hair, they make a bag of the ſkin, and turning the hair-ſide outwards, pour into it a ſtrong decoction of alder-bark. They let it lie ſome time, then hang it upon a tree, and beat it with a ſtick. This they repeat till the colour has penetrated through the ſkin. Then picking out the ſtitches, they ſtretch it out, dry it in the air, and at laſt rub it till it becomes ſoft for uſe.

They make glue of the dried ſkins of fiſhes, and particularly of that of the whale.

Before they were conquered by the Ruſſians, the men made uſe of ſtones and bones inſtead of metals, and of them made hatches, ſpears, arrows, needles, and lances. Their hatches were ſometimes made of flint, and ſometimes of the bones of whales or rein-deer: they were in the form of a wedge, and faſtened to crooked handles. With theſe they hollowed out their canoes, troughs, and bowls: but the work was ſo tedious, that a man would be three years in making a canoe. Hence their wooden bowls, which they were long in making, were more valued by them than veſſels of the moſt precious metals and moſt curious workmanſhip are with us. In theſe bowls they dreſs their victuals, and heat their broth, by throwing red-hot ſtones into them.

They made their knives of a greeniſh mountain cryſtal, ſharp-pointed, ſhaped like a launcet, and ſtuck into a wooden handle. Of the ſame cryſtals they likewiſe made their lancets, with which they ſtill continue to let blood. With this cryſtal they alſo pointed their arrows and ſpears. They uſed to ſew their cloaths with thread made of the fibres of deer, which they ſplit till they brought it to the thickneſs required. Their needles they made of the bones of ſables, and with them the women not only ſewed their cloaths, but alſo made curious embroidery.

In order to kindle a fire, they uſe a board of dry wood, in which are ſeveral round holes, and putting the end of a ſmall round ſtick into one of theſe, they roll it backwards and forwards with the palms of both hands, till the friction cauſes the wood to take fire; and inſtead of tinder they uſe dry graſs beat ſoft. Theſe inſtruments are ſo highly valued by the Kamtſchadales, that they are never without them; for they prefer them to ſteel and flints: they are, however, exceſſive fond of iron hatches, knives, and needles. At the firſt arrival of the Ruſſians they conſidered a piece of iron as a valuable preſent, and even yet receive it with thankfulneſs; for they know how to make uſe of the leaſt bit, either in pointing their arrows, or their darts, which they perform by hammering it out cold between two ſtones.

Indeed, all the ſavage inhabitants of theſe parts are particularly fond of iron; but as ſome of them delight in war, the Ruſſian traders are forbid to ſell them any warlike inſtruments; yet they are ſo ingenious as to make ſpears and arrows out of the iron pots and kettles that are ſold to them; and are ſo dexterous, that when the eye of a needle is broke, they make a new one, which they repeat till nothing remains but the point.

SECT. IV.

Of the Religion and Laws of the Kamtſchadales.

THE Kamtſchadales have very mean and abſurd ideas of the Deity, to whom they pay no religious worſhip; they call him Kutchu, and frequently reproach him for having made ſo many ſteep hills and rapid rivers, for ſending ſo many ſtorms and ſo much rain. They erect a kind of pillar in a ſpacious plain, and bind it round with rags. Whenever they paſs by it they throw to it a piece of fiſh or ſome other victuals, and near it never gather any berries, or kill either birds or beaſts; but they offer nothing that

is

is of uſe, of which they would not otherwiſe be obliged to throw away. Burning mountains, hot ſprings, and particular woods they eſteem ſacred, and imagine them inhabited by evil ſpirits, whom they fear and reverence more than their god; for they have filled almoſt every place with different ſpirits, to whom they make offerings upon every occaſion; and ſome carry little idols about them, or have them placed in their dwellings. They have no notion that the Supreme Being can diſpenſe happineſs or miſery, but maintain that every man's good or bad fortune depends upon himſelf. They believe that the world is eternal, and the ſoul immortal; that it ſhall be again united to a body, and live for ever ſubject to the ſame troubles and fatigues as in the preſent life, only that they ſhall enjoy a greater plenty of all neceſſary accommodations. They even imagine that the ſmalleſt animals will riſe again and dwell under the earth; for they believe the earth is flat, and under it another ſky and another earth like ours, where, when we have ſummer, they have winter.

Their religious ſentiments are ſo extravagant, that they pay a kind of ſolemn regard to ſeveral animals from which they apprehend danger. They offer fire at the holes of the foxes and ſables; when hunting they beſeech the wolves and bears not to hurt them; and in fiſhing intreat the whales and ſea-horſes not to overſet their boats.

Being chiefly employed about providing what is abſolutely neceſſary for the preſent, they take no care for the future. They have no notion of riches, fame, or honour; therefore covetouſneſs, ambition, and pride are unknown among them: but, on the other hand, they are careleſs, luſtful, and cruel. Theſe vices frequently occaſion quarrels and wars among them, not from the deſire of increaſing their power, but to carry off their proviſions, and more frequently their girls; which is ſometimes practiſed as the ſhorteſt method of procuring a wife. They believe every thing lawful that can procure the gratification of their paſſions; ſo that they neither eſteem murder, ſelf-murder, adultery, oppreſſion, or the like, any crime: but, on the contrary, think it a mortal ſin to ſave any one that is drowning, becauſe they are perſuaded that whoever ſaves him will ſoon be drowned himſelf. They alſo reckon it a ſin to bathe in or to drink hot water, or to aſcend the burning mountains.

It is a law with them, that if one man kills another, he is to be killed by the relations of the perſon ſlain. The thief for the firſt offence muſt reſtore what is ſtolen, and live without expecting any aſſiſtance from others; but they burn the hands of thoſe who are frequently caught thieving. To puniſh an undiſcovered theft, they, with great ceremony, burn the ſinews of the ſtone-buck, imagining that as theſe are ſhrunk by the fire, the thief will have his limbs contracted. They never have any diſpute about their lands, for each has more than he wants.

Though they are involved in ignorance, and might be thought, from their manner of life, extremely wretched; yet they think themſelves the happieſt people upon earth, and look upon the Ruſſians who live among them with contempt. This opinion, however, loſes ground; for as the old people, who are fond of their antient cuſtoms, drop off, and the young ones frequently embrace the Chriſtian religion, they inſenſibly adopt the Ruſſian cuſtoms, and begin to deſpiſe the ſuperſtition and barbarity of their anceſtors.

By the care of the late empreſs Elizabeth, miſſionaries were appointed to inſtruct them in the Chriſtian religion; and ſince the year 1741 many of them have been baptized, and ſchools erected in ſeveral places, to which the Kamtſchadales very readily ſend their children.

SECT. VII.

Of their home Trade and Method of bartering, their Ignorance of Numbers, Diviſion of the Year, and little Skill in any of the Sciences.

THEIR trade only tends to procure the neceſſaries and conveniences of life, by exchanging what they abound with for what they want. This kind of barter is carried on among themſelves under a great ſhow of friendſhip, for if one wants any thing another has, he goes freely to viſit him, and without any ceremony tells him what he wants, though he never had an acquaintance with him; and the other is obliged, according to the cuſtom of the country, to give him whatever he has occaſion for; but he afterwards returns the viſit, and telling what he deſires, is alſo immediately ſupplied.

They keep no account of their age, though they can reckon as far as an hundred, but they count every thing with their fingers, and it is diverting to ſee them reckon above ten; for having counted the fingers of both hands they claſp them together, which ſignifies ten, then beginning with the toes they count twenty, after which they are confounded, and cry, "Where ſhall I take more."

They divide the year into ten diviſions, ſome of which are longer and others ſhorter; for they do not make this diviſion from the changes of the moon, but from ſome particular occurrences that annually return. The firſt diviſion is named the purifier of ſins, from holiday at that time, in which they perform ſome acts of purification. The ſecond is called, the breaker of hatchets, from the great froſt. The third, the beginning of heat. The fourth, the time of long days. The fifth, the preparing time. The ſixth, the red fiſh ſeaſon. The ſeventh, the white fiſh ſeaſon. The eighth, the Kaiko fiſh ſeaſon. The ninth, the great white fiſh ſeaſon. The tenth and laſt, the fall of the leaf. This laſt continues till the month of November, or of purification, and laſts almoſt three months. Theſe names, however, are only uſed by the inhabitants upon the river Kamtſchatka; for thoſe of the northern parts give them other names, which are different only on account of their different employments.

They commonly divide our year into two, calling the winter the year, and the ſummer another. The winter begins in November, and the ſummer in May. They do not diſtinguiſh the days by particular names, nor form them into weeks or months.

When eclipſes happen they carry fire out of their huts, and pray the luminary eclipſed to ſhine as formerly. They know only three conſtellations, the great bear, the pleiades, and the three ſtars in Orion. They have no writings, nor hieroglyphics to preſerve the memory of any remarkable events; ſo that all their knowledge depends on tradition, which ſoon becomes fabulous and uncertain with reſpect to what is paſt.

SECT. VIII.

Of the Method in which the Kamtſchadales make War. The Tax they pay to Ruſſia. The Ruſſian Forts erected in the Country, and the Manner in which the Coſſacks live at Kamtſchatka.

BEFORE the Kamtſchadales were conquered by the Ruſſians they did not appear to have the ambition of enlarging their territories, or increaſing their power, and yet the quarrels that aroſe between themſelves were ſo frequent, that a year ſeldom paſſed in which ſome village was not entirely ruined. The motives of theſe wars were unjuſt, and frequently trifling: they fought in order to take priſoners, that they might employ them, if males, in doing their laborious work; or, if females, make them either their wives or concubines. At other times neighbouring villages went to war for quarrels that happened among their children, or for neglecting to invite each other to their feaſts.

Yet they are ſuch cowards, that unleſs forced by neceſſity they never openly attack an enemy, which is the more extraordinary as no people ſeem to deſpiſe life more than they, or are more frequently guilty of ſelf-murder. In the night time they ſteal into the enemy's village, there being no watch to oppoſe them, and ſecuring the entrance of the huts, knock down all who come out, and bind them faſt. The males eſpecially, if they are of any conſequence, are treated with the utmoſt barbarity, as burning, cutting them to pieces, tearing out their intrails while alive, and hanging them by the feet. Soon after the conqueſt of Kamtſchatka, this was the fate of ſeveral Ruſſian Coſſacks; and theſe barbarities were exerciſed with rejoicing and triumph.

Theſe

These quarrels among themselves rendered it easy for the Cossacks to subdue them; for the natives on seeing them attack one village, were so far from assisting their countrymen, that they rejoiced at their destruction, without considering that they would soon suffer the same fate. They indeed destroyed more of the Cossacks by treachery than by arms; for on their coming to any village to demand the tribute, they were received in the most friendly manner, and the tribute not only paid them, but they had presents made them for receiving it. Thus having lulled them into a state of security, they either cut their throats in the night, or set fire to the huts of their neighbours, and burnt them with all the Cossacks that were with them. The Cossacks are now upon their guard, and are particularly afraid of extraordinary caresses, and always expect some treacherous design when the women in the night-time leave their huts.

Whenever they hear that troops are marching against them, instead of meeting their enemies, they retire to some eminence, which they fortify as strongly as possible, and building huts there, wait till they are attacked. They then bravely defend themselves with their bows and arrows, and every other method in their power; but if they find the enemy is likely to make themselves masters of the fortress, they first cut the throats of their wives and children, and then either throw themselves down a precipice, or, with their arms in their hands, rush upon their enemies, and sell their lives as dear as possible.

Their arms are bows and arrows, spears, and, what may be called, a coat of mail: their quivers are made of the wood of the larch-tre, on which is glewed birch bark; their bow-strings are the blood-vessels of the whale, and their arrows, which are about four feet long, are all poisoned, so that whoever is wounded by them usually dies in twenty-four hours, there being no other remedy but sucking out the poison; and their coats of mail are made of mats, or the skins of sea-horses and seals, cut into thongs, and platted together. They put them upon the left side, and tie them with thongs upon the right; behind they fix a high board to defend their head, and another before as a breast-plate.

The taxes they pay to Russia consist of only one skin of such creatures as every man is used to hunt, such as sables, foxes, and sea-beavers; and justice, except in criminal cases, is administered by their own chiefs.

There are five Russian forts in Kamtschatka; these we shall particularly mention; only we shall first observe, that a werst is somewhat less than three quarters of an English mile. The Bolscheretskoi fort stands on the northern bank of the great river, thirty-three werests from the Penschinska sea. This fort is seventy feet square, and is fortified on the east and north sides with pallisadoes, as is the south and west with different buildings. Beyond the fort is a church consecrated to St. Nicholas, with a belfrey erected upon pillars. It contains about thirty houses, one public house for selling brandy, and a distillery. It is defended by forty-five Cossacks.

The upper fort of Kamtschatka stands upon the left bank of the river of the same name, two hundred and forty-two werests from the Bolscheretskoi fort. This building is seventeen fathoms square; the gate fronts the river, and over it is a warehouse. Within the fort are two magazines, the office for receiving the taxes, and a room for keeping the hostages. On the outside is also a church consecrated to St. Nicholas, the commissary's house, a distillery, and twenty-two private houses for the accommodation of the garrison, which consists of fifty-six Cossacks.

The lower Kamtschatka fort is three hundred and ninety-seven werests distant from the former, and is situated upon the same side of the river, about thirty werests from its mouth. This fort is a parallelogram made with pallisades: it is forty fathoms broad, and forty-two long. Within it is a church dedicated to the Virgin Mary, the office and magazine for the taxes and stores, and a commissary's house, all built of larch wood. Without the fort are twenty-nine private houses, a public house, distillery, and ninety-two male inhabitants. Game is here in such plenty, that the poorest Cossack seldom dines without a swan, goose, or duck.

The fourth fort is built upon the bay of Awatscha; its greatest beauty is its church, which is well built in a fine situation.

The fifth fort is erected upon the river Teghil, and is garrisoned with thirty-seven male inhabitans; but we have no account of its form.

The Cossacks who are at Kamtschatka, live much in the same manner as the natives; they feed like them upon fish and roots, and their employments are nearly the same. The only difference seems to be, that the Cossacks live in houses, and the natives in huts under ground. The Cossacks generally eat their fish boiled, and the natives mostly dry. As it is impossible for people to live there without the help of women; who are very necessary to clean their fish, dry their roots, and to make their cloaths, and as the Cossacks first settled there without their wives, it will be proper to observe by what methods they procured them. The Cossacks did not reduce these people without meeting with opposition, and in their wars with the natives they took many women and children, as well as men prisoners, and obliged them to perform all the labour. The care of overlooking these servants was intrusted to those whom they made their concubines, whom they frequently married if they had any children by them; and sometimes the natives offered them their daughters, whom they promised to marry as soon as a priest arrived. Thus it sometimes happened, that the Cossacks had a marriage and a christening at the same time; for there was only one priest in Kamtschatka, who once in a year or two visited the settlements.

The Cossacks, who are themselves extremely rude, were well pleased with this manner of life, and obliged their slaves to furnish them with sables and other furs in abundance, while they spent most of their time in playing at cards. Before there were any brandy shops, they used to meet in the office where the tax was received; there the gamesters brought their furs, and when they had none they brought their slaves, and sometimes played till they had lost both them and all their cloaths. This way of life was attended with great confusion; for the poor slaves were sometimes obliged to change their masters twenty times a day.

The goods demanded in Kamtschatka, besides the natural produce of Russia, are many sorts of European goods, as coarse cloaths of various colours, serges, linen, silk and cotton handkerchiefs, red wine, tobacco, some sugar, and several toys: from the other parts of Siberia unwrought iron, knives, hatchets, saws, and fire-steels; also wax, hemp-yarn for nets, tanned deer-skins, coarse Russian cloth and linen: from Bokaria and the country of the Kalmucks several sorts of cotton stuffs: from China silk and cotton stuffs, coral, tobacco, and needles, which are preferred to those brought from Russia: from the Koreki they buy great quantities of rein-deer skins, both dressed and undressed, which they can always sell in what quantities they please. The goods brought from Kamtschatka consist of furs, as foxes, sables, sea-beavers, and a few otter-skins. As there was formerly no money in the country, they gave furs in exchange for what they wanted; and now they have money, the price is fixed by the skins, reckoning a good fox skin at a ruble. The produce of Kamtschatka, on being carried from thence, pay ten per cent duty, and the sables twelve.

SECT. IX.

Of the KURILES.

Their Persons, Dress, Customs, and Manners; their Hospitality to Strangers; their Method of catching Foxes and Beavers; a ridiculous Way of punishing Adulterers; their Religion and Treatment of their Idols.

THE Kuriles, who inhabit the southern point of the peninsula of Kamtschatka, from their form and external appearance, seem a very different people from tha Kamtschadales. They are small of stature, have black hair, a round visage, and are somewhat swarthy; but have better features than any of their neighbours. Their beards are thick, and their whole body is pretty hairy, in which respect they differ from the other inhabitants of Kamtschatka. The men shave their heads as far back as the crown; but behind allow their hair to grow to its full length: a custom they probably borrowed from the Japa-

neſe, with whom they have ſome commerce. The women cut only the hair over their forehead, that it may not hang over their eyes. The men have their lips blackened about the middle; but thoſe of the women are entirely black: their arms are alſo ſtained with different figures as high as the elbows: this is a cuſtom they have in common with the Tchukotſkoi and Tunguſi. Thoſe of both ſexes wear ſilver ear-rings, which they obtain from the Japaneſe.

Their cloaths are made of the ſkins of foxes, ſea-fowls, ſea-beavers, and other amphibious animals, and are commonly formed of the ſkins of very different creatures, ſo that a whole ſuit is ſeldom ſeen of the ſame ſort of ſkins. The faſhion has a nearer reſemblance to that of the Tunguſi, than to that of the Kamtſchadales. But though they pay ſo little regard to uniformity of dreſs in the cloathing of their native country, they are very fond of acquiring ſuch as are made of ſilk, cloth, or ſerge, particularly thoſe of a ſcarlet colour; yet when they have them they will wear them when about their dirtieſt work.

Their huts reſemble thoſe of the Kamtſchadales, but they generally keep them cleaner, and cover the walls and floor with mats. Their principal food conſiſts in amphibious animals, and they eat very little fiſh. During the ſummer, inſtead of travelling by land, they coaſt the country, or ſail up the rivers in boats; and in the winter travel with ſnow ſhoes. In the ſummer the women attend their huſbands in hunting; and in the winter they are buſied in ſewing, while their huſbands are employed in killing the amphibious animals that approach the ſhore.

Theſe people are more civilized than thoſe of the neighbouring nations; for they are perfectly honeſt and peaceable: they have a ſoft and modeſt way of ſpeaking: the old they treat with reſpect, and behave with affection to each other, particularly to their relations. It is impoſſible to ſee without pleaſure the friendly and hoſpitable reception they give to their friends who come to viſit them from the Kuriliſki iſlands. Thoſe who come in boats, and thoſe that leave their huts to receive them, march with great ceremony in all their warlike accoutrements, ſhaking their ſpears and ſwords, and bending their bows as if going to engage an enemy. They thus dance up to each other till they meet, and then embrace, claſping each other in their arms, and ſhedding tears of joy. The people of the huts then conduct their viſitors to their habitation, where, ſtanding around them, they hear them relate all the adventures of their voyage. The eldeſt man has the honour of making this relation, and he informs them of every thing that has happened ſince their laſt meeting; how they lived, how they were employed, where they travelled, what good or ill fortune they have experienced, and the like. This relation ſometimes continues three hours; and, when he has ended, the eldeſt of thoſe who are viſited gives him alſo an account of all that has happened to them. Before he has done the reſt muſt not ſo much as ſpeak to each other, and then they either condole or join in congratulations, and finiſh the entertainment with eating, ſinging, dancing, and telling of ſtories.

The Kuriles catch foxes in a manner peculiar to themſelves: they have a net made of the hair of whales beards, compoſed of ſeveral rings; this being ſpread upon the ground, they bind a magpye to a ring in the middle, and round the neck draw a cord, the ends of which are held by a man concealed in a pit; who, when the fox ſprings upon the bird, draws the cord, and gathers the net together, which ſurrounds the fox as a drag-net does the fiſh. In order to catch bears, they faſten a ſnare upon a tree, and place behind it a proper bait; which the bear endeavouring to ſeize, is held faſt by the head or paw. Another method is to lay a board driven full of iron hooks in the bear's track, near which they place ſomething that eaſily falls. This frightening the bear, he runs with greater force on the board; when finding one of his fore-paws wounded and ſeized by the hook, he endeavours to free himſelf by beating the board with the other; and thus both being fixed, he reſts on his hinder-legs, which cauſes the board to riſe before his eyes, and ſo perplexes him, that, growing furious, he beats himſelf to death.

The Kuriles differ but little from the other Kamtſchadales in their courtſhips, marriages, and the education of their children. Though they have two or three wives, they never publickly ſleep with any of them; but ſteal to them privately in the night. They have a very extraordinary and ridiculous method of puniſhing adultery. The huſband challenges the adulterer to accept of a match at beating, which is thus performed: when they meet they both ſtrip naked, and the injured challenger gives the other a club about three feet long, and near as thick as a man's arm; and then the challenger is obliged to receive three ſtrokes upon his back from the adulterer, who then returns him the club, and is treated in the ſame manner. This they perform three times, and it is generally followed with the death of both; but it is eſteemed as great a diſhonour to refuſe this way of fighting, as it is in Europe to refuſe complying with a challenge: but if the adulterer prefers his ſafety to his honour, he muſt pay the huſband whatever he demands, either in proviſions, cloaths, ſkins, or the like.

Theſe people are as ignorant of the Deity as the Kamtſchadales. They have idols in their huts made of chips or ſhavings, curiouſly curled. They call them Ingool, and are ſaid to pay them a kind of veneration; but whether as good or evil ſpirits is not known. To them they ſacrifice the firſt animal they catch, but they eat the fleſh themſelves, and hang up the ſkin before the image. When they change their huts they leave the ſkin and the idol behind; but if they make any dangerous voyage, they take the idol with them; and, in caſe of imminent danger, throw their god into the ſea, in order to pacify the ſtorm: yet in all their excurſions think themſelves ſafe while they have this protector with them.

The women are ſaid to have harder labours than thoſe of the Kamtſchadales; and, if they have twins, one of the unhappy infants is doomed to death. Self-murder is as frequent here as among the Kamtſchadales. Such perſons as die in ſummer are interred in the earth, but in the winter they are buried in the ſnow.

SECT. X.

Of the KOREKI *and* TCHUKOTSKOI, *or* TCHUKTCHI.

THE Koreki are divided into the Rein-deer, or Wandering Koreki, and thoſe that are ſettled in one place, who live in huts in the earth like the Kamtſchadales, whom almoſt in every other reſpect they alſo imitate.

The Fixed Koreki inhabit the coaſt of the Eaſtern Ocean, from the river Ukoi as far as the Anadir, and along the coaſt of the ſea of Penſchina, round the Penſchina-bay to the ridge of a mountain called Naktchatmnin, out of which riſes the river Nuktchan.

The Koreki are from theſe rivers diſtinguiſhed by different names. The Wandering Koreki remove to the weſt with their herds from the Eaſtern Ocean to the head of the rivers Penſchina and Omolona; they ramble towards the north as far as the Anadir, and ſouthward to the rivers Leſnaya and Karaga. They ſometimes approach very near to Kamtſchatka; but this never happens, except they are in fear of being moleſted by the Tchukotſkoi, who are their moſt dangerous neighbours. The people they border upon are the Kamtſchadales, the Tchukotſkoi, the Ukageri, and the Tunguſi or Lamuti.

The Koreki differ not only in their behaviour from one another, but alſo in the form of their bodies. The Wandering Koreki are low of ſtature, and very lean; they have ſmall heads, and black hair, which they ſhave every day; their face is oval, their eyes ſmall, and ſhaded with hanging eye-brows; they have a ſhort noſe, a wide mouth, and a black and pointed beard, which they frequently pluck. The Fixed Koreki are ſomewhat taller and thicker than the former, eſpecially thoſe that live towards the north, who reſemble the Kamtſchadales and Tchukotſkoi.

Beſides, there is a great difference in their habits and cuſtoms. The Wandering Koreki are extremely jealous, and often kill their wives upon ſuſpicion only; but when any are caught in adultery, both parties are condemned to death. On this account the women ſeem to ſtrive to render themſelves diſagreeable; for they never waſh their hands and faces, nor comb their heads; and their upper garments are ragged, dirty, and torn, the beſt being worn underneath. This proceeds from the jealouſy of their huſbands, who aſſert, that a woman has no need

to adorn herſelf, unleſs ſhe intends to gain the affections of ſtrangers; for her huſband will love her without it.

But the Fixed Koreki conſider it as the moſt certain mark of friendſhip when they entertain a friend, to put him to bed to his wife or daughter; and his refuſal to comply would be conſidered as ſuch an affront, that they are capable of murdering a man for it. The wives of the Fixed Koreki therefore adorn themſelves as much as they can, by painting their faces, wearing good cloaths, and endeavouring to ſet off their perſons. They even ſit naked in their huts in the company of ſtrangers. The whole nation is rude, paſſionate, revengeful, and cruel; and the Wandering Koreki are equally proud and vain: they think no people upon earth ſo happy as themſelves, and conſider all the accounts given by ſtrangers of other countries as entirely fabulous; for, ſay they, "If you enjoy "theſe advantages at home, why did you take the trouble "of coming to us? You ſeem to want many things which "we poſſeſs; while we are ſatisfied with what we enjoy, "and never come to ſeek any thing from you."

The pride of the Wandering Koreki appears owing to the reſpectful awe with which they are treated by the Fixed Koreki, who are never known to do them the leaſt injury: this can only be attributed to the reſpect which the poor generally pay to the rich. Hence the Rein-deer Koreki call the others their ſlaves, and treat them accordingly, though they are much their ſuperiors in number; but, at the ſame time, are ſo afraid of the Tchukotſkoi, that fifty of the Rein-deer Koreki would fly before twenty of them; and were it not for the protection of the Coſſacks, the Tchukotſkoi would have extirpated the whole nation.

The Koreki live in ſuch places as abound with moſs for their rein-deer, without concerning themſelves about the ſcarcity of wood or water; for during the winter they uſe melted ſnow, and for firing, moſs or graſs. Their way of life, eſpecially in that ſeaſon, is even more diſagreeable than that of the Kamtſchadales; for as they are frequently obliged to change their habitations, the huts to which they remove are frozen; and on their attempting to thaw them with fires made of green ſhrubs or graſs, there ariſes a ſmoke that is extremely pernicious to the eyes. Their huts reſemble thoſe formed by other wandering nations: in the winter they are covered with raw deer-ſkins, and in the ſummer with thoſe that are tanned. They have no floorings or partitions, but only four ſtakes in the middle, between which is their hearth: to theſe they generally tie their dogs, which frequently drag the meat out of their kettles while it is dreſſing. Indeed, a man muſt be very hungry before he can eat with them; for, inſtead of waſhing their kettles or platters, they are ſatisfied with their dogs licking them; and the very fleſh they tear out of the mouths of theſe dogs, they, without waſhing, throw again into the kettle.

The Tchukotſkoi, or Tchuktchi, live upon the banks of the river Anadir, and extend along the ſhore to the north and north-eaſt as far the Cape of Tchukotſkoi, which, according to the Ruſſian maps, is in ſeventy-four degrees north latitude, where the ſea turns to the weſt; one ſide of that promontory being waſhed by the Eaſtern Ocean, and the other by the Frozen Sea. Thoſe who dwell on that promontory keep tame rein-deer, and frequently change their habitations between the rocks, while thoſe who have no rein-deer dwell on the banks of the ſea, where the ſea-horſes uſually come on ſhore; theſe laſt live by hunting wild rein-deer, and on the fleſh and fat of the whales, ſea-horſes, and ſeals, feeding alſo on roots and herbs. The Tchukotſkoi who live to the north of the Anadir, are not ſubject to Ruſſia; but frequently make incurſions upon thoſe that are, killing and making them priſoners, and driving off their herds of deer. During the ſummer they fiſh not only in the ſeas near the mouth of the Anadir, but even come a great way up the river, when thoſe ſubject to Ruſſia frequently fall into their hands.

When a ſtranger comes to viſit theſe northern Tchukotſkoi, whether he be of their own nation, or of any other, they at the firſt ſalutation offer him their wives and daughters for his bed-fellows; but if they are too diſagreeable or too old for the gueſt, they bring him ſome from among their neighbours; and the woman he chooſes preſents him a baſon of her own urine, made in his preſence, with which he is obliged, in point of honour, to rinſe his mouth; but if he refuſes the offer, they eſteem him their enemy; and, from his accepting it, conclude him their ſincere friend. This circumſtance, ſo contrary to the cuſtoms of all nations, is mentioned by the Ruſſians who have been amongſt the Tchukotſkoi, and was confirmed by the Tchukotſkoi themſelves at Anadirſk.

The winter-huts of the Tchukotſkoi are much warmer and more ſpacious than thoſe of the Koreki. In the ſame huts live ſeveral families, that have their ſeparate benches covered with deer-ſkins, on which they ſit or ſleep. Upon each bench a lamp of fiſh-oil, with a wick of moſs, burns day and night. On the top they have an opening that ſerves for a chimney; and they are ſo warm, that in the coldeſt places the women ſit naked; but they are almoſt as ſmokey as thoſe of the Koreki.

Their cloaths are made of the ſkins of rein-deer, in the ſame manner as thoſe of the Kamtſchadales. The rein-deer are ſo extremely numerous, that ſome of the rich have ten or twenty thouſand; and yet are ſo penurious, that they are loth to kill them for their own uſe, and are contented with eating ſuch as die of themſelves, or are killed by the wolves, which frequently happens. However, for a particular friend, they will kill one of their own herd.

They never milk the rein-deer, nor do they know the uſe of milk; they eat their fleſh boiled, and what is not immediately conſumed they dry with the ſmoke in their huts. They eat every other animal, except dogs and foxes; and in general eat neither herbs, roots, or the bark of trees, though the poor feed on them in times of great ſcarcity. They eat berries only freſh in the ſummer, and ſave none of them for the winter. Mr. Kraſheninicoff obſerves, that he ſaw one of their chiefs greatly ſurpriſed at the firſt ſight of ſugar, which he took for ſalt; but taſting it, was ſo pleaſed with its ſweetneſs, that he begged ſome pieces to carry to his wives; but being unable to reſiſt the temptation of ſo delicious a rarity, he eat it all up by the way, and when he came home, told them he had taſted ſalt ſweeter than any thing he had ever known; they would not believe him, and inſiſted, that nothing could be ſweeter than cranberries with deers fat and lilly roots.

The Koreki are entirely ignorant of all the rules of civility; they not only make no compliments, but treat ſtrangers with an air of ſuperiority. However, when they entertain their gueſts, they give them what they have in ſufficient plenty, without obliging them to over-eat themſelves. Their favourite food is fat meat; for all theſe ſavage nations are exceſſively fond of fat. The Tchukotſkoi would loſe an eye for a fat dog, and the Jakutſki for a piece of fat horſe-fleſh. The latter know that the ſtealing of cattle is puniſhed with the loſs of all their goods, yet when an opportunity offers they cannot refrain from ſtealing a fat horſe, comforting themſelves amidſt their misfortunes, with their having once in their lives made a delicious meal.

In their marriages the rich are united to the rich, and the poor to the poor, with very little regard to perſonal charms, or any other accompliſhment. They generally marry into their own family, and with any relation, except their own mother or daughter. Tho' the bridegroom ſhould be ever ſo rich, he is obliged to ſerve five, or at leaſt three years for his bride; but during that time they are allowed to ſleep together, though the form of catching the bride is deferred till the marriage is celebrated, which is done without much ceremony. They have two or three wives, whom they keep at different places, giving them an herd of deer, and a perſon to look after them.

They are very fond of their children, whom they inure from their infancy to labour and œconomy. The old women give the children their names, on which occaſion they ſet up two rods, which they tie together with thread, and between them hang a ſtone, wrapt in a piece of ſheep-ſkin; they then aſk in a muttering voice the name they ſhall give, and mentioning thoſe of ſeveral of their relations, whatever name the ſtone ſhakes at, they give to the child. The child-bed woman never ſhows herſelf, nor leaves her hut for ten days; and if during that time they remove their habitations, ſhe is carried in a covered ſledge. The children ſuck till they are three years old, but have neither

neither cradle nor ſwadling cloaths. Their ſick are carefully attended, and their ſhamans or ſorcerers beat a little drum to drive away their diſtempers. Theſe are their phyſicians, though they are but little acquainted with the virtues of plants.

When a perſon is dead they erect a great pile of wood, and having dreſſed the deceaſed in his fineſt apparel, cauſe him to be drawn by the deer which they imagine were his favourites; then placing the body on the pile, throw upon it his ſpear, quiver, arrows, knives, hatchets, kettles, and other furniture. They then ſet fire to the pile, and while it is burning, kill the deer that drew the corpſe, and having feaſted upon it, throw the fragments into the flames. A year after the perſon's death all the relations aſſemble, and taking two young rein-deer that have never drawn a ſledge, and a number of horns, which during the whole year, they have collected for that purpoſe, they go to the place where the body was burned, if it be near, or if it be at a diſtance, to ſome other high place, where they kill the deer; and the ſhaman driving the horns into the earth, pretends that he ſends a herd of deer to the deceaſed. They then return home, and in order to purify themſelves, paſs between two rods fixed in the ground, while the ſhaman, beating them with another, intreats the dead not to carry them away.

The Koreki only ride on ſledges drawn by rein-deer during the winter, but never mount upon their backs in the ſummer, as it is ſaid the Tunguſi do. Their ſledges are about ſix feet long, and their ſides about four inches thick; but rather thinner at the fore part, where they are bent upwards. They yoke two deer before every ſledge. They have collars ſomething like thoſe of horſes, and alſo bridles and reins, with four little ſharp bones upon the deer's forehead, which are uſed as bits to pull them in; for theſe bones, piercing the ſkin, make them ſtop. They are only put on the head of the right-hand deer; for if he ſtops, the other cannot proceed. They drive them forward with a goad about four feet long, that has a ſharp bone at one end, and a hook at the other. They prick the deer with the bone to make him go forwards, and with the hook lift up the harneſs. The rein-deer run much ſwifter than the dogs, and will go one hundred and fifty verſts, or near a hundred miles a day; but care muſt be taken to feed them frequently. They geld ſome of the males, by piercing the ſpermatic veſſels, and tying them with thongs. The Settled Koreki have very few rein-deer; and theſe are only uſed for drawing; but the Tchukotſkoi have great herds, and yet generally feed upon fiſh and amphibious animals.

The religion of the Koreki is as abſurd as that of the Kamtſchadales: they ſeem to have a great reſpect for evil ſpirits, which they ſuppoſe inhabit the fields and woods: but this reſpect ſeems entirely owing to fear. They have no regular times of worſhip, but whenever they pleaſe, kill either a rein-deer or a dog, and fixing its head upon a ſtake, turn its face towards the eaſt, crying, "This is "for you; and may you ſend us ſomething that is good;" after which they immediately retire. When they are going to paſs a river or deſart, which they imagine is inhabited by evil ſpirits, they kill one of their deer, and eating the fleſh, faſten the bones of the head upon a pole.

Before they became ſubject to the Ruſſian empire, they had no magiſtrates, only the rich had ſome authority over the poor, nor had they then the form of an oath. At preſent, inſtead of ſwearing upon the goſpel, the Coſſacks oblige them to hold a muſquet by the barrel, threatening that whoever does not obſerve this oath, will be ſhot by a ball; which they are ſo much afraid of, that rather than run the riſk of being thus killed for perjury, they will, if guilty, confeſs their crime.

Their other cuſtoms reſemble thoſe of the Kamtſchadales.

Before we leave the coaſt of the eaſtern ocean, we ought not to omit obſerving, that from the late diſcoveries of the Ruſſians, it appears that the continent of America is ſcarce more than two degrees and a half from the cape of Tchukotſkoi, from which, and the neighbouring ſhore of Aſia, it ſeems to have been once ſeparated by an earthquake. The American continent is there known from fifty-two to ſixty degrees north latitude. It enjoys a much better climate than the coaſt in the ſame latitude on the north-eaſt ſide of America; for at ſixty degrees the ſhore is covered with wood.

But it is not for us to dwell here on this new diſcovered land; our province is at preſent Aſia: we ſhall therefore leave a farther account of this country, till we have almoſt encompaſſed the globe. Mean time thoſe who are impatient to learn a farther account of this part of America, with reſpect to the land, the animals, and the inhabitants, may obtain ſatisfaction by having recourſe to a very judicious and entertaining work lately publiſhed, entitled, The Hiſtory of Kamtſchatka, and the Kurilſki iſlands, with the countries adjacent; publiſhed in the Ruſſian language by order of her Imperial Majeſty, and tranſlated into Engliſh by James Grieve, M.D.

SECT. XI.

Of the TUNGUSI.

Their different Tribes, as the Sabatſchi Tunguſi, the Oleni Tunguſi, and the Konni Tunguſi. Their Dreſs and Manner of Life.

THE Tunguſi are a moſt numerous pagan nation diſperſed in different tribes through very diſtant parts of Siberia, and are ſuppoſed to amount to ſeven or eight thouſand men; they are diſtinguiſhed into the Konni Tunguſi, or thoſe that make uſe of horſes for riding, and draught; the Oleni Tunguſi, or thoſe who uſe rein-deer for thoſe purpoſes; and the Sabatſchi Tunguſi, or thoſe who uſe dogs.

Theſe tribes are eaſily perceived not only to ſpring from the ſame ſtock, but to be of the old Scythian or Tartaric extraction, ſince they ſeem to retain much of the ſame cuſtoms and inclinations; but they are taller and of more bravery and antiquity than moſt of the other Siberians. Among the Sabatſchi Tunguſi, who live between the Lena and the Penſchinſka ſea, both the men and women go naked in ſummer, wearing only a piece of a ſkin about a ſpan broad round the waiſt; but in cold weather they are cloathed with the ſkins of rein-deer with the hair outward, and their ſtockings, breeches, and coat, are all of a piece, but the cap is generally made of ſome other fur, according to the fancy of the wearer.

In ſummer they live on fiſh, and in winter on the game they kill; for they breed up no other cattle but dogs and rein-deer.

They acknowledge a Supreme Being, but pay their adorations only to ſome ill-ſhaped wooden idols of their own making. They hang their dead upon trees till the fleſh is rotted off, or devoured by birds, and then bury their bones. The men and women of diſtinction are known by black ſpots made on their faces and hands, which they are accuſtomed to conſider as a ſingular ornament.

The Oleni Tunguſi, who dwell near the ſprings of the Lena and Aldan, north of that of the Sagalian-ula, or the Amur, live much after the ſame manner; but beſides the game and fiſh they catch, they live upon the milk of their cattle, which they breed up in great numbers, and ſometimes feaſt on their fleſh, as well as cloath themſelves with the ſkins. Theſe are eſteemed ſomewhat leſs barbarous than the reſt. Inſtead of bread they uſe onions, and the roots of yellow lilies, which, when dry, they either make into a kind of meal, or boil up into a pap, as they fancy beſt. They have a ſtrange way of adminiſtering oaths to each other, which is thus performed. He that gives the oath ſtabs a dog in the belly, and holds the wound to the man who ſwears, and who ſucks the blood as a proof of his veracity; for they imagine he would immediately burſt if he ſwore falſely. Their chief weapons are the broad ſword, cutlaſs, and hatchet, the firſt of which hath lately been brought among them.

A ſmall canton of the Oleni Tunguſi is under the dominion of the emperor of China; but all the reſt are ſubject to the Czarina, and annually pay their quota of furs.

The Konni Tunguſi, who are ſituated between the lake Baykal and the city of Newzinſkoi along the river Amur, are commonly very ſtrong and courageous, nimble and active, and as they generally go armed, they are trained up to uſe their weapons, as well on horſeback as on foot. Both men and women ride a horſe with great dexterity.

SECT. XII.

Of the JAKUTI *or* JAKUTZK.

Of its Situation, Climate, and Produce, with the Manners, Cuſtoms and Religion of the Natives.

THE province of Jakuti or Jakutzk lies to the north. The cold here, and in the other northern parts of Siberia, exceeds that of almoſt every other country upon earth; but Providence has kindly dealt out to the inhabitants wood for fuel, and furrs which they uſe to preſerve them againſt the ſeverity of the weather. Even ice itſelf is converted into a fence againſt the cold; for in the northern parts, particularly at Jakutzk, it is uſual to hew a piece of tranſparent ice, of the ſize of the hole, which ſerves the peaſants for a window; and having placed it on the outſide, they ſprinkle a little water at the edges, which immediately freezes, and cements the ice in the hole. This ice window keeps out the wind and cold, without much diminiſhing the light. Thoſe who have alſo glaſs windows, place them on the inſide of the hole, that they may not be incommoded with the moiſt effluvia of the ice; but the common people do not regard this. Theſe ſevere winters are ſucceeded by warm and delightful ſummers, when the heat is ſo intenſe, that the Tunguſians, who inhabit the province of Jakutzk, go almoſt naked. Here is hardly any night during that ſeaſon, and towards the Frozen Ocean, the ſun continually appears above the horizon. The vegetables and fruits of the earth are here extremely quick in their growth. Thunder is ſeldom heard near the Ice Sea, though the ſouth part of Siberia is ſubject to dreadful tempeſts. In the moſt northern parts of Siberia, beyond the ſixtieth degree of latitude, neither corn nor fruit grows, but they are ſupplied with corn from the ſouthern, where the fertility of the ſoil is ſurprizing. Their want of fruit is richly compenſated by the great plenty of tame and wild beaſts, and fowls, and the vaſt variety of fine fiſh.

Jakutzk produces ſome corn, but the inhabitants being more intent upon hunting ſables, foxes, and other animals, for the ſake of their furs, neglect cultivating the earth. Though the little corn ſown in the country ſoon ripens, the ſtraw never exceeds ſix inches in height; for the corn no ſooner peeps out of the ground, than it ſhoots into ears, and ripens in ſix weeks time: the reaſon of which is, that the ſun is here in ſummer hardly ever below the horizon, but cheriſhes the earth by its warmth both night and day. It is worthy of remark, that during this whole time it never rains, and that the earth never thaws above nine inches deep. Thus the roots are plentifully ſupplied with moiſture from below, while the conſtant heat of the ſun above invigorates what is above the ground.

There are here pretty large horſes, which being turned out all the winter long, ſcrape the ſnow aſide with their hoofs to come at the graſs. They alſo eat the buds of the birch and aſpen tree, and growing ſleek, plump, and fat, during the ſeverity of winter, they appear much handſomer than in ſummer, when their hair grows long.

The city of Jakutzk is the capital of the province, and is ſituated on the river Lena, above four hundred miles from the Frozen Sea, and is the reſidence of the governor-general.

Theſe people compoſe one of the moſt numerous pagan nations in Siberia, and conſiſt of ten tribes, all of which amount to about thirty thouſand men taxed by the Ruſſians. The natives offer ſacrifices to the inviſible God of heaven, yet have a wretched type or image of him ſtuffed out with a monſtrous head, eyes of coral, and a body like a bag. This image they hang upon a tree, and ſurround it with the furs of ſables and other animals. Each tribe has one of theſe images; and they have all many ſuperſtitious cuſtoms in relation to particular trees, which they conſider as ſacred; and when they meet with a very fine one, hang upon it pieces of iron, braſs, and copper. While they are performing their ſuperſtitious rites, their bihuns or prieſts wear a garment adorned with bits of iron, rattles and bells.

The fields no ſooner begin to be covered with verdure, than each tribe aſſembles at a place where there is a fine tree, and a pleaſant ſpot of ground, and there they ſacrifice horſes and oxen as a new year's offering, and ſtick up the heads round the tree. Then taking a certain liquor, which they call cumiſes, they ſit down in a circle, and having drank to each other, dip a bruſh in the liquor, and ſprinkle ſome in the air, and ſome into the fire, which they light upon that occaſion. At this feſtival they get intolerably drunk, and gorge themſelves to exceſs.

They eat the fleſh of cows and horſes, but no pork, though ever ſo hungry; yet they never regard whether the cattle be ſick or ſound. They are extremely naſty; the veſſels in which they ſtamp their dried fiſh, roots and berries, are made of cows dung dried; and the cattle ſtand in the ſame hut where they themſelves dwell. They are fond of ſmoking tobacco, which they procure from the Ruſſians in exchange for their furs. In February and March, when the ſap aiſes in the trees, they go into the woods, and cutting down young pines, taks off the inner bark, and carrying it home, dry it for their winter's proviſions; they then beat it to a fine powder, boil it in milk, and eat it with dried fiſh, which is alſo beat to powder.

Their winter huts are ſquare, and made of thin planks and beams, the roof is covered with earth, and a hole as uſual is left in the top to let out the ſmoke. Their ſummer dwellings, which are round, and in the ſhape of a ſugar-loaf, are covered on the outſide with the bark of birch-trees, curiouſly joined and embroidered with horſe-hair of many colours. A hole is alſo left at the top for the paſſage of the ſmoke; and the fire is made in the midſt of the hut, where they fix a hook to hang their pots on; theſe they make themſelves, as they do alſo their kettles.

They have different ways of diſpoſing of their dead: perſons of diſtinction ſometimes pitch upon a pine-tree, and declare they will be buried under it; and when the corpſe is interred, ſome of the beſt moveables that belonged to the deceaſed are put along with him into the grave. Some only place the corpſe upon a board, which they fix in the wood upon four poſts; then covering the body with a horſe's or an aſs's hide, leave it. But moſt of them when they die are left in their huts, and their relations, taking the moſt valuable things, cloſe up the door, and remove to another hut.

Among theſe people each tribe looks upon ſome particular creature as ſacred; for inſtance, a ſwan, a gooſe, or a raven; and theſe are not eaten by that tribe, though the others may eat it without offence.

SECT. XIII.

Of the Bratſki, the Kamſki, the Barabinſki, and the Mahometan Nations on the Banks of the Irtiſch; with a particular Account of the Oſtiacs, their Manners, Cuſtoms, Religion, and Form of an Oath.

NEAR the lake of Baikal are the Bratſki Tartars, ſome of whom enjoy great affluence; for it is not unuſual there for a private man to have four or five hundred horſes, and a proportionable number of other cattle. They live chiefly on veniſon, but eſteem horſe-fleſh a much greater dainty. They drink mare's milk, and alſo a ſtrong ſpirit which they diſtil from it. They apply themſelves to agriculture and trades, and many of them are expert mechanics. They purchaſe their wives with their cattle, and often give an hundred horſes or oxen for a virgin whom they admire. They worſhip an idol formed of the ſkins of beaſts, and hung up in their huts.

Somewhat farther to the weſt live the Kamſki Tartars in huts covered with bark. They are pagans, and their food is fiſh and veniſon, which they eat raw as well as dreſſed, and roots ſerve them inſtead of bread.

Farther to the weſt is the great deſart of Baraba, in which the Barabinſki live during the winter, which they employ in hunting of ſables; but in ſummer they remove to the banks of the rivers, where they employ themſelves in fiſhing. They are pagans, and ſeem to live very wretched lives. Their houſes are low in the ground, and their roofs, which riſe about three feet above the ſurface, are covered with ruſhes or ſkins. The deſart affording no water, they drink melted ſnow, and eat dried fiſh and barley-meal. They ſcarce know the uſe of money;

money; but for a little tobacco a man may purchaſe any thing they have. They, like the reſt of the Siberians, wear coats, caps, and ſtockings made of pieces of fur ſewed together.

Along the river Irtiſch live a Mahometan nation that is wealthy in cattle, the people having numerous herds and flocks. Their habit reſembles that of the ancient Ruſſians, and the women wear rings in their noſtrils. Their principal food is veniſon, dried fiſh, and barley-meal, which they make into a paſte, and eat much in the ſame manner as ſome of the Indians do their rice. Like moſt of the Tartars they drink mare's milk, and ſometimes tea, which they mix with flour and butter. At great entertainments they generally dreſs a young horſe, and drink a liquor called braga, diſtilled from oat-meal and mare's milk, with which they often get drunk. They pay a tribute to Moſcovy of ſables, fox-ſkins, and other furs, notwithſtanding their having princes of their own.

Farther to the weſt are the Oſtiacks, who extend along the rivers Oby and Jeniſay, and on many of the rivers which fall into them: they employ themſelves in hunting and fiſhing. In ſummer they take and dry the fiſh which ſerves them in the winter; and when that ſeaſon begins, they go into the woods with their bows and arrows, their dogs and nets, to kill ſables, ermines, bears, rein-deer, elks, martens, and foxes. Part of theſe furs is paid as a tax to the empreſs, and the reſt are ſold at a ſtated price to the Ruſſian governors; but ſometimes they are allowed to diſpoſe of them to private perſons.

They chiefly live upon veniſon, wild-fowl, fiſh, and roots; for they have neither rice nor bread. They drink for the moſt part water; and it is ſaid they can diſpenſe with a draught of train-oil. They are immoderately fond of tobacco, and of ſwallowing the ſmoke, which ſoon intoxicates them. In the winter they build their huts in woods and foreſts, where they find the greateſt plenty of game, and dig deep in the earth to ſecure themſelves from the cold, laying a roof of bark or ruſhes over their huts, which are ſoon covered with ſnow. In ſummer they build above ground on the banks of the rivers, to enjoy the convenience of fiſhing, and make no difficulty of forſaking their habitations. The materials of their houſes conſiſt of little more than ſome green poles and the bark of trees, with the ſkins of wild beaſts for their beds.

As to their religion, they have ſome little brazen idols tolerably well caſt, repreſenting men and animals; but the reſt are ill made, every man being his own carver. They place them on the tops of hills, in groves, and in the pleaſanteſt places their country affords; yet they have no ſet time for performing religious worſhip, but apply to their gods for ſucceſs in all their undertakings. They have no regular prieſts, but every old man may devote himſelf to that ſervice, and the office is frequently performed by the maſters and heads of families. Strahlenberg obſerves, that when he was among them he ſaw one of their temples, which was built of wood in an oblong form like a great barn, covered at the top with birch-bark. At the end of the wall ſupporting the gable was a kind of altar made of timber, on which were placed two idols, repreſenting a man and woman dreſſed in all ſorts of rags; and round theſe were other ſmall figures, as deer, foxes, and hares; all which were roughly carved in wood, and alſo cloathed in rags. They did not appear to have much devotion, nor any great reverence for their idols. When they offer ſacrifices, they preſent the beaſt to the idol, and having bound it, an old man puts up the petitions of thoſe who brought the offering; he then lets fly an arrow at the beaſt, and the people aſſiſt in killing it. 'Tis then drawn three times round the idol, and the blood being received into a veſſel, they ſprinkle it on their houſes; they afterwards dreſs the fleſh and eat it, rejoicing and ſinging their country ſongs: they alſo beſmear the idol with the blood of the ſacrifice, and greaſe their mouths with the fat. What they cannot eat they carry home to their families, and make preſents of it to their neighbours; and they as often ſacrifice a fiſh as a beaſt. At the concluſion of the feaſt they ſhout, to ſhew their gratitude to the idol for his attending and accepting their devotions; for they are perſuaded, that the ſaint or hero repreſented by the image always attends their ſacrifices, and when they are over, returns to his abode in the air.

When the Oſtiacks take an oath of fidelity to the Ruſſian government, they uſe the following ceremony. Having laid down a bear-ſkin and an axe, and holding over it a piece of bread on a knife, they ſay, "In caſe I "do not to my life's end prove true and faithful to the "ſupreme government of the country; or if I knowingly "and willingly break through my allegiance, or be "wanting in the duty I owe to the ſaid ſupreme govern-"ment, may the bear tear me to pieces in the wood; "may the bread I eat ſtick in my throat, and choak me; "may the knife ſtab me, and the axe cut off my head." The like ceremony is uſed among them in the depoſition of a witneſs.

They purchaſe a wife of her relations for three or four rein-deer, and take as many as they pleaſe, returning them again if they do not like them, only loſing what they gave for the purchaſe. Upon the birth of their children ſome give them the name of the firſt creature they happen to ſee afterwards. Thus the child has frequently the name of an animal, and you hear a man call his ſon perhaps Sabatſki, or, my little dog; others call their children according to the order of their birth, as Firſt, Second, Third, &c.

SECT. XIV.

Of SAMOIEDA, *or* SAMOJEDA.

Their Perſons, Dreſs, and Houſes. Of their Love of their Country. Of their Sledges and Rein-deer; their Cuſtoms, Manners, and Religion.

ON the north-weſt part of Siberia is Samoieda, or Samojeda, a very extenſive province on the coaſt of the Frozen Sea. The natives, who are called Samoiedes, are ſhort, thick, broad ſhouldered, and of a tawny complexion: for it is obſerved, that, in this reſpect, a very hot and a very cold climate have the ſame effect upon the ſkin. They have long little eyes, broad flat faces, hanging lips, with high cheek-bones, and, in general, very diſagreeable countenances. Both the men and women have hair only on their head, and their nipple is as black as ebony. The hair of both the men and the women hangs at its full length, only that of the women is ſometimes braided, and little bright pieces of copper and ſlips of red cloth are tied at the ends. The men have little or no beard.

As to their dreſs, they wear fur caps, with waiſtcoats and buskins of the ſame; but the women have their cloaths ſometimes adorned with a red edging: their coats are made of the skins of rein-deer; and, during the winter, they have an upper coat of fur, which alſo ſerves for a cap and gloves, and almoſt hides the face; beſides theſe, they in winter-time wear boots. In making their cloaths they uſe thread made of the ſinews of animals.

In ſummer they live in houſes made in the form of a bee-hive, with a hole at the top; but in winter they have caves under ground, to which they retreat during the ſeverity of the weather, and are there confined eight or nine months in the year, amidſt the ſtench of their lamps, and the cloſeneſs and filth of theſe ſubterraneous dwellings. Yet the love of ſociety, during this long ceſſation from labour, induces them to make ways under ground to the habitations of their neighbours, that they may ſee and viſit each other during theſe months of feſtivity and pleaſure; which to them have ſuch delights, that Olearius ſays, two of their deputies ſent to the court of Moſcow told him, that if the Czar knew but the charms of their climate and country, he would doubtleſs chuſe to go and live among them. They confeſſed themſelves tired of the hurry and vain glitter of the court, and impatient to return to their dear native ſoil. Thus has Providence wiſely implanted in the human mind this love of the land where man firſt drew his breath, and was reared from infancy to active life; to ſweeten the rigours of every climate, and diſpenſe happineſs in plenteous ſtreams to thoſe human beings, whom we, fond too of our native ſoil, are apt to eſteem miſerable.

The Samoiedes live upon the fleſh of horſes, oxen, ſheep, deer, and fiſh; but think it has the beſt reliſh when it begins to grow tainted. Hence the horſe-fleſh and other

other meat which hang round the inside of their huts render them extremely offensive to any one not used to them. They are said to prefer the entrails of an animal to any other part; and use at their meals neither bread, rice, nor salt.

They travel in sledges drawn by a pair of rein-deer, or dogs. The sledges are about eight feet long, three or four broad, and turn up before like scates. The driver sits cross-legged, with his staff in his hand, with which he pushes and drives the rein-deer, which run with greater swiftness than a horse, holding up their heads so high that their horns touch their backs. It is said they never sweat; but when weary put out their tongues, and pant like dogs. They resemble our stags, but are stronger, and have shorter legs. Their colour is nearly white, and some of them are grey. They cast their horns every spring, and generally live about eight or nine years. The Samoiedes set nets for those that are wild, and hunt them in winter, when they are shod with wooden scates, with which they run over the snow with incredible swiftness. While they are hunting they have a kind of shovel in their hands, fastened to a long staff, and with this they throw snow at the rein-deer, to drive them towards the places where they have set their nets. These animals eat a kind of white moss, and though the snow lies a fathom deep, they will dig through to come at it.

The Samoides also catch the sea-dogs, which in March and April couple upon the ice. These people, covered with hair, and resembling brutes more than men, creep towards them with a large hook and line in their hands, and when they come within a proper distance throw the hook. When the sea-dog attempts to escape he commonly fastens himself upon it: but sometimes jumps into the sea with such force that he pulls the poor fisherman after him, the rope being fastened to his middle. They extract an oil from these animals, eat the flesh, and cloath themselves with the skin. They also sometimes kill rein-deer, by cloathing themselves with the skin of that beast, and creeping among them till they come within their reach, and then strike them with their darts. They purchase their wives of their relations for three or four rein-deer, in the same manner as the Ostiacs.

We learn from a gentleman, who travelled in this country, that on his asking one of the Samoiedes about their religion, he replied, that they believed there was a heaven and a God, whom they called heyha; that they were fully convinced that none were greater and more powerful than he; that all things depended on him; that he was our common father, and that good men would be happy after death. Yet they worship the sun, moon, and stars, with several kinds of beasts and birds, from whom they hope to receive benefits; they also worship images of the human form, but so ill carved and dressed, that it is difficult to discover what they represent.

They have priests among them, who pretend to magic, and to foretel future events. These they consult upon all occasions: as what success they shall have in hunting or fishing, or whether they shall recover from a fit of sickness. On their coming to inquire of him he works himself into a kind of phrenzy, and in this condition delivers his oracles.

To all these people missionaries have been sent, and many of them are said to have embraced the Christian religion, and to become members of the Greek church.

SECT. XV.

Of the principal Cities of Siberia, particularly Tomskoy, Pobem, Tobolski, the Capital, Catharineburg, Tiumen, Jeneseisk, and Irkatsk.

HAVING given a general account of the most considerable of those savage nations that inhabit this vast country, we shall now mention the principal cities that have not been treated of in that account.

Tomskoy, a strong frontier town, and the capital of a province of its own name, is situated in fifty-six degrees fifty minutes latitude, and in eighty-four degrees thirty-seven minutes east longitude from London, on the river Tora, just before it falls into the Oby, and contains above two thousand houses. On the highest part of the town stands the wooden castle defended by fourteen pieces of cannon, and in it are a cathedral built with wood, the government chancery, and an arsenal. The lower part of the town is the most populous, and is separated into two parts by the rivulet Ushaika. In that part which lies to the left, are a church, a monastery, and a nunnery; and in that part on the right, are three parish churches, and an exchange for merchants. There is also a church in the upper part of the town. The inhabitants carry on a considerable trade, it lying on the great road through all the eastern and northern parts of Siberia; and here are all kinds of tradesmen and artificers; but they are extremely indolent and slothful, owing to the cheapness of provisions and their propensity to drinking.

Narim, the capital of a territory of the same name, is situated in fifty-eight degrees fifty minutes north latitude, and is also seated on the Oby. It is a large and populous city, defended by a strong fortress, and a good garrison of Cossacks. The territory around it abounds with beavers, sables, foxes, and ermines. The banks of the Oby are near this place inhabited by the Ostiacks.

The fortress of Pobem, built by the Russians, is situated on a river that flows from the north into the Tobol, falling from a high mountain, near the coast of the Frozen Sea. The town is inhabited by Muscovites; the soil of the adjacent country being very fertile, and the woods affording a variety of wild beasts, such as wolves, foxes, sables, &c.

Tobolsk or Tobolski, the capital of all Siberia, and the residence of the governor-general, is seated in fifty-eight degrees north latitude, and sixty-seven degrees east longitude from London, on the river Irtis near the influx of the Tobel into that river. The city is divided into the Upper and Lower town. The Upper town stands very high on the east side of the Irtis, and the Lower on a plain between the hill and the river. Both towns taken together are of a very large circumference, but all the houses are built with wood. In the Upper town, which is properly called the city, stands the fort, which is built with stone, and contains the government court, the governor's house, the archbishop's palace, the exchange, and two of the principal churches, which are all stone buildings. The Upper town is inclosed with an earthen rampart, and has also three wooden churches, a convent, and a market; but the inhabitants are under the necessity of going down the hill for water. Besides large masses of earth fall from the hill almost every year, which obliges the inhabitants to rebuild the houses that stand near the declivity. The Lower town contains seven churches, and a convent built with stone, and has also a market. This city contains about 15,000 inhabitants. The Lower town is exposed to inundations, and there is a communication between that and the Upper town by three different ways.

The women of all ranks and ages paint, though they are in general very handsome, but have not that feminine softness which is the principal charm of the sex.

This city once carried on a considerable trade to China by caravans; but the mutual knavery of the Russian and Chinese merchants soon reduced it to a languishing state; and some differences that arose between the two powers have since entirely destroyed it.

Neiwianskoi, a town in the province of Tobolski, seated on the river Neiura, was built in the year 1701, at the expence of the crown, in order to superintend the iron-works in its neighbourhood. It consists of a wooden fort, and about eight hundred houses, most of which are built in direct lines, and form strait broad streets. Very curious and serviceable copper and brass utensils are made here.

Catherineburg, a regular town built in the German manner, is seated in the same province, 550 wersts from the city of Tobolski, and was begun in the year 1723 by Peter the First, and finished in 1726 by the Czarina Catherine his Consort, from whom it received its name. It stands on the river Isett, which runs through the middle of it, and is well fortified. All the houses were built at the expence of the government, and most of its inhabitants are officers belonging to the crown, the rest are artificers

tificers and head-miners, who have the care of the works. It conſiſts of about 450 houſes, beſides the ſuburbs without the walls, which are in part inhabited by exiled criminals, or others who voluntarily work at the fortifications or mines for daily pay. The public buildings of the town are a wooden church, a ſtone edifice for the publick offices, an exchange with ſhops, an arſenal, and a toll or cuſtom-houſe. Cartherineburg may be eſteemed the centre of all the Siberian mine-works belonging to the crown; hence the director of the Siberian mines reſides here, and iſſues his inſtructions to the other directors of the works, and paſſes their accounts. The water of the river Iſett is raiſed by a dam 98 fathoms long, three fathoms high, and twenty broad, in order to ſupply a great number of mills and other engines belonging to the mines. All the forges and works about the town, are kept in a good condition, and the miners and artificers work with extraordinary ſpirit and diligence. All kinds of proviſions are here ſold very cheap, and when any of the workmen fall ſick, great care is taken of them in the hoſpital, to which patients are alſo brought from the neighbouring works. Adjoining to the hoſpital is a phyſic garden for the uſe of the patients.

There are a great many copper and iron mines in this circle, and Mr. Buſhing obſerves, that from the ſmelting houſes here, ſeveral hundred thouſand pounds are annually ſent out of Siberia.

There are alſo found jaſper, marble, porphyry, and other ſtones of the like kind, which abound in all parts of Siberia, where cornelians and ſardonixes are alſo found.

Tiumen, a conſiderable town in the province of Tobolſki, is ſeated on the ſouth ſide of the river Tura, over which is a bridge 83 fathoms in length; and a little below it ſtands a fort built with ſtone, in which is a church of the ſame materials. Without this fortification are five hundred houſes, ſix churches built with wood, and a convent of nuns, with a church. This town has two ſuburbs, one of which has two hundred and fifty houſes, inhabited by people of all ranks and profeſſions, three churches built with ſtone, and a monaſtery. The other ſuburb is inhabited by Ruſſians, who have a church, and by Mahometan Tartars and Bucharians, who have a moſque.

Jeniſeisk, the capital of the province of Jeniſei, is ſeated on the river Jeniſei, and is about ſix werſts in circuit. The city contains three churches, a monaſtery, a nunnery, an exchange for merchants, a powder magazine, and ſeven hundred private houſes. The commodious ſituation of the town, cauſes a very briſk trade to be carried on here, eſpecially in ſummer; and moſt of the inhabitants are more or leſs concerned in commerce. Here is great plenty of corn, fleſh, and fowl; but the only fruit this country produces are two or three ſorts of berries.

Irkutſk the capital of the province of the ſame name, is ſeated in a fine plain, near the river Angara, and is one of the moſt conſiderable and populous towns in all Siberia. It contains near a thouſand good dwelling houſes, and is ſurrounded with palliſadoes, within which are fourteen ſmall forts, a moat, and ſome chevaux de frize. It is alſo defended by a fort without the town, near the Angara, planted with ſixteen pieces of cannon. Within the city are two churches built with ſtone, and four with wood; and without the city are two churches, one of which belongs to a nunnery. It is the ſee of a biſhop, and the adjacent county is diverſified with hills and vallies, in which is plenty of game, as roe-bucks, elks, ſtags, and wild-boars, and alſo partridges, ſnipes, wood-cocks, and moor-hens, with plenty of fiſh.

SECT. XVI.

Of the Manners of the Ruſſian Inhabitants of Siberia: with the Method taken by Peter the Great to people and improve Siberia.

WE ſhall now give a general account of the manners of the Ruſſian inhabitants, as well as of the original natives, from the Abbé d'Auteroche, who however obſerves, that the rapidity with which he traverſed this vaſt country, would not permit him to ſearch into the manners of the people with an attention equal to his wiſhes. It is however far the beſt that can be procured.

They profeſs, ſays he, the religion of the Greek church, but with a fanaticiſm that appears gradually to increaſe with the diſtance from the capital. Born in the moſt dreadful ſlavery, they have loſt the very idea of liberty. Their ſtate and ſituation do not admit the indulgence of artificial wants, their deſires are therefore neceſſarily few: the people in general live great part of the year in total idleneſs and inactivity, ſhut up in their ſtoves, the extreme naſtineſs of which is not to be conceived; they are however fond of their condition, and hate the thoughts of ſtirring out, eſpecially to bear arms; but if they are forced into the ſervice, brandy, and the fear of puniſhment, will make them tolerable ſoldiers. The unwholeſomneſs and inconvenience of their hovels are greatly increaſed by the ſeverity of the winter, which prevents their communication with the freſh air; their windows are ſeldom more than a foot wide, and ſix inches high; and in the moſt northern parts they are deprived of the light of the ſun all the while he is paſſing through the ſouthern ſigns; nor have they any artificial light but by ſplinters of birch wood, which they ſet on fire, and ſtick up in the chinks of the floor. But notwithſtanding all this inactivity, confinement, and naſtineſs, they enjoy robuſt and uninterrupted health; ſo effectually does perpetual temperance counterbalance all that can weigh againſt health and life. There is ſcarce one among them that is weakly or deformed, and their manner of education ſecures to them this good fortune.

The child, as ſoon as it is born, is laid upon a heap of ſtraw, or old rags, in a baſket, where it ſprawls about, and ſtretches its limbs, without any reſtraint; it is nouriſhed with milk by means of a horn which is fitted to a cow's teats, but is ſometimes ſuckled by the mother; the baſket is hung at the end of a long elaſtic pole, ſo that it may eaſily be put in motion, and the child rocked as in a cradle; but before it can go alone, it is placed upon the ground, where it rolls about at pleaſure, till it learns firſt to ſtand, and then to totter along, with nothing to cover it but a ſhirt, which ſcarce reaches to the middle of the thigh: by this management their children walk ſooner than ours can ſtand alone. As ſoon as they are able they are ſuffered to run about, and at the end of the winter are playing in the road in the midſt of the ſnow, while the weather is ſtill ſo cold that the traveller is afraid of going out of his ſledge, though he be covered with fur from head to foot. They are of a large ſtature, extremely muſcular and ſtrong, and live longer than the inhabitants of any other known part of the world; this, however, is not becauſe their ſituation, upon the whole, is favourable to life in the tender years of infancy, but the contrary; for all the children who are not ſtrong by conſtitution die ſoon, and none are reared but thoſe who are born with the greateſt natural advantages; more than two-thirds of the children that are born here die in their infancy, and it is common to find but three or four alive in families that have had ſixteen or eighteen. Many other cauſes concur gradually to depopulate the villages that are ſcattered through this vaſt deſert.

The ſmall-pox frequently carries off half the inhabitants of one of theſe hamlets at a time, and ſometimes a greater proportion; the ſcurvy is alſo very fatal among them; and where they can procure ſpirituous liquors, the inroads of diſeaſe and mortality are in proportion to their want of the advantages which make intemperance leſs fatal in other places. The venereal diſeaſe alſo makes great havock among theſe unhappy wretches, to whom the method of cure is intirely unknown.

Upon a review of all that has been here ſaid of this immenſe country, it muſt appear to every reader accuſtomed to a moderate climate, as a deſolate and uncomfortable region, very thinly peopled, but capable of being greatly improved and rendered valuable by a trade carried on by land, and the rivers of the country, with the empires of China and Indoſtan and all the kingdoms and ſtates in the Indies: and by ſea from the ſouth-eaſt coaſt near Kamtſchatka to the neighbouring iſlands of Japan, to China, the Spice Iſlands, and every part of the Eaſt Indies.

Indies. Nothing then could be more politic, and at the ſame time more cruel, than the ſtep taken by Peter the Great, in ſending ſo many brave men to diffuſe ſome beams of the learning, the arts, and the poliſhed manners of Europe through this ſavage country. This has been already hinted; but it certainly will not be diſpleaſing to our readers, if we here conclude our account of Siberia with the particulars of that extraordinary proceeding.

On the defeat of the Swedes at the battle of Pultowa, in 1709, about ten thouſand Swediſh priſoners, including officers, were barbarouſly ſent into Siberia; and among theſe no leſs than eight hundred captive officers were in the city of Tobolſki. During their captivity, the common ſoldiers received remittances from Sweden only twice, which amounted in all to no more than three crowns a head, and the officers received nothing. They were, however, well uſed at firſt, till ſome who had leave to be abſent on their parole did not return; and others, who had entered into the Ruſſian ſervice, took an opportunity to make their eſcape. After this the unfortunate captives were more ſtrictly guarded, and diſperſed into remote parts; and thoſe who were ſureties for the return of their comrades were cloſe confined.

The brave Swediſh ſoldiers, who had often made the Ruſſians fly before them, had now no means left for their ſubſiſtence, and were obliged to earn their bread by applying to the mechanic arts with which they were acquainted, in order to ſupport themſelves. There were among them painters, gold and ſilver-ſmiths, ſhoe-makers, turners, card-maker, weavers and taylors. Theſe were by ſome means or other enabled to follow their ſeveral buſineſſes; and ſome, who had fallen into a way of trade, had leave to travel about the country, the paſſes being ſo well guarded that it was ſcarce poſſible for them to eſcape to Europe; while others, who could not attain the knowledge of any mechanic art, were obliged to undergo the laborious employment of cutting down wood.

The men of learning ſet up public ſchools, and not only taught the children of the Ruſſians, but thoſe of their fellow priſoners, many of whom had either their wives with them, or married Ruſſian women; for the great towns of Siberia were chiefly inhabited by colonies of Ruſſians, whom the czar tranſplanted thither for the ſecurity of his dominions on that ſide. Theſe officers in their ſchools and academies taught Latin, High Dutch, French, ethics, mathematics, fencing, riding the great horſe, and other manly exerciſes. And ſome of thoſe ſchools acquired ſuch reputation, that it is ſaid the citizens of Moſcow ſent their children into Siberia for education.

It was perhaps impoſſible for the czar to take a more effectual method to civilize and improve all the principal towns in this remote part of his dominions, than by baniſhing thither theſe unhappy Swediſh captives, among whom were ſome of the politeſt men in Europe, who, upon the fame of the king of Sweden's ſucceſs, had entered into his ſervice. It was happy for thoſe gentlemen that it was ſo cheap a country, that a ſingle man might live tolerably well for ſeven or eight pounds a year.

To alleviate the unhappineſs of their captivity, prince Gagarin, the governor of Siberia, behaved to them with great generoſity, and never let any of them apply to him for relief in vain; and the Swediſh officers thought they never could ſufficiently applaud his humanity, and uſed to ſay, that their only misfortune was their being baniſhed to a country ſo remote from their relations and friends.

CHAP. VII.

Of the LADRONES.

SECT. I.

Of the Situation, Extent, and Number of the Ladrones, or Marian Iſlands; the Number of the Inhabitants, and a particular Account of the Iſland of Guam; and of the Flying Proas uſed by the Natives.

WE have now deſcribed the countries ſituated in the moſt eaſtern part of Aſia, from China to the Frozen Sea, and have given as particular an account of whatever appeared worthy of notice as our materials would allow; we ſhall now, therefore, return to the ſouth-eaſt, and deſcribe the oriental iſlands, beginning with the Ladrones, which are ſituated about eighteen hundred miles to the eaſt of Canton, in China.

Theſe iſlands have been repreſented as extremely beautiful, and abounding with all the neceſſaries of life, by all our circumnavigators, particularly by Woodes, Rogers, and Dampier; but none of them have deſcribed them in ſo particular and beautiful a manner as the ingenious gentleman who compiled the account of commodore Anſon's voyage round the world, to which the Rev. Mr. Walter has prefixed his name; we ſhall therefore here chiefly make uſe of what we find of thoſe iſlands in that moſt entertaining and inſtructive work.

The Ladrones, or Marian iſlands, were diſcovered by Magellan, in the year 1521, who gave them the name of Ladrones, or Iſlands of Thieves, from the natives ſtealing ſome of his goods. From the account given of the two firſt the commodore fell in with, it ſeems probable that they were thoſe of Saypan and Tinian, they being deſcribed as very beautiful iſlands, and as lying in between fifteen and ſixteen degrees of north latitude. Theſe characteriſtics are peculiarly applicable to the two above-mentioned places, for the pleaſing appearance of Tinian occaſioned the Spaniards to give it the additional name of Buenoviſta; and Saypan, which is in the latitude of fifteen degrees twenty-two minutes north, affords no contemptible proſpect when ſeen at ſea.

There are generally reckoned twelve of theſe iſlands, but if the ſmall iſlets and rocks are counted, they will amount to about twenty. Moſt of them were formerly well inhabited; and even not eighty years ago the three principal iſlands, Guam, Rota, and Tinian, are ſaid to have contained above fifty thouſand people; but Tinian hath, ſince that time, been intirely depopulated, and only two or three hundred Indians left at Rota to cultivate rice for the iſland of Guam, which can alone be properly ſaid to be inhabited. This iſland is the only ſettlement of the Spaniards: here they keep a governor and garriſon; and here the Manila ſhip generally touches for refreſhment in her paſſage, from Acapulco to the Philippines.

Guam is computed to be about thirty leagues in circumference, and is full of hills, dales, and ſtreams of good water. It produces the bread-fruit, cocoa-nut, and other fruit natural to the ſoil and climate; beſides oranges, lemons, citrons, with muſk and water melons, which were originally brought thither by the Spaniards. Captain Woodes Rogers obſerves, that the indigo plant grows wild there in ſuch abundance, that were they induſtrious they might make great quantities of that valuable article of

commerce; but as they have ſo remote a ſituation, and are out of the way of trade, they make no uſe of it.

They have plenty of cattle, but they are lean and ſmall, and generally white. The hogs, from their feeding almoſt entirely on cocoa-nuts and bread-fruit, make excellent pork; and were not the Spaniards remarkably ſlothful, they might enjoy almoſt all the delicacies and ſuperfluities of life.

This iſland contains near four thouſand inhabitants, one thouſand of which are ſuppoſed to live in the city of San Ignatio de Agana, where the governor uſually reſides. The houſes are built of ſtone and timber, and covered with tiles, an unuſual method of building in theſe warm climates. This iſland alſo hath thirteen or fourteen villages. The original natives are tall, ſtrong, and of an olive complexion; they go naked, except wearing a cloth before, and the women a ſmall petticoat. The men are very dexterous at ſlinging, and make uſe of pieces of clay of an oval form which they burn till it is as hard as marble. They are ſuch excellent markſmen that they ſeldom miſs hitting any mark, and throw with ſuch force as to kill a man at a conſiderable diſtance.

As Guam is eſteemed a place of conſequence on account of its affording refreſhments to the Manila ſhip, there are two caſtles on the ſea-ſhore; one is the caſtle of St. Angelo, which lies near the road where the Manila ſhip uſually anchors, and is but an inſignificant fortreſs, mounting only five eight-pounders: the other is the caſtle of St. Lewis, which is four leagues to the north-eaſt of St. Angelo, and is intended to protect a road where a ſmall veſſel anchors that arrives every year from Manila. This fort mounts the ſame number of guns as the former. Beſides theſe, there is a battery of five pieces of cannon on an eminence near the ſea-ſhore. The Spaniſh troops employed at this iſland conſiſt of three companies of foot, of between forty and fifty men each. This is the principal ſtrength on which the governor depends, for he cannot rely on the aſſiſtance of the Indian inhabitants, with whom he is generally upon ill terms, and is ſo much afraid of them, that he has debarred them the uſe both of fire-arms and lances.

The reſt of the iſlands, though uninhabited, abound in proviſions and refreſhments, but there is no good harbour or road amongſt them all.

The original natives are a bold, ſtrong, and well limbed people, and ſeem, from ſome of their works, to be no ways defective in underſtanding, for their flying proas, which are the only veſſels that for ages paſt have been uſed by them, are ſo extraordinary an invention, that it would do honour to the moſt ingenious nation.

This veſſel received the name of flying proa from the ſwiftneſs with which it ſails, it being able to run with a briſk trade-wind near twenty miles an hour, and the Spaniards ſay much more. Its conſtruction is contrary to the practice of all the reſt of mankind, for as the head of the veſſel is uſually made different from the ſtern, and the two ſides alike, the proa, on the contrary, has her head and ſtern exactly alike; but her ſides very different; for that intended to be always the lee-ſide is flat while the wind-ward ſide is built rounding like other veſſels: but to prevent her overſetting, which from her ſmall breadth, and the ſtreightneſs of her leeward ſide, would without this precaution infallibly happen, a frame is laid out from her to windward, to the end of which is faſtened a log formed in the ſhape of a ſmall boat, and made hollow. The weight of the frame is intended to balance the proa, and the ſmall boat, which is always in the water, to prevent her overſetting to windward. This frame is uſually called an out-rigger. The body of the proa is formed of two pieces joined end-ways, and ſewed together with bark, for no iron is uſed in her conſtruction: ſhe is about two inches thick at the bottom, which at the gunwale is reduced to leſs than one.

The proa generally carries ſix or ſeven Indians, two of which are placed in the head and ſtern, who alternately ſteer the veſſel with a paddle according to the tack ſhe goes on; he in the ſtern being the ſteersman. The others are employed either in bailing out the water, which ſhe accidentally ſhips, or in ſetting and trimming the ſail.

From this deſcription it is ſufficiently obvious how well they are fitted for ranging the Ladrone iſlands, ſince as they are nearly north and ſouth of each other, and are within the limits of the trade wind, the proas by ſailing moſt excellently on a wind, and with either end foremoſt can run from one of theſe iſlands to the other, and back again, only by ſhifting the ſail without ever putting about, and by the flatneſs of their lee-ſide, and their ſmall breadth, are capable of lying much nearer the wind than any other veſſel yet known.

Veſſels bearing ſome diſtant reſemblance to theſe are to be met with in various parts of the Eaſt-Indies; but none of them ſeem worthy to be compared with thoſe of the Ladrones, either for their conſtruction or celerity, which renders it probable that this was originally the invention of ſome genius of theſe iſlands, and afterwards imperfectly copied by the neighbouring nations.

SECT. II.

Of Tinian.

Its Situation and Extent. The beautiful Appearance of the Country. The Animals and Vegetables, with a particular Deſcription of the Bread-fruit. The principal Inconveniencies of the Iſland, and by what means this beautiful Spot became depopulated.

THE iſland of Tinian is ſituated in fifteen degrees, eight minutes north latitude; and in one hundred and fourteen degrees, fifty minutes weſt longitude from Acapulco. It is only about twelve miles long, and about half as much in breadth, yet, on account of its extraordinary beauty and fertility, it well deſerves a particular deſcription. The ſoil is every where dry and healthy, and being alſo ſomewhat ſandy, it is the leſs diſpoſed to a rank and too luxuriant vegetation. Hence the meadows and bottoms of the woods are much nearer and ſmoother than is cuſtomary in hot climates. The land riſes in gentle ſlopes from the ſea-ſhore to the middle of the iſland, tho' the general courſe of its aſcent is frequently interrupted by vallies of an eaſy deſcent, many of which wind irregularly through the country. Theſe vales and the gradual ſwellings of the ground, which their different combinations give riſe to, are moſt beautifully diverſified by the mutual encroachments of woods and lawns, which coaſt each other, and traverſe the iſland in large tracts. The woods conſiſt of tall and ſpreading trees, moſt of them celebrated either for their beauty or their fruit; while the lawns are uſually of a conſiderable breadth. Their turf is clean and uniform, it being compoſed of a fine trefoil, intermixed with a variety of flowers. The woods are in many places open, and free from all buſhes and underwood, and the neatneſs of the adjacent turf is frequently extended to a conſiderable diſtance under the hollow ſhade formed by the trees.

Hence ariſes a multitude of the moſt elegant and entertaining proſpects, according to the different blendings of theſe woods and lawns, and their various interſections with each other, as they ſpread themſelves differently through the vallies, and over the ſlopes and declivities, in which the place abounds.

There are, however, no ſtreams, yet the water of the wells and ſprings, which are every where to be met with near the ſurface, is extremely good, and near the center of the iſland are two or three pieces of excellent water, the turf of whoſe banks is as clear, as even, and as regularly diſpoſed, as if they had been baſons formed for the decoration of the place. Theſe waters abound with duck, teal, and curlew: and in the iſland is prodigious penty of the whiſtling plover.

The beauties of Tinian are not ſolely confined to the excellency of its landſcapes, ſince the animals, which, during the greateſt part of the year, are the ſole poſſeſſors of this happy ſoil, in ſome meaſure partake of the romantic caſt of the iſland, and are no ſmall addition to its wonderful ſcenery; for the cattle, of which it is not uncommon to ſee herds of ſome thouſands feeding together in a large meadow, are all of them milk white, except their ears, which are generally black or brown, and notwithſtanding

ſtanding there being no inhabitants, yet the clamour and frequent parading of domeſtic poultry, which in great numbers range the woods, continually excite the idea of the neighbourhood of farms and villages, and contribute to the chearfulneſs and beauty of the place.

The cattle, which are computed at leaſt to be ten thouſand, are far from being ſhy; they are extremely well taſted, and the fleſh of an eaſy digeſtion. The fowls too are exceeding good, and eaſily run down. There are alſo abundance of wild hogs. Theſe are very excellent food, but they are a very fierce animal, and can only be obtained by ſhooting them, or hunting them with dogs. The country is equally to be admired on account of its fruits and vegetable productions, which are happily adapted to the cure of the ſea-ſcurvy, which is of the greater advantage, as theſe iſlands are on the borders of the vaſt eaſtern ocean, and are extremely convenient for landing after a tedious voyage, which is ſeldom made without many of the crew ſuffering by that dreadful diſeaſe. In the woods are inconceivable quantities of cocoa-nuts, with the cabbages growing on the ſame tree. There are beſides guavas, limes, ſweet and ſour oranges, and a kind of fruit peculiar to theſe iſlands, called by the Indians rhumay, and by commodore Anſon's people the bread-fruit; for they conſtantly eat it during their ſtay upon the iſland inſtead of bread, and it was ſo univerſally preferred to it, that no ſhips bread was expended all the while they ſtaid there.

It grows upon a pretty lofty tree, which, near the top, is divided into large and ſpreading branches; the leaves, which are of a remarkable deep green, are notched about the edges, and are generally from a foot to eighteen inches in length. The fruit itſelf is found indifferently in all parts of the branches, and is in ſhape rather eliptical than round: it is covered with a rough rind; and is uſually ſeven or eight inches long; each grows ſingly, and not in cluſters. The fruit is fitteſt to be uſed when full grown, but ſtill green; when, being roaſted in the embers, it has ſome diſtant reſemblance to the taſte of an artichoak's bottom, and is, like that, of a ſoft and ſpungy texture. As it ripens it becomes ſofter, turns yellow, and contracts a luſcious taſte and an agreeable ſmell, not unlike a ripe peach, but it is then eſteemed unwholeſome, and is ſaid to produce fluxes.

Mr. Dampier ſays, that it is as large as a two-penny loaf, and that the inſide is ſoft, tender, white, and crummy like bread; and, if eaten in twenty-four hours after it is plucked, has a ſweet and agreeable taſte, and that this extraordinary fruit is in ſeaſon eight months in the year.

All the advantages that have been mentioned, with reſpect to this delightful iſland are greatly enhanced by the healthineſs of its climate, by the almoſt conſtant breezes that prevail there, and by the frequent ſhowers that fall; for theſe, inſtead of the heavy continued rains, which in ſome countries render a great part of the year very diſagreeable, are uſually of a ſhort and almoſt momentary duration: hence they are extremely grateful and refreſhing, and are perhaps one cauſe of the ſalubrity of the air, and the extraordinary influence it had upon the men belonging to the Centurion, in increaſing and invigorating their appetites and digeſtion. This effect was extremely remarkable, ſince thoſe among the officers who were accuſtomed to ſpare and temperate diet, and beſides a ſlight breakfaſt uſed to make but one moderate meal a-day, were here, to appearance, transformed into gluttons; for, inſtead of one meal of fleſh, they were ſcarcely ſatisfied with three, and each of them too ſo prodigious in quantity, as would at another time produce a ſurfeit. Yet their digeſtions ſo well correſponded with the keenneſs of their appetites, that they were neither diſordered nor even loaded by this uncommon repletion; for having, according to their cuſtom, while on the iſland, made a hearty breakfaſt of beef, it was not long before they began to conſider the approach of dinner as a very deſirable, though ſomewhat tardy incident.

The principal inconvenience attending the iſland is the vaſt number of muſchatoes and other ſpecies of flies, together with a kind of tick, which, though principally attached to the cattle, will frequently faſten on the limbs and bodies of the human ſpecies, and, if not perceived and removed in time, will bury its head under the ſkin and raiſe a painful inflammation. There are alſo a few centipedes and ſcorpions, but none of Commodore Anſon's men received the leaſt injury from them. Another inconvenience attending the iſland is the little ſecurity, in ſome ſeaſons, for a ſhip at anchor, the road being extremely inconvenient.

The only proper anchoring place for ſhips of burthen is at the ſouth-weſt end of the iſland, but the anchorage is very unſafe.

However, it muſt appear very ſurpriſing that an iſland ſo richly furniſhed with the conveniencies of life, and ſo well provided not only for the ſubſiſtence, but for the enjoyment of mankind, ſhould be entirely deſtitute of inhabitants, eſpecially as it is in the neighbourhood of other iſlands, that in ſome meaſure depend upon this for their ſupport. But Mr. Walter obſerves, that he was told by the Indians, it was not then fifty years ſince the iſland was depopulated. The three iſlands of Tinian, Rota, and Guam, were all full of inhabitants, and Tinian alone contained 30,000; but ſickneſs raging among the iſlands, and deſtroying multitudes of the people, the Spaniards, to recruit their numbers at Guam, which were extremely diminiſhed by the mortality, ordered all the inhabitants of Tinian thither, where, languiſhing for their native ſpot, the greateſt part of them in a few years died of grief.

There are ſtill remains to be met with in the iſland, which ſhew that it was once extremely populous, for in all parts of it are ruins of a particular kind; theſe uſually conſiſt of two rows of pyramidical pillars, each pillar being about ſix feet from the next, and the diſtance between the rows about twelve feet: theſe pillars are about five feet ſquare at the baſe, and about thirteen feet high; and on the top of each is a ſemi-globe with the flat ſurface upwards. The whole of the pillar and ſemi-globe is ſolid, being compoſed of ſand and ſtone cemented together and plaſtered over. Theſe were ſaid by the neighbouring Indians to be foundations of particular buildings ſet apart for only thoſe of the natives who had engaged in ſome religious vow. But if they were originally the baſes of their common dwelling-houſes, their number muſt have been very conſiderable; for in many parts of the iſland they are planted very thick, and ſufficiently evince the multitude of its former inhabitants.

Before we conclude this chapter, it will be proper to obſerve, that the ingenious writer of commodore Anſon's Voyage ſays, that though the Ladrones have no immediate intercourſe with any other people, yet there lie to the ſouth and ſouth-weſt of them a multitude of lands that are ſuppoſed to extend to the coaſt of that part of a new-diſcovered continent, called New Guinea. Theſe iſlands are ſo near the Ladrones, that canoes from them have ſometimes, by diſtreſs, been driven to Guam; whence it is very natural for us to ſuppoſe, that the Ladrones were originally peopled from the ſouthern continent, a very ſmall part of which has yet been diſcovered, and that in a very imperfect manner. This continent is thought to extend from New Holland and New Guinea through the far greateſt part of the Eaſtern or Pacific Ocean; and very ſtrong and convincing reaſons have been given for this ſuppoſition; but it would be very inconſiſtent with that order which ought to be obſerved in a work of this kind to treat of a very different part of the earth, when our ſubject is only Aſia and the Aſiatic iſlands, we ſhall therefore defer a particular conſideration of the diſcoveries made on that continent, 'till having almoſt encompaſſed the globe, we draw near the concluſion of this work, and ſhall therefore now proceed to the Philippine iſlands.

CHAP.

CHAP. VIII.

Of the PHILIPPINES.

SECT. I.

Of the NEW PHILIPPINES.

The Dreſs, Cuſtoms, and Manners of the Inhabitants. There are ſome Reaſons to ſuſpect the Truth of the Accounts given of thoſe Iſlands.

THE New Philippines, or Caroline Iſlands, ſaid to be ſituated between the ſixth and one hundred and thirty-eighth degree of north latitude, are but imperfectly diſcovered. The beſt if not the only account we have of them, is to be found in the Philoſophical Tranſactions, in two letters from Father Clan and Father Gobien, dated from the iſland of Manila, founded on the report of ſome natives of thoſe iſlands, driven upon the iſle of Samar, in 1696.

Theſe are ſaid to conſiſt of thirty-two iſlands, ſituated between the Ladrones and the Philippines. The country is extremely populous, and all the iſlands are under the dominion of one king, who keeps his court in the iſle of Lamarec. The natives go half naked, and the men paint and ſtain their bodies with ſeveral figures; but the women and children are not painted. In the complexion and form of their faces they nearly reſemble the tawny Philippines. The dreſs of the men only conſiſts in a cloth faſtened round their loins which covers their thighs, and a looſe cloth about their bodies which they tie before. The principal difference between the dreſs of the men and women is, that the cloth worn by the latter hangs a little lower; beſides, the moſt conſiderable among the women wear necklaces, bracelets, and rings of tortoiſe ſhell.

The people are ſaid to be of ſo peaceful a diſpoſition, that they never do violence to each other; and that murder or homicide was never heard of amongſt them. Their language is different both from that of the Philippines and the Ladrone iſlands, and comes neareſt to that of the Arabs. They are ſaid to have no cattle, dogs, nor any quadrupeds in their iſlands, nor any land-fowls but cocks and hens, which they breed up, but never eat their eggs. Without obſerving ſet meals, they eat and drink when they have an appetite. They ſalute a perſon by taking him either by the hand or foot, or gently ſtroaking his face. Their lances or darts are pointed with ſharp bones. Among their tools they have a ſaw made of a large ſhell, ſharpened with a ſtone, for they are ſaid to have no iron or other metals on their iſlands.

After all, there is ſome reaſon to believe theſe accounts fictitious, ſince we find no notice taken of them by later diſcoverers; and there are even ſome contradictions in the accounts given by thoſe miſſionaries themſelves; for Father Gobien ſays, theſe iſlands are eighty-ſeven in number, and form one of the fineſt archipelagoes in the eaſt. He alſo gives a map of them, which is likewiſe inſerted in the Philoſophical Tranſactions, in which he makes them extend from two degrees ſouth to ſeventeen degrees north latitude, though he had no other means of knowing their latitude, number, and ſituation, with reſpect to each other, than from ſome of the ſuppoſed inhabitants ranging pebbles on a table.

SECT. II.

The Situation and Names of the principal of the Philippine Iſlands: the Climate and Fertility of the Soil: the Trees, Plants, and Shrubs: with a particular Account of ſome ſpecies of the Palm and Plaintain, and of ſeveral poiſonous Herbs; and others Providence has wiſely formed as Antidotes to them.

THE Philippine Iſlands are very numerous, ſome ſay they even amount to a thouſand. They extend from the fifth degree of north latitude to the nineteenth, and from the one hundred and fourteenth degree of longitude almoſt to the hundred and thirtieth; and are ſituated about four hundred leagues to the weſtward of the Ladrones, one hundred and twenty to the ſouth of China, and two hundred eaſt of Cochin-china. They were diſcovered by Magellan, and received the name of Philippines in honour of Philip II. king of Spain, in whoſe reign the Spaniards firſt planted an European colony there.

The principal of theſe iſlands are, 1. Luconia, or, as it is called by the Portugueſe, Manila, from the chief town in the iſland. 2. Samar, or Tandago, ſometimes called Philipina. 3. Maſbate. 4. Mindoro. 5. Luban. 6. Paragoia, or Paragoa. 7. Panay. 8. Leyta. 9. Bohol. 10. Sibu, Cibau, or Zebu. 11. Negroes Iſland. 12. St. John's. 13. Xolo: and 14. Mindanao.

The weather in theſe iſlands is not ſo exceſſively hot as might be expected from their being ſo nearly ſituated to the line; they being conſtantly refreſhed by ſea breezes, the winds blowing eaſterly one part of the year, and weſterly the other. Thoſe from the eaſt begin in October, but are not ſettled till about the middle of November. This wind is accompanied with fair weather. It begins to turn to the weſt in May; but does not blow ſteadily from that quarter till June. When the wind firſt veers to the weſtward, it blows faintly, and there is one or two hurricanes in a day; but after the ſtorm is over, the wind again ſhifts about to the eaſt, and the ſky becomes ſerene. In a little time there are ſeveral hurricanes in a day, with violent guſts of wind and loud claps of thunder; and at length they come on ſo thick, that the wind continues in that quarter from whence the hurricanes ariſe, that is out of the weſt, where it remains till October or November; during which time there is thick cloudy weather, violent rains, and ſometimes ſuch dreadful thunder and lightning, that the largeſt trees are torn up by the roots, and the rivers, overflowing their banks, drown the flat country.

The worſt weather is about the latter end of July, or the beginning of Auguſt, when it is very cool and chilly. In September the wind and rain abate, and the air becomes clear; but ſtill the morning fogs laſt till almoſt noon, when the ſun ſhines out.

How diſagreeable ſoever it be to have ſo great a part of the year tempeſtuous and rainy, yet there is not any country in the world that appears more beautiful; for there is here a perpetual verdure; and buds, bloſſoms, and fruit, are found upon the trees all the year round, not only in well cultivated gardens, but in the fields and mountains; and no ſoil in the world produces greater plenty of all the neceſſaries of life.

In ſome of theſe iſlands great quantities of gold are waſhed down from the mountains, and found mixed with the ſand of the rivers. There are alſo found mines of other metals, and excellent loadſtones.

The country abounds with a variety of fruits, one of the moſt valuable of which, called the ſanter, grows wild in the woods: it is of the ſize, ſhape, and colour of a ripe peach, and has five kernels like the ſeeds of an orange. The Spaniards preſerve it in the ſame manner as quinces, and alſo when half ripe pickle it with vinegar. The tree reſembles that of the walnut, but has large leaves that are uſed in medicine.

They have a fruit called magol, which is downy like a peach, and of the colour of an orange; but it is not well taſted, and is hard of digeſtion. The tree is as tall as a pear-tree, and has thick boughs, with leaves like thoſe of the laurel; the wood is but little inferior to ebony.

They have alſo durions, mangoes, and moſt other Indian fruits; beſides oranges of ſeveral kinds, different from thoſe of Europe, and ſome of them much bigger. There are alſo great and ſmall lemons, but theſe are generally ſweet.

The moſt profitable trees are the palms, and in theſe conſiſt the principal wealth of the great men. Of this tree are reckoned forty ſpecies, the moſt valuable of which is the ſago. Theſe trees grow wild in the woods, and of the

the pith is made the ſago brought to Europe, which the natives eat inſtead of bread four or five months in the year. The bark and wood are thin and hard, and when they cut down the tree they ſplit it in the middle, then ſcrape out the pith, and beat it with a wooden peſtle in a mortar; they then ſtrain it through a cloth, pouring in water, which carries the ſubſtance of the pith through the cloth, and leaves nothing but a little huſk behind. After it is ſtrained it has a ſediment, which, when the water is drawn from it, is made into cakes and baked, and proves very good bread. The ſago exported into the other parts of the Indies is dried hard, in ſmall bits no bigger than ſeeds, and is commonly eaten with the milk of almonds by thoſe who are ſick of the bloody flux.

The ſecond ſort of palm-trees are thoſe which yield wine, and are generally found in ſalt-water marſhes: the fruit reſembles the date, but never comes to maturity, becauſe as ſoon as it bloſſoms they cut off the branches, that the liquor may run into the veſſels they place under them.

Another ſpecies of palm-trees, called yonba, furniſhes them with a kind of wool of which are made quilts and pillows, and with a black thread of which they make cables for ſhips, which will laſt in ſea-water longer than thoſe of hemp. Of the leaves of any of the palm-trees they make hats, mats for rooms, ſails for their ſhips, and covering for their houſes.

Tamarinds are a wild fruit that grows in cods like peas; they have a ſharp taſte, and are frequently preſerved with ſugar. The tree is tall and thick, with ſmall leaves, and the wood ſerves for the ſame uſes as ebony.

In theſe iſlands there are alſo plenty of plantains, the leaves of which are ſo long and broad, that one of the fathers obſerves two of them will almoſt make a cloak. Theſe trees are planted by the Indians about their houſes, and on many accounts deſerve a particular deſcription. This tree, or ſhrub, is about ten feet high and three feet in circumference, and is not raiſed from ſeed but from ſlips and ſuckers taken from the old tree, which will bear within ten months after they are planted in their native ſoil; though they will be fifteen months if removed into other ground. The fruit is no ſooner ripe than the tree decays; but many young ſhoots grow up and ſupply its place. At its firſt ſpringing out of the ground it has two leaves, and when it is a foot high it has two more between the firſt, but a little lower; and ſoon after two others, and ſo on. By the time it is a month old, the body is near as thick as a man's arm; the uppermoſt leaves are about a foot long and half a foot broad, and as it increaſes in height the leaves grow larger; ſo that when it is at its full growth, the leaves are ſeven or eight feet long, and a foot and a half broad near the ſtalk, ending in a round point. The ſtalk of the leaf is as big as one's arm, almoſt round, and about a foot in length from the body of the tree to the leaf. When the tree is full grown there ſprings from the top a ſtrong ſtem harder than any other part of the body, and about the thickneſs and length of a man's arm; round this ſtem grows the fruit in cluſters, each about ſix or ſeven inches long, and thicker than one's wriſt, much in the ſhape of a Bologna ſauſage. The outſide, when ripe, appears ſoft and yellow, and within the pulp is ſweet, and ſofter than butter; it is much of the ſame colour, and melts in the mouth, having neither ſeed nor ſtone. This fruit when green they often roaſt or boil, and eat it inſtead of bread; and the Engliſh in our plantations ſometimes take the pulp of five or ſix of them and boil them in a bag like a pudding. A tolerable ſweetmeat is alſo often made of the ripe plantains, by drying them in the ſun. When the natives make drink of it they take the pulp of ten or a dozen ripe plantains, and maſhing them together, pour two gallons of water upon them, and in two hours it ferments and has a head upon it like wort; and in four hours is fit to drink; but as it will not keep much above twenty-four hours, they brew it every morning. It drinks briſk and cool; but is very windy, as is alſo the fruit when eaten raw; but when boiled or roaſted it has no ill effect. The plantain drink being ſet in the ſun, makes very good vinegar. As the tree never bears fruit but once, that is no ſooner gathered than they cut it down, which may be done with one blow of an ax; ſo thin is the wood that incloſes the pith. Having ſtripped off the bark they ſplit the body into four quarters; and, after it is dried two or three days in the ſun, the women divide it with their fingers into ſmall threads, of which they make their cloth; but it is pretty ſtubborn while it is new, and ſoon wears out: but the poor people of Mindanao and other of the iſlands wear no other cloth.

The bonano-tree reſembles the plantain in ſhape and ſize, but the fruit is not half ſo large. It is leſs luſcious, and has a more delicate taſte; and beſides is oftener uſed in making of drink.

The caſſia-tree is alſo found in theſe iſlands. This tree is ſmaller than that of the tamarinds, but has much thicker boughs; the leaves, which are of a beautiful green, are ſomewhat larger than thoſe of the pear-tree, and being boiled with the bloſſoms in the manner of a conſerve, produce the ſame effect as the fruit, and are leſs nauſeous. The young fruit made into a conſerve is a ſafe and good laxative. This fruit abounds ſo much in the mountains, that in May and June the inhabitants of the iſland of Mindanao fatten their hogs with it. Excellent ananas, or pine-apples, are alſo found here.

Here is alſo a tree named amet, from whence the natives draw water by cutting a hole in it; and alſo a kind of cane, which the Spaniards call vaxuco, which, if cut, yields a good draught of water; and there is happily plenty of them in the mountains, where water is moſt wanted. It uſually creeps up to the tops of trees, winding about them like ivy; but ſome of them are very ſtraight, and of theſe laſt the natives make pike and halberts.

In the mountains is timber fit for building either ſhips or houſes; among the reſt they have black ebony and iron wood, with ſeveral ſorts of wood uſed in dying.

The camondog is a tree of ſo venomous a nature, that the fiſh which eat the leaves that fall into the ſea ſpeedily die; as do alſo the perſons who eat the poiſoned fleſh. The natives dip the points of their darts in the liquor which, upon inciſion, flows from the trunk of this tree. It is ſaid that even the ſhadow of it is ſo deſtructive, that no herb or graſs will grow within it; and, if tranſplanted, it kills all the plants around it, except a ſmall ſhrub, which is an antidote againſt it, and is always with it. A leaf of this ſhrub carried in a man's mouth is ſaid to be a ſecurity againſt the venomous effects of the tree.

Here are alſo plenty of ſugar-canes, and abundance of odoriferous herbs and flowers that grow without cultivation: alſo indigo, tobacco, and many medicinal herbs; one of which is uſed for the ſame purpoſes as the Turks chew opium, that is, to chear the ſpirits, and render the people void of fear when they engage an enemy. Among the roots which ſerve for food are potatoes, of which there are ſeveral kinds; and there is ſuch plenty of all ſorts of roots fit for the kitchen, that many thouſands of the natives live chiefly upon them.

Near to Cathalagan, in the iſle of Samar, is a plant of ſurpriſing virtue; it reſembles ivy, and twines about any tree near which it grows. The fruit, which ariſes from the knots and leaves, reſembles in ſize and colour a melocotoon, and has within it eight, ten, or ſixteen green and yellow kernels, as big as a large hazle nut; which, when ripe, drop out of themſelves. This is a powerful antidote againſt venomous herbs and the darts uſed by the natives of Macaſſar, Borneo, and the Philippines. The uſual doſe is the ſixteenth part of an ounce powdered and mixed in wine or water.

Theſe remedies againſt poiſon could no where be placed to greater advantage by the hand of the wiſe Creator, than in theſe iſlands, where, beſides the poiſonous tree already mentioned, the ſoil produces many venomous herbs and flowers, which in ſome of theſe iſlands not only kill thoſe who taſte them, but infect the air; ſo that many people die in the time of their bloſſoming.

SECT. III.

Of the Beaſts, Birds, Reptiles, and Fiſhes.

WITH reſpect to the animals, there are in ſome of theſe iſlands ſuch numbers of wild buffaloes, that a good huntſman on horſeback, armed with a ſpear, will kill ten or twenty in a day. The Spaniards take them for their ſkins, which they ſell to the Chineſe, and the fleſh ſerves the mountaineers for their food.

The woods alſo abound with wild bears, deer, and goats, which laſt are ſo plentiful in one of theſe iſlands, that the Spaniards gave it the name of Cabras.

The Spaniards have imported from New Spain, China, and Japan, horſes and cows, which are greatly multiplied; but the ſheep they brought over ſoon died, which is perhaps owing to the heat of the climate, and the moiſture of the earth.

There are monkies and baboons in theſe iſlands of a monſtrous ſize, which it is ſaid will defend themſelves if attacked by men. When no fruit is to be found in the mountains, they go down to the ſea-ſhore to catch crabs, oyſters, and other ſhell-fiſh. That the oyſter may not cloſe and catch their paws, they put a ſtone between the ſhells to prevent their ſhutting cloſe. They catch crabs by putting their tail in the holes where they lie, and when the crab lays hold of it, they draw him out.

Civet cats are very numerous; as are alſo flying ſquirrels: and in the iſland of Leyte is a creature that has ſome reſemblance to a mouſe, only the head is of a prodigious ſize.

The ignana is a creature like an aligator, but the ſkin is purple, ſpeckled with yellow, the tongue is cloven, and the feet is armed with claws. It devours poultry, and, though it is a land-animal, ſwims over rivers with great ſwiftneſs. The Indians and ſome Spaniards eat it, and ſay the fleſh is not unlike that of the turtle.

There are aligators found in the lakes and in the ſea near Mindanao and Xollo. There are alſo ſaid to be a great number of ſea-horſes.

Turtle are found in theſe ſeas, ſome of which are very large, and are eat by the natives; and on the ſhore are tortoiſes, which are not good to eat, but the ſhell is much valued.

The turkies carried by the Spaniards to the Philippines could not live, but they have a fowl called xolo, that has long legs, and is as well taſted as a turkey. They have another ſpecies of fowls called camboxa, whoſe legs are ſo ſhort that their wings trail on the ground. They are in no want of common poultry, and beſides theſe it is ſaid they have a ſort in which the fleſh and bones are both black, but yet they are well taſted.

Theſe iſlands afford ſeveral ſorts of parrots and white cocatoes, that are ſomething larger than a parrot, and have their heads adorned with a tuft of feathers: in ſome of the iſlands are abundance of peacocks, but pheaſants and partridges are unknown; there are however heath-cocks, quails, and other game.

The tavan is a black ſea-fowl, ſomething leſs than a hen, and has a long neck. Theſe birds lay their eggs in the ſand by the ſea-ſhore, each placing forty or fifty in a trench, and then covering them till they are hatched by the heat of the ſand. They are as large as gooſe eggs; and when the chickens are hatched, the yolk appears whole and ſweet, and on them the chickens feed till they have ſtrength to break through the ſand. People go in ſearch of theſe neſts, and wherever they find the ſand thrown up, they open it, and ſometimes find eggs, and at others young chickens, both of which are eſteemed very good food.

The herrero is a green bird, of the ſize of a hen, and has ſo large and hard a beak, that it will make a hole in the trunk of a tree and build its neſt in it. From the noiſe it makes when at this work, the Spaniards give it the name of herrero, or carpenter.

There are a kind of turtle-doves, grey on the back, and white on the breaſt; in the middle of which is a red ſpot, not unlike a wound with the freſh blood upon it. They have a bird called colin, of the ſize of a black-bird, but diſtinguiſhed by aſh-colour and black feathers; beſides, the head is bald, and has a crown of fleſh.

The laſt we ſhall mention is the ſaligan, which builds her neſt on the ſides of rocks, as the ſwallows do againſt the walls, and theſe make the delicious bird's neſts ſo much eſteemed.

Theſe iſlands likewiſe produce a multitude of ſnakes, ſome of them of a prodigious ſize, and others exceeding venomous. It is uſual for ſnakes to come into the houſes, and even into the ſhips.

There are likewiſe ſeveral kinds of venomous inſects; as ſcorpions whoſe ſting is in their tails, which turn up in a ring upon their backs; and centipedes four or five inches long, red on the back, and about as thick as a gooſe quill; they have a multitude of feet, which extend from the head to the tail, from whence they have their name. Their bite is eſteemed more dangerous than the ſting of a ſcorpion. Theſe are often found among dry timber, and in old houſes.

They have great plenty of fiſh about theſe iſlands, particularly bonetoes, cavallies, breams, and mullets.

SECT. IV.

Of the different People who inhabit theſe Iſlands, their Perſons, Habits, Food, Liquors, Diverſions, Arms; their Genius and Temper; their Marriages, the Names they give their Children, and their Funerals; their Religion and Superſtition.

THESE iſlands are inhabited by four or five different nations, as the Blacks, who dwell in the woods, mountains, and moſt inacceſſible places: the poſterity of the Chineſe, who once poſſeſſed part of the ſea-coaſt; the Malayan Moors, or Mahometans, who came thither from Malacca, Sumatra, Borneo, and Macaſſar; the Spaniards, Portugueſe, and other Europeans; and a mixed breed compounded of all theſe.

The Blacks were probably the firſt inhabitants, ſince they poſſeſs all the inland parts, and may have been driven into the woods and mountains by the other nations which now poſſeſs the ſea-coaſt. Theſe Blacks have as regular and well proportioned features as any European, and have long black hair. All the natives of theſe iſlands are of a middle ſtature, and well ſhaped. The women tie up their hair in a roll on the hinder part of the head, adorning it with jewels, or ſomething elſe that makes a glittering ſhew; and they have alſo necklaces and ear-rings, with bracelets on their arms and legs, and rings on their fingers; the more civilized who live among the Spaniards wear a kind of waiſtcoat and a cloth about them which reaches below their knees, and many of them conform entirely to the Spaniſh faſhions. The Blacks who live in the mountains have only a cloth about their loins, and the meaner ſort of the people generally wear neither ſhoes nor ſtockings. The Chineſe dreſs after the manner of their country, which has already been deſcribed.

It ought not to be omitted, that one of the tawny nations who inhabit theſe iſlands paint and ſtain their bodies like our antient Britons and Picts, and from thence have obtained the name of Pintadoes.

The natives who dwell on the ſea coaſt ſit croſs-legged like moſt of the other Aſiatics, both at their meals and at all other times. Their uſual food is boiled rice and fiſh, and they ſeldom eat fleſh but at their feſtivals. Their common drink is hot water, and they have alſo palm-wine and toddy drawn from the palm and cocoa-trees, and from both they diſtil a ſpirit that reſembles arrack. This laſt ſpirituous liquor they alſo make from rice. They have alſo a liquor called chiliam, which is the juice of the ſugar-cane boiled in water.

Thoſe who dwell on the mountains live chiefly on fruit, roots, and the fleſh of wild beaſts which they take in hunting; for they are not acquainted with huſbandry, and never apply themſelves to ſowing rice, or any other grain.

Thoſe Spaniards who keep good tables generally eat fleſh at noon, and fiſh at night. The natives who inhabit the ſea-coaſt have plays, muſic, and dancing, like the Chineſe. In their ſongs one of them ſings a verſe, and another repeats it to the ſound of a gong or metal drum. Their dancing has a martial appearance, and ſeems in imitation of a battle. All their motions are regular, ſometimes they aſſault each other with their ſpears, and then retire very gracefully; but their greateſt diverſion is cock-fighting.

They are expert ſwimmers, and very fond of bathing, which they conſtantly practiſe both in the morning and evening, and this may be one of the reaſons why the natives build ther houſes on the banks of rivers; even lying-in women and children newly born are conſtantly plunged into cold water. Both the men and women are fond of ſmoaking tobacco, and of chewing betel and areca.

The arms of the natives are bows and arrows, and a lance headed with iron or wood hardened in the fire; they have alſo broad two-edged daggers and canes, thro' which they blow little poiſoned darts, which have ſuch an effect, that the ſlighteſt wound given by them are mortal, if a proper remedy be not immediately applied. They have alſo a long narrow ſhield, a kind of helmet and a guard for the back and breaſt, made of cane covered with a buffaloe's hide, as a defence againſt the poiſoned darts.

The Blacks of the mountains are ſo fond of liberty, that they could never be brought to ſubmit to the government of the Spaniards, to whom they are ſuch enemies, that if they happen to kill one of them, they invite all their family to rejoice for three days ſucceſſively; and, while the entertainment laſts, 'tis ſaid they conſtantly drink out of his ſkull. On the other hand, the Spaniards make ſlaves of all the Blacks that fall into their hands. But, though the Spaniards have no immediate commerce with theſe mountaineers, they have ſome intercourſe with them by means of the Indian nations, who dwell in the plains; for to them Spaniards ſell tobacco, and ſeveral other commodities, which the Blacks purchaſe of them by giving gold duſt, bees wax, &c. in exchange.

With reſpect to their marriages, the huſband pays a ſum of money to the father, or neareſt relation, to purchaſe his wife. They both eat out of one diſh, to ſhew they are to run the ſame fortune and partake of the ſame joys and ſorrows; and having ſacrificed ſome beaſt, an entertainment begins, and completes the ceremony. They not only marry in their own tribes, but eſpouſe the neareſt of their kindred, except in the firſt degree. Divorces are allowed on both ſides; but among ſome of them polygamy is not permitted, except the wife prove barren. Other of the Indian nations allow two or more wives.

Some of the Indians in theſe iſlands have no other marriage ceremonies than joining of hands before their parents and friends; but in thoſe parts of the country ſubject to the Mahometans a plurality of women is allowed.

The mothers give names to their children, and this is commonly done from ſome circumſtance of their birth; as for inſtance, Malaccas, which ſignifies ſtrong, from its appearing ſo when brought into the world: Malivag, or difficult, becauſe of the difficulty of the labour; but at other times they give it the name of the firſt thing that occurs, as Dama, the name of an herb; and by this they are known afterwards. What appears very ſingular is, that the firſt ſon or daughter, on being married, give their name to their parents, as Amani Malaccas, Immani Malivag; that is, the father of Malaccas, the mother of Malivag.

When a perſon of diſtinction dies, ſtrangers are hired to come and mourn, and to lament in their ſongs the departure of the deceaſed. The body, being waſhed and perfumed with benjamin and other fragrant gums, is wrapt up in ſilk, according to his quality, and put into a coffin made ſo cloſe as to keep out the air; then being placed upon a table, the cloaths and arms of the deceaſed are laid in a cheſt by the coffin; and if it be a woman, the utenſils neceſſary for her work: food is alſo ſet before the corpſe. At length the body is interred in the burying-place of the family, and a feaſt made for thoſe invited to the funeral; but the widows and children for ſome time abſtain from animal food and live only on rice and herbs. Some of theſe nations mourn in black, and others in white, ſhaving their heads and eye-brows; and formerly when a great man died, the neighbourhood were obliged for ſeveral days to keep ſilence. Sacrifices are offered to thoſe who die in defence of their country.

The original natives are ſo extremely ſuperſtitious, that there is ſcarce a rock, ſtone, promontory, or river to which they do not pay a kind of religious worſhip; and they have ſuch a veneration for old trees, that they think it a kind of ſacrilege to cut them down on any account whatſoever. They have alſo the ſame veneration for ſome antient tall canes, from the belief that the ſouls of their anceſtors dwell in them, and that the cutting of thoſe trees or canes would put them to pain.

Antiently they worſhipped their idols in certain caves, and there the prieſts offered their ſacrifices. On theſe occaſions a young and beautiful virgin gave the firſt ſtroke to the victim with a ſpear, after which it was ſlain, cut in pieces, dreſſed, and eat in a reverential manner. The miſſionaries ſay they are ſo ſuperſtitious, that if a ſnake be found on their cloaths they will never wear them again; and if they are going out on the moſt important buſineſs, if a ſnake croſſes the way they will defer it, and immediately return home.

SECT. IV.

Of the Iſland of MINDANAO.

Its Situation, Extent, and different Nations. The Perſons, Dreſs, Food, Cuſtoms, and Manners of the Mindanayans.

IN deſcribing theſe iſlands we ſhall begin with the ſouth and proceed to the north, treating laſt of Manila. Mindanao is the largeſt of all the Philippines, except Manila, it being ſixty leagues in length, and between forty and fifty over. It has ſeveral fine harbours and navigable rivers, which are plentifully ſupplied with fiſh. The ſouth-weſt part of it is ſituated in about the ſixth degree of north latitude, and the north-eaſt part in about the eighth.

The ſeas and rivers about this iſland are attended with an inconvenience that is of the utmoſt prejudice to commerce; for they are ſo infeſted with worms, that they will deſtroy a ſhip in a very ſhort time; and therefore the natives, whenever they come from ſea, immediately haul their ſhips upon dry land, as they do their canoes and barges, and never ſuffer them to lie long in the water. Theſe worms are chiefly in the bays, creeks, and mouths of rivers; or in places near the ſhore.

The greateſt part of the inhabitants are Mahometans, and ſubject to the ſultan of Mindanao, who governs arbitrarily and without any written laws. His ſubjects who dwell near the coaſts are called Mindanayans, and have the greateſt commerce with ſtrangers: for the whole iſland is not ſubject to this prince, nor is either the religion or language the ſame in every part of it. Thoſe who live in the woods and mountains in the midſt of the country are called Hilanoons, and have rich mines of gold and great plenty of bees-wax, which they exchange with the Mindanayans for cloaths and other neceſſaries.

The Sologues are the leaſt nation that inhabit this iſland. They are planted on the north-weſt part of it, and have little commerce with the Mindanayans, though they carry on a conſiderable trade to Manila and the neighbouring iſlands.

The Mindanayan men have little heads and oval faces, with ſmall black eyes; their foreheads are flat, their noſes ſhort, their mouths wide, their lips are red and thin, their hair black and ſtraight, and, as in other parts of India, they black their teeth. They are of a tawny complexion, but of a brighter colour than ſome of their neighbours; their limbs are ſmall, and their bodies ſtraight; they wear their nails to a great length, eſpecially that of the left thumb, which they never cut but ſcrape and nouriſh it with great induſtry. They have a ſtately mien, but are civil to ſtrangers, and entertain them with great familiarity, except they are inſulted or injured, and then they are implacable in their revenge, which they execute ſecretly by poiſon or aſſaſſination.

They wear a kind of linen ſhirt, which ſcarcely reaches down to their knees, and a pair of drawers, but have neither ſhoes nor ſtockings. They wear a ſmall turban on their heads, which is tied once round, and the ends, which are fringed, hang down.

The features of the women are ſomething more agreeable than thoſe of the men, but their noſes are too ſmall; they have long black hair, which they tie up in a roll on the back part of the head, and their faces are rounder than thoſe of the men: their complexion is alſo ſomewhat more agreeable. They wear a ſhort frock, or a ſhirt like the men, but the ſleeves are a great deal wider than their arms; but ſo ſtraight at the wriſt, that they can hardly get their hands through. They have alſo a ſhort petticoat or a piece of cloth wrapt once round their waiſt. The common people wear cloaths made of the plantain-tree, but thoſe in better circumſtances are cloathed in ſilk and callicoe. They have ſmall feet, but, like the men, wear neither ſhoes nor ſtockings, though they have rings on their fingers, and bracelets of gold or ſilver on their wriſts.

The

The Mindanayans are ſaid to be an ingenious and witty people. They can be active enough when they pleaſe, but are generally lazy, and will ſeldom work unleſs they are compelled to it by hunger, which is chiefly attibuted to the tyranny of the prince, who will not permit them to enjoy the wealth they acquire.

The women are allowed to converſe with foreigners, and to entertain them with innocent gallantry at their houſes. When any foreigners arrive at Mindanao it is cuſtomary for the men to go on board and enquire if any of the ſhip's company chooſe a comrade, or a pagally: by a comrade is meant a male friend, and by a pagally one of the other ſex. Almoſt every ſtranger is under a neceſſity of contracting ſuch an acquaintance, and when he comes on ſhore is welcomed to his comrade's or pagally's houſe, where he eats, drinks, and ſleep; but for this his hoſt expects to be paid, and ſeldom makes any other preſent gratis but tobacco or betel. Perſons of the beſt quality allow their wives the freedom of converſing with their pagallys in publick.

The common people live principally on rice, ſago, and ſmall fiſh; while thoſe in better circumſtances eat buffaloe beef and fowls with their rice, but their cookery is very indifferent. As they uſe no ſpoons, they take a handful of rice out of the diſh, which they ſqueeze together and put into their mouths. They always waſh after their meals, and after touching any thing they eſteem unclean. They have a pretty ſtrong liquor made of rice ſteeped in water, and with this they will be very merry; but when they invite foreigners, they do not chooſe to drink out of the ſame veſſel, for fear they ſhould be defiled by the touch.

On days of rejoicing they have women bred to ſinging and dancing, who perform before them; but they have no inſtruments of muſic. Theſe dancers do not leap from the ground, but ſhew the ſuppleneſs of their limbs by the odd poſtures they twiſt themſelves into, ſo that one would hardly believe they have any bones in their fleſh. At theſe entertainments they introduce a ſingle man, who ſeems to act the part of a hero, and putting on a dreadful look ſtrides acroſs the room with his lance in one hand, and a great broad ſword in the other; and, having traverſed it ſeveral times in a menacing manner, throws his lance and draws his dagger, then cuts and ſlaſhes the air, till at length, ſeeming to have brought his enemy down, he gives two or three blows with his broad ſword on the floor, as if he was cutting off his head. He then withdraws, and is ſucceeded by another. Their generals and great men ſometimes exhibit theſe mock battles; and if the ſultan be preſent he frequently concludes this kind of play by behaving as if he was really encountering a dangerous enemy.

They hunt buffaloes, wild cows, deer, and other animals; and frequently take their women with them to partake of their ſport. As they have no dogs, they are but little uſed to firelocks; their hunting only conſiſts in driving the game into a ſtrong fence prepared for that purpoſe.

SECT. VI.

A Deſcription of the City of Mindanao; the Sultan's Palace; the Trade of the Mindanayans; their Schools, mechanic Arts, and Religion.

THE city of Mindanao, which is the chief town in the iſland, is ſituated in about the ſixth degree of north latitude, on the banks of a ſmall river about two miles from the ſea. It is about a mile in length, but is narrow, though it has ſome houſes on the oppoſite ſhore. This city is not well ſituated for commerce, for there is a bar at the mouth of the river, which at a ſpring-tide has not above ten or eleven feet water; ſo that large ſhips cannot eaſily come up to the city.

The houſes of Mindanao are built on poſts between fourteen and twenty feet above ground, and have but one floor, which is divided into ſeveral rooms; and to theſe they aſcend by means of a ladder. Their building in this manner is extremely neceſſary, becauſe their towns being ſituated in the plains by the ſides of rivers, would otherwiſe be deſtroyed, as theſe rivers annually overflow their banks to a very great height. Their buildings, however, are very ſlight; their walls and floors being made of ſplit cane and bamboo, and their roofs covered with palmeto leaves. Underneath their rooms the people keep their ducks and poultry, and make their dunghills, on which account they are not very ſweet, except at the time of the inundation.

The ſultan's palace is very lofty and ſpacious, for it ſtands on one hundred and eighty pillars, and is much higher than the common buildings; a broad ſtair-caſe leads up to it, and in the firſt room are twenty iron cannon mounted upon carriages. Several of the grandees have alſo great guns in their houſes. The floors of the rooms are neatly matted, on account of their ſitting croſs-legged upon them, for they uſe no chairs.

At a ſmall diſtance from the ſultan's palace is a houſe erected for the reception of ambaſſadors and foreign merchants, which is alſo uſed for a council-chamber.

They build ſerviceable ſhips, and veſſels both for trade and pleaſure, and have alſo ſome ſhips of war. They chiefly trade to Manila, to which they export gold and bees-wax; and in return bring back calicoes, muſlins, and China ſilks. They alſo carry on a trade with the iſland of Borneo, and the Dutch come thither in ſloops from Ternate and Tidore to purchaſe rice, bees-wax, and tobacco; for the laſt grows more plentifully at Mindanao than in any other iſland except Manila, and is an excellent ſort, but the people have not the art of managing it to advantage like the Spaniards at Manila. The tobacco at Mindanao is of a deeper colour than that of Manila, and the leaf much larger, which is imputed to the fatneſs of the ſoil. The Manila tobacco is of a bright yellow, and the leaf, which is of a moderate ſize, is not ſtrong, but very pleaſant to ſmoke. The people of that iſland, by well ordering of it, ſell it all over India at a very high price; while that of Mindanao, which is ſaid to be really as good, is ſold exceeding cheap.

Mindanao gold is valued at fourteen Spaniſh dollars the Engliſh ounce, and eighteen dollars the Mindanao ounce, for Spaniſh dollars are the current coin of all theſe iſlands.

In the city of Mindanao they ſpeak two languages, the one the proper language of the iſland, and the other the Malayan tongue, which is ſpoken in all the oriental iſlands, and in ſeveral countries on the continent, as at Cochin-china, Cambodia, and Malacca.

In that city are ſeveral ſchools, in which children are taught to read and write; and it is obſervable, that many of their words, eſpecially in their devotions, are Arabic, and ſome of their forms of ſalutations are in the Turkiſh language. As the Mindanayans do not underſtand accompts, they employ the Chineſe, who live among them, when they have any to ſettle with foreigners. There are but few handicrafts in the city of Mindanao, where the chief trades are the goldſmiths, blackſmiths, and carpenters. The blackſmiths, conſidering their tools, are excellent workmen; they have neither anvil, vice, or hammer, but a great ſtone or piece of an old gun to hammer upon; and in this manner they not only make common utenſils, but all iron-work for ſhips tolerably well. Almoſt every man is a carpenter, and can uſe the ax and adze; and as they have no ſaws, they ſplit all their planks, and then ſmooth them with theſe tools; but, though this requires great labour, they work cheap.

The Mindanayans are frequently afflicted with a kind of leproſy, or dry ſcurf, which ſpreads all over the body, and produces an intolerable itching; for which reaſon they are perpetually ſcratching themſelves. However, they do not ſeem to be under any great fear of catching this loathſome diſeaſe, and never refrain from each others company on that account. Their other diſtempers are the fever, ſmall-pox, and flux; the latter of which occaſions great pains in the bowels.

The Malayans are of the Mahometan religion, and the inhabitan s of the inland country are pagans.

The people of Mindanao, like other Mahometans, allow ſeveral wives and concubines, and the ſultan has about thirty, with whom he chiefly ſpends his time; but the married women here are not ſo cloſely confined as in other places where the doctrines of Mahomet prevail, but are

ſuffered not only to walk the ſtreets, but freely to converſe with ſtrangers. As their religion prohibits their eating ſwine's fleſh, the wild hogs multiply extremely, and even come down from the woods into the towns, ſearching under their houſes for food; while the people dare not kill them for fear of being defiled by their touch, but are very glad when the Europeans will do it for them. Yet they will not ſuffer an European to come near them immediately after he has touched hog's fleſh.

SECT. VII.

Of the Sultan of Mindanao, the Manner in which he goes abroad, and a Deſcription of the Barge in which he takes his Pleaſure by Water; with an Account of the Government of that Prince, and the Manner in which he makes War.

THE ſultan, notwithſtanding his being an abſolute prince, is very poor, for the Hilaloons who inhabit the mountains poſſeſs all the gold-mines, and the country affords little elſe for the uſe of ſtrangers, except ſago, rice, tobacco, and bees-wax; and the laſt alſo comes from the woods and mountains. However, the poverty of the prince ſeems more owing to his tyranny and oppreſſion, than to the want of the materials of commerce; for this puts a ſtop to all induſtry, and neceſſarily occaſions the neglect of trade: for if the prince knows that any of his ſubjects have money, he immediately borrows it, and ſeldom makes any return.

When this prince goes abroad, he is carried on a couch or open palanquin on four men's ſhoulders, and is attended by eight or ten of his guards. When he takes his pleaſure upon the water, he is accompanied by his women. In the middle of the barge is an apartment capable of holding fifty or ſixty people: this is erected with ſplit bamboos, about four feet high, with ſmall windows on the ſides, and the roof is neatly covered with palmeto leaves. This apartment conſiſts of three rooms, one for the prince himſelf, the floor and ſides of which are matted, and it is alſo furniſhed with a carpet and pillows for him to ſleep on. The next room, which is for his women, is furniſhed much in the ſame manner; and the third is for the ſervants, who wait upon them with betel and tobacco, for they are always chewing the one or ſmoking the other. The watermen ſit at the head and ſtern when they row the veſſel.

The prince has one prime miniſter, to whom he commits both his civil and military affairs; and both the natives and foreigners apply to him for permiſſion to trade. As this perſon is alſo general of the ſultan's forces, the ſinging women who perform before him make his great actions in the field the ſubject of their ſongs.

The ſultan of Mindanao is frequently at war with the mountaineers, and ſeldom with any other people. The weapons uſed by his ſoldiers are a lance, a ſword, and a kind of ſhort dagger. They ſeldom come to a general engagement, for the armies are no ſooner advanced within a ſmall diſtance of each other, than they begin to throw up intrenchments and redoubts. Thus they paſs two or three months, ſending out ſmall parties and ſkirmiſhing every day.

SECT. VIII.

Of the ſmall Iſlands ſituated between Mindanao and Manila.

BEFORE we give a particular account of Manila, the largeſt and moſt valuable of all the Philippine iſlands, we ſhall deſcribe the ſituation of the moſt conſiderable of the ſmaller iſlands; for as the cuſtoms and manners of the inhabitants have been already mentioned, they need not be here repeated.

Thirty leagues to the ſouthward of Mindanao is the iſle of Xolo, or Jolo, which is governed by a prince of its own. All the ſhips of Borneo touch here, and this may be conſidered as the mart of all the Mooriſh kingdoms of the eaſt. It abounds in rice, and is the only iſland of all the Philippines that has elephants, which here multiply very faſt, becauſe the inhabitants, it is ſaid, never take them. A great deal of ambergris is thrown on the ſhore of this iſland.

An iſland named Leyto is ſituated to the north-eaſt of Mindanao. It is about one hundred leagues in compaſs, and is divided in the middle by a mountain, which is ſaid to occaſion a great alteration in the air, it being frequently cold on one ſide, while it is very hot on the other.

To the weſt of the laſt mentioned iſland lies Sibu, or Cibou, which is about twenty leagues long, and eight broad. The chief city is Nombre de Dios, which was the firſt town built by the Spaniards in the Philippine iſlands; it is a biſhop's ſee, and has a cathedral, and ſeveral monaſteries. It had formerly a great trade, and the privilege of ſending ſhips to New Spain; but the trade is now removed to Manila.

Bohol, an iſland of about forty leagues in circumference, lies to the ſouth-weſt of Leyta.

To the weſt of Sibu lies Negroes iſland, in ten degrees latitude. It extends in length from north to ſouth, and is about one hundred leagues in circumference. It takes its name from the blacks, its principal inhabitants.

Panay lies to the weſtward of Negroes iſland, in the latitude of ten degrees; it is ſomewhat of a triangular form, and is alſo one hundred leagues in compaſs.

Peragoia, or Paragoa, is the largeſt of the Philippine iſlands, except Manila and Mindanao. It lies to the weſtward of them all, and is about one hundred leagues in length, and from ten to twenty-five in breadth. The ſouth part of the iſland, which lies neareſt to Borneo, is governed by the king of that iſland, and the inhabitants are Mahometans: the north-eaſt part of it is under the dominion of Spain; but the middle of the iſland is poſſeſſed by its original inhabitants.

To the north of Paragoia are three ſmall iſlands, called the Calamines, famous for their edible bird-neſts.

Philippina, or Samar, lies to the ſouth-eaſt of Manila, and is about one hundred and thirty leagues in circumference. The capital of the iſland is called Catbalagan, and is governed by an alcade. The north-eaſt point forms the cape called Spirito Sancto.

Maſbate lies to the weſtward of Samar, and alſo to the ſouth of Manila, in twelve degrees north latitude, and is about thirty leagues in compaſs.

Mindoro lies to the weſtward of Maſbate, in thirteen degrees latitude, and is ſeventy leagues in compaſs.

And to the northward of this laſt iſland is the ſmall iſle of Luban, which is rendered famous by its volcano.

We ſhall now proceed to Manila or Luconia, which is ſituated to the ſouth, and being a place of the utmoſt importance, deſerves a very particular deſcription.

SECT. IX.

Of LUCONIA *or* MANILA.

Its Situation, Extent, Rivers, and Lakes. It is ſubject to Earthquakes. Its Climate, and a Deſcription of the Bay and City of Manila.

MANILA, by far the largeſt of all the Philippine iſlands, extends from thirteen degrees, thirty minutes, to nineteen degrees north latitude, and has been ſometimes reſembled to a bended arm. It is one hundred and ſixty Spaniſh leagues in length; but is of very unequal breadth; it being in ſome places twenty, in ſome thirty, and in others forty leagues over.

This iſland abounds both in rivers and lakes, the principal of which is the lake of Bahia, which is near the city of Manila, and is about ninety miles in compaſs; it is long and narrow, and has great plenty of fiſh: but it is infeſted with crocodiles, that devour both the men and cattle which approach the banks. Near this great lake is a ſmall one upon a mountain, which the natives being unable to fathom, imagine it has no bottom; but it has only ſome ill-taſted fiſh.

This iſland is extremely ſubject to earthquakes; theſe in 1627 levelled one of the mountains, and in 1625, a third part of the city of Manila was overthrown, and no leſs than three thouſand perſons periſhed in the ruins; and the following year there was another earthquake not much leſs dreadful.

Manila, notwithſtanding its ſituation, is eſteemed to be in general extremely healthy, and the water found upon it is ſaid to be the beſt in the world. It produces all the fruits of the warm climates, and has an excellent breed of horſes, ſuppoſed to be firſt carried thither from Spain. It is well ſituated both for the Indian and the Chineſe trade, and the bay and port of Manila, which is on its weſtern ſide, is perhaps the moſt remarkable on the whole globe, the bay being a circular baſon near ten leagues in diameter, and great part of it entirely land-locked. On the eaſt ſide of this bay ſtands the city of Manila. The port, peculiar to the city, is called Cabite, and lies near two leagues to the ſouthward; and in this port all the ſhips employed in the Acapulco trade are uſually ſtationed.

The city of Manila, the capital of the iſland, is in a healthy ſituation; it is well watered, and is in the neighbourhood of a very fruitful and plentiful country; but as the principal buſineſs of this place is its trade to Acapulco, it lies under ſome diſadvantages, from the difficulty there is in getting to ſea to the eaſtward; for the paſſage is among iſlands and through channels, where the Spaniards, by reaſon of their unſkilfulneſs in marine affairs, waſte much time, and are often in great danger.

This city, which is large and populous, ſtands at the foot of a ridge of high hills fronting the harbour. The houſes are ſpacious, ſtrong, and covered with tiles; and the ſtreets large and regular, with a market place in the midſt, and it has ſeveral handſome churches and convents, the principal of which are a cathedral, which is large, but not much adorned on the inſide. The college of Jeſuits is a great building, adorned with arches and ſpacious dormitories. Adjoining to it is the college of St. Joſeph, which has forty collegians, who ſtudy humanity, philoſophy, and divinity. The collegians are cloathed in purple, and have red cloth gowns, and the graduates, by way of diſtinction, wear ſomething like a collar of the ſame cloth.

There are alſo in Manila ſeveral churches, chapels, convents, and hoſpitals that are endowed: in the convent of the church of Miſericordia, dedicated to St. Elizabeth, are received the orphan daughters of Spaniards and Muſtees, who are born of Spaniſh and Indian parents: theſe have a portion of three or four hundred pieces of eight paid for them, and if they chuſe to be nuns, they have a ſuitable annual allowance. The inſide of their churches and chapels are extremely rich; that of St. Auſtin's in particular has fifteen altars richly gilt, but moſt of the public ſtructures are built of wood, on account of the frequent earthquakes in theſe iſlands.

SECT. X.

Of the Government of Manila, and the Number of the People ſubject to Spain.

THE Spaniards have a captain-general, who keeps his court in the city of Manila: This is one of the moſt profitable poſts under the king of Spain, and moſt of the grandees would be ambitious of obtaining it, were not this iſland at ſo great a diſtance from Europe. This officer has under him twenty-two alcades, or governors of towns and provinces, two of whom reſide in the city of Manila: one having the government of the Europeans, and the other that of the Aſiatics. There is alſo a tribunal of three or four judges, in which the captain-general preſides, though he has no voice; for when their opinions are equal, he appoints ſome doctor of laws to give the caſting-vote. Both theſe judges and the ſolicitor for the crown have their places for life, and cannot be turned out by the viceroy; but all military employments are in his gift, and he appoints the governors of provinces: he has likewiſe the nomination of the captains of the galeons which ſail every year to Spain, which poſt is ſaid to be worth fifty thouſand crowns a year. The viceroy uſually keeps a garriſon of about eight hundred ſoldiers in the city, and has three or four thouſand more under his command in other parts of the country. The pay of each man is two pieces of eight and fifty pounds of rice a month.

The captain-general is no ſooner recalled, than proclamation is made for all perſons within ſixty days to come and exhibit their complaints againſt him; he then undergoes a trial, his ſucceſſor being frequently his judge; and this trial being over, he is ſent back to Spain, with an account of his conduct, and of the proceedings againſt him.

As to the eccleſiaſtical government, there is an archbiſhop at Manila elected by the king, who determines all appeals from his ſuffragan biſhops, as well as all affairs in his own dioceſe: but there lies an appeal from him to the pope's delegate, who reſides in one of the Philippines. The revenue of the archbiſhop amounts to ſix thouſand pieces of eight per annum, which he receives from the crown; and that of the biſhops of Sibu, Camerines, and Caguayan, five thouſand. Beſides, that there may be no intermiſſion in the care of ſouls before a new prelate can arrive, there conſtantly reſides at Manila a titular biſhop, or coadjutor, who aſſiſts in the firſt vacant church. There is alſo a court of inquiſition at Manila, under the conduct of a principal inquiſitor appointed by the court of inquiſition at Mexico.

The Chineſe had formerly the dominion of great part of the ſea-coaſt, and it is ſaid three or four thouſand of their deſcendants ſtill remain in this iſland; and being the only mechanics and artiſans of the country, the Spaniards are unable to do without them, and therefore ſuffer them to profeſs their religion at Manila, which is a favour they do not uſually grant in their colonies. Theſe have however an alcade and other Spaniſh officers appointed over them, whoſe ſalary they are obliged to pay; and, beſides other duties and taxes to the crown of Spain, they are ſaid to pay no leſs than ten thouſand pieces of eight per annum only for the liberty of gaming a few days at the beginning of every new year. Their uſual game is called matua, which is no more than even or odd; a ſmall heap of money being laid down, a perſon gueſſes whether the number of pieces in the heap be even or odd. If he gueſſes right, he wins the heap; if not, he pays as much as he would have won. The Spaniards do not permit any of the Chineſe to remain in the houſe of a Chriſtian in the night-time, nor after it is dark to have any light or fire in their own.

There are ſuppoſed to be in all theſe iſlands about two hundred and fifty thouſand ſouls ſubject to the king of Spain, and yet it is computed that theſe do not amount to the twelfth part of the people who inhabit the Philippines. Every maſter of a family under the government of the Spaniards pays an annual duty of ten rials, and every ſingle man above eighteen and under ſixty, pays five rials; and the ſaid ſum is ſaid to be paid by every ſingle virgin who is upwards of twenty-four and under fifty years of age.

As the inhabitants are a mixture of people conſiſting of Spaniards, Chineſe, Indians, &c. their complexions are as different, conſiſting of white, tawny, and black. There are computed to be about three thouſand ſouls within the walls of the city, and as many more in the Chineſe ſuburb. There are beſides other large ſuburbs, that conſiſt of ſeveral Indian nations, who live near the river in houſes built on wooden pillars; and beyond the ſuburbs, on both ſides the river, gardens, farms, and country houſes, extend a great way up into the country, and afford an agreeable proſpect. The inhabitants of the mountains live under the ſhelter of great trees, or in ſmall huts made of their branches; and when they have eaten up the fruit, and the roots proper for nouriſhment that are to be found near them, they remove to another place.

SECT. XI.

Of the Trade of Manila, and the Manner in which the Ships of that Iſland ſail to Acapulco. That Iſland taken by the Engliſh.

MANILA, from its excellent port placed in a manner between the rich kingdoms of the Eaſt and Weſt, was once conſidered as the beſt ſituation for trade in the known world, eſpecially when the Molucca iſlands were under the ſame government; for the Spaniards had there the

the beſt ſhare of the Eaſt as well as the Weſt Indies. Hither diamonds and other precious ſtones were brought from Golconda; ſilver, from New Spain and Peru; nutmegs and cloves, from the Moluccas; cinnamon, from Ceylon; pepper, from Sumatra and Java; ſilks, from Bengal; camphire, from Borneo; benjamin and ivory from Cambogia; china-ware ſilks, from China; and formerly two or three ſhips came every year from Japan, freighted with ſilver, amber, ſilks, cabinets, and other japan-ware, in exchange for hides, wax, and the fruits of the country; and two veſſels annually ſail to Acapulco, in New Spain, loaded with the riches of the Eaſt, and returned, as they do at preſent, chiefly freighted with ſilver.

The trade carried on from Manila to China, and different parts of India, is principally for ſuch commodities as are intended to ſupply the kingdoms of Mexico and Peru. Theſe are ſpices, all ſorts of Chineſe ſilks and manufactures, particularly ſilk ſtockings, of which, it is ſaid, fifty thouſand pair are uſually ſhipped in each cargo; great quantities of Indian ſtuffs, as chints and calicoes, with gold-ſmith's work, and other articles, chiefly made at the city of Manila.

All the inhabitants of Manila do not enjoy the benefit of trading to Acapulco. The ſhips employed in this commerce are found by the king of Spain, who pays the officers and crew, and the tonage is divided into a certain number of bales, all of the ſame ſize. Theſe are diſtributed among the convents at Manila, but principally to the jeſuits, as a donation to enable them to ſupport their miſſions for the propagation of the catholic faith. Thus the convents have a right to embark ſuch a quantity of goods on board the Manila ſhip as amount to the tonage of their bales; or if they do not chooſe to be immediately concerned in trade, they may ſell this privilege to others; and when the merchant to whom they ſell their ſhare is unprovided with a ſtock, it is not uncommon for the convents to lend him conſiderable ſums of money on bottomry.

The trade is limited by the royal edicts to a certain value, which the annual cargo ought not to exceed. This limitation is ſaid to be ſix hundred thouſand dollars; but it does not fall much ſhort of three millions of dollars.

As the greateſt ſhare of the treaſure returned from Acapulco is again diſperſed into different parts of India, and as all European nations have generally eſteemed it good policy to keep their American ſettlements in an immediate dependance on their mother country, without permitting them to carry on directly any gainful trade with other powers; many remonſtrances have been preſented to the court of Spain againſt this Indian trade allowed to the kingdom of Mexico. It has been urged, that the ſilk manufactures of Valencia, and other parts of Spain, are by this means greatly prejudiced, and the linens carried from Cadiz much injured in their ſale; ſince the Chineſe ſilks coming almoſt directly to Acapulco can be afforded conſiderably cheaper there than any European manufactures of equal goodneſs, and the cotton from the coaſt of Coromandel ſupply the place of the European linens. So that the Manila trade renders both Mexico and Peru too little dependant upon Spain for a ſupply of their neceſſaries, and exhauſts thoſe countries of a conſiderable quantity of ſilver, the greateſt part of which, were this trade prohibited, would center in Spain, either in payment for Spaniſh commodities, or in gains to the Spaniſh merchants: whereas, now the only advantage received from it is, the enriching the jeſuits, and a few particular perſons at the other extremity of the world. Theſe arguments ſo far influenced Don Joſeph Patintho, who was formerly prime miniſter, and an enemy to the jeſuits, that about the year 1725 he reſolved to aboliſh this trade, and to permit no Indian commodities to be introduced into any of the Spaniſh ports in the Weſt Indies, except ſuch as were brought thither by the regiſter ſhips from Europe. But the powerful intrigues of the jeſuits prevented this regulation from taking place.

The trade between Manila and Acapulco is generally carried on in one, or at moſt two annual ſhips. Theſe ſail from Manila in about July, and arrive at Acapulco in December, January, or February following; and having there diſpoſed of their effects, return for Manila in March, and uſually arrive there in June. Thus a whole year is nearly taken up in the voyage. For this reaſon, though one ſhip is only freighted at a time, yet another is always ready when that arrives. Hence there are always three or four ſtout ſhips, that in caſe of any accident the trade may not be ſuſpended. The largeſt is deſcribed as little leſs than one of our firſt-rate men of war, and ſometimes has twelve hundred men on board; and though their other ſhips are far inferior in bulk, yet they are ſtout large veſſels, of the burthen of twelve hundred tons and upwards, and generally carry fifty guns, and have on board from three hundred and fifty to ſix hundred hands, paſſengers included.

For theſe and many other obſervations in relation to Manila, and the important branch of trade carried on between that city and Acapulco, we are indebted to commodore Anſon's Voyage; from which we ſhall, for the ſatisfaction of the curious, give a circumſtantial detail of the navigation from thence to Acapulco. The ſhip having received her cargo on board, and being fitted for the ſea, generally weighs from the mole of Cabite about the middle of July, when the weſterly monſoon ſets in. Its ſailing through the channel, called the Boccadero to the eaſtward, is ſo troubleſome a navigation, that it is ſometimes the end of Auguſt before they complete it. When they have cleared this paſſage, and are diſentangled from the iſlands, they ſteer to the north-eaſt till they arrive in the latitude of thirty degrees, or upwards, where they expect to meet with weſterly winds, before which they ſtretch away for California; and never let go her anchor till ſhe arrives on that coaſt. This voyage ſeldom takes up leſs time than ſix months, and the ſhip being deeply laden with merchandize, and crowded with people, it muſt appear ſurpriſing how they can be ſupplied with a ſtock of freſh water for ſo long a voyage; and this being done by a method extremely ſingular, it deſerves to be particularly mentioned.

Their water is preſerved on board, not in caſks, but in earthen-jars, that almoſt reſemble the large oil-jars we often ſee in Europe. When the Manila ſhip firſt puts to ſea, ſhe has on board a much greater quantity of water than can be ſtowed between decks, and the jars which contain it are hung all about the ſhrouds and ſtays, ſo as to exhibit at a diſtance a very odd appearance. Though theſe jars are much more manageable than caſks, and are liable to no leakage, unleſs they are broken; yet a ſix, or even a three months ſtore of water, could never, by any management, be ſtowed in a ſhip ſo loaded; and therefore, without ſome other ſupply, this navigation could not be performed: but this ſupply ſeems at firſt ſight ſo extremely precarious, that it is amazing ſuch numbers ſhould run the hazard of periſhing by the moſt dreadful of all deaths. In ſhort, their only method of obtaining a freſh ſupply of water is by the rains they meet with between the latitudes of thirty and forty degrees north, and which they are always prepared to catch; for they take with them a great number of mats, which, whenever the rain deſcends, they range ſlopingly againſt the gunwale, from one end of the ſhip to the other, their lower edges reſting on a large ſplit bamboo; whence all the water that falls on the mats drains into the bamboos, which conveys it into the jars. However accidental this method of furniſhing themſelves with water may appear, it hath been never known to fail; and it is common for them, when their voyage is a little longer than uſual, to fill all their jars ſeveral times over.

In 1743 commodore Anſon took near this iſland a large Acapulco ſhip, in which was one million three hundred and thirteen thouſand eight hundred and forty-three pieces of eight, and thirty-five thouſand ſix hundred and eighty-two ounces of virgin ſilver, beſides ſome cochineal and other commodities, which he brought to England in 1744.

Towards the concluſion of the laſt war, when Spain, upon the moſt idle pretences, joined with France to put a ſtop to the amazing ſucceſſion of victories, with which Providence had bleſſed our arms, it was reſolved to attack Manila. Vice-admiral Corniſh and general Draper were directed to go upon this expedition: the troops alotted for the enterprize were only the ſeventy-ninth regiment, and a company of royal artillery; but the gentlemen of Madraſs furniſhed them with thirty of their artillery, ſix hundred

hundred of their ſeapoys, a company of caffrees, another of tapazes, and another of pioneers, with two companies of Frenchmen who had inliſted in their ſervice, and ſome hundred of unarmed Laſcars; to which rear-admiral Corniſh added a fine battalion of five hundred and fifty ſeamen, and two hundred and ſeventy marines; the whole force for the land operations amounting to two thouſand three hundred men; who, with the neceſſary ſtores, embarked on board his majeſty's ſquadron, and two India ſhips employed as tranſports.

On the 23d of September, 1762, they anchored in Manila-bay, and the next day, having in vain ſummoned the city to ſurrender, a part of the troops landed in the evening near a church and village called Malata, about two miles to the ſouth of Manila; while the frigates kept up a briſk fire to protect their flanks, and diſperſe the enemy, conſiſting of both horſe and foot, that began to aſſemble, in order to oppoſe their deſcent. This had the deſired effect, for they retired, and left a clear coaſt; but a violent ſurf which aroſe daſhed many of the boats to pieces, and damaged the arms and ammunition. The Engliſh, however, having formed on the beach, marched and took poſſeſſion of Malata, while the Spaniards of the city of Manila were employed in burning part of the ſuburbs.

On the twenty-fifth they ſeized the fort of Polveriſta, which the Spaniards had abandoned; and the ſame day colonel Monſon, with two hundred men, took poſſeſſion of the church of Hermita, about nine hundred yards from the city, and the prieſt's houſe was made the head-quarters. They ſoon found that the monſoon had broke upon them, the rains that fell deluged the country, and made it impoſſible to encamp. This poſt was therefore of the utmoſt conſequence, both from its ſtrength and the great ſhelter it afforded, and therefore to ſecure it major More marched up with the ſeventy-ninth regiment. Then proceeding ſtill nearer to the city, they advanced, under cover of the houſes, to the church of St. Jago, which is ſituated near the ſea, and within three hundred yards of the city:

Mean while the ſurf continuing dangerous, and the rains increaſing, the landing of the artillery and ſtores was attended with great hazard, and the remaining troops were put on ſhore with ſome loſs; but the courage and activity of the ſeamen ſurmounted all obſtacles. The next day the Spaniards, who had before endeavoured in vain to diſlodge them, took poſſeſſion of a church about two hundred yards to the right of St. Jago, and began a cannonade with two field-pieces upon the right flank of the poſt; but a party being ſent againſt them, they were ſoon driven back into the town, with ſuch precipitation, that they left one of the field-pieces upon the glacis, and colonel Monſon had orders to keep poſſeſſion of this ſecond church; for as they had neither a ſufficient number of men, nor dry ground to make regular approaches, they were forced, by their critical ſituation, into theſe raſh meaſures.

From the top of this laſt poſt they had a perfect view of the enemy's works, and found that the front they were obliged to attack was defended by the baſtions of St. Diego and St. Andrew, with orillons and retired flanks, a ravelin, which covered the royal gate, a wet ditch, covered-way, and glacis. The baſtions, which were in excellent order, were lined with a great number of fine braſs cannon; but their ravelin was not armed, the covered-way was out of repair, the glacis was low, and the ditch not carried round the capital of the baſtion of St. Diego; which determined them to attack it, and a ſmall part of the ſeventy-ninth regiment, under the brave captain Fletcher, had the courage to approach the walls and ſound the ditch, which they found to be about thirty yards broad, and the depth of the water only five feet: while the Spaniards, firing from their baſtion, killed or wounded three of theſe bold adventurous men.

The great extent of this populous city rendering it impoſſible for the beſiegers to inveſt it, two ſides were conſtantly open to the Spaniards, who made uſe of this advantage by introducing ſupplies of men and proviſions, and the garriſon of eight hundred men was augmented by ten thouſand Indians, a fierce and barbarous people: but no difficulty could check the ardour of the troops, who made faſcines and gabions, opened batteries, and continued their bombardment day and night.

Mean while the governor ſent a flag of truce to apologize for ſome barbarities committed by the ſavages who had murdered ſome ſtraggling ſeamen, and to deſire that his nephew, who had been taken in the bay, might be ſent aſhore. This requeſt was granted, and lieutenant Fry was ordered to conduct him into the town with a flag of truce: but as that gentleman was advancing with him, a large party of the garriſon, intermixed with Indians, making a ſally, the barbarians, without reſpecting his character, inhumanly murdered him, mangling his body in a moſt ſhocking manner; and alſo mortally wounded a gentleman who endeavoured to ſave him: when it being evident that the Indians alone were guilty of this horrid piece of barbarity, our ſoldiers ſhewed them no mercy.

At length the weather grew ſo tempeſtuous, that the whole ſquadron was in danger, and all communication with it was cut off; while the violence of the ſtorm forced the South-Sea-Caſtle ſtore-ſhip, from her anchors, and drove her aſhore; but even in this ſituation ſhe was of great uſe, by enfalading the whole ſea-beach to the ſouthward, and keeping in awe a large body of Indians, who menaced the Polveriſta and the Engliſh magazines at the Malata. The deluge of rain and the roaring of the wind continuing, the enemy ſeemed to truſt entirely to the elements; while the archbiſhop, who acted as governor, gave out that an angel of the Lord was gone forth to deſtroy their enemies, like the hoſt of Sennacherib.

But the weather no ſooner became moderate, than, by the ſkill and management of major Barker and the officers under him, a freſh battery ſilenced twelve pieces of cannon on the baſtion of St. Diego: yet ſoon after one thouſand of the Indians attacked the cantonment of the ſeamen. This was performed on the fourth of October, three hours before day, when their approach was favoured by a multitude of thick buſhes that grew upon the ſide of a rivulet, which they paſſed in the night; and, by keeping cloſe, eluded the vigilance of the patroles. Colonel Monſon and captain Fletcher, with the picquets, were ſent to the aſſiſtance of the ſeamen, who bravely kept their poſts, and were ſatisfied with repulſing them till day-break; though the Indians, armed with bows, arrows, and lances, advanced to the very muzzles of their pieces, and died gnawing of the bayonets; but it no ſooner grew light, than a freſh picquet of the ſeventy-ninth regiment appearing, they fled with the loſs of three hundred men.

Scarce were theſe Indians diſperſed, when another body of them, with part of the Spaniſh garriſon, attacked the church which the Engliſh had before taken from the Spaniards, and forcing the ſeapoys from their poſt in it, took poſſeſſion of the top, from whence they killed and wounded ſeveral of our people, who were entirely expoſed to all their weapons: yet the European ſoldiers, with great firmneſs and patience, maintained their poſt behind that ſtructure; and at laſt, with the aſſiſtance of ſome field-pieces, diſlodged the enemy.

This was the enemy's laſt effort: all their Indians, except eighteen hundred, diſcouraged by their loſſes, returned home: and the fire of our batteries, which had been a little interrupted by theſe attacks, was renewed with greater ſpirit than ever. A conſiderable breach being made, on the ſixth of October, at four o'clock in the morning, the troops, to give the leſs ſuſpicion, filed off in ſmall parties, and aſſembled at St. Jago's church. At day-break the walls being cleared by the cannon, ſixty volunteers, under lieutenant Ruſſel, ſupported by a body of grenadiers, at the ſignal of a general diſcharge of the artillery and mortars, with the greateſt intrepidity, ruſhed on to the aſſault, under the cover of a thick ſmoke, that blew directly upon the town: they were cloſely followed by the engineers, the pioneers, and others to clear and enlarge the breach, and make lodgments in caſe the enemy ſhould be too ſtrongly intrenched. Then advanced colonel Monſon and major More, at the head of two grand diviſions of the ſeventy-ninth, the battalion of ſeamen followed next, ſuſtained by the other two diviſions of the ſeventy-ninth, and the company's troops cloſed the rear. They all mounted the breach with amazing ſpirit and rapidity; upon which the Spaniards in the baſtion diſperſed ſo ſuddenly,

as to raiſe a ſuſpicion that they depended on their mines. They met with little reſiſtance, except from the guard-houſe over the Royal-gate, where one hundred Spaniards and Indians, boldly refuſing to ſurrender, were put to the ſword, and from the lofty houſes that ſurround the grand ſquare. Three hundred men were drowned in attempting to eſcape over the river: mean while the governor and principal officers retired to the citadel, where they were glad to ſurrender at diſcretion, and were admitted priſoners of war on their parole of honour; while all the Indians who were taken were diſmiſſed in ſafety. The people and their effects were taken under his majeſty's protection; and they were freely allowed to enjoy their religion, liberties, and trade: on the other hand, the Spaniards conſented to pay four millions of dollars, and to deliver up the port of Cavite and the citadel, with all the iſlands and forts dependent on Manila, to his majeſty; with all the military ſtores and magazines, for the preſervation of the town and their effects. The Engliſh alſo took ſeveral large ſhips, and among the reſt the Santiſſimo Trinidad, bound for Acapulco.

But before this agreeable news had reached England, the peace was concluded, by which it was agreed, that any acquiſitions made of the Philippine iſlands ſhould be reſtored to Spain.

CHAP. VII.

Of the Iſland of CELEBES, or MACASSAR.

SECT. I.

Its Situation, Extent, Climate, Plants, and Animals.

TO the ſouth of Mindanao lies the iſland of Celebes, or Macaſſar, which is called the key of the Spice Iſlands. It extends from one degree thirty minutes north latitude to five degrees thirty minutes ſouth, and is ſituate to the eaſt of the great iſland of Borneo. From the ſouth-weſt point to the north-eaſt is about five hundred miles in length, and in the broadeſt part it is near two hundred miles over. On the ſouth part of the iſland is a bay ſeven or eight leagues wide, that runs forty or fifty leagues into the country; and on the eaſt ſide of the iſland are ſeveral bays and harbours, and many ſmall iſlands and ſhoals. The country is there low, flat, and watered by many ſmall rivulets; but towards the north the land riſes in hills.

The air is hot and moiſt, for the country lying under the line is ſubject to great rains. The time of the northern monſoons is the moſt healthful ſeaſon; but if theſe fail to blow the accuſtomed time, which very ſeldom happens, great numbers of people are ſwept away by ſickneſs. In the country are mines of gold, copper, and tin; but it does not appear that any great uſe is made of them. The gold they have is chiefly found in the ſands of the rivers, and at the bottoms of the hills, where it is waſhed down by the torrents.

Their woods conſiſt of the trees uſually found within the tropics. They have particularly ebony, calamback, and ſanders, with ſeveral ſorts of wood proper for dying. The bamboos are remarkably large, ſome being four or five fathoms long, and about two feet in diameter: theſe they make uſe of in building their houſes and boats.

Their fruits and flowers reſemble thoſe of the Philippines; but the former are ſaid to have a more delicious flavour than the fruits of other countries expoſed to floods. The plains are here covered with the cotton ſhrub which bears a red flower, and when that falls leaves a head about the ſize of a walnut, from whence the cotton is drawn; and that which grows in this iſland is eſteemed the fineſt in all India.

They have pepper and ſugar of their own growth, and alſo great plenty of betel and areca; but neither nutmegs, mace, nor cloves: though they formerly imported ſuch quantities from the Spice Iſlands, that they had not only ſufficient for their own uſe, but ſold great quantities of thoſe ſpices to foreigners.

Their rice is ſaid to be better than in other parts of the Eaſt Indies, and from its goodneſs alone the natives are thought to be of a ſtronger conſtitution than thoſe of the continent. This iſland produces great quantities of opium, which is much admired by the natives, who make it up in little pills, which they often diſſolve in water, and ſprinkle their tobacco with it. Thoſe who are uſed to this ſlow poiſon can never leave it off; they are lulled as it were into a pleaſing dream, and intoxicated as if with ſtrong liquor, but it inſenſibly preys upon their ſpirits and ſhortens their lives. When they enter into battle they put about the quantity of two pins heads of it into a pipe of tobacco; and they have no ſooner ſmoked this pipe, than they become almoſt inſenſible of wounds or danger while the effect continues.

The natives are famous for compounding poiſons from the venomous drugs and herbs produced in the country. In theſe fatal mixtures they dip the point of their daggers, and the darts they blow through their hollow trunks: and though theſe have been poiſoned twenty years the fatal venom ſtill continues, and the leaſt wound proves mortal; and ſo ſuddenly does the poiſon ſeize the vitals, that a criminal being by way of experiment wounded in the toe by one of theſe little pointed darts he died, though two European ſurgeons, who ſtood by, cut off the part as ſoon as it was wounded.

Some of theſe poiſonous plants ſo nearly reſemble that which produces opium, that it is difficult to diſtinguiſh the one from the other; yet it is obſerved, that the cattle have ſuch ſagacity that they ſeldom touch a noxious herb, and if they happen to tread near one, will haſtily fly from it, as if they knew better than man the danger of approaching ſuch fatal plants.

Few countries in the world afford larger or better cattle than the iſland of Celebes; but there are ſuch numbers of large monkies, and baboons, that they are dangerous to travellers, and a man ought to be well armed in order to defend himſelf againſt them. Some of them have no tail, but others have very long ones. Some walk on fours, and others are ſaid to walk upright like men, and never to uſe their fore feet but as hands. The white are as big as an Engliſh maſtiff, and much more dangerous than the ſtraw coloured, and the black; but their principal ſpight is ſaid to be at women; for if they meet with one alone, they will call their companions together, and, if not prevented, ſtrangle her and pull her into a thouſand pieces. They are ſaid to be maſters of the foreſt, and by keeping in bodies are too hard for any of the wild beaſts; but they are much afraid of the ſerpents, who are of a monſtrous ſize, and continually make war upon them: it is even ſaid they will purſue them to the very tops of the trees, and devour them. In ſome of theſe monkeys is found the bezoar ſtone, which is eſteemed much better, and is conſequently dearer than thoſe found in goats.

They have abundance of ſmall horſes for riding, but uſe no other ſaddle, than a painted cloth without any ſtirrups; and a cord with a wooden bit ſerves them for a bridle. Theſe horſes have very bad hoofs, and are never ſhod, nor are they ever put to drawing, for that is ſolely performed by oxen and buffaloes.

There is but one conſiderable river in the iſland, and that is much infeſted by crocodiles.

hundred of their ſeapoys, a company of caffrees, another of tapazes, and another of pioneers, with two companies of Frenchmen who had inliſted in their ſervice, and ſome hundred of unarmed Laſcars; to which rear-admiral Corniſh added a fine battalion of five hundred and fifty ſeamen, and two hundred and ſeventy marines; the whole force for the land operations amounting to two thouſand three hundred men; who, with the neceſſary ſtores, embarked on board his majeſty's ſquadron, and two India ſhips employed as tranſports.

On the 23d of September, 1762, they anchored in Manila-bay, and the next day, having in vain ſummoned the city to ſurrender, a part of the troops landed in the evening near a church and village called Malata, about two miles to the ſouth of Manila; while the frigates kept up a briſk fire to protect their flanks, and diſperſe the enemy, conſiſting of both horſe and foot, that began to aſſemble, in order to oppoſe their deſcent. This had the deſired effect, for they retired, and left a clear coaſt; but a violent ſurf which aroſe daſhed many of the boats to pieces, and damaged the arms and ammunition. The Engliſh, however, having formed on the beach, marched and took poſſeſſion of Malata, while the Spaniards of the city of Manila were employed in burning part of the ſuburbs.

On the twenty-fifth they ſeized the fort of Polveriſta, which the Spaniards had abandoned; and the ſame day colonel Monſon, with two hundred men, took poſſeſſion of the church of Hermita, about nine hundred yards from the city, and the prieſt's houſe was made the head-quarters. They ſoon found that the monſoon had broke upon them, the rains that fell deluged the country, and made it impoſſible to encamp. This poſt was therefore of the utmoſt conſequence, both from its ſtrength and the great ſhelter it afforded, and therefore to ſecure it major More marched up with the ſeventy-ninth regiment. Then proceeding ſtill nearer to the city, they advanced, under cover of the houſes, to the church of St. Jago, which is ſituated near the ſea, and within three hundred yards of the city:

Mean while the ſurf continuing dangerous, and the rains increaſing, the landing of the artillery and ſtores was attended with great hazard, and the remaining troops were put on ſhore with ſome loſs; but the courage and activity of the ſeamen ſurmounted all obſtacles. The next day the Spaniards, who had before endeavoured in vain to diſlodge them, took poſſeſſion of a church about two hundred yards to the right of St. Jago, and began a cannonade with two field-pieces upon the right flank of the poſt; but a party being ſent againſt them, they were ſoon driven back into the town, with ſuch precipitation, that they left one of the field-pieces upon the glacis, and colonel Monſon had orders to keep poſſeſſion of this ſecond church; for as they had neither a ſufficient number of men, nor dry ground to make regular approaches, they were forced, by their critical ſituation, into theſe raſh meaſures.

From the top of this laſt poſt they had a perfect view of the enemy's works, and found that the front they were obliged to attack was defended by the baſtions of St. Diego and St. Andrew, with orillons and retired flanks, a ravelin, which covered the royal gate, a wet ditch, covered-way, and glacis. The baſtions, which were in excellent order, were lined with a great number of fine braſs cannon; but their ravelin was not armed, the covered-way was out of repair, the glacis was low, and the ditch not carried round the capital of the baſtion of St. Diego; which determined them to attack it, and a ſmall part of the ſeventy-ninth regiment, under the brave captain Fletcher, had the courage to approach the walls and ſound the ditch, which they found to be about thirty yards broad, and the depth of the water only five feet: while the Spaniards, firing from their baſtion, killed or wounded three of theſe bold adventurous men.

The great extent of this populous city rendering it impoſſible for the beſiegers to inveſt it, two ſides were conſtantly open to the Spaniards, who made uſe of this advantage by introducing ſupplies of men and proviſions, and the garriſon of eight hundred men was augmented by ten thouſand Indians, a fierce and barbarous people: but no difficulty could check the ardour of the troops, who made faſcines and gabions, opened batteries, and continued their bombardment day and night.

Mean while the governor ſent a flag of truce to apologize for ſome barbarities committed by the ſavages who had murdered ſome ſtraggling ſeamen, and to deſire that his nephew, who had been taken in the bay, might be ſent aſhore. This requeſt was granted, and lieutenant Fry was ordered to conduct him into the town with a flag of truce: but as that gentleman was advancing with him, a large party of the garriſon, intermixed with Indians, making a ſally, the barbarians, without reſpecting his character, inhumanly murdered him, mangling his body in a moſt ſhocking manner; and alſo mortally wounded a gentleman who endeavoured to ſave him: when it being evident that the Indians alone were guilty of this horrid piece of barbarity, our ſoldiers ſhewed them no mercy.

At length the weather grew ſo tempeſtuous, that the whole ſquadron was in danger, and all communication with it was cut off; while the violence of the ſtorm forced the South-Sea-Caſtle ſtore-ſhip, from her anchors, and drove her aſhore; but even in this ſituation ſhe was of great uſe, by enfalading the whole ſea-beach to the ſouthward, and keeping in awe a large body of Indians, who menaced the Polveriſta and the Engliſh magazines at the Malata. The deluge of rain and the roaring of the wind continuing, the enemy ſeemed to truſt entirely to the elements; while the archbiſhop, who acted as governor, gave out that an angel of the Lord was gone forth to deſtroy their enemies, like the hoſt of Sennacherib.

But the weather no ſooner became moderate, than, by the ſkill and management of major Barker and the officers under him, a freſh battery ſilenced twelve pieces of cannon on the baſtion of St. Diego: yet ſoon after one thouſand of the Indians attacked the cantonment of the ſeamen. This was performed on the fourth of October, three hours before day, when their approach was favoured by a multitude of thick buſhes that grew upon the ſide of a rivulet, which they paſſed in the night; and, by keeping cloſe, eluded the vigilance of the patroles. Colonel Monſon and captain Fletcher, with the picquets, were ſent to the aſſiſtance of the ſeamen, who bravely kept their poſts, and were ſatisfied with repulſing them till day-break; though the Indians, armed with bows, arrows, and lances, advanced to the very muzzles of their pieces, and died gnawing of the bayonets; but it no ſooner grew light, than a freſh picquet of the ſeventy-ninth regiment appearing, they fled with the loſs of three hundred men.

Scarce were theſe Indians diſperſed, when another body of them, with part of the Spaniſh garriſon, attacked the church which the Engliſh had before taken from the Spaniards, and forcing the ſeapoys from their poſt in it, took poſſeſſion of the top, from whence they killed and wounded ſeveral of our people, who were entirely expoſed to all their weapons: yet the European ſoldiers, with great firmneſs and patience, maintained their poſt behind that ſtructure; and at laſt, with the aſſiſtance of ſome field-pieces, diſlodged the enemy.

This was the enemy's laſt effort: all their Indians, except eighteen hundred, diſcouraged by their loſſes, returned home: and the fire of our batteries, which had been a little interrupted by theſe attacks, was renewed with greater ſpirit than ever. A conſiderable breach being made, on the ſixth of October, at four o'clock in the morning, the troops, to give the leſs ſuſpicion, filed off in ſmall parties, and aſſembled at St. Jago's church. At day-break the walls being cleared by the cannon, ſixty volunteers, under lieutenant Ruſſel, ſupported by a body of grenadiers, at the ſignal of a general diſcharge of the artillery and mortars, with the greateſt intrepidity, ruſhed on to the aſſault, under the cover of a thick ſmoke, that blew directly upon the town: they were cloſely followed by the engineers, the pioneers, and others to clear and enlarge the breach, and make lodgments in caſe the enemy ſhould be too ſtrongly intrenched. Then advanced colonel Monſon and major More, at the head of two grand diviſions of the ſeventy-ninth, the battalion of ſeamen followed next, ſuſtained by the other two diviſions of the ſeventy-ninth, and the company's troops cloſed the rear. The Engliſh alſo took ſeveral large ſhips, and among the reſt the Santiſſimo Trinidad, bound for Acapulco.

But before this agreeable news had reached England, the peace was concluded, by which it was agreed, that any acquiſitions made of the Philippine iſlands ſhould be reſtored to Spain.

CHAP. VII.

Of the Iſland of CELEBES, or MACASSAR.

SECT. I.

Its Situation, Extent, Climate, Plants, and Animals.

TO the ſouth of Mindanao lies the iſland of Celebes, or Macaſſar, which is called the key of the Spice Iſlands. It extends from one degree thirty minutes north latitude to five degrees thirty minutes ſouth, and is ſituate to the eaſt of the great iſland of Borneo. From the ſouth-weſt point to the north-eaſt is about five hundred miles in length, and in the broadeſt part it is near two hundred miles over. On the ſouth part of the iſland is a bay ſeven or eight leagues wide, that runs forty or fifty leagues into the country; and on the eaſt ſide of the iſland are ſeveral bays and harbours, and many ſmall iſlands and ſhoals. The country is there low, flat, and watered by many ſmall rivulets; but towards the north the land riſes in hills.

The air is hot and moiſt, for the country lying under the line is ſubject to great rains. The time of the northern monſoons is the moſt healthful ſeaſon; but if theſe fail to blow the accuſtomed time, which very ſeldom happens, great numbers of people are ſwept away by ſickneſs. In the country are mines of gold, copper, and tin; but it does not appear that any great uſe is made of them. The gold they have is chiefly found in the ſands of the rivers, and at the bottoms of the hills, where it is waſhed down by the torrents.

Their woods conſiſt of the trees uſually found within the tropics. They have particularly ebony, calamback, and ſanders, with ſeveral ſorts of wood proper for dying. The bamboos are remarkably large, ſome being four or five fathoms long, and about two feet in diameter: theſe they make uſe of in building their houſes and boats.

Their fruits and flowers reſemble thoſe of the Philippines; but the former are ſaid to have a more delicious flavour than the fruits of other countries expoſed to floods. The plains are here covered with the cotton ſhrub which bears a red flower, and when that falls leaves a head about the ſize of a walnut, from whence the cotton is drawn; and that which grows in this iſland is eſteemed the fineſt in all India.

They have pepper and ſugar of their own growth, and alſo great plenty of betel and areca; but neither nutmegs, mace, nor cloves: though they formerly imported ſuch quantities from the Spice Iſlands, that they had not only ſufficient for their own uſe, but ſold great quantities of thoſe ſpices to foreigners.

Their rice is ſaid to be better than in other parts of the Eaſt Indies, and from its goodneſs alone the natives are thought to be of a ſtronger conſtitution than thoſe of the continent. This iſland produces great quantities of opium, which is much admired by the natives, who make it up in little pills, which they often diſſolve in water, and ſprinkle their tobacco with it. Thoſe who are uſed to this ſlow poiſon can never leave it off; they are lulled as it were into a pleaſing dream, and intoxicated as if with ſtrong liquor, but it inſenſibly preys upon their ſpirits and ſhortens their lives. When they enter into battle they put about the quantity of two pins heads of it into a pipe of tobacco; and they have no ſooner ſmoked this pipe, than they become almoſt inſenſible of wounds or danger while the effect continues.

The natives are famous for compounding poiſons from the venomous drugs and herbs produced in the country. In theſe fatal mixtures they dip the point of their daggers, and the darts they blow through their hollow trunks: and though theſe have been poiſoned twenty years the fatal venom ſtill continues, and the leaſt wound proves mortal; and ſo ſuddenly does the poiſon ſeize the vitals, that a criminal being by way of experiment wounded in the toe by one of theſe little pointed darts he died, though two European ſurgeons, who ſtood by, cut off the part as ſoon as it was wounded.

Some of theſe poiſonous plants ſo nearly reſemble that which produces opium, that it is difficult to diſtinguiſh the one from the other; yet it is obſerved, that the cattle have ſuch ſagacity that they ſeldom touch a noxious herb, and if they happen to tread near one, will haſtily fly from it, as if they knew better than man the danger of approaching ſuch fatal plants.

Few countries in the world afford larger or better cattle than the iſland of Celebes; but there are ſuch numbers of large monkies, and baboons, that they are dangerous to travellers, and a man ought to be well armed in order to defend himſelf againſt them. Some of them have no tail, but others have very long ones. Some walk on fours, and others are ſaid to walk upright like men, and never to uſe their fore feet but as hands. The white are as big as an Engliſh maſtiff, and much more dangerous than the ſtraw coloured, and the black; but their principal ſpight is ſaid to be at women; for if they meet with one alone, they will call their companions together, and, if not prevented, ſtrangle her and pull her into a thouſand pieces. They are ſaid to be maſters of the foreſt, and by keeping in bodies are too hard for any of the wild beaſts; but they are much afraid of the ſerpents, who are of a monſtrous ſize, and continually make war upon them: it is even ſaid they will purſue them to the very tops of the trees, and devour them. In ſome of theſe monkeys is found the bezoar ſtone, which is eſteemed much better, and is conſequently dearer than thoſe found in goats.

They have abundance of ſmall horſes for riding, but uſe no other ſaddle, than a painted cloth without any ſtirrups; and a cord with a wooden bit ſerves them for a bridle. Theſe horſes have very bad hoofs, and are never ſhod, nor are they ever put to drawing, for that is ſolely performed by oxen and buffaloes.

There is but one conſiderable river in the iſland, and that is much infeſted by crocodiles.

SECT. II.

Of the Perſons, Dreſs, Genius, Manners and Cuſtoms of Natives; the Education of their Children; their Food, and the manner in which they ſit at their Meals.

THE inhabitants of this iſland are of a moderate ſtature, they are of a ſwarthy complexion; their cheek-bones riſe very high, and their noſe is generally flat, which is eſteemed a beauty, and nearly as much pains is taken to flatten them in their infancy, as to make the Chineſe ladies have ſmall feet. Their hair, which is black and ſhining, is tied up, and when they are dreſſed is covered with a turban; but at other times they wear a kind of hat with ſmall brims.

The people in affluent circumſtances are cloathed in a veſt that reaches down to the knees, and is often made of brocaded ſilk or ſcarlet cloth with gold plate buttons; it has a ſtraight ſleeve like a waiſtcoat, and is buttoned at the wriſt. They wear likewiſe a rich ſaſh, the ends of which hang below the knees, and in it they wear their dagger, their knife and purſe. The cloaths of the poor people are made of cotton. None of them wear ſtockings or ſhoes, but the quality ſometimes put on a kind of ſlippers or ſandals. They uſually dye their nails red, and their teeth either red or black.

The women have ſhifts of fine muſlin that reach down to their knees, the ſleeves are as ſtraight as a waiſtcoat, and come no lower than the elbows, the neck is ſo narrow and cloſe, that their breaſts are not ſeen; they alſo wear a kind of drawers or breeches made of ſilk or cotton, which ſit cloſe upon them, and reach to the middle of the leg; and the ladies of quality have their breeches knees embroidered; for they are excellent workwomen, and make their cloaths themſelves. When they go abroad, they throw over their ſhoulders a looſe linen cloth, or a piece of ſtriped muſlin, which completely covers them. They have no other head-dreſs but their hair tied up in a roll on the back part of the head, with ſome curls that fall gracefully on their necks. Their hair is perfumed and oiled, which adds to its natural blackneſs, and gives it a gloſs. The men alone wear jewels in their hair, for the women have no other ornaments than a gold chain about their necks.

Their bodies are ſtrong and robuſt, and being naturally induſtrious, they are ready to undergo any fatigue. They are addicted to arms, and being conſidered as the beſt ſoldiers on that ſide of India, are hired into the ſervice of other princes and ſtates, in the ſame manner as the Swiſs are in Europe. They are even frequently employed by the Europeans, who have ſometimes ſuffered for uſing them with too much ſeverity, which is a treatment they cannot bear, and accordingly never fail to revenge it.

Theſe people have excellent memories, and are ſo handy and quick of apprehenſion, that they will imitate any thing they ſee, and would probably become good proficients in all the arts and ſciences had they good maſters to inſtruct them. They ſeem inſpired with juſt ideas of honour and friendſhip, and there are inſtances of many of them who have expoſed their lives even in the defence of foreigners and Chriſtians, and of others who have generouſly relieved and ſupported people in diſtreſs, with whom they have even ſhared their eſtates. Their love of liberty was alſo ſo ſtrong, that they could not bear the thoughts of being enſlaved by the Dutch; nor did they ſubmit to that nation till they had long ſtruggled in vain to preſerve their freedom, and after a long and expenſive war, in which almoſt the whole force of the Dutch in India was employed againſt them. They are indeed haſty and paſſionate; but this ſudden fury is ſoon over, and if they are in the wrong they will readily condemn their own heat and raſhneſs.

This is the account given of them by the Engliſh who traded to this iſland before it was entirely ſubdued: but the Dutch repreſent them as naturally thieves, traitors, and murderers, and add, that it is not ſafe for any Chriſtian to venture, after it is dark, without the walls of the Dutch forts, or to travel at any time far into the country. Their love of liberty, and averſion to their conquerors, may probably prompt them to commit many acts of violence, in return for the treatment they have received; but they certainly do not all deſerve this character; for the Dutch themſelves acknowledge, that abundance of the natives live under the protection of their forts, and being made free burgeſſes, carry on a conſiderable trade with them.

As to the women of Celebes, they appear remarkably chaſte and reſerved, and it is their intereſt to be ſo; for the leaſt ſmile or glance at any but their huſbands is thought a ſufficient reaſon for a divorce. The women dare not admit of a viſit, even from a brother, except it be in the preſence of the huſband, who may lawfully kill any man he finds alone with his wife, or on whom ſhe has conferred any mark of her favour. The man, on the other hand, may keep as many wives and concubines as he pleaſes, and nothing is more ignominious than the want of children, and having but one wife. This love of women, and deſire of children, is here univerſal, and the happineſs of a man is rated according to the number of his women and children.

The women of faſhion are, however, allowed at certain feſtivals to go abroad, and ſpend their time in public company, in dancing and other diverſions; but the men do not mix with them: however, they have the pleaſure of ſeeing and being ſeen, which makes them impatiently wait for theſe happy times.

They rub the limbs of their infants with oil to render them nimble and active, and this is thought to be one reaſon, why a lame or crooked perſon is hardly ever ſeen among them. The male children of perſons of rank, it is ſaid, are always taken from their mothers at ſix or ſeven years of age, and committed to the care of ſome diſtant relation, to prevent their being too much indulged, and rendered effeminate by the mother's fond careſſes. They are ſent to ſchool to their prieſts, who teach them to read, write, and caſt up accompts, and of whom they learn the precepts of the Koran. Their characters very nearly reſemble the Arabic, which is not ſtrange, if it be true, as ſome have aſſerted, that the anceſtors of many of them were Arabians. Every child is alſo bred up to ſome handicraft trade, and if they are of quality, they are likewiſe taught ſeveral ſports, and martial exerciſes.

Children are generally matched by their parents in their infancy, and ſometimes ſoon after they are born. When the youth is ſixteen or ſeventeen years of age, and has gone through his exerciſes, he is allowed to wait on his miſtreſs, and ſoon after to marry her. The exerciſes taught to youth are learning to ride, to diſcharge a fuſee, to draw the bow, handle his ſcymeter and dagger, and to ſhoot the little darts already mentioned through a ſmooth trunk of ebony, or other wood. This dart is pointed with the tooth of a ſea-fiſh dipt in poiſon; and with theſe they are ſaid to hit a ſmall mark at the diſtance of fourſcore yards. One who has made arms his profeſſion is ſo much a gentleman, that he will ſeldom ſubmit afterwards to huſbandry, or any mean employment.

They have games not unlike draughts and cheſs; but, as they are prohibited playing for money, they ſeldom quarrel on theſe occaſions. They are fond of flying a paper kite, and even old men are pleaſed with it; and cock-fighting is one of their greateſt diverſions.

The girls are taught to read and write, and inſtructed in all kinds of houſewifery. They learn to ſpin, to ſew, to embroider and make their own, and the men's cloaths; for there are neither taylors nor mantua-makers among them, nor are there any cooks, and therefore they are taught to dreſs ſuch diſhes as are in uſe amongſt them.

Their common food is rice, herbs, roots, fiſh, and fruit. They have likewiſe beef, kid, and poultry, which being boiled, and high ſeaſoned with ſpices, is cut in ſmall pieces and laid by their rice; but they eat very little fleſh. They have only two meals a day, one at eight or nine in the morning, and the other about ſun-ſet, which is their principal and heartieſt meal: the reſt of the day they chew betel and areca, or ſmoke tobacco, with a mixture of opium. Their uſual drink is water or ſherbet; they alſo drink chocolate, tea, and coffee, the firſt of which they procure from the Spaniards of the Philippines. They have likewiſe palm wine and arrack.

At

At their meals they ſit croſs-legged on the floor, and have low japan tables, on which their proviſions are ſet in diſhes of ſilver, copper, or wood. No ſpoons, knives, forks, or napkins are uſed, but they take up the rice with their hands, and making it up in lumps, put it in their mouths. There are but few ſlaves in the country, the laws prohibiting their making ſlaves of their brethren of the ſame faith; and on this account they are more active and induſtrious than other Indians, from their being uſed to labour, and to do their work themſelves. Their great men are, however, never without a train of vaſſals or hired ſervants when they appear in public; but many of them are only hired upon theſe occaſions, and may be had upon very reaſonable terms.

Their houſes are built with ebony, and other fine wood of various colours, and the inſide being rubbed every day, makes the wood look more beautiful than any wainſcot. They are in other reſpects very neat, and have their mats and carpets upon which they ſit, duſted every morning, and beſides have veſſels to ſpit in when they chew their betel, or ſmoke tobacco. They have little furniture, beſides the neceſſary utenſils of their kitchens. The reſt of the houſhold goods conſiſt of carpets, couches, on which they ſleep; pillows and cuſhions, and the little tables on which they eat. At their viſits a carpet and cuſhion is always brought for the ſtrangers to ſit upon, as chairs are ſet in this part of the world.

SECT. III.

Of their Buildings; with a Deſcription of the City of Macaſſar. Of the Government and Laws of the Country. Of their Marriages and Funerals.

THE city of Macaſſar is ſeated on the banks of the great river above mentioned, and here the Dutch Eaſt India company have a ſtrong fort, defended by a numerous artillery, and a garriſon of ſeven or eight hundred men. The ſtreets are wide and neat, but not paved, and trees are planted on each ſide. The palaces, moſques, and houſes of the great are of ſtone, but thoſe of the meaner ſort are of wood of various colours, built on pillars, and the roofs covered with palm or cocoa leaves. Along the ſtreets are ſhops, and there are alſo large market places, where a market is held twice in twenty-four hours, that is, in the morning before ſun-riſe, and an hour before ſun-ſet. There only women are ſeen, for a man would be laughed at on being found among them. Young girls from all the villages crowd to theſe markets with fleſh, fowls, fiſh, and rice; for they only abſtain from pork, which is forbidden by their religion.

The number of inhabitants in this city and the neighbouring villages has been computed to amount to one hundred and ſixty thouſand men able to bear arms, but there are not now half that number; for ſince the Dutch deprived them of their trade, many of the natives both of that city and the other towns and villages have forſaken their country.

The government was anciently monarchical; but that the crown might never deſcend to an infant, unable to govern or protect the people, it was inherited by the king's eldeſt brother, and all his children excluded. Though the king was an abſolute monarch, his prime miniſter diſpoſed of almoſt all places of truſt in the civil government, firſt giving a liſt of them to the king; but the officers of the houſhold, and of the revenue, were appointed by the ſovereign, who took care to muſter his troops every month. His forces in time of peace had nothing allowed them but their cloaths, arms, and ammunition; but if they were drawn into actual ſervice, they were ſubſiſted at the king's expence, and it is ſaid, that in ſome of the former wars he brought twelve thouſand horſe, and fourſcore thouſand foot into the field. Theſe infantry, as hath been already obſerved, are eſteemed the beſt in this part of the world; but their horſes are not only ſmall, but have no ſaddles, or other accoutrements proper for that purpoſe. As for their artillery, the great guns are of a large bore, but their powder is ſo weak, that they ſeldom do much execution. Their armies are divided into regiments and battalions, and theſe again into companies of two hundred men each, with three officers, equivalent to our captain, lieutenant, and enſign.

The princes of this iſland formerly divided ſome of their lands among the great lords, as is the practice in ſeveral of the neighbouring countries; and all the inhabitants of ſuch a lordſhip were, in a manner, the vaſſals of the lord, who himſelf held theſe lands of the prince, by certain rents and ſervices, and was particularly bound to attend the king in his wars with a certain number of ſoldiers at his own expence. Theſe lords never appear at court, or in any public place, without being attended by four-ſcore or a hundred of their vaſſals and tenants. Theſe were conſidered as the principal nobility of the iſland, and accordingly took place immediately after the royal family. There were beſides two inferior orders of nobility, who held their eſtates by nearly the ſame tenure, but had ſmaller diſtricts, or perhaps no more than a particular village under their command.

But the laſt war of Macaſſar ended in the complete ruin of the prince of the country; and the inland parts of the iſland are under the dominion of three different princes, who, very happily for the Dutch, live in a conſtant bad intelligence with each other; and were it not for this they might at any time drive the Dutch out of the iſland. One of theſe princes is called the company's king, becauſe he lives in a good correſpondence with them, and promotes their intereſt as far as lies in his power. In return, they from time to time make him preſents of gold chains, coronets of gold, ſet with precious ſtones, and other things of value, in order to keep him ſteadily to his alliance, and prevent his coming to a good underſtanding with the other princes.

Among the natives of this country are no lawyers, attorneys, or bailiffs; but, every one exhibiting his complaint in perſon, ſpeedy juſtice is executed, as in other Mahometan countries. In criminal matters, indeed, they are frequently allowed to do themſelves juſtice; and whoever takes a murderer, adulterer, or robber in the fact, may execute him himſelf: but the highwaymen in this country hardly ever murder thoſe they rob, except in their own defence.

The daughters have no other portion upon their marriage, but the preſents made them before that ceremony is performed; this is done by a prieſt: after which, while all the gueſts are for three days rejoicing at the houſe of the wife's father, the new-married couple are ſhut up in an apartment by themſelves, with only a ſervant to bring them what they want; and when that time is expired, the bridegroom and bride come out and receive the congratulations of their friends: after which the bridegroom conducts her to his own houſe, where ſhe immediately applies herſelf to the buſineſs of the family; for the ladies are not here indulged in the lazineſs practiſed in many other Eaſtern nations.

If the woman ſurvives her huſband, and has no children, ſhe retains only half of the preſents that were made her, and the other half goes to the father or mother of the huſband: but if ſhe has children ſhe keeps the whole, and diſpoſes of them as ſhe thinks fit; except ſhe marries again, and then ſhe has but a third part of the jewels, &c.

When the parents die without diſpoſing of their effects, they are divided among the ſons; and if there are none, among the daughters. They never ſhare the inheritance with their brothers, who are only obliged to maintain them 'till they get huſbands.

If a man is deſirous of being divorced, he need only acquaint the prieſt; and if there be the leaſt reaſon to ſuſpect the woman of levity, or even an unguarded conduct, it is never denied. The ſecular judge pronounces the divorce, and ſettles the conditions; after which they are both at liberty to marry again.

As all the domeſtic uneaſineſs is occaſioned by their concubines, perſons of quality generally keep them in an apartment diſtinct from the houſe; for the ladies of Macaſſar have ſuch ſpirit, that there are inſtances of a wife's ſtabbing to the heart a beloved concubine in the arms of her huſband.

We ſhall treat of their purifications and the circumciſion of their children when we come to other Mahometan countries. As to their funerals, the meaneſt perſons lay up money to defray the expence of them, while they are in full

full health. The ſick no ſooner find ſome dangerous ſymptoms, than leaving the phyſician, they ſend for their prieſts, who have recourſe to prayers and exorciſms, and attributing their diſeaſe to the practices of ſome evil ſpirit, write the names of God and Mahomet on little ſcrolls of paper, and then hang them about the patient's neck: if theſe have no effect, they proceed to prepare him for his diſſolution.

A perſon is no ſooner dead than his corpſe is waſhed, perfumed, and cloathed in a white robe, with a turban on his head, and placed in a chamber hung with white, which is conſtantly perfumed with incenſe and aromatic gums. He is carried on a palanquin, or couch, by his ſlaves to the grave, followed by the prieſts, incenſe and perfumes being burnt all the way. The corpſe is interred without a coffin, covered only with a plank, and the earth thrown upon it. A tomb, adorned with flowers, is afterwards erected ſuitable to the quality of the deceaſed, and perfumes are burnt for forty days; after which a noble entertainment is prepared for thoſe who come to pay their laſt devoirs to the deceaſed.

CHAP. X.

Of the MOLUCCAS, or SPICE ISLANDS.

SECT. I.

A general Hiſtory of the Trade to the Spice Iſlands; with a conciſe View of the firſt Voyages of the Portugueſe, Spaniards, Engliſh, and Dutch to the Eaſt Indies; and of the Practices by which the Dutch excluded the Engliſh from that beneficial Branch of Commerce.

FOR above two thouſand years Europe has partaken of the ſpices of the Eaſt, though it is little more than two hundred years ſince we became acquainted with the iſlands where they grow. The Perſians, Arabians, and Egyptians formerly brought them through the Red Sea, and from thence down the Nile to the coaſt of Egypt; and thither the Carthagenians, the Greeks, the Romans, the republic of Marſeilles, and afterwards the Venetians, the Genoeſe, and Catalans reſorted to buy the ſpices and ſilks of India; which, at a moſt extravagant profit, they diſperſed over all Europe.

The Mahometans of Arabia, and the neighbouring countries, improperly called Moors by the firſt diſcoverers of the Indies, in order to carry on this trade to the greateſt advantage, planted colonies on all the oriental iſlands, and drove the native inhabitants from the coaſts up into the mountains, where they retained their former religion, their liberty, and cuſtoms; but lived in a perpetual ſtate of hoſtility with the unjuſt invaders, who had driven them from their ſpicy groves. Thus the aromatic ſweets of theſe iſlands were almoſt as fatal to the inhabitants, as the gold and ſilver of Mexico and Peru were long after to the unhappy natives of thoſe regions of America; but the orientals better preſerved their native freedom. They ſtill continue to ſlay and plunder thoſe who fall into their power, and hence are denominated ſavage murderers and robbers; while both the Chriſtians and Mahometans, on the other hand, ſeize every opportunity of deſtroying them, and of reducing all who fall into their hands to a ſtate of ſlavery; and then call themſelves very honeſt men.

At length ſeveral European republics having acquired immenſe wealth, by purchaſing the ſpices brought to Egypt, and ſelling them at prodigious profit, the Portugueſe, who had been ſixty years in making diſcoveries along the coaſt of Africa, in 1486, reached the Cape on its moſt ſouthern extremity; and Bartholomew Diaz, who made the important diſcovery, gave it the name of Cabo Tormentoſo, or the Cape of Storms, from the tempeſtuous weather he found there: but when he returned to Portugal with the joyful news, king John II. flattering himſelf that his ſhips would ſoon find a way by ſea to the Indies, changed the name to Cabo de Buena Eſperanza, or the Cape of Good Hope: but it was not till the year 1497, that Vaſco di Gama, doubling that Cape with three ſhips, traced out a way to the Eaſt Indies; but before this time Columbus, in 1487, perſuaded that it was poſſible to diſcover the Indies by ſailing to the Weſt, made the daring and proſperous voyage by which he gave a new world to Europe.

The Portugueſe, continuing their diſcoveries, ſettled factories in different countries of the Eaſt, not ſubject to the Moors; but met with conſtant oppoſition from thoſe traders, who ſtill carried on the commerce of the Eaſt. And at length they diſcovered the Spice Iſlands, and taking advantage of the differences which ſubſiſted between the kings of Ternate and Tydore, who had long been at war with each other, they engaged thoſe princes to refer their differences to them; and the people being ready to grant every thing they propoſed, in hopes of their alliance, they found no difficulty in ſettling their factories and building forts. Theſe they ſoon erected in many parts of the Indies, and every where treated the natives as their vaſſals.

The Portugueſe having thus eſtabliſhed themſelves in the Eaſt Indies, and having the pope's bull, as well as an agreement with the Spaniards to ſecure their pretenſions, aſſumed the lofty title of lords of the navigation, conqueſt, and commerce of Ethiopia, Arabia, Perſia, and India; and continued to erect forts and cities at convenient diſtances along the African, Arabian, Perſian, and Indian coaſts, and particularly in the Spice Iſlands.

By the abovementiond bull pope Alexander VI. had unjuſtly granted to the Spaniſh crown the property and dominion of all places, either already diſcovered, or that ſhould be diſcovered, an hundred leagues to the weſtward of the iſlands of the Azores, leaving all the unknown countries to the eaſtward of this limitation, to the Portugueſe; and this boundary being afterwards, by the agreement of both nations, removed two hundred and fifty leagues more to the weſtward, it was imagined, that this regulation would have ſuppreſſed all the ſeeds of future conteſts: the Spaniards preſuming, that the Portugueſe would be prevented from meddling with their American colonies; and the Portugueſe ſuppoſing, that their Eaſt Indian ſettlements, and particularly their ſpice iſlands, would be for ever ſecured from any attempts of the Spaniards.

But it ſeems, as an ingenious author obſerves, that on this occaſion, the infallibility of the Holy Father had deſerted him, and for want of being more converſant in geography, he had not foreſeen that the Spaniards, by purſuing their diſcoveries to the Weſt, and the Portugueſe to the Eaſt, might at laſt meet, and be again embroiled, as it actually happened within a few years after. For Ferdinand Magellan, an officer in the king of Portugal's ſervice, having received ſome diſguſt, entered into the ſervice of the king of Spain, and in 1519 ſet ſail from the port of Seville, with five ſhips and two hundred and thirty men, and having had the good fortune to diſcover thoſe ſtreights, which have received their name from him, opened a paſſage into the South Sea; he at length croſſed that extenſive ocean, and firſt diſcovered the Ladrones, and afterwards the Philippines, where venturing on ſhore in an hoſtile manner, and ſkirmiſhing with the natives, he was ſlain.

Magellan's original deſign of ſecuring ſome of the Spice Iſlands was defeated by his death; for thoſe who were left in command contented themſelves with ranging through them, and purchaſing ſpices of the native; after which they returned home round the Cape of Good Hope, and theſe were the firſt ſhips that ſurrounded this terraqueous globe, and by this means demonſtrated by an experiment obvious

obvious to the moſt unlettered mind, the reality of its long diſputed ſpherical form. But though Spain did not acquire the property of the Spice Iſlands, yet the diſcovery of the Philippines was thought too conſiderable to be neglected, as they were not only near the places that produced ſpices, but were well ſituated for a trade to China and the commerce of other parts of India. A communication was therefore ſoon eſtabliſhed between theſe iſlands and the Spaniſh colonies on the coaſt of Peru; whence the city of Manilla, which was built on the iſland of Luconia, ſoon became the mart of all Indian commodities, which were bought up by the Spaniſh inhabitants, and annually ſent to Peru.

The next European nation that viſited the Spice Iſlands was the Engliſh, under the command of Sir Francis Drake, who ſet ſail from Plymouth on the thirteenth of December 1577, with five ſhips, and one hundred and ſixty-four men, and paſſing through the Streights of Magellan, took many rich ſhips, and afterwards croſſing the South Sea arrived at the Molucca Iſlands on the fourteenth of November 1579, and ſent a preſent to the king of Ternate; who was ſo pleaſed with his behaviour, and ſo exaſperated at the inſolent behaviour of the Portugueſe, who pretended to debar his ſubjects from trading with any other nation, that he deſired the aſſiſtance and protection of the queen of England. The admiral had ſeveral conferences with this prince and the chief men of the country, by whom he was ſplendidly entertained; and having purchaſed a conſiderable quantity of cloves, he ſet ſail for England, where he arrived on the third of November 1580.

In 1587 Mr. Cavendiſh ſailed round the world, purſuing the courſe taken by admiral Drake, and touching at the Moluccas, found the natives ſtill deſirous of trading with the Engliſh; he then ſailed to the Iſle of Java, and afterwards returned by the Cape of Good Hope to England.

Spain and Portugal had been united in 1580 under one head; and the Dutch, by the aſſiſtance of England, had freed themſelves from the rigour of the Spaniſh yoke and the terrors of the Inquiſition. The United Provinces affording an aſylum to all who fled from the cruelty of the Spaniards, a multitude of merchants reſorted thither, filled the country with money, and in the different branches of commerce they carried on, bred up numbers of mariners, whoſe experience and boldneſs enabled them to carry into execution almoſt any ſort of naval undertaking with ſucceſs; and having firſt endeavoured in vain to diſcover the north-eaſt paſſage to the Indies, the city of Amſterdam, in 1595, fitted out four ſhips for the Eaſt Indies, which the next year arrived at Bantam, in the Iſle of Java, where they purchaſed ſpices, and returned with a rich cargo to Holland.

They made other ſucceſsful voyages without diſcovering the Spice Iſlands, though the Spaniards, enraged that a few merchants, the rebels of their ſtate, ſhould thus ſucceſsfully rob them of a valuable branch of their commerce, fitted out ſtrong ſquadrons to chaſtiſe them; but the Dutch merchants conquered all oppoſition, ſunk, burned, and took their ſhips, and ſtill returned loaded with ſpices. Among theſe adventurers admiral Van Nort ſailed through the Streights of Magellan, and had the glory of being the firſt Hollander who ſurrounded the globe.

At length, in 1599, James Van Neck ſailed with eight ſhips to Bantam, in the iſland of Java, where the Portugueſe had been expelled on a quarrel between them and the natives. Here four ſhips took in their lading of pepper, while the other four under Van Warwyk ſailed to the Moluccas; two of them took in their lading of cloves at Amboyna and Ternate, and the other two ſailed to Banda, where having ſettled a factory, as the other ſhips did at Ternate, they freighted their ſhips with nutmegs and mace, and returned to Holland in 1600.

The Dutch in theſe expeditions behaved with a modeſty and moderation very different from the pride and inſolence which their own ſucceſs afterwards occaſioned. So great was their humanity to their priſoners, and with ſuch honour did they behave in every thing that related to them, that the Spaniſh governors at Malacca and in the Moluccas gave them ample teſtimonies of their kindneſs and generoſity; a character the more undoubted, as proceeding from their rivals and their enemies. "This good conduct, ſays the author of The new Hiſtory of the Indies, "contributed in a great meaſure to the ſucceſs of their "deſigns, by wiping off the imputation of piracy, and "gaining them the character of a humane and generous "nation amongſt the Eaſtern princes; an advantage by ſo "much the greater, as the Portugueſe were already of a "long time hated for the weight and ſeverity of their "yoke."

In the mean time a multitude of Dutch companies were formed, which, as they were rivals in intereſt, no harmony or good underſtanding ſubſiſted between them. Ships were fitted out by ſeveral ſocieties for the ſame ports, and their cargoes, conſiſting of aſſortments, glutted the markets with the ſame commodities, and diſcouraged all the adventurers by the loſs on the ſales, or the ſtagnation of their capitals. The States General, taking into conſideration the proper methods to put a ſtop to theſe evils which threatened the ruin of this favourite trade, called together at the Hague the directors of all the different companies, and obliged them to unite into one body corporate, granting them particular privileges. Things being thus ſettled, the company advanced by rapid ſteps; numbers of the richeſt perſons in the ſtate added their ſtocks to its capital, which now amounted to ſix millions ſix hundred thouſand florins.

The Dutch now enlarged their views, and with this treaſure, added to their united forces, fitted out ſtrong fleets to the Eaſt Indies; and being an overmatch for the Portugueſe, attacked their ſhips wherever they met them, and took one place after another, till they hardly left them a fort or factory in India. In 1605 Van Hagen, with twelve ſhips, defeated the Portugueſe, and made themſelves maſters of the fort at Amboyna. A part of the fleet then ſailed to Tydore, and attacking a Portugueſe fortreſs in that iſland, the magazine of powder in the caſtle blew up, and deſtroying part of the wall, gave the Dutch an eaſier conqueſt than they expected. But the next year the Spaniards recovered theſe forts from the Dutch: but they ſoon got footing there again, as allies to the king of Ternate.

In 1609 the Dutch arriving at Banda with a ſtrong fleet and forces on board, demanded leave of the oran cayas, or ſtates of the country, to build a fort in the ſmall iſle of Nero, to defend them from the inſults of the Portugueſe and Spaniards; but the Bandaneſe, alarmed at the propoſal, and at the greatneſs of the fleet they ſaw on the coaſt, apprehended their liberties to be in danger, and abſolutely refuſed to comply with this demand: upon which the Dutch making a deſcent with a good body of troops, attacked and routed the Bandaneſe; who finding themſelves too weak to withſtand the force of ſo powerful an enemy, had recourſe to artifice, and pretended to ſubmit to the building a fort; when the Dutch deſiring to treat with them on the excluſion of all other nations, the natives drew admiral Varheuf and ſeveral officers into a wood, where, having laid an ambuſcade, they were all ſlain. This treachery the Dutch revenged by making war on that people, which they continued till they were entirely ſubdued; though the natives, as the beſt expedient to preſerve their expiring liberties, implored the protection of the Engliſh, who had for ſeveral years traded to theſe iſlands.

The Engliſh in their firſt attempts to eſtabliſh a trade in the Eaſt Indies were very unſucceſsful; notwithſtanding which an Engliſh Eaſt India company was incorporated by letters patent in 1600; but the Dutch, who had already gained a footing in the Spice Iſlands, forgetting the obligations they were under to the Engliſh, and puffed up with their extraordinary ſucceſs, had begun to monopolize the ſpice trade, and treated all the Engliſh who approached thoſe iſlands with acts of hoſtility and the groſſeſt abuſe; yet, in ſpight of all oppoſition, captain Keeling ſettled an Engliſh factory at Bantam, in the Iſle of Java, in 1609; and in 1616 the principal perſons of the iſlands of Pooloroon and Pooloway made a formal ſurrender of thoſe iſlands to Mr. Nathaniel Courthop, Mr. Thomas Spurway, and Mr. Sophon Cozocke, for the uſe of his majeſty James I. in conſideration of their being protected againſt the Dutch, and annually ſupplied by the Engliſh with rice, cloathing, and other neceſſaries. Upon this occaſion a writing was drawn up and ſigned by both parties. They alſo delivered a nutmeg-tree, taken up with the roots, and the fruit

upon it, and a live goat by way of ſeiſin; and, at their deſire, the Engliſh colours were planted in the iſland of Pooloroon, and thirty-ſix guns were fired in honour of this ceſſion.

The king and principal perſons of Wayre and Roſinging alſo ſurrendered thoſe iſlands to England on the ſame conditions.

Lantore, or Banda, alſo ſought the protection of the Engliſh; and on the twenty-fourth of November 1620, the chiefs of that iſland ſurrendered it up in form by a writing, which they ſigned and delivered to Mr. Hayes, who took the command of an Engliſh fort erected there.

Nothing could be more honourable with reſpect to the Engliſh; nothing could convey a better title, than the ſurrender of theſe iſlands by the people who poſſeſſed them. The free conſent and voluntary ſurrender of the natives ſurely gives a claim to a country more noble, more juſt, and equitable than force can ever obtain, or conqueſt beſtow. But the Dutch, in time of peace, took our ſhips, beſieged our forts, and carried on an open war with the Engliſh in the Indies; while the ſtates of Holland, juſt redeemed from ſlavery by thoſe they now ſo ungenerouſly, ſo ungratefully oppoſed, cajoled the puſillanimous monarch James the Firſt, who, to the diſgrace of England, then filled the Britiſh throne.

While things were in this ſituation a treaty was ſigned by both nations in Europe, and ratified by the ſovereigns of each, the miniſters on both ſides governing the debates, and obliging each company to accept of ſuch terms as they thought fit. By this treaty it was agreed, That the Engliſh company ſhould enjoy a free trade at Palicate, and bear half the charge of maintaining the fort and garriſon there. "That in the iſles of the Moluccas, Banda, and "Amboyna, the trade ſhould be ſo regulated by common "conſent, that the Engliſh company ſhould enjoy a third "part of that trade, as well for the importing and ſelling "of goods in thoſe iſlands, as of the fruits and merchan-"dize of the growth of thoſe iſlands, which ſhould be "exported thence; and the Dutch company enjoy the "other two-thirds. And that as to the buying and ſhar-"ing the ſaid fruits and merchandizes, the principal fac-"tors of the two nations ſhould buy them at the current "price, and divide them by lot, to each their reſpective "ſhare; and for that end it ſhould be lawful for either "party to have acceſs to, and abide in, the forts and ma-"gazines of the other; and that the forts, as well on the "one part as the other, ſhould remain in the hands of "thoſe who were at preſent in the poſſeſſion of them."

But no ſooner was this treaty, ſo favourable to the Dutch, known to the Indies, than, contrary to the expreſs words of the treaty, they invaded the iſlands of Lantore and Pooloroon, which were in the poſſeſſion of the Engliſh, maſſacred the principal natives, demoliſhed the forts and factories of the Engliſh, murdered ſome of their ſervants, and made the reſt priſoners; uſing them in a more inſolent and barbarous manner than would have been practiſed by a declared enemy.

It is not eaſy to account for the ſtrange regulation by which the Engliſh company were obliged to accept of a third part of the ſpice trade, when the Banda iſlands were their property: but when it was conſented to, and ratified by the ſupreme powers of both nations, the Dutch might ſurely have permitted the Engliſh to enjoy this one-third in quiet, and to have retained the iſlands in their poſſeſſion.

In purſuance of the above treaty, the Engliſh company ſettled factories at the Moluccas, at Amboyna, and Banda, for carrying on the trade in the ſtipulated proportion; imagining that the Dutch had made ſo advantageous a bargain for themſelves, that they for the future ſhould receive no moleſtation from them. But ſcarcely were they fixed in their ſettlements, when the Dutch traders, in the year 1622, formed a ſham plot, charging the Engliſh and Japaneſe with a conſpiracy to ſurprize their principal fort at Amboyna, and barbarouſly tortured them to make them ſign a falſe confeſſion of their intending to attack them. They even, contrary to the law of nations, put ſeveral of the Engliſh and Japaneſe to death, as if they had been their ſubjects taken in rebellion, and then expelled thoſe who ſurvived their cruelties.—But the ſtory is too dreadful for repetition; the writer of this work is ſtruck with horror, and gladly eſcapes from ſcenes which ſhock humanity.—However, it is neceſſary to obſerve, that theſe unhappy victims of the cruelty of the Dutch died profeſſing their innocence in the ſtrongeſt terms; and that theſe proceedings were atteſted, upon oath, in the court of admiralty, by the Engliſh factors who were ſuffered to eſcape to England.

The Dutch immediately after ſeized upon all the Engliſh factories in the Spice Iſlands, and have ever ſince excluded us and all other nations from that valuable branch of commerce.

SECT. II.

Of the Situation and Produce of the Moluccas or Spice Iſlands in general. The Perſons and Dreſs of the Natives.

THE Moluccas are a cluſter of ſmall iſlands ſituated between New Guinea, which lies to the eaſt, and Celebes to the weſt, extending from one hundred and twenty-one to one hundred and thirty degrees of eaſt longitude from London, and from the fifth degree of north latitude to the ſeventh degree ſouth. They are named Moluccas from the word Moloc, which in the language of thoſe countries ſignifies head, they being ſituated as it were at the head or entrance of the Archipelago of St. Lazarus, and are denominated Spice Iſlands from their abounding in ſpices, particularly nutmegs and cloves, which grow in no other countries in the known world.

This ſmall part of the globe produces ſuch plenty of theſe fragrant ſpices that great quantities of cloves drop ungathered from the trees, and are ſuffered to rot on the ground; and millions of nutmegs are often deſtroyed on the ſpot by the Dutch, who have monopolized theſe commodities, to prevent the markets being overſtocked, which would infallibly lower the price of them. Sir William Temple, in his Obſervations on the Netherlands, ſays, he was informed by an Eaſt India ſeaman, that he ſaw three heaps of nutmegs burnt at one time, each of which would fill a ſmall church.

The Molucca iſlands are ſeparated by narrow ſtreights, which are rendered dangerous by ſands and ſhelves; yet ſeveral of them have good roads. The ſoil of theſe iſlands is dry and ſpungy, ſo that it immediately ſoaks up the rain, and is always covered with graſs and ever-verdant ſhrubs. The air is unwholſome, and occaſions dropſies, for which the natives formerly uſed wine made in the Philippine iſlands, mixed with ginger and cloves, and the Dutch the juice of lemons. There is no difference here between ſummer and winter, nor any certain ſeaſon for rains.

In the Moluccas are neither corn, rice, nor hardly any butchers meat, but goats fleſh. They eat chiefly ſago, the pith of a tree made into cakes, inſtead of bread: here are alſo almonds, oranges, lemons, and other fruit.

The natives have large eyes and long hair on their eyebrows, which they paint: they are of a yellowiſh brown complexion, but the women are fairer than the men, and tolerably handſome. They generally wear their hair falling looſe on their ſhoulders, and anoint it with ſweet-ſcented oil; but ſometimes they tie it up neatly with flowers and feathers. They are fond of bracelets, ear-rings with bobs, and wear necklaces of diamonds or rubies, without any diſtinction of quality; and moſt of their cloaths are of ſilk.

The general language uſed by the natives of theſe iſlands is the Malayan, and their religions the Mahometan and Pagan. They puniſh robbery with great ſeverity, but eaſily forgive adultery, from the maxim that propagation cannot be too much encouraged. They extract a liquor from the ſago-tree, called tuas, which, when new, is ſweet and very fattening; and when boiled has the taſte of wine. They draw another from bamboos and cocoa-trees.

Here are ſaid to be ſerpents above thirty feet long, but not venomous. Some authors ſay, that after eating a certain herb they aſcend the trees on the banks of the ſea or rivers, from whence they vomit it into the water; and the fiſh eagerly devouring it, are ſoon ſo intoxicated, that they ſwim on the ſurface, and become an eaſy prey to theſe ſerpents.

Crocodiles

Crocodiles are here more dangerous by land than by water: there are here alſo two ſorts of ſea-crabs, one of which is poiſonous, but the other feeds on herbs, and is very wholeſome food.

SECT. III.

Of the principal Moluccas, or Spice Iſlands, including Ternate, Tydore, Machian, Motyr, Bachiau, and Amboyna; with a particular Deſcription of the Clove-Tree.

THE iſland of Ternate is the chief, though not the largeſt of the Molucca iſlands: it abounds with all ſorts of proviſions, and whatever is neceſſary to render life eaſy and agreeable. The inhabitants are a middle-ſized people, and in general have a much better opinion of the Europeans than any of their neighbours. Moſt of them are Mahometans, or pagans; however, a great number of them are become Chriſtians, and the king himſelf is of that religion. They make a kind of palm-wine, which is exceeding ſtrong; and, as a ſmall quantity of it will intoxicate a man, it is highly eſteemed by the natives.

There is here a kind of birds that are the moſt beautiful imaginable; for their feathers, which are of all colours, are ſo finely diverſified, that it is impoſſible to conceive any thing of the kind more charming. They are commonly ſent to Batavia, where they are ſold at a very high price, not only on account of their extraordinary beauty, but of their docility; for they are taught to ſing finely, and to imitate the human voice.

This iſland is the moſt diſtant of all thoſe which belong to the Dutch in the Eaſt, for which reaſon they conſider it as a kind of frontier; it is therefore ſtrongly fortified. The governor is a merchant, and, like other governors, has a council. The king of Ternate is eſteemed the beſt ally the company has, and as his country would abound with cloves, at the company's requeſt, he cauſes them to be grubbed up every year; for which they allow him an annual penſion of eighteen or twenty thouſand rix-dollars. He has concluded a perpetual alliance with the Dutch, by which he has obliged himſelf to aſſiſt them againſt all their enemies. On the other hand, the company treat him with the utmoſt reſpect, and afford him whatever aſſiſtance he ſtands in need of. He has a numerous life-guard, and a very ſtrong fort, in which there is a good garriſon maintained by the company. The kings of Tydore and Bachian are now his tributaries.

The Dutch India company diſpoſe of great quantities of cloth in this iſland, and alſo of ſuch goods as they receive from Guinea; in return, they receive from thence tortoiſe-ſhell and other commodities; and ſome years ago a gold mine was diſcovered there, richer than any in the Moluccas, and from thence the company have doubtleſs received great profit.

Tydore is upwards of thirty miles in circumference: the chief town is of the ſame name, and has a pretty good harbour, but a chain of rocks lies before it, and renders the entrance very dangerous. The town is ſtrongly ſituated by nature; but the Dutch have rendered it much ſtronger by art, having ſtrengthened it by modern fortifications.

Machian is ſituated almoſt under the equator, but rather to the northward; it riſes in the form of a ſugar-loaf, with its top reaching above the clouds, and was once a very fertile country. The Dutch have three forts here, ſeated on inacceſſible rocks. Here is ſaid to be a clove-tree, that differs from all others, and is much eſteemed on that account. The fruit is not purchaſed for money, but is preſented by the governor in ſmall quantities to his friends, as a moſt acceptable preſent.

Motyr nearly reſembles Machian in its form and height, but is a ſmaller iſland. It is ſituated about half a degree to the northward of the line, and the Dutch have a fort at the north end. It formerly produced great quantities of cloves.

Bachian lies a little to the ſouthward of the equinoxial, and is called Great Bachian to diſtinguiſh it from a ſmall iſland of the ſame name ſituated near it. It has a very good harbour, the entrance of which is defended by a ſtrong fort called Barnevelt, built with ſtone. The iſland abounds in ſagoe, fruit, and fiſh, and formerly produced great quantities of cloves.

Amboyna is one of the largeſt of the Moluccas, and is ſituated in the Archipelago of St. Lazarus, between the third and fourth degree of ſouth latitude, and is one hundred and twenty leagues to the eaſtward of Batavia. It was conquered by the Portugueſe in 1519, who erected a fort upon it, with a view of not only bridling the inhabitants, but of keeping a force there ſufficient to ſubdue all the adjacent iſlands. This fort was, however, taken from them by the Dutch in 1605; and in 1622 the Engliſh were deprived of their ſhare of it in a manner equally baſe and ſhocking to humanity. But of this we have already given ſome account in the firſt ſection of this chapter.

Amboyna is the center of the rich commerce in cloves; and the more effectually to keep it there, the company have cauſed all the clove-trees in the adjacent iſlands to be grubbed up and deſtroyed, and ſometimes when the quantity produced at Amboyna in one ſeaſon is extraordinary great, they even burn a part of that.

The clove-tree reſembles the laurel, only the leaves being narrower, are more like thoſe of the almond and willow; the very wood and leaves taſte as ſtrong as the cloves themſelves. The trees bear a great quantity of branches and flowers, and each of the flowers bring forth a clove, which is at firſt white, then green, and at laſt red, and pretty hard. While they are green, they have the moſt fragrant and refreſhing ſcent imaginable.

Theſe cloves grow with little ſtalks, and hang on the trees like cherries. When they gather them, inſtead of plucking them off one by one, ſome ſtrip them off the boughs with a rope, and others beat them down with long poles. They bear fruit when they are eight years old, and are ſaid to continue bearing for above an hundred years; they ripen from the latter end of Auguſt till the beginning of January; and it is remarkable, that their heat is ſo great, that no vegetable, not even a weed, will grow under the tree. A few days after the fruit is fallen, they collect the cloves together, and dry them before the fire on hurdles, by which means they loſe the beautiful red colour they derive from nature, and change to a deep purple, or rather black. This is perhaps alſo occaſioned by their being ſprinkled with water, which it is ſaid is neceſſary to hinder the worm from getting into the fruit.

It might be imagined that ſo rich a commerce as that in cloves would be ſufficient to repay the expence the company is at in this iſland; but ſuch care do they take to improve every thing to the beſt advantage, that they have cauſed coffee to be planted in Amboyna. Gold is alſo ſaid to be waſhed down by torrents from the mountains; and among other valuable productions of this iſland, is a kind of red wood, which, beſides the beauty of its colour, is exceeding firm and durable, and what muſt appear ſtill more extraordinary, its grain naturally runs into abundance of beautiful figures. With this wood they make tables, eſcrutores, and other pieces of furniture, of which preſents are made to the principal perſons of the government, and the reſt ſold all over the Indies at a very high price.

The inhabitants, who live on the coaſt, were probably deſcended from the Moors. Theſe are of a middle ſtature, and of a black complexion; they are in general very lazy, and moſt of them have a ſtrong propenſity to thieving. Some are, however, very ingenious, and have a ſingular art in working up the cloves, while green, into abundance of curious toys, as ſhips, crowns, houſes, &c. which are uſually ſent to Europe as preſents, and they are eſteemed extraordinary curioſities Thoſe of the Amboyneſe, who dwell near the coaſt, are ſubject to the king, and profeſs the Mahometan religion; but, beſides theſe, there is a great number of idolaters, who were probably the original natives, and were driven into the mountains, where they ſtill preſerve their freedom; but both the king and the company conſider them as ſavages. They frequently attack and kill thoſe perſons who fall into their hands, and whenever any of them are caught, they are condemned to perpetual ſlavery, employed in the moſt laborious works, and treated with the utmoſt rigour. An inexpreſſible hatred ſubſiſts between theſe people, and the reſt of the inhabi-

tants,

thants, with whom they are in perpetual war, and to whom they very ſeldom give quarter. They are armed with a ſword, a kind of pike or javelin, and a buckler.

The king of Amboyna has an annual penſion from the company, with a guard of European ſoldiers maintained at their expence. The company's force in Amboyna principally conſiſts in the garriſon, which is very numerous, and compoſed of their beſt troops. The fort is ſo ſtrong, both from art and nature, that it is in a manner impregnable; and ſo effectually commands the harbour, that it ſeems impoſſible for a veſſel to ſail in or out without being ſunk by the cannon of the fort, if the governor ſhould give orders for that purpoſe.

It is no wonder that this iſland is ſo ſtrongly fortified. It has been termed the gold mine of the company, on account of the vaſt profit they draw from it; and there being no reaſon to fear its ever being exhauſted. As a proof of this, it need only be obſerved, that a pound weight of either cloves or nutmegs does not coſt the company much above a halfpenny, and every body knows the high price at which they ſell in Europe.

SECT. IV.

Of the Iſland of Gilolo, ſometimes included among the Moluccas, and the neighbouring Iſles of Ceram, Bouro, and Bouton.

THERE are four iſlands frequently included among the Moluccas, which are larger than the ſpice iſlands, but are ſaid to produce neither cloves nor nutmegs, or ſuch ſmall quantities of them as are ſcarcely worth mentioning; theſe are, Gilolo, Ceram, Bouro, and Bouton.

Gilolo extends from two degrees north to one degree ſouth latitude, a little to the eaſtward of the iſlands of Ternate and Tydore, and is upwards of two hundred miles in length, but in moſt places is not above fifty miles broad. It is divided by three deep bays, which, at a ſmall diſtance, give it the appearance of ſo many iſlands, and in theſe bays ſhips may ride in ſafety.

Ceram is ſituated in three degrees ſouth latitude, and ſtretching from eaſt to weſt is about fifty leagues in length, but not above twenty in breadth. It is high land, and covered with trees. At the principal town, which is named Cambello, the king reſides; but the Dutch have a fortreſs there, and both the king and people are vaſſals to the company.

The iſland of Bouro, which is in the latitude of two degrees ſouth, is about forty or fifty leagues in circumference, and the country is indifferently fertile. The Dutch were formerly in a great meaſure maſters of it, from their having a very ſtrong fort there; but the inhabitants, after a long ſiege, demoliſhed it, having firſt put all the garriſon to the ſword. At preſent the company are ſatisfied with ſending annually a number of men to root out the clove-trees, and the natives receive a preſent at the ſame time, for ſuffering this to be done. The iſland is for the moſt part pretty high land, and abounds with trees and ſhrubs of various kinds.

The ſituation of the iſland of Bouton is remarkably advantageous; it extends from the fourth to the ſixth degree of ſouth latitude, and is about four or five leagues diſtant from the ſouth-eaſt part of the iſland of Celebes, and is in extent nearly equal to the iſle of Bouro. It is extremely fertile in rice; it alſo enjoys plenty of cattle and fiſh, and would produce a great number both of clove and nutmeg-trees, were they permitted to grow.

The king has a very ſtrong fort, on which the Dutch ſtandard is diſplayed, though there is no Dutch garriſon, nor indeed any need of one. The Dutch company are ſatisfied with ſending thither every year ſome deputies to ſee the ſpice-trees deſtroyed, and in conſideration of the king's ſubmitting to this, the company pay him a conſiderable ſum in ready money. This nation has been remarkably faithful to the Eaſt India company, whom they not only aſſiſted in expelling the Portugueſe, but in oppoſing the inhabitants of the neighbouring iſlands whenever they attempted to take up arms againſt them, in conſideration of which the inhabitants of Bouton are permitted to enjoy many privileges that are granted to no other Indian nations. Thus, whenever they enter any fort belonging to the company, in whatever country it be, they are permitted to keep their arms, which is not allowed even to the inhabitants of the places where the Dutch forts are ſituated.

Some time ago the king of this iſland ſent his eldeſt ſon ambaſſador to the governor-general of the Dutch company at Batavia, where he was received with all poſſible marks of diſtinction.

It would not have been eaſy to have diſtinguiſhed this this young prince to have been an Indian, had he not worn a turban of three rows high, richly embroidered with gold and precious ſtones, for the reſt of his dreſs was entirely European; and inſtead of a cutlaſs, he wore a ſword. His train was very numerous, and dreſſed after the Indian manner, twelve of them went armed, each with a cuiraſs, and buckler, and holding a naked ſword.

SECT. V.

Of the Banda Islands.

Particularly of Banda Proper, with a Deſcription of the Nutmeg-tree. Of Poolaway, Pooloroon, and the other Banda Iſlands.

WE now come to the Banda Iſlands, which are famous for their nutmegs. Theſe lie from three degrees and a half to the fifth degree of ſouth latitude, having the iſland of Ceram to the north, Celebes on the weſt, and the ocean on the eaſt and ſouth. The iſlands of Banda are firſt Banda, which gives name to the reſt, Pooloway, Pooloroon, Nero, Roſinging, Gonapi, and ſeveral ſmall iſlands, of which travellers give no particular account.

The iſland of Banda is ſituated twenty leagues from Amboyna to the ſouth of the Moluccas, and is ſomewhat more than twelve leagues in circumference. The governor is generally an eminent merchant, who reſides at Neira, the capital of the country, and has under his juriſdiction ſeveral other ſmall iſlands in its neighbourhood. The country is very hilly, and produces no leſs profit to the company, than the valuable iſland of Amboyna, from the important commerce in nutmegs, which grow here in ſuch prodigious quantities, as to enable the Dutch to ſupply all the markets in Europe.

The tree that bears this excellent fruit very much reſembles a pear-tree, but its leaves are like that of a peach, only they are ſhorter and rounder. It produces ripe fruit three times a year, that is, in April, Auguſt, and December; but the April nutmegs are the beſt, and in that month the crop is more plentiful than in the other two. The nutmeg, when ripe, is much of the ſame ſize as the walnut, and is covered with a thick ſhell, which opens and falls off of itſelf as the fruit ripens, and when candied has a very fine taſte. Under this is a ſkin of a fine ſcarlet colour, and a very fragrant ſmell. This ſkin, which is called mace, alſo falls off the nutmeg, when it changes to an orange colour. Immediately under the mace appears the fruit, with a little bud at the top, reſembling a very beautiful flower.

Theſe nutmegs when preſerved in ſugar are much eſteemed, as being the beſt ſweetmeats in the Indies. But thoſe commonly uſed in Europe are only well dried, after their being firſt thrown into quick lime, which is done to prevent the worms breeding in them.

There are ſeveral iſlands in the neighbourhood of Banda, in which nutmegs would grow, did not the company take care to have them deſtroyed every year; for there is a kind of birds in this and the neighbouring iſlands, ſhaped like a cuckoo, which picking off the green huſk, ſwallow the nuts; and theſe having been ſome time in the ſtomach, they void by the ordinary way, after which they take root in the place where they fall, and grow up to a tree: whence the Dutch properly ſtile theſe birds the gardeners of the ſpice-iſlands.

There likewiſe grows in this iſland, as well as at Amboyna, a tree called caliputte, from which they draw a rich and ſalutary oil, that is ſold at a very high price.

Among the inhabitants are a kind of free burgeſſes, called perkiniers, to whom are intruſted the care of curing the nutmegs, and furniſhing the company with what quantities they think proper to demand. Theſe people live much at their eaſe, though they receive a very moderate gratification.

Banda

Banda is ſo well fortified, that it is thought impregnable; yet to prevent an enemy from getting into the port under Dutch colours, there is always a ſquadron of ſmall veſſels plying round the coaſt, which, on the firſt appearance of a ſtrong ſhip, ſurround her, and examine whence ſhe comes, whither ſhe is bound, and what is her ſtrength.

The garriſon is numerous, and yet is in a worſe condition than any other in the company's ſervice. This ariſes from the want of proviſions, for the iſland being extremely barren, produces little food, on which account the ſoldiers who have the misfortune to be ſtationed there are glad to eat cats, dogs, and any other animals they can get. Turtle is however pretty plentiful for about ſix months in the year, and after that ſeaſon they think themſelves very happy if they can ſometimes catch a few fiſh. They make their bread of the juice of a tree, which, when firſt extracted, reſembles the dregs of beer, but on being dried, becomes as hard as a ſtone; yet on its being put into water it ſwells and ferments, and thus becomes fit to eat, at leaſt in a country where nothing elſe is to be got. Rice, butter, dried fiſh, and other proviſions, are ſent thither from Batavia, but are too dear for the ſoldiers to have any great plenty of them.

The natives of this iſland are repreſented by the Dutch as ſo cruel, perfidious, and untractable, that the company were forced in a great meaſure to root them out for their own ſecurity, and to ſettle a Dutch colony in the iſland; but how they will reconcile this treatment of the natives, who had never injured them, to the laws of juſtice and humanity, is not eaſy to determine. The colony they have ſettled there is indeed formed of the moſt debauched and abandoned people, who may probably much exceed the natives in wickedneſs. They are, however, generally ſoon carried off by the dry gripes, the epidemical diſeaſe of the country. For this reaſon, and becauſe debauched young fellows are ſometimes ſent thither by their relations, the Dutch at Batavia call Banda The Iſland of Correction.

Poolowoy appears a perfect paradiſe; there nutmegs and the moſt delicious fruits were uſed to abound, and ſtill the whole iſland ſeems like a garden furniſhed with all manner of varieties. Their only want is ſprings and rivers; but theſe are in ſome meaſure ſupplied by the frequent rains, and when theſe fail, the natives fetch water from Banda. The Dutch have a fort on the eaſt ſide of this iſland, called The Revenge: it is a regular pentagon, and eſteemed one of the ſtrongeſt places belonging to the Dutch in theſe iſlands, and the pleaſanteſt reſidence of their Indian governors. This iſland the Dutch wreſted from the Engliſh, in order to ingroſs all the ſpice trade to themſelves, which they could not ſo eaſily do while other nations had acceſs to this iſland.

Pooloroon being a barren iſland, the Dutch were neither induced by the pleaſure nor the profit it afforded to take it from the Engliſh; the ſole deſign of that expedition being to ingroſs the whole ſpice trade to themſelves, which they could not ſo eaſily do while any other nation had acceſs to that iſland.

The Iſle of Nero is divided from Gorpi by a very ſmall channel, and theſe, together with the iſland of Lantor, or Banda, form a very commodious harbour. The caſtle of Nero, or Naſſau, ſtands in a plain cloſe by the water-ſide; it is a large and ſtrong fortification; and it being commanded by a riſing ground at about the diſtance of a muſket-ſhot, the Dutch have alſo built a ſtrong fort upon that, and both are defended by numerous garriſons.

The largeſt of the Banda iſlands does not exceed twenty leagues in circumference, and moſt of them are much leſs. The many volcanoes and frequent earthquakes which happen here are very dreadful; for ſcarce a year paſſes without ſome miſchief done by them, which greatly leſſens the pleaſure the Dutch would otherwiſe enjoy in this terreſtrial paradiſe; particularly on the 1ſt of September 1763, was felt at Banda a moſt violent ſhock of an earthquake at about five in the afternoon; it laſted about four minutes, during which no perſon could keep on his feet: this ſhock was ſucceeded by ſeveral others the ſame evening, and in the night, during which the ſea was much agitated, overflowed the country, and did great damage. The caſtle, governor's houſe, magazine, &c. were rendered uſeleſs, and the church full of cracks. More than three quarters of the north part of the iſland were deſtroyed, and Neira entirely ruined: no part eſcaped without great damages. At the ſame time the volcano Papenberg threw out vaſt ſtones, &c. but, what is very extraordinary, only ſeven perſons were killed. The inhabitants of this iſland were obliged to live under tents, on account of the noiſes in the earth, which reſembled the firing of cannon, for fear of greater calamities.

CHAP. XI.

Of JAVA, TIMOR, and the neighbouring Iſlands.

SECT. I.

Of the Iſle of JAVA.

Its Situation and Extent; the Climate, Monſoons, and Face of the Country. It is ſubject to Earthquakes.

THE iſland of Java extends from the hundred and fifth to the hundred and ſixteenth degree of longitude from London, and from five degrees thirty minutes to eight degrees ſouth latitude, and is about ſix hundred and ſixty miles in length, and one hundred, and ſometimes one hundred and fifty, in breadth. It extends almoſt due eaſt and weſt, and has the iſle of Borneo on the north, the iſland and ſtreights of Baly towards the eaſt, the Indian ocean to the ſouth, and is ſeparated from Sumatra at the weſt end by the famous ſtreights of Sunda. From this laſt ſtreight the iſlands of Java, Sumatra, and Borneo, are denominated Sunda iſlands.

As to the ſeaſons and monſoons: on the north ſide of Java, and the iſlands which lie to the eaſtward, the worſt weather is during the weſterly winds, which generally begin in the firſt week in November. They blow freſh in December, and then the rains increaſe. In January the weather is at the worſt, with reſpect to the wind and rain, which continue till the latter end of March. In April the weather becomes fair, and the winds variable with calms; but ſudden guſts of wind from the weſtward generally happen at the full and change of the moon. About the firſt of May the eaſtern monſoon may be ſaid to be ſettled, and in June and July is frequently attended with rain, though when the eaſterly winds blow hardeſt there is none at all. During this monſoon the weather is generally pleaſant and wholeſome, and continues ſo till the latter end of September. In October the wind frequently ſhifts, but the eaſterly winds blow very faintly; and in the beginning of November the weſterly monſoon ſets in again; however, in ſome years the monſoons happen fifteen days ſooner or later than in others.

It is obſervable, that the currents here conſtantly follow the winds, and ſet eaſt-north-eaſt, or weſt-ſouth-weſt, as the monſoon does at ſea.

The air is ſweet and mild; great part of the land is fertile, and finely diverſified with hills and valleys, which, near the city of Batavia, are improved by regular plantations, beautiful canals, and whatever can contribute to render a country pleaſant and agreeable. The iſland produces not only every thing neceſſary for the ſubſiſtence of man, but a large proportion of thoſe valuable effects which

form the commerce of the country. It is divided by many woods, mountains, and rivers, in which nature has bountifully beſtowed her treaſures; and it is certain that in ſome parts of the iſland are mines of gold.

Moſt of the mountains are ſo high as to be ſeen at ſea at the diſtance of thirty or forty leagues, particularly that called the Blue Mountain, which is by far the higheſt. There are here however frequent and very terrible earthquakes, one of which happened when commodore Roggewein was there. It began about eight in the morning, and ſhook the city of Batavia and the adjacent places to ſuch a degree, that the fall of the houſes was every moment expected. The agitation of the waters in the road was ſo exceſſive, that their motion reſembled that of a boiling pot, and in ſome places the earth opened. The inhabitants are perſuaded that theſe earthquakes are cauſed by the mountain Parang, which is full of ſalt-petre, ſulphur, and bitumen; and they maintain, that it is very common, after ſuch an accident, to ſee a large cloud of ſmoke hang over the top of the mountain. Some years ago general Ribeck, who commanded in the iſland, aſcended to the top of that mountain with a conſiderable number of attendants. On his arrival there he perceived a large cavity, into which he cauſed a man to be let down, in order to examine the inſide. When the man returned, he reported that the mountain was hollow within; that he heard on every ſide a moſt frightful noiſe that ſeemed to proceed from torrents of water; and that in ſeveral places he had ſeen flaſhes burſt out, and had been extremely afraid of going farther, from the apprehenſions of his falling thro' ſome of the chaſms, or of being ſtifled by the vapours.

The waters in the neighbourhood of this mountain are far from being wholeſome, and even thoſe that come to Batavia are impregnated with ſulphur, ſo that the people who drink much of them contract various diſeaſes, and particularly the dyſentery; yet this water is ſo freed from all theſe ſulphureous particles by being well boiled, that it then does no harm, though drank ever ſo copiouſly.

SECT. II.

Of the Trees and Plants of Java, with a particular Deſcription of the Cocoa-Tree. Of the Animals of that Iſland.

THE fruits and plants of this iſland are excellent in their kind, and almoſt innumerable; one of the moſt valuable of the fruit-trees is the cocoa. This is a ſpecies of the palm, which grows in moſt places in the Eaſt and Weſt Indies: it is large, ſtraight, and inſenſibly grows ſmaller from the bottom to the top. The fruit hangs to the trunk in bunches, united by a tendril not unlike the twig of a vine, but ſtronger: the flowers are yellow, like that of a cheſnut; and the branches are all towards the top. As it bears branches of fruit every month, ſome are always ripe, others green, and ſome juſt beginning to button. The fruit is of a greeniſh hue, and of different ſizes from that of an ordinary ball to the bigneſs of a man's head. It is covered with two rinds, the outer compoſed of long tough threads, of a colour between red and yellow; but the ſecond is as hard as a man's ſkull. Within theſe is a thick, firm, white ſubſtance, which in taſte reſembles a ſweet almond. The inhabitants eat this ſubſtance with their victuals as we do bread, and by preſſing it draw a liquor which in taſte and conſiſtence reſembles almond-milk. This milk, being expoſed to the fire, is converted into a kind of oil, which they uſe as we do butter, in their ſauces, and as oil in their lamps; they likewiſe uſe it medicinally, and often rub their bodies with it. Beſides this white ſubſtance found in the nut, there is a conſiderable quantity of a clean, bright, cool liquor, which taſtes like ſugar-water. They alſo draw from the tree itſelf a very agreeable liquor, which the Indians call ſura, and the Europeans ſtile palm-wine; and indeed it is little inferior to Spaniſh white-wine, except in keeping; for in about two days time it turns ſour, when they expoſe it to the ſun, and by this means it becomes excellent vinegar. As this wine is ſtrong and heady, they generally temper it with the clear water drawn from the nut. In order to extract this wine, they cut one of the largeſt twigs at the diſtance of about a foot from the tree, and hang to it either a bottle or a calabaſh. This wine, when boiled, produces another; and by diſtilling it they alſo obtain a ſpirit, which many prefer to the arrack diſtilled from rice. Beſides all theſe advantages the people in the Eaſt Indies reduce the bark of this tree into threads, of which they make very good cordage, and particularly cables. The timber is equally fit for building ſhips and houſes, which are covered with the leaves of the ſame tree. It is ſaid that in this country when the father of a family has a child born, he orders a cocoa-tree to be planted, that the child may afterwards know its own age, for on the trunk of this tree a circle annually riſes, ſo that its age is known by inſpection; and if any body aſks the father how old his children are, he ſends them to his cocoa-trees.

Pepper and coffee grow in the country, and about Batavia are ſeveral conſiderable ſugar-plantations, and ſome of tobacco. However, no other corn but rice grows in the iſland: yet, though they have wheat imported from Bengal, the Europeans, after being a little time there, prefer boiled rice to bread.

Almoſt all ſorts of garden ſtuff thrive there, and the ſeeds brought from Europe, Perſia, and Surat, yield a great increaſe; ſo that the kitchen-gardens of Batavia afford peas, beans, roots, and herbs ſufficient to ſupply that populous city.

There is a great number of woods and foreſts ſcattered over the iſland, in which there is a prodigious variety of wild beaſts, ſuch as apes, rhinoceroſes, buffaloes, tygers, and wild horſes: they likewiſe abound with an infinite variety of ſerpents, ſome of which are of a prodigious ſize. Crocodiles are alſo very large in Java, and are chiefly found in the mouths of rivers; for being amphibious animals, they delight moſt in marſhes and ſavannahs. Some of theſe are from twenty to thirty-three feet long, but their legs are extremely ſhort; and if a perſon has the preſence of mind to turn frequently when he flies from one of them, he will eaſily eſcape, for they cannot turn about without taking up ſome time; and indeed they obtain moſt of their prey while lying among the reeds, like the trunk of an old tree, by the ſide of a river, and ſuddenly ſeize upon the incautious traveller before he is aware. They are, however, frequently taken by the Malayans, who bait a large iron hook with a dog, which ſeems to be their favourite food, and then fiſh for them at the mouth of ſome rivulet or creek, where they uſually lie to ſeize upon what is driven down towards the ſea. The back of this animal is covered with ſuch hard ſcales, that they are not to be penetrated even by a muſket-ball; but he is eaſily killed if they come at his belly. Theſe creatures are ſo much dreaded at Batavia, that the government allows a reward to thoſe that take or kill them.

Here are fowls of all ſorts, and extremely good, eſpecially pheaſants, partridges, wood-pigeons, and peacocks: for curioſity they have the Indian-bat, which differs but little in its form from ours; yet though the body is of the ſize of a rat, the wings, when extended, meaſure a full yard.

They have fiſh of different ſorts in great plenty, and very good; ſo that for the value of three-pence enough may be bought to dine ſix or ſeven men. They have likewiſe a multitude of turtle.

As the flat country thus abounds with all ſorts of proviſions, great quantities are daily brought to Batavia; and, to prevent any danger of ſcarcity, the company's ſhips are continually employed in bringing proviſions, ſpices, and other neceſſaries, from the moſt diſtant parts of the iſland.

SECT. III.

A particular Deſcription of the City of Batavia.

THE city of Batavia is ſituated in the iſland of Java, in the latitude of ſix degrees ſouth, and is the capital of the vaſt dominions belonging to the Dutch Eaſt India company; it alſo ſerves for the emporium, where all the riches and merchandize of that wealthy company are laid up. The Dutch having taken the town of Jacatra from the Portugueſe in 1618, they ſoon after built there a fort in its neighbourhood, which they called Batavia; but it had

had not been long finiſhed, when the natives, animated and aſſiſted by the Engliſh, attacked it ſeveral times, but without ſucceſs, and at laſt blocked it up; but the Dutch being at length ſuccoured by a powerful ſquadron from Europe, under the command of admiral Koen, the Engliſh raiſed the ſiege, and the natives were obliged to retire with the utmoſt precipitation.

The Dutch now conſidering the excellent ſituation of the fort, and the many advantages reſulting from it, immediately reſolved to build a town near it. With this view they demoliſhed Jacatra, and upon its ruins erected the famous city which, from the name of the fort, they called Batavia. This city is encompaſſed by a rampart twenty-one feet thick, covered on the outſide with ſtone, and fortified with twenty-two baſtions. This rampart is ſurrounded by a ditch about forty-five yards broad, and the avenues to the city are defended by ſeveral forts, ſix of which are built with ſtone, and furniſhed with excellent braſs cannon. Theſe deſerve to be particularly mentioned; they are named Anſiol, Anke, Jacatra, Ryſwick, Noordwich, and Vythock. The fort of Anſiol is ſeated on a river of the ſame name, eaſtward from the ſea, and about twelve hundred yards from the city; it is built intirely of ſquare ſtone, and is conſtantly provided with a ſtrong garriſon. The fort of Anke is ſituated on a river of the ſame name on the coaſt to the weſtward, and about five hundred yards from the city, and is likewiſe built entirely of ſquare ſtone. The fort of Jacatra alſo lies on a river of the ſame name; it exactly reſembles the other two forts, and is at the diſtance of about five hundred paces from the city, the road to which is between two rows of lofty trees regularly planted, with fine country houſes, and gardens on each ſide. The other three forts are erected in the ſame manner, and of the ſame materials, all of them on the land ſide of the city, and at a ſmall diſtance from it. The two firſt of theſe forts ſecure the city on the ſide of the ſea, and the other four defend its entrance on the land ſide, and at the ſame time protect the houſes, plantations, and gardens of the inhabitants. Thus this city can never be ſurpriſed by an enemy, ſince, on whatever ſide it ſhould be attacked, the enemy would meet with a ſtrong reſiſtance. Beſides, as a farther ſecurity, no perſon is ſuffered to paſs beyond theſe forts without a paſſport.

The river, which ſtill preſerves its ancient name of Jacatra, paſſes through the midſt of the city, and forms fifteen canals of running water, all faced with free-ſtone, and adorned with trees that are always green, and conſequently afford a very agreeable proſpect. Over theſe canals are fifty-ſix bridges, beſides thoſe built without the town. All the ſtreets are perfectly ſtraight; they are generally thirty feet broad, and the houſes, which are built of ſtone, after the manner of thoſe in Holland, are moſtly very high. The city is about a league and a half in circumference; but the ſuburbs contain at leaſt ten times as many houſes as the city itſelf. The walls have five gates, including that of the port, near which is the barrier, which is regularly ſhut at nine o'clock in the evening, and is ſtrongly guarded by a body of ſoldiers night and day.

The principal buildings are a very fine town-houſe, four churches for the uſe of the Calviniſts, and abundance of other places of worſhip for perſons of all religions: a ſpinhuys, or houſe of correction, in which women, who behave looſely, are confined, an orphan-houſe, a magazine for ſea-ſtores, many other magazines for ſpices, and other public buildings.

We ought not to omit, that beſides the many forts above-mentioned, there is a citadel, which is a fine regular fortification, ſituated at the mouth of the river facing the city, and flanked with four baſtions, two of which command the ſea, and the other two the town. This citadel has two great gates. On both ſides of the curtain the keepers of the magazines have their lodgings, and here the governor-general of the Indies has his palace, which is built of brick, and has a noble front, after the Indian manner. Oppoſite to it is the palace of the director-general, who is the next perſon to the governor. Here alſo the counſellors, and other principal officers of the company have their apartments, as have likewiſe the phyſicians, the ſurgeon, and apothecary. It has likewiſe a ſmall church, which is remarkably neat and light. There are beſides in the citadel arſenals, and magazines, furniſhed with ammunition for many years. In ſhort, this citadel is the general factory, in which all the affairs of the company are tranſacted, and where all the archives are depoſited.

In this city the Dutch have founded ſchools, in which the learned languages are taught, and ſome advances made in the liberal arts; and the inhabitants, being compoſed of almoſt every Indian nation, moſt of the Indian languages are ſpoken here; but thoſe of the moſt general uſe are the Dutch, the Malayan, and a corrupt Portugueſe.

In Batavia almoſt all ſorts of mechanic arts flouriſh; for the Dutch encourage every manufacture proper for the country: they have their printing-houſe, paper-mills, gunpowder mills, ſugar-bakers, ſpinners, cotton-weavers, rope-makers, carpenters, bricklayers, braſiers, and ſmiths, who forge all ſorts of iron ware. If theſe workmen are inferior to the Europeans, it is chiefly where the work requires fine ſprings and movements, as in clocks and watches, which are hardly ever brought to a proper temper in hot countries; and even the beſt watches ever brought from Europe, will not go true in this climate. The very ſteels of their firelocks in time become ſoft.

Coaches are almoſt as common as in the great towns of Europe, and they have fine horſes from Perſia; the iſland alſo affords others of a ſmall ſize, that are very ſerviceable.

SECT. IV.

Of the Inhabitants of Batavia, with their Perſons, Dreſs, and Employments. The Manner of Life, of the Javaneſe, Malayans, Amboyneſe, Mardykers or Topaſſes, the Macaſſars, and Bougis, who live there; with a conciſe Account of the Maſſacre of the Chineſe.

BATAVIA is not only inhabited by the Dutch, but by abundance of Portugueſe, French, and other Europeans, who have ſettled there on account of trade. The Portugueſe are principally the deſcendants of thoſe who formerly lived in the iſland of Java, and did not chuſe to remove when the coaſts were reduced under the dominion of the Dutch company, and are now moſtly of the reformed religion. Here is likewiſe a great multitude of people of different nations, as the Javaneſe, or natives of the country, Malayans, Negroes, Amboyneſe, Armenians, natives of the iſle of Baly, Mardykers, Timors, Macaſſars and Bougis. Nothing can be more entertaining, than to behold ſuch a multitude of people in one city of different nations living at their own dwellings, and after their own way. One ſees every moment new cuſtoms, ſtrange manners, a variety of habits, and faces of different colours, as white, black, brown, and olive-coloured; every one living as he pleaſes, and ſpeaking his own language; yet notwithſtanding this variety of cuſtoms oppoſite to each other, a very ſurpriſing union is obſervable among theſe citizens; this is purely the effect of commerce, which, like a common ſoul, actuates the whole body.

With reſpect to liberty of conſcience all the inhabitants enjoy it; but are not allowed the public exerciſe of their worſhip. Prieſts and monks are not permitted here, any more than in the United Provinces, to walk the ſtreets in the habits of their reſpective orders; yet they are all allowed to live here, except the Jeſuits, who are excluded, not on account of their religion, but for fear of their intrigues.

In order to convey a clear idea of the manner in which the people live at Batavia, we ſhall mention ſome particulars of each nation. The Javaneſe chiefly apply themſelves to agriculture, fiſhing, and ſhip-building. They wear ſcarcely any other habit beſides a ſhort petticoat, that reaches to their knees, the reſt of their bodies being naked, except their having a little bonnet on their heads, and a ſcarf acroſs their ſhoulders, in which hangs a ſhort ſword. Their cabins, which are ſuperior in neatneſs to thoſe of the other Indians, are built of ſplit bambóo, with a large ſpreading roof that hangs over the ſides of the houſe, and under it they ſit to take the air. Thoſe who are eſtabliſhed in the neighbourhood of Batavia, and in a tract about forty leagues along the mountains of Bantam, are immediately ſubject to the governor-general. The com-

company ſends commiſſaries among them, who adminiſter juſtice, and collect the public revenues; and the principal men among the Javaneſe at certain times reſort to Batavia to give an account of the behaviour of theſe commiſſaries.

The Malayans, who live at Batavia, chiefly employ themſelves in fiſhing. Their veſſels are very neat, and their ſails ingeniouſly made of ſtraw; but they are a moſt wicked and profligate people, and frequently commit murders for very trifling gains. They profeſs the Mahometan religion, but are entirely void of morals, and make a merit of cheating Chriſtians. Their habits are either of ſilk or cotton, and the men alſo wear a piece of cotton cloth about their heads, with their black hair tied up in a knot behind.

The negroes at Batavia are chiefly Mahometans. Some of them work in mechanic trades, others are a kind of pedlars, but the moſt conſiderable of them trade in ſtone for building, which they bring from the neighbouring iſlands.

The Amboyneſe ſettled in this city chiefly apply themſelves to building of houſes with bamboos, the windows of which are made of ſplit cane neatly wrought in different figures. They are a very bold people, and are ſaid to be ſo turbulent, that they are not permitted to live in the city, but have a quarter allotted for them at ſome diſtance from it. They have a chief to whom they pay great reſpect, and he has a very magnificent houſe in their quarter, well furniſhed after their manner. The men wear a piece of cotton cloth round their heads, with the two corners hanging down behind; and this kind of turban they adorn with many flowers. Their arms are chiefly large ſabres, and long bucklers. The women wear a habit that ſits cloſe to their bodies, and wrap a cotton mantle round their ſhoulders, but leave their arms naked. Their houſes are built with boards, and covered with leaves; they are two or three ſtories high, and the ground-floors, in particular, are divided into ſeveral apartments.

The Mardykers, or Topaſſes, are idolaters compoſed of various Indian nations, and are of different trades and profeſſions. Their merchants being furniſhed with paſſports from the company, carry on a conſiderable commerce in all the neighbouring iſlands. Some of theſe people are gardeners, others breed cattle, and others fowls. The men generally dreſs like the Dutch, but the women like the other Indians. They reſide both in the city and in the country; their houſes are much better than thoſe of other Indian nations, and are uſually built either of ſtone or brick: they are ſeveral ſtories high, and very neat.

There are alſo at Batavia ſome of the Macaſſars, ſo famous for their little poiſoned arrows, which they blow from a trunk.

The Bougis are the inhabitants of three or four ſmall iſlands near Macaſſar, and ſince the conqueſt of this laſt iſland have ſettled at Batavia. They are hardy bold fellows, on which account the company makes uſe of them for ſoldiers. Their arms are bows and arrows, ſabres and bucklers. The Armenians, and ſome other Aſiatics, who reſide in Batavia, come thither merely on the account of trade, and ſtay no longer than their occaſions call them.

The Chineſe at Batavia were formerly ſo very numerous, that thoſe in the city and ſuburbs were ſaid to amount at leaſt to five thouſand. Moſt of the ſugar mills in Batavia belonged to them, and the diſtillery of arrack was intirely in their hands. They were the carriers of Aſia, and the Eaſt India company itſelf frequently made uſe of their veſſels. They kept all the ſhops, and moſt of the inns in the city, and were likewiſe the farmers of the duties, exciſes, and cuſtoms. But in the year 1740, the governor being informed that the Chineſe had entered into a conſpiracy to exterminate the ſubjects of the company, he loſt not a moment's time to prevent its ſucceſs: they were condemned without trial, and ſentenced to ſuffer death without being heard. The ſeamen were inſtantly landed from the fleet, and to encourage them in the bloody ſlaughter they were appointed to make, the plunder of the Chineſe ſuburb was abandoned to them: animated by this reward, they fell with mercileſs fury on the conſpirators, and cut them to pieces.

SECT. V.

Of the two ſupreme Councils at Batavia, and the Tribunal of the City. Of the Power and State of the Governor; the Office and Employment of the Director-General. Of the Major-General, and the Land and Sea Forces of the Company. Of the Eccleſiaſtical Government of Batavia. The Regulations of the military Eſtabliſhment, and the maritime Force of the Company.

THE city of Batavia, and all the dominions in the Eaſt Indies in the poſſeſſion of the company, are governed by two ſupreme councils, both fixed in the city of Batavia, as the capital of all the countries under the company's juriſdiction. One of theſe is ſtyled the council of the Indies, and the other the council of juſtice. To the firſt belong all matters of government, and the direction of public affairs, and to the latter the adminiſtration of juſtice in all its branches. The governor-general always preſides in the firſt, which is uſually compoſed of eighteen or twenty perſons, ſtyled counſellors of the Indies; but it ſeldom happens that they are all at Batavia at the ſame time, as they are uſually provided with ſome or other of the ſeven governments in the company's diſpoſal. They regularly aſſemble twice a-week, and upon extraordinary occaſions, as often as the governor-general pleaſes. They deliberate on whatever relates to the intereſt of the company, ſuperintend the iſland of Java, and iſſue orders and inſtructions to other governments, which are implicitly obeyed; and in this council all letters directed to the governor-general, or to the director, are read, and the anſwers agreed on by a plurality of voices.

The council of juſtice is compoſed of a preſident, who is uſually a counſellor of the Indies, eight counſellors of juſtice, a fiſcal or attorney-general for affairs of government, another fiſcal for maritime affairs, and a ſecretary. All the counſellors of this college are doctors of the civil law. The firſt attorney-general has not only a vote, as well as the other counſellors, but has the third of all fines under an hundred florins, and a ſixth part of the fines that are above that ſum. It is his duty to take care that the laws are ſtrictly obſerved, and to prefer informations againſt thoſe who preſume to violate them. The fiſcal of the ſea takes the ſame care with regard to frauds committed in commerce, acts of piracy, and whatever has a tendency to diſturb the ſettled rules in maritime affairs.

Beſides theſe two ſovereign boards, there is the council or tribunal of the city of Batavia, compoſed of nine aldermen, including the preſident, who is always a counſellor of the Indies, and a vice-preſident. The bailiff of the city, and the commiſſary of the adjacent country, have alſo ſeats in this aſſembly, and, with the ſecretary, make up the board.

The governor-general is the head of the empire eſtabliſhed by the company in the Eaſt Indies, and is in reality ſtadtholder, captain-general, and admiral. By this office he is preſident of the council of the Indies, in which he has two votes; he has the key of all the magazines, and directs every thing that has a relation to them: like a deſpotic prince he commands by his own proper authority, and every body is bound to obey him, but is liable to be removed by the directors of the company at home; and in caſe of treaſon, or other enormous crimes, the council of juſtice may ſeize his perſon, and call him to account. The company allow him eight hundred rix-dollars a month, and five hundred more for his table; they alſo pay the ſalaries of ſuch as compoſe his houſhold. Theſe appointments are, however, only a ſmall part of his revenue, the legal emoluments of his office being ſo great, that within two or three years he may, without oppreſſing the people, or burthening his conſcience, raiſe an immenſe fortune.

As the governor-general is in a manner the ſovereign of the countries belonging to the company, in compliance with the mode of the Indian nations, he is allowed a court, and moſt of the honours paid to crowned heads. Whenever he leaves his palace, in order to retire to his country-ſeat, he is preceded by the maſter of his houſhold, at the

head of ſix gentlemen on horſeback with a trumpet; two halbardiers on horſeback go immediately before his coach. On the right he has his maſter of the horſe at the head of ſix halbardiers on horſeback, then follow the other coaches which carry his friends and retinue, and the whole is cloſed by a troop of horſe, conſiſting of forty-eight men, commanded by a captain and three quarter-maſters, and preceded by a trumpet richly cloathed.

Though his office is very conſiderable on account of its revenues, power, and the honours annexed to it, yet it is extremely fatiguing. He is employed from morning till night in giving audience to thoſe who have buſineſs with him, in reading of letters, and giving orders for the company's ſervice, ſo that he ſpares only one half hour for dinner; and even while at table diſpatches ſuch affairs as are extremely preſſing. He alſo receives all the Indian princes and their ambaſſadors, many of whom come every year to Batavia.

Next to the governor, the director-general has the greateſt authority, and is the ſecond perſon in the council of the Indies. His employment likewiſe demands great care and attention: he buys and ſells all the commodities that enter into, or go out of the company's magazines: he orders what ſort, and what quantity of each ſort of goods ſhall be ſent to Holland, or elſewhere: he has the key of all the magazines, and every officer in the company's ſervice makes a daily report to him of the ſtate of every thing under his charge. In ſhort, he has the ſupreme direction of whatever relates to the commerce of the company, both at Batavia and in other places; and the members of all the factories belonging to the company are accountable to him for their conduct in their reſpective offices.

The next perſon in the government is the major-general, who under the governor has the command of all the forces, which throughout the Indies may be computed at twelve thouſand troops, excluſive of the militia, who are alſo well diſciplined, and amount to about one hundred thouſand men. In fine, the regular military ſtrength of the company by land and ſea, officers, ſoldiers, and ſeamen included, may amount to about twenty-five thonſand men kept in conſtant pay; and the company always keep for the ſupport of their commerce one hundred and eighty ſhips, which carry from thirty to ſixty guns; and in caſe of extremity, they are at any time able to fit out forty of a larger ſize.

The eccleſiaſtical government at Batavia is generally in the hands of eleven perſons, all of whom are miniſters of the reformed religion: theſe are five for the two Dutch churches in the city and that in the citadel, beſides the miniſter that reſides in the iſland of Onruſt, in the mouth of the harbour of Batavia; three Portugueſe miniſters, and two Malayans. The five laſt are Dutchmen by birth, though they preach in the Portugueſe and Malayan tongues. As it is thought neceſſary that the ſtate ſhould be informed of whatever paſſes at the meetings of the clergy, the eleventh perſon is a deputy on the part of the government, who is to ſee that they undertake nothing prejudicial to the civil government, or inconſiſtent with the laws preſcribed by the company.

Beſides theſe miniſters, the conſiſtory is compoſed of eight elders and twenty deacons. A principal branch of their buſineſs is to ſend miniſters into other governments, where, after a certain term of years, they are relieved, and either return to Batavia or to Holland, to enjoy in peace the fruits of their labours. In ſmall places they have no ordinary miniſter, but one is regularly ſent every three or four years, to baptize, marry, and adminiſter the Lord's ſupper, which is the more neceſſary, as the ſynods have taken the reſolution not to permit any religion but that of Calviniſm to make any progreſs in the dominions of the Eaſt India company. Indeed the Lutherans have for a long ſpace of time warmly ſolicited for a church at Batavia, but have been conſtantly refuſed, though nothing could be more juſt and reaſonable than this requeſt, eſpecially in a place where Mahometans and Pagans are freely tolerated in the exerciſe of their religions.

This eccleſiaſtical council have alſo under them conſolators of the ſick, ſchool-maſters, and catechiſts. Of theſe laſt the company have many in their ſervice on board their ſhips, who ſay prayers conſtantly every day, and inſtruct ſuch as embrace the Chriſtian religion. Theſe catechiſts are for the moſt part natives of the country, and as they ſpeak ſeveral languages, are able to give neceſſary inſtructions, and to teach the confeſſion of faith to many different nations.

In conſequence of theſe regulations, the reformed religion makes a conſiderable progreſs, particularly among the negroes, of whom Mr. Roggewein ſays, he has ſeen one hundred and fifty at a time deſire to be baptized. This requeſt, however, is not raſhly granted; for all who receive baptiſm muſt firſt give proof of their being well inſtructed, and be able to make their confeſſion of faith. In this they are ſo ſtrict, that they do not diſpenſe with it even with reſpect to princes and princeſſes themſelves.

The military eſtabliſhment in the Eaſt Indies is much the ſame as in the United Provinces, the company's troops being as regularly paid and as well diſciplined as thoſe in Holland. The firſt officer in command, in time of peace, has no higher rank than that of major, under whom are captains, lieutenants, and enſigns: but when the troops are in the field, the lieutenants and enſigns are at the head of companies, the captains lead brigades, and the major, acting as major-general, commands in chief. The natives of the country are under their own officers, who are capable of riſing to the rank of a captain, but no higher. The burgeſſes of Batavia alſo chooſe their own officers, as high as the rank of captains of horſe and foot, and are under the command of a colonel, who is both one of the counſellors of the Indies, and preſident of the council of war.

The company's maritime force is regulated on the ſame maxims as their military eſtabliſhment, that is, there are no officers wanting that are neceſſary to the preſervation of good diſcipline, nor are any honoured with high titles merely to ſecure large appointments to them without any benefit to the ſtate. The whole fleet is under the direction of a commodore, who has under him a vice-commodore. Theſe are the only flag-officers; but every captain has the command of his ſhip. When their veſſels are in the harbour of Batavia, the captains are obliged every morning to repair to the commodore, in order to give him an account of the ſtate of their veſſels, and to receive his orders: yet the commodore himſelf can do nothing of conſequence without the conſent and approbation of the governor-general, to whom all the officers of the company, civil, military, and marine, are accountable.

The company's ſhips ſail from Batavia for Holland five times a year: the firſt ſquadron, which is compoſed of four or five ſail, leaves that city in January: the ſecond ſails in March, and only conſiſts of one ſhip; this veſſel does not ſail till the Chineſe fleet, which brings the tea, is arrived, and of this the beſt part of the cargo of this veſſel conſiſts; whence it is called the tea-ſhip, but the common people give it the name of the book-ſhip, from its bringing the company's account of all their proceedings during the laſt year, by which means the directors in Holland ſee the ſtate of the trade in the Indies: the third ſails in July, and is compoſed of four or five ſhips, which in their paſſage touch at the iſland of Ceylon: the fourth ſquadron, which conſiſts of ſix or ſeven veſſels, ſails in September; and the fifth, which forms a fleet of ſixteen or twenty ſail, leaves Batavia in the month of October. All theſe veſſels, laden with the riches of the Eaſt, ſail from the port of Batavia; the ſhips from Mocha, which bring home the coffee, being the only veſſels in the ſervice of the India company that are allowed to proceed directly home without going to Batavia.

SECT. VI.

Of the other Towns in the Iſle of Java, particularly Bantam, Cheribon, Japara, and Palamboan.

THE other towns in the iſland of Java are Bantam, Cheribon, Samarang, Japara, Roombong, Tuban, Sidaya, Jortan, and Surabaiga. Theſe are on the north coaſt as well as Batavia, and at the eaſt end of the iſland are the cities of Paſſarvan, Panarucan, and Palamboan: about the middle of the ſouth coaſt is the city of Mataran,

where the king of Mataran reſides. Of theſe towns we have very little knowledge, except of Bantam, Cheribon, Japara, and Palamboan.

Bantam is ſeated in a plain at the foot of a mountain, out of which iſſues three rivers, or rather one river that divides itſelf into three branches, two of which ſurround the town, and the other runs through the middle of it. When this city was in its proſperous ſtate, it was no leſs than twelve miles in circumference, and was very populous. It lay open towards the land, but had a very good wall to the ſea fortified with baſtions, and defended by a numerous artillery. The king's palace was a place of conſiderable ſtrength, and there were ſeveral publick buildings and palaces of the great men that made a good figure. This was one of the greateſt ports in the eaſtern ſeas, and to it many nations reſorted; but it is now a poor and wretched place, without trade, for the principal inhabitants are removed.

The head of the Dutch factory at this city has the title of a chief. The Dutch have there a ſtrong fort and a numerous garriſon to keep the people in awe, who are far from being well affected to them. The king has alſo a fort at the diſtance of ſome hundred paces from that which belongs to the company, and a ſtrong garriſon in it for the ſecurity of his perſon. The bay of Bantam is very ſafe and pleaſant, in which are many iſlands that ſtill retain the names given them by the Engliſh, who had formerly a very fine factory at this place, from which they were unjuſtly expelled in 1683.

The only commodity of this part of the country is pepper, of which they are able annually to export ten thouſand tons. The Dutch Eaſt India company oblige the king to furniſh them with a certain quantity of this ſpice, but in all other reſpects treat him with great civility. This their intereſt obliges them to do, he being the ſovereign of a great and populous country, and his ſubjects bold, hardy, and enterprizing.

The country is very fertile, abounding in cattle, rice, and fruits; and at a conſiderable diſtance from the ſhore are frequently found precious ſtones of great value; but theſe ſeldom fall into the hands of the Dutch, the people dreading leſt theſe ſhould tempt them to extend their conqueſts, by which they are already too much oppreſſed.

At the diſtance of forty leagues from Batavia is Cheribon, where the Dutch company have a factory, the head perſon of which has the title of reſident, and is not dependent on any governor or director, but correſponds directly with the governor-general of Batavia. The company here carry on a very advantageous commerce in cotton, indigo, cardamoms, and coffee. The land is as fertile in rice and other proviſions as perhaps any country upon earth: it is of conſiderable extent, and the people who inhabit it are under the dominion of four great lords, who where formerly ſtiled pangerans, or princes, but are now called ſultans, or kings, though their authority is not much extended in conſequence of this new title. One of them is particularly denominated the company's ſultan, from his being always attached to the Dutch intereſt. Indeed all of them might be very properly termed the company's ſultans, ſince they are under the protection of the Dutch, and are freed from all apprehenſion of their being attacked by the king of Bantam, who formerly carried on a continual war with them, and would probably have reduced them under his ſubjection, had not the company aſſiſted them, and driven the Bantameſe out of their territories. Theſe princes have in return, both from gratitude for paſt favours, and from the expectation of being protected for the future, granted the company great privileges in their dominions, particularly that of erecting a fort at Cheribon, where they have a garriſon of ſixty men.

At the diſtance of about half a league from this fort are the tombs of the princes of Cheribon, in a vaſt temple, which was probably erected for that purpoſe: they are three ſtories high, and built of various kinds of fine ſtone. Theſe tombs are ſaid to contain immenſe riches; but though they are left unguarded, the princes are under no apprehenſions of their being carried away, from the firm perſuaſion that they are protected by ſome ſpiritual beings; and they report many inſtances of perſons who they pretend dropped down dead on approaching the places where theſe riches are concealed, in order to carry them away. A multitude of prieſts are maintained about this temple, many of whom have gone in pilgrimage to Mecca, and on that account are treated with extraordinary reſpect.

The whole body of this prieſthood is governed by one ſovereign pontiff, who is more revered than the ſultans themſelves.

Our author obſerves, that there was once a very conſiderable Engliſh factory at Cheribon, with a little town belonging to it; but that the perſons who belonged to the factory intriguing with the wives of the natives, they were ſo exaſperated, that they maſſacred them all in one night's time, and then deſtroyed the town.

Japara is ſituated at the bottom of a mountain of a moderate height, and is chiefly inhabited by the Javaneſe and Dutch. The port is ſafe and commodious, and is defended by a fort built chiefly of wood, and erected at the the top of the mountain, where it commands the whole road; this is called the Invincible Mountain, becauſe when the Portugueſe were maſters of the place, the Javaneſe were conſtantly defeated in their attempts to get it into their poſſeſſion.

The king of Japara generally reſides at a town called Kattaſura, ſituated twenty-nine leagues up the country, where the Dutch have a ſtrong fort and a good garriſon, that ſerve both to ſecure their conqueſt and for a guard to the king. This prince is a mahometan, and like moſt eaſtern monarchs, is conſtantly ſerved by women, of whom he takes as many as he pleaſes, either as wives or concubines. Some of his prieſts are obliged to go every year in pilgrimage to Mecca, in order to make vows for the ſafety and proſperity of the king and his family. His ſubjects are extremely faithful and devoted to his intereſt. The principal perſons of his court, whenever they obtain an audience, approach him creeping on their knees; but this ſlaviſh cuſtom is diſuſed in time of war. Thoſe who commit the ſlighteſt fault are ſtabbed on the ſpot with a little dagger; and this is almoſt the only puniſhment in uſe amongſt them.

His ſubjects are fond of chewing betel. The prevailing diverſion among the people is a kind of comedies. The women who act in theſe are very richly dreſſed; but the entertainment chiefly conſiſts in ſinging and dancing, accompanied by their muſic, which is not very agreeable, at leaſt to an European ear; for they have no other muſical inſtrument beſides a kind of little drum, which they beat very dexterouſly. Their dancing is generally of the groteſque kind, in which they excel; for they throw their bodies with an inexpreſſible agility into a variety of poſtures, by which they expreſs the paſſions of the mind in ſo comical and ludicrous a manner, that it is almoſt impoſſible to avoid laughing. Theſe Indians alſo practiſe the war-dance, in which the king and his courtiers frequently bear a part. They are likewiſe fond of cock-fighting, at which they lay ſuch large ſums, that they are frequently reduced to beggary.

This part of the country abounds with all the neceſſaries of life, particulary with horned cattle, hogs, and an amazing quantity of fowls. Nothing is ſcarce here but mutton. As to wild beaſt, they have buffaloes, ſtags, tygers, and the rhinoceros, which the Javaneſe hunt chiefly for its horn of which they make drinking-cups that are highly valued, from an opinion that they will not hold poiſon, but inſtantly break as ſoon as it is poured into them. The land is every where extremely fertile, producing in vaſt abundance pepper, ginger, cinamon, cardamoms, &c. and of late years they have planted coffee with great ſucceſs. Fruit-trees grow every where, and as they are green throughout the year, and planted in rows along the river-ſides, there are here the moſt beautiful walks in the world. Sugar-canes grow very faſt, and the vines bear grapes ſeven times a year; but they are only fit for raiſins, and not for wine, becauſe the climate ripens them too haſtily.

The laſt city we ſhall mention is Palamboan, which is ſituated in a bay on the ſouth-eaſt coaſt of Java, oppoſite the iſle of Bally, and near the ſtreights of that name, in eight degrees ſouth latitude, and in one hundred and eleven degrees thirty minutes eaſt longitude from London. It is for many miles round encompaſſed by a pleaſant champain

champain country, and ſeveral ſmall rivers fall into the ſea on each ſide the city. As our Eaſt India ſhips were uſed ſometimes to paſs this way in their voyage home from Borneo, they ſent their boats up theſe ſtreams to bring off water and proviſions; but a great ſurf frequently renders it troubleſome watering here. The ſtreights between Java and Bally are very difficult to ſtrangers. In the narroweſt place this channel is not much broader than the Thames, and the mountains on each ſide, which are of a prodigious height, and hang almoſt over your head, afford a dreadful proſpect; while the noiſe made by the ſea in the hollow of the rocks, and the guſts of wind coming down from the mountains, and ſuddenly veering round the compaſs, encreaſe the horror.

The king generally reſides at Palamboan, and ſometimes at a fort fifteen miles from the ſea. His dominions extend from the eaſt of Java about eighty miles along the ſouth coaſt, and at the coaſt end, and about ſixty miles from north to ſouth, but how far it reaches up the country is unknown.

Captain Beeckman obſerves, that the people of Palamboan were under ſuch conſternation on his firſt appearing before the place, that they ſent to inform the king of it, who was then up the country; but the ſabander, the principal officer of the port, being a Chineſe, let them know that it was an Engliſh ſhip, of which he was informed by the colours, and immediately their fears vaniſhed. The king no ſooner underſtood that the commander was an Engliſhman, than he invited him on ſhore, and the next day, ſeeming to place an entire confidence in him, went on board the pinnace. The king was dreſſed in a ſhort black velvet waiſtcoat, trimmed with narrow gold lace, with a red cap on his head, and many gold and ſtone rings on his fingers: but his attendants were ſo thieviſh that they were obliged to watch them very cloſely. The Engliſh officers were afterwards entertained at the palace, which was a large ſquare, ſurrounded with a palliſado, containing ſeveral apartments for the king and his women. The entertainment conſiſted of fowls, veniſon, and high-ſeaſoned broths. When dinner was over about thirty of the king's women, each attended by a ſlave carrying a baſket of fruit, came in, and preſented it to the officers; and the quantity was ſo great, that there was more than the boat could carry on board at once; the king alſo made them a preſent of two oxen, three large deer, with ſome geeſe, ducks and hens, and ſeveral bags of rice.

The power of the king does not ſeem to be reſtrained by any laws: his oran cayas, or noblemen, ſhew him the moſt profound reſpect. His religion is pagan, as is that of moſt of his ſubjects, though here are ſome Mahometans among them: the Chineſe have found their way thither, as well as to every other port in the Indies.

SECT. VII.

Of the ſmall Iſlands near the Coaſt of Java; with a more particular Account of Timor, the largeſt and moſt conſiderable of them. Its Situation, Extent, Coaſt, and Climate. It is jointly poſſeſſed by the Dutch and Portugueſe. Its Vegetables and Animals, with a Deſcription of the Perſons, Dreſs, and Manners of the Natives.

TO the northward of Java are ſeveral iſlands, where the Engliſh, in their voyages to Borneo, meet with very good refreſhments, at a much eaſier rate than at Batavia. Among theſe are Carimon Java, which is ſituated between the coaſt of Java and Borneo; and there European ſhips frequently touch in their voyage to the laſt-mentioned iſland. Madura lies towards the north-eaſt end of Java, at the bottom of the great bay. A little to the eaſtward of Java lies the iſland of Bally, or Leſſer Java; and farther to the eaſtward Lomboy, Combava, Flores, Solor, Timor, and ſeveral others; in moſt of which the Dutch have forts and ſettlements, and take the liberty of governing and even tranſplanting the natives whenever they pleaſe: from hence they alſo frequently recruit their troops, and thus make one nation of Indians contribute to keep another in ſubjection.

Timor is the largeſt and moſt conſiderable of theſe iſlands, and its natives reſembling the reſt in their perſons and manners, a deſcription of this iſland will give the reader a ſufficient idea of the reſt.

The iſland of Timor extends nearly north-eaſt and ſouth-weſt; the middle of it being in nine degrees ſouth latitude, and in one hundred and twenty-four degrees longitude from London. It is near two hundred miles long, and generally fifty broad; and has no navigable river, nor any harbours, but many bays, in which ſhips, at certain ſeaſons of the year, may ſafely ride at anchor. The ſhore is very bold and free from rocks, iſlands, or ſhoals, except a few which are viſible, and therefore eaſily avoided. The lands are low for about three or four miles up into the country; but then the hills begin to riſe. Near the ſea the land is ſandy, and covered with tall ſtraight-bodied trees; and from thence to the mountains there is a tract of marſhy ground, over-run with reeds and red mangroves, and overflowed at every tide; the tops and ſides of the mountains are cloathed with woods, intermixed with paſture-groves, and the country is pretty well watered with ſprings and ſmall rivers.

The ſafeſt riding for ſhips is in the bay of Babas, about five leagues from the fort of Concordia, where they are defended by the land from weſt-and-by-ſouth to the eaſt-north-eaſt, which is of the greateſt advantage, as no other winds blow with any violence: but here the worms will ſpeedily deſtroy a ſhip, if the utmoſt care be not taken to prevent this misfortune.

The ſeaſons here reſemble thoſe of the other parts of India in the ſouthern latitude: fair weather begins in April or May, and continues till September or October, when theſe parts begin to be viſited with ſtorms and tornadoes; but the worſt weather is in the middle of December, when the wind blows from the weſt, or north-weſt, with ſuch violence, that in the ſeas which waſh the northern ſhores there is no bearing up againſt it; and theſe winds are attended with heavy rains till the middle of February, when they begin to abate; and about the end of April, or the beginning of May, the eaſterly monſoon and fair weather are generally ſettled. But though the year is divided into the eaſtern and weſtern monſoons, when the weather is fair, there are every day ſea and land breezes near the ſhore, with which a ſhip may ſail either eaſt or weſt.

About a league from the ſouth-eaſt point of the iſland is the ſmall fort of Concordia, ſituated upon a ſolid rock cloſe by the ſea. On the eaſt ſide of which is a ſmall river of freſh water, over which there is a broad boarded bridge, near the enterance into the fort, about one hundred yards from the ſea-ſide, and as many from the fort. The company, as at moſt of their forts, have a fine garden, ſurrounded with a good ſtone wall, in which there is plenty of ſallads, cabbages, and roots for the kitchen, and a parterre. In another part of it are fruit-trees, as jakas, pumplenoſes, oranges, and ſweet-lemons, muſk and water-melons, pine-apples, pomecitrons, and pomegranates; and by the walls are cocoa-nuts and toddy-trees in great plenty. Between this garden and the river there is a kind of paddock for black cattle, which are very numerous. Beyond the company's ground is a ſmall town, in which the natives have about ſixty houſes.

On the north coaſt, about fifty miles to the eaſtward of the above fort, is Laphao, a Portugueſe ſettlement; the people there ſpeak Portugueſe, but have been ſo intermixed with the natives by intermarriages, that they can ſcarcely be diſtinguiſhed from them: though they are proud of being called Portugueſe, and have embraced the Romiſh religion, they ſeem to have withdrawn themſelves from the Portugueſe government, refuſing to ſubmit to the governors ſent from Goa. They have no place of ſtrength, yet their government extends much farther into the country than that of the Dutch, they being in a manner incorporated with the original natives, many of whom are of the ſame religion: but in other parts of the iſland Paganiſm and Mahometaniſm ſtill prevail, and there the people generally ſide with the Dutch againſt the Portugueſe.

Laphao is ſituated by the ſea-ſide, and only conſiſts of about forty or fifty low houſes covered with palmeto leaves, and a ſmall church built up with boards. In a little ſhed are ſix old

old iron guns on a decayed platform, which would contribute but little to their defence, their greateſt ſtrength conſiſting in the numbers they are capable of aſſembling from the country. Some Chineſe live there, and, as the junks of that country annually viſit Laphao, it has the beſt trade of any place in the iſland, except Porto Nova, which is ſituated at the eaſt end. There the principal Portugueſe governor reſides, who, it is ſaid, can aſſemble, in twenty-four hours time, five hundred men armed with firelocks. But both this town and the Dutch town of Concordia have been plundered and burnt by a pirate.

The iſland is divided into many kingdoms, which ſpeak different languages, though in their cuſtoms and manner of living, as well as in their ſhape and colour, they ſeem to be originally of one deſcent. The chief of theſe kingdoms are Amaby, Lortriby, Pobumby, and Namquimal; each of which has a ſovereign, who has ſeveral rajas under him, and other inferior officers. Theſe princes are, for the moſt part, enemies to each other, and their enmity is fomented and kept up by the Dutch.

They have ſeveral ſorts of trees fit for building, though none of them are like ours; one of them grows by the ſea-ſide, and reſembles a pine; it is a hard, ponderous, reddiſh wood, and is very good timber. This iſland alſo produces palms of ſeveral kinds, one of them ſeven or eight feet in circumference, with branches only at the top like the cocoa-tree; the fruit alſo reſembles the cocoa-nut, but is no bigger than a hen's egg, and contains no water. There is another palm as large as the former; but though it bears ſeveral buſhels of ſmall fruit, which hang on the branches, this tree has no leaves, or any thing green about it. There are alſo large groves of the common cocoa-trees, which, as hath been already obſerved, are of the greateſt advantage to the people of India.

In this iſland are cotton-trees, ſandal-wood, with which moſt of the neighbouring iſlands abound; calabaſhes, wild tamarinds, wild fig-trees, pine-apples, jakas, oranges, lemons, limes, mangoes, plantains, pomegranates, and ſeveral other Indian fruits, moſt of which are ripe in September and October.

Several kinds of good eating-herbs grow wild in the iſland, particularly one that eats like ſpinage; and purſlain grows wild in the fields.

Buffaloes and wild boars abound in the iſland; and both the Dutch and Portugueſe breed horſes, oxen, goats, and ſheep; but the latter neither increaſe nor thrive ſo well as in colder climates. Here are likewiſe monkies, lizards, and guanoes, ſerpents of various kinds, ſcorpions, centepedes, and a multitude of inſects.

The woods abound with poultry that run wild, eagles, hawks, parrots, paraquets, cockatoes, turtle-doves, pigeons, crows, and a great variety of ſmall birds that have a gay plumage; and ſome of them, it is ſaid, have very muſical notes, which is pretty ſingular in this part of the world, where the bright colours of the birds pleaſe the eye more than the notes do the ear.

One of the ſmall birds is called by our travellers the ringing-bird, for he has ſix notes which he generally repeats twice, beginning with the higheſt and ending very low; he is about the ſize of a lark, but his wings are blue, and his head and breaſt of a paliſh red.

Their tame fowls are common poultry, geeſe, and ducks; but the two laſt have been brought thither by the Europeans, and are not very plentiful.

The woods contain great numbers of bees, which produce a conſiderable quantity of wax and honey.

They have great plenty of ſea and river fiſh, and, beſides many unknown to us, have mackerel, breams, mullets, ſnooks, conger eels, rock-fiſh, ſeveral kinds of oyſters, ſome of which are very large; cockles of an extraordinary ſize, turtle, ſhrimps, prawns, and craw-fiſh. In the bays and rivulets are ſome alligators.

The natives are of ſo ſwarthy a complexion, that the Europeans frequently call them black; they have long black hair, and are of a middle ſtature, ſtraight-bodied, with ſlender limbs, and a long viſage. It is ſaid that thoſe who are independent of the Dutch and Portugueſe are very inhoſpitable to ſtrangers, and cut off any Europeans that land upon the coaſt whenever they have an opportunity; but they have probably had ſufficient provocation from the Portugueſe and Dutch, who are too apt to treat the Indians with great inſolence, and ſometimes barbarity, when they fall into their hands.

The only cloathing of the natives is a little cloth tied round their loins, which being brought up between their legs and faſtened before, juſt hides their nakedneſs. Their greateſt finery conſiſts in a ſort of coronet of mother of pearl, or thin plates of ſilver or gold ſcalloped or indented on the edges, of the breadth of a crown piece, and of an oval form. Three or four of theſe on the forehead make a mighty glittering ſhow; but moſt of the people wear caps of palmeto leaves, made up in ſeveral forms.

They always go armed with ſwords, darts, and lances; with theſe they hunt the wild buffaloes, which they run down, and then ſtrike them with their darts, as they do alſo fiſh in the water.

Whether they take fleſh or fiſh, they make a fire and dry it upon a kind of wooden gridiron, in order that it may keep, for they generally continue their ſport two or three days.

No man has any other property in the land than what he gains by cultivating it, for whoever clears a piece of ground is for that year conſidered as the proprietor; for they ſeldom plant their Indian corn twice in the ſame place. They burn the graſs and ſhrubs upon any ſpot of ground they think fit for their purpoſe, and thus prepare it againſt the wet ſeaſon: they however live chiefly by hunting and upon their fruits, and do not care to take the pains to ſow much corn; ſo that among them land is of little value.

The common languages ſpoken here are the Malayan and a baſtard Portugueſe. The natives, however, have a language peculiar to themſelves.

They are not much acquainted with arts and ſciences, nor would artiſts and mechanics be of any great uſe among them, the materials and implements they employ in cloathing and building being of ſmall value. Theſe are ſupplied by the Chineſe, who bring hither coarſe rice, coarſe or mixed gold, tea, iron-work, porcelain, and ſilk both wrought and raw: in exchange for which they have gold which is gathered here, bees-wax, and ſandal-wood. It is ſaid that about twenty ſmall Chineſe veſſels come hither every year from Macao, and commonly one veſſel a year from Goa, which brings European commodities, callicoes, and muſlins. Here are alſo ſome barks that trade from this place to Batavia, and bring from thence both European and Indian goods, and particularly rice. The veſſels generally come hither in March, and ſtay ſtill September, by which means they ſecure the benefit of the trade-winds, and obtain regular and advantageous markets for their commodities.

CHAP.

CHAP. XII.

Of the Iſland of BORNEO.

SECT. I.

Its Situation, Extent, Climate, and the Face of the Country.

BORNEO, the largeſt of the Sunda Iſlands, is of great extent, reaching from ſeven degrees thirty minutes north to four degrees ſouth latitude, and from the hundred and ſeventh to the hundred and ſeventeenth degree of longitude, and is about ſeven hundred miles in length, five hundred in breadth, and is ſuppoſed to be eighteen hundred miles in circumference. To the eaſtward lies the iſland of Celebes, to the north-eaſt the Philippine Iſlands, to the ſouth the iſland of Java, and to the weſt the iſland of Sumatra.

The air of the country is not ſo exceſſive hot as might be expected from its being ſituated under the line, for it is almoſt every day refreſhed with ſhowers and cool breezes. Thoſe parts of the iſland which border on the ſea-coaſt form a flat plain for ſeveral hundred miles, and are annually overflowed. Upon the retiring of the waters the whole ſurface of the ground is covered with mud, and the ſun darting its rays perpendicularly upon it, raiſes noiſome fogs that are not diſperſed till nine or ten in the morning, and render thoſe parts of the iſland very unwholeſome. The multitude of frogs and reptiles which, when the water is dried up, is left behind, being ſoon killed by the heat of the ſun, cauſe, at that time of the year, an intolerable ſtench, which ſerves to corrupt the air. If we add to all this the cold chilling winds and damps that ſucceed the hotteſt days, it is eaſy to conclude, that this place muſt be extremely unhealthful, at leaſt to European conſtitutions: but the gold and precious ſtones which abound here, make our adventurer ſlight death in every form rather than not poſſeſs them.

The monſoons, or periodical winds, are weſterly from September to April, or thereabout. This is their wet ſeaſon, when heavy rains continually pour down, intermixed with violent ſtorms of thunder and lightning; and at this ſeaſon there are ſeldom two hours together fair weather on the ſouth coaſt of the iſland, to which the Europeans chiefly reſort. The dry ſeaſon uſually begins in April, and continues till September; and even in this part of the year, they ſeldom fail of having a ſhower every day when the ſea-breeze comes in.

The river of Banjar is, towards its mouth, twice as broad as the Thames at Graveſend; and the banks, being planted with thick groves of ever-greens, render the paſſage up this river extremely pleaſant. A little within its entrance are three iſlands, the firſt of which, being covered with trees of a prodigious height, may be ſeen off at ſea, and ſerve for a land-mark to ſail over the bar. At the north and ſouth ends are large ſand-banks, which are very dangerous; and the vaſt floats of trees that are perpetually driving down the ſtream, increaſe the danger. The beſt place to anchor in is a mile or two within the river's mouth; at a ſmall diſtance from it, it is joined by the China river, which is thus named from the China junks conſtantly ſailing up it.

The tides here riſe about twelve feet, and never flow more than once in twenty-four hours, and that always in the day-time: for during the night the water never riſes above half a foot, except in an extraordinary dry ſeaſon. This proceeds from the ſtrength of the torrents and the violence of the land winds, which blow much ſtronger in the night than in the day.

The harbours to which the Europeans uſually reſort are Banjar Maſſeen, Succadana, and Borneo; but they come much oftener to the firſt than to either of the other, on account of the great quantities of pepper that grow near the ſource of that river, which diſcharges itſelf into the ſea in three degrees eighteen minutes ſouth latitude.

The inland part of the country is dry and mountainous; but upon the ſouth coaſts, for a hundred miles one way, and two hundred another, the land is a ſtinking moraſs; yet is covered with woods of very tall trees: this part of the country is intirely overflowed in the rainy ſeaſon, and the other coaſts are not much better. Theſe inundations, though prejudicial to health, may be of ſervice to the inhabitants in ſecuring them from invaſion.

In the fair ſeaſon the grounds about fifty or ſixty miles up the country become dry, and herds of cattle are ſeen grazing upon the banks of the rivers; for the graſs grows there to a very great height: but when the rains return, all the cattle are forced up to the hills, and the flat country becomes again a great watery grove. In the country are mines of iron and tin, and very good load-ſtone; the mountains alſo abound in gold, ſome of which is very fine.

SECT. II.

Of the Vegetables and Animals of Borneo; with a particular Account of the Ouran-outang, or Man of the Woods.

BESIDES rice, which is the only grain eat by the inhabitants, the country affords plenty of lemons, oranges, pine-apples, citrons, cocoa-nuts, plantains, melons, bananas, and all other Indian fruits. They have alſo a great deal of very fine timber, with the cotton ſhrub, canes, and rattans; but foreigners chiefly reſort to this iſland for its pepper.

Of the black-pepper are three ſorts found in Borneo; the firſt, called molucca, or lout-pepper, is the beſt; the ſecond, named caytongee-pepper, is a middling ſort; and the third, and worſt ſort, is negaree-pepper, of which they have the greateſt quantity, but it is ſmall, hollow, and light, and uſually full of duſt; it ſhould therefore be bought by weight, and not by meaſure. Here is alſo white-pepper, which is ſold at double the price of the black.

The animals of the greateſt uſe in this country are elephants, horſes, which are of a ſmall ſize, oxen, buffaloes, deer, and goats. There are here ſeveral kinds of wild beaſts, as bears, tygers, and monkies; of the laſt there are vaſt numbers, and a very great variety: but the ouran-outang, or man of the woods, is the moſt remarkable; he is ſaid to be no leſs than ſix feet high, when full grown, and walks upright like a man. His arms are ſomewhat longer than thoſe of the human ſpecies. He has no tail, nor any hair on his body, except where it is found on man's. He is very ſtrong and nimble, and will throw ſtones, or any thing elſe that come in his way, at thoſe who provoke him. Captain Beeckman ſays, he bought one of them, and that he was ſo fond of ſpirituous liquors, that he would drink heartily of punch, if he was left in the cabin with a bowl of it upon the table; and that he would open his caſe, and take a bottle of brandy, and having drank a conſiderable quantity, would return the bottle to its place. If the captain was angry with him he would ſigh and whine, till he was reconciled: he alſo ſlept like a man, with one arm under his head; but though he was not twelve months old when he died, he was ſtronger than any man in the ſhip.

This iſland has ſcarce any of the birds that breed in Europe, except the ſparrow; but there are parrots and parroquets of all ſizes, among which the luree is by far the moſt beautiful: he is of the ſize of a common parrot, but his feathers are of a lively red, intermixed with blue and green, and ſo finely ſhaded as not to be imitated by the pencil. Theſe birds are more eaſily taught than any kind of parrots, and, even in the country, coſt two or three guineas a piece. They are frequently purchaſed by

the European captains; but commonly die in their voyage upon entering a cold climate.

They have here very large bats, or, as ſome people call them, flying-cats; the body in colour, ſhape, and ſmell, reſembles that of a fox, but is not ſo large; but the wings are of ſo prodigious a ſize, that, when extended, the diſtance from the tip of one to that of the other is ſaid to be no leſs than five or ſix feet. During the weſtern monſoon they fly from weſt to eaſt for two or three hours every evening in ſuch multitudes, that they darken the ſky.

This iſland has alſo great plenty of ſea and river-fiſh, ſome of which are well known in Europe. They have alſo many others to which we are ſtrangers, particularly a fiſh called the cockup, which is not inferior in taſte to any of ours. The natives are very fond of the cat-fiſh; but it is ſeldom eaten by the Europeans. Their heads are large, and are ſaid to have ſome reſemblance to the head of a cat: theſe fiſh are ſometimes five or ſix feet long, but have no ſcales. In the river of Banjar they have prawns ſix or eight inches in length, and rock-oyſters of a very large ſize.

The muſketoes are intolerably troubleſome, and ſo venomous that when foreigners firſt come to this iſland, their faces are ſo ſwelled by their bite, that a man can hardly know his moſt intimate acquaintance; but, after they have been there ſome time, their bite has not this effect.

SECT. III.

A general Character of the Natives: their Perſons, Dreſs, Manners, Cuſtoms, Religion, Marriages, and Funerals: their ſuperſtitious Method of treating the Sick, and their little Skill in Navigation.

THE people of the iſland are divided into Mahometans and Pagans: the Mahometans, who are called Banjareens, inhabit the ſea-coaſt and all the principal towns of trade; and the Pagans, who are called Byayos, poſſeſs the inland country, and are repreſented by the Mahometans as barbarians; while the popiſh miſſionaries, who have made ſome progreſs in their converſion, ſay, that they are more tractable and ready to embrace Chriſtianity than the Moors. Indeed it is not extraordinary that two nations inhabiting one iſland, and differing ſo widely in their manners as well as religion, ſhould repreſent each other as barbarians, how peaceable or polite ſoever they may appear to foreigners who have not their prejudices.

The Byayos, who are deſcended from the original inhabitants, and dwell in the woods and mountains in the inland part of the country, apply themſelves but little to trade or merchandize, or to promote the arts and ſciences. Being a robuſt war-like people, they ſpend their time chiefly in hunting and attending their cattle; but have little commerce with foreigners, which renders it difficult to give a particular deſcription of them: but probably were we to become better acquainted with them, all the accounts that have been given of their barbarity would vaniſh, and we ſhould only find that, like the reſt of mankind who live in woods and foreſts, they are a little rough and unpoliſhed, but perhaps more ſincere and generous than their more civilized neighbours, whoſe converſation with the Chineſe merchants ſeems only to have rendered them more expert in the art of cheating.

The Banjareens have long ſhining black hair, and are well proportioned, but low of ſtature, and their features are not very engaging. The women are little and ill ſhaped, and their features and complexion much better than thoſe of the men. They have a very engaging mien, and few people move with a better grace. All the natives of Borneo are extremely ſwarthy, like the other people who live under the equinoctial, whence ſome travellers call them blacks; but there is a conſiderable difference between their complexion and that of the negroes; for it is not the heat of the climate alone that makes men black; for that only renders them tawny.

The Byayos who dwell in the mountains are much taller and ſtronger bodied than the Banjareens, which may be aſcribed both to their ſituation and their way of life, they being inured to hardſhip and fatigues, and conſtantly following the chace; while the people of the flat country uſe hardly any other exerciſe beſides rowing, and are ſo little uſed to ride or walk, that they are ſaid to do both very awkwardly: they even take but little pains in fiſhing, for by once caſting a net before their own doors, they take as many fiſh as they know what to do with in a whole day; and as they find little difficulty in obtaining food for the ſubſiſtence of their family, they are generally very indolent.

We don't find that the Byayos have any other cloathing than a piece of cloth wrapped round their waiſts; they paint their bodies indeed of a blueiſh colour, which at a diſtance has ſome reſemblance to cloathing, and generally ſmear themſelves with ſtinking oil, which, added to the ſteams of their bodies in this hot climate, is ſufficient to ſtifle an European who happens to be in a crowd of them. Yet among theſe people vanity has a ſufficient power, for ſo prevalent is the force of cuſtom and faſhion, that there is ſcarce a conſiderable man among the Byayos who does not diſtinguiſh himſelf from the vulgar, by pulling out his fore-teeth to put others made of gold in their room; and their greateſt ornament is a ſtring of tyger's teeth hung about their necks like an alderman's gold chain.

Among the Banjareens the common people are not much better cloathed than the Byayos; but their princes and great men uſually wear a kind of cloſe veſt of blue or red ſilk, and ſometimes of European cloth, over which they throw a looſe piece of ſilk that wraps once or twice about them, and reaches down to their knees; they alſo wear a pair of drawers, but they have no ſhirt, and their legs and feet are always bare. Their hair is tied up in a roll in the back part of their heads, about which they tie a piece of muſlin or calicoe, which is not near large enough for a turban. A dagger, which they wear in a ſaſh on the left ſide, is always part of their dreſs.

The Banjareens live in a friendly hoſpitable manner, their houſes being always open for the reception of their friends. Their food chiefly conſiſts of veniſon, fowls, fiſh, boiled rice, and hard eggs, which at the houſes of the great are ſerved up in gold and ſilver diſhes or bowls; and thoſe of inferior rank uſe veſſels of braſs or earthenware. They ſit at their meals croſs-legged on mats, and are ſeldom ſeen in any other poſture. They uſually drink water or tea; but though their religion prohibits their taſting ſtrong liquors, few of them will refuſe wine or arrack, when they are among the Europeans, and then they will drink as freely as they.

Almoſt all the day long they have ſmall tables by them of the ſize and ſhape of a tea-board, on which ſtands their betel and areka in veſſels of gold, ſilver, or braſs; the table itſelf being of the ſame metal according to the quality of the owner: theſe they chew perpetually, unleſs when they are eating, or ſmoaking tobacco, of which both the men and women are very fond, and their tobacco is uſually mixed with opium. The maſter of the houſe generally lights the pipe firſt, for they uſe but one at an entertainment, and after he has ſmoked two or three whiffs, gives it the perſon who ſits next him, and he to a third; till it has gone round the company, who ſit croſs-legged in a ring upon mats. When they have continued ſmoking for ſome time, they grow exceeding chearful, but if they continue too long at it, they become mad or ſtupid.

The Banjareens are generally quick of apprehenſion, extremely inquiſitive, and learn any thing with great eaſe. They are of a very peaceable diſpoſition, and ſeldom quarrel among themſelves; but when they are thoroughly provoked, their revenge will be ſatisfied with nothing leſs than the life of an enemy, which they always take in a private manner.

Their uſual way of ſalutation is by joining their hands, raiſing them towards their breaſt or head, and gently bowing; but when they appear before the great, they lift their joined hands to their foreheads, falling down on the knees and faces; if it be before a prince, they do this at a conſiderable diſtance, then creep towards him, and after they have received an anſwer retire in the ſame manner.

They amuſe themſelves with dancing and comedies, like the other eaſtern nations. The Chineſe have likewiſe taught them gaming. Their more manly diverſions are ſhooting at a mark, and hunting, which, as they manage it, requires but little labour, for the game being rouſed, they

they ſoon ſurround the poor animal, and diſpatch him with a multitude of wounds, every man darting his ſpear at him, and ſome of them even after he is dead, to entitle them to a ſhare of the honour acquired by his fall.

The Banjareens chiefly travel in covered boats, and in the night-time, to enjoy the cool air: theſe veſſels being made very ſharp and narrow, ſail with amazing ſwiftneſs. The great men on ſhore ride on elephants, and ſome on horſes; but the common people, for the moſt part, travel on foot.

The religion of the people of the inland country is paganiſm; but the inhabitants of all the ſea-coaſt are Mahometans, and deſcended from colonies which tranſported themſelves from Perſia, Arabia, and Africa, about four hundred years ago, to the oriental iſlands, to which they were invited by the ſpices, and other rich merchandizes, for which the eaſt had for many ages been famous. They are extremely ſuperſtitious, and have a way of charming diſeaſes by making a ſmall boat, and filling it with various kinds of proviſions, of which they make an offering to the incenſed demon; then launching the little veſſel, ſuffer it to drive down the ſtream, imagining that all the infirmities of the ſick man will be carried off in the devoted boat; and ſhould any one preſume to take it up, they believe the demon to whom it is dedicated, will either inſtantly ſtrike him dead, or at leaſt transfer to him the diſeaſe of the ſick.

Theſe demons they pretend to have ſeen under various forms; but if an European deſires to bear them company, when they expect to meet them, they pretend that they are afraid of incurring their diſpleaſure. It is probable they are themſelves deceived by the artifices of their prieſts, or by ſome natural phenomenon; for if they are aſked in what manner theſe demons appear, they ſometimes anſwer, like a diſtant fire in the night, and uſually in meadows, and low grounds, which ſeems to be no more than an ignus fatuus.

They frequently marry their daughters at eight or nine years of age, and they have children ſoon after; but they are uſually paſt bearing at twenty-five. Fornication is not accounted any great crime, nor is it any objection to a woman that ſhe has had a gallant before hand: for whatſoever has been their conduct before marriage, they are ſaid to be very faithful to their huſbands. The Mahometans of this iſland uſe much ceremony in their marriages, of which we ſhall give a particular account from Mr. Beeckman, who was preſent at one of them.

All the partitions of a large houſe being taken down, it was laid into one room, the floor of which was covered with fine mats, and at the upper end was a ſopha, over which was a large canopy, and on the floor were cuſhions and pillows to lean upon. The night before the wedding, people beat continually on their gongs or brazen drums, and ſounded their country pipes and trumpets, which made very harſh muſic; while others jingled chains, and beat upon braſs or iron utenſils.

The next morning flags and ſtreamers were hung about the door of the houſe, and all the veſſels in the river put out their colours, and were continually firing their guns; ſeveral people were alſo planted about the houſe, who were continually ſhouting and firing guns.

A great number of people were invited, and in the middle of the afternoon a handſome dinner was ſerved up, and the company having eaten plentifully, each perſon had a baſket given him to carry home the remainder of the proviſions that were left. After which betel, areka, and opium, were ſerved round, which had the ſame effect upon them as ſtrong liquor has upon us.

Towards the evening a large float of timber came driving down the river, on which was a pageant made in the form of a ſhip of about two hundred tons burden, in the middle of the quarter deck appeared the bridegroom ſeated on a throne. The machine ſtopped at a houſe where the bride was, and twelve young virgins deſcended from it, each with a large bowl of gold, ſilver, or braſs, in which were the preſents made by the bridegroom to his bride, who ſat on a throne to receive them, and in return made preſents to the bridegroom.

At length the bridegroom coming to the door of the houſe was met by a prieſt, who having repeated ſome words, ſtrewed rice upon his head, as an omen of his future plenty, at which the people ſhouted, and fired a volley of ſmall ſhot: he being then led to the bride, was ſeated on her right hand, and ſoon after the company withdrawing, they were left alone.

As their ſtate and grandeur principally conſiſts in the number of their wives and concubines, when one of them dies, or is divorced, which frequently happens, the huſband immediately provides another, and let him be ever ſo old, he chuſes one as young and beautiful as he can poſſibly obtain. They here purchaſe their wives as in other eaſtern countries; whence a man's daughters, if they are tolerably handſome, are eſteemed a part of his treaſure, otherwiſe they remain a burthen to the family.

The funerals of the Mahometans are here ſolemnized in much the ſame manner as in other countries, where that religion prevails; only they practiſe ſome pagan cuſtoms, as burying ſeveral neceſſaries with them, which it is ſuppoſed may be of uſe to the deceaſed in the other world. The mourners are cloathed in white, as in Japan, and China, and the people who attend their friend to the grave generally carry lighted torches in their hands. Their burying-places are always out of the reach of the floods, and the head of the corpſe is conſtantly placed to the north.

They have no mechanics among them, except goldſmiths and carpenters; but every man has a knack at carving, and will carve the head of a cane or dagger very neatly, without any other tool but an ordinary knife.

They have very little ſkill in phyſic, and are amazed that any one ſhould ſuffer himſelf to be let blood, and willingly part with what they call his life. They impute moſt diſtempers to the malice of ſome evil ſpirit, eſpecially if a perſon be delirious, and rambles in his diſcourſe. In this caſe, inſtead of having recourſe to medicine, they uſually prepare a handſome entertainment of fowls, rice, and other proviſions, which they carry into the fields, and place under a certain tree, where a ſmall oratory is erected; they offer their meats with prayers for the health of the ſick, and if he recovers, they ſeldom fail to bring another offering, and return their thanks for his being reſtored to health; but if the ſick man dies, they expreſs their reſentment againſt the angry demon, whom they imagine to be the occaſion of his death.

They have but little ſkill in navigation, they make no diſtant voyages, and indeed have not any veſſels of force or bulk. Their ſmall boats or flying proas are their moſt remarkable veſſels, and theſe are here formed of the body of a tall tree, hollowed, and made ſharp at both ends. They have neither keel nor rudder, but are ſteered with a long narrow paddle. Some of theſe boats are thirty feet long, and only two feet wide, and the ſeats for their rowers are laid acroſs the boat. They have alſo out-layers, ſomewhat like thoſe we have deſcribed in the account we have given of the proas of the Ladrone iſlands.

The Banjareens and other Moors, who inhabit the coaſts, ſpeak the Malayan tongue; but the people of the inland country have a language peculiar to themſelves.

SECT. IV.

Of their Manner of Building their Towns, and a Deſcription of an Entertainment given by the Sultan of Caytongee.

THE towns to which the Europeans trade, are, for the moſt part, built upon great bundles of bamboo, and ſometimes on floats of timber, but little larger than the ſom[ent] of each houſe: the weight of the ſuperſtructure be- exte[me]s inconſiderable, that a part of the floats remain above ing ſ[ur]face of the water. Upon theſe floats joiſts are laid, the ſu[r]on them a floor of ſplit bamboo. The walls are and up[on] of the ſame materials as the floor, and raiſed to the made o[f] ſix or eight feet, and upon them is built a light height o[f] roof, like a barn, covered with palmeto leaves, ſloping r[oo]ling is divided into rooms by partitions made of The build[ers] cane, or bamboo, and the floors covered with ſplintered [ca]d of matting. Theſe buildings are ranged in a pretty ki[nd] ſh ſide the river, and form a regular ſtreet, a line on ea[ch] nt their being carried away by the ſtream, and to preve[nt] n down at the corners of each building, to poſts are driv[en] ſtructure is faſtened by rings made of rattans, which the ſtru[cture] which

which do not hinder their rising and falling with the tide; but some have flat rattan cables with which they are fast moored to the trees on shore. Behind the street, upon the oozy bank, usually stand rows of houses built on pillars, and inhabited by the people in affluent circumstances. From these houses on the pillars, to those built in the river, are laid timbers, on which people walk from one to the other.

One of the most considerable inland towns is named Catongee, the sultan of which is said to be the most potent prince in the island. This city is about one hundred miles up the river Banjar.

Before the palace of the sultan of that town is a building, which consists of one large room, in which the councils are held, and foreigners entertained. It is erected on pillars seven or eight feet above the ground, and is open on all sides, but covered with a roof. This room is about fifty yards long, and thirty broad. In the middle is the sultan's throne, which is a wooden chair gilt, over which is a large canopy of gold and silver brocade. About the room are planted seven or eight great guns, ill mounted on broken carriages; but serve neither for ornament, nor defence.

At Matapoora, which is situated about ten miles from Catongee, in a part of the country that is never overflowed, is the palace of the prince of Negaree, who has a handsome armory erected before the gates of his palace, in which are deposited a considerable number of fire-arms, and several guns; but they make little use of them.

This island is divided into several petty kingdoms, besides those already mentioned; and when any prince becomes more powerful than the rest, he frequently brings his neighbour into a state of dependance, and sometimes obtains the name of sultan, or king of the whole island. The inhabitants of the mountains are, however, not subject to any of the Moorish sultans, but are divided into numerous clans under their respective heads; but their manner of government is little known to any Europeans, we shall therefore confine ourselves to the princes of the Mahometan religion, with whom our merchants sometimes converse.

Whoever has any affairs to transact with the sovereigns of this country, ought never to come empty handed, for they will seldom suffer any foreigner to approach them till they are informed of the value of his presents, and then they will treat him accordingly.

We are informed by captain Beeckman, that when he had an audience of the sultan Caytongee, the prince of Negaree introduced him into the council-chamber, where he was directed to sit cross-legged on a carpet about ten or twelve feet from the throne which was erected in the midst of the room. Soon after the sultan entered in a kind of vest, with drawers something like those of our rope-dancers: he had also scarlet stockings and slippers, and over all a loose gown wrought with gold and silver; and in his girdle a dagger, richly set with diamonds. Before him were carried in arms two beautiful children, one cloathed in scarlet, and the other in rich yellow silk, with turbans on their heads, guarded by twelve men armed with blunderbusses and muskets; besides twelve more armed with sampits, or the trunks through which they shoot their poisoned darts, with bayonets fixed at the end of their sampits, and daggers in their girdles.

Upon the king's entering the hall of audience, the Englishmen instantly rose up to do him honour, which it seems was the greatest affront they could have offered him; but their ignorance was their excuse. His subjects, on the contrary, lifting their hands to their heads as they sat cross-legged, fell down on their faces. The sultan sat silent a few minutes, steadily viewing the English gentlemen, then thanked them for their present, and bad them welcome, telling them he hoped they were well used by his subjects. He also enquired whether their ships belonged to the company, which they denied, from the apprehension that if they acknowledged they were, they should be ill-treated on that account; for he had before thought himself ill-treated by the company's factors, and therefore expressed his resentment on that account.

They were afterwards entertained in the sultan's palace: the dishes were of gold, silver, and brass, set upon a carpet without any linen. They had above fifty dishes of boiled and broiled fowls, strong broth made of fish and flesh, rice coloured with turmeric, hard eggs, the flesh of buffaloes, and venison, which last was excellent and well dressed; but the prince, being a strict observer of the law of Mahomet, treated them with no other liquor but water. During dinner-time the king's music played, and sometimes the English trumpets, with which he was highly pleased; and after dinner little tables of betel and areka were, as usual, brought in.

At length the sultan, ordering the music to play, made a sign to an old woman who sat behind with a white wand in her hand, and who immediately striking the floor, there instantly appeared four beautiful girls of about seventeen years of age, with golden coronets on their heads, and their hair falling gracefully with a seeming negligence on their shoulders. Their arms, legs, and feet were bare, but painted of a light yellow, only on their wrists and ancles they had bracelets of gold: one of them was taller and more richly dressed than the rest, and seemed to represent some princess. At their first entering the room they prostrated themselves on their faces three times before the throne, after which they arose and fell into a kind of dance, which chiefly consisted in twisting their bodies into antic or lascivious postures; but they seldom moved their feet from the floor. This diversion lasted about half an hour, when having again prostrated themselves three times before the sultan, they withdrew.

SECT. V.

The Chinese alone keep Shops at Borneo. The Goods proper to be carried thither; and such as may with most Advantage be purchased in that Island. Their Weights and Measures, and the Money current there.

THE Chinese are the only people in this island who retail goods and keep shops: these are chiefly furnished with China and Japan-ware, tea, silks, chints, calicoes, betel, and drugs.

The goods proper to be carried thither, besides dollars, are guns from one to two hundred weight, blunderbusses, small-arms with brass mounting, ordinary horse-pistols, gun-powder, knives, and other cutlery-wares, except forks, which are never used here. Iron and steel bars, hangers, the smallest sort of spike nails, twenty-penny-nails, grapplings of about forty pounds weight, sheet-lead, showy calimancoes, and leather boots, clock-work, looking-glasses, and spectacles.

Pepper is the principal commodity exported from thence, and turns to the best account. Diamonds may also be bought to advantage, but they are seldom to be met with at the port of Banjar above three carats weight. Gold is purchased here by giving a certain number of silver dollars for the weight of one dollar in gold. If the natives offer gold in bars, they ought to be cut half through, and then broke and touched; for they will sometimes so artfully cover a base metal with gold, that if it be cut through with a chisel, it will draw the gold over it, and the fraud remain undiscovered.

The dragons blood produced in this country is the finest in the world. This is a gum that issues from a tree that bears fruit as red as a cherry. That gum which appears of the brightest colour, after its being rubbed on paper, is the best. The country people expose it to sale in drops of about an inch long, every piece being wrapt up in leaves; but the buyer ought to insist upon having it without them, if he would avoid being imposed on. The best is sold at about forty dollars the pecul.

Jambee canes are sold for four dollars a hundred.

Their fine monkey-bezoar is sold for about five times its weight in silver, and the best is of a greenish colour. These stones are from a penny-weight to an ounce, and sometimes more, but the largest are thought to be goat-bezoar. The natives make a compound, which so nearly resembles the right bezoar-stone, that it is difficult to distinguish them. The way to discover whether there be any fraud, is by rubbing white-lead, lime, or chalk on white paper, and afterwards rubbing the bezoar upon it; and, if it be right, it will give the white-lead or chalk a greenish cast. The best unrefined camphire is also said to be produced in this country. Their

Their bird-neſts are alſo eſteemed excellent, and are ſold for ninety or a hundred dollars the pecul; thoſe that are white and clean are eſteemed the beſt. They are particularly purchaſed by the votaries of Venus, who imagine that this food inſpires them with freſh vigour.

Before we conclude this ſection, it is proper to obſerve, that if they barter with you, there is no relying either on their ſamples or their weights; but every thing muſt be thoroughly examined; for the Chineſe have taught them to be ſharpers, and they are grown almoſt as expert as their maſters: nor do they reckon it any diſgrace if they are detected in attempting to over-reach thoſe who deal with them.

Their uſual meaſure is the ganton, which contains about a Wincheſter gallon.

Their weights are the cattee and the pecul. The former is about twenty-two ounces, and therefore a hundred cattees make one pecul, or one hundred thirty-two pounds averdupoiſe weight. Their leſſer weights are the tical, the mas, the tela, and the mattaboorong: three mattaboorongs make one tela, ſix telas one mas, ſixteen maſes one tical, and one tical an ounce and eight penny-weights Troy.

The only money current amongſt them are dollars, half dollars, and quarter dollars, except their caſh, which conſiſts of rings of baſe metal ſtrung, which ſerve them in purchaſing things of little value.

CHAP. XII.

Of the Iſland of SUMATRA.

SECT. I.

Its Situation, Extent, and Climate. Its Mountains and Minerals.

THE iſland of Sumatra is long and narrow, ſtretching in a ſtraight line from the north-weſt to the ſouth-eaſt, extending from five degrees thirty minutes north latitude to five degrees ſouth, and from the ninety-third to the hundred and fourth degree of longitude from London, and is about nine hundred miles in length; but is only from a hundred to a hundred and fifty in breadth, the ſouth-eaſt part of the iſland being the broadeſt. On the north-eaſt lies the peninſula of Malacca, from which this iſland is about eight leagues diſtant. Java lies on the ſouth-eaſt, and is ſeparated from this iſland by the ſtreights of Sunda, and to the weſtward it is bounded by the Great Ocean.

The air of this iſland is very unwholeſome, but is not ſo hot as ſome countries at a diſtance from the line. This is attributed to the cool breezes that blow from the ſea, which muſt produce more ſenſible effects on account of the narrowneſs of the iſland. It may be added, that naturally the air is not ſo warm in countries under the line, and a little on each ſide of it, as in thoſe which lie towards the tropics; becauſe in the laſt the ſun in ſummer ſtays longer above the horizon, and the days are longer than the nights; but here the days and nights being equal, the ſun always riſing at ſix in the morning, and ſetting at ſix in the evening, without any ſenſible difference, the heat of the air and the earth cauſed by the ſun in the day, is cooled by the length of the night. The monſoons are much the ſame as in the other countries we have laſt deſcribed, only the rains begin ſomething ſooner than they do farther northward, and they are no where more violent, for they ſometimes pour down for three or four days together without intermiſſion. There is no country in the Indies where theſe rains, during the weſtern monſoons, are attended with more terrible ſtorms of thunder and lightning; but the people, being uſed to them, are not much alarmed, but bear them patiently, and are ſeldom heard to complain of the climate.

This iſland ſtretches from the ſouth-eaſt to the north-weſt, and a long ridge of mountains extend through the middle of it from one end to the other: one of them, which is about forty miles within the land beyond Bencoolen, is above a mile perpendicular. Thoſe that lie towards the weſt coaſt are ſtony, but produce ſmall trees, ſhrubs, and graſs; and towards the bottom good timber. In one of theſe iſlands is a volcano that almoſt continually caſts out flames. The champain country has a rich deep mould of various colours, as red, grey, and black, and is well watered with brooks and ſmall rivers, but none that are navigable for ſhips of burthen. The ſoil about Bencoolen and Marlborough-fort is a fertile clay, and produces very high graſs. The low-lands cloſe to the ſea are almoſt one continued moraſs, producing only reeds, or great hollow bamboo canes.

Gold, tin, copper, and lead, appear to be the only metals found in the country; and the former is as plentiful here as in any part of Aſia; great quantities of gold-duſt being found in the rivers and rivulets, particularly during the time of the weſt monſoon, when the torrents roll with great rapidity from the mountains. It is uſually found in duſt or ſmall bits weighing from half a grain to two or three pennyweights; but we are aſſured by Mr. Lockyer, that he ſaw a lump as it came from the mines that weighed an ounce; but he acknowledged that it is not uſually found in ſuch large pieces. The rock-gold, as it is called at Achen, is known by its brightneſs, and is very fine. The gold-mines are probably in ſome mountains towards the middle of the iſland; but they are as much as poſſible concealed from foreigners, no European having ever viſited them, or at leaſt have never returned from thence. But though the mountaineers are in poſſeſſion of the gold-mines, they make but little advantage of them. They exchange this rich metal with the inhabitants of the flat country at a low price for rice, cloathing, tobacco, and other neceſſaries; while the ſubjects of Achen and the Malayans, being better acquainted with its value, make extravagant demands of all the foreigners they deal with for the gold they bring them; and, that ſtrangers may have no inclination to penetrate farther into the country, and eſtabliſh a trade directly with the mountaineers, they repreſent them as the moſt barbarous and inhuman canibals.

In the mountains all ſorts of precious ſtones are to be found, with the value of which the inhabitants are but little acquainted, and yet will not allow ſhem to be ſought after.

SECT. II.

Of the Trees, Fruits, and Plants of Sumatra; with a particular Deſcription of the Pepper-Plant and Silk Cotton-Tree. Of the Beaſts, Reptiles, Fowls, and Fiſhes of that Iſland.

THE inhabitants have very conſiderable plantations of ſugar-canes, which are chiefly cultivated on account of the ſpirits they extract from them, which they find to be of great advantage in ſo moiſt an air. The gardens are furniſhed with beans, peas, radiſhes, yams, potatoes, pumpkins, and ſeveral kinds of pot-herbs unknown in Europe. The potatoes are three or four inches long, mealy, and of a ſweet taſte; they are red on the outſide, and, like ours, white within. But the only grain that grows in this country is rice.

Here are found moſt of the fruits to be met with in other parts of India in great perfection; as pine-apples, plantains, limes, oranges, citrons, cocoa-nuts, pomegranates, mangoes, durions, guavas, the mangoſteen, the pumplenoſe, &c.

The mangoſteen, which is eſteemed a moſt delicious fruit, reſembles in its form the pomegranate, but is leſs;

the outside rind, or shell, is thicker than that of the pomegranate, but softer, and of a dark red; the inside is of a deep crimson, where the fruit consists of four or five cloves about the size of a man's thumb, as white as milk, and very soft and juicy; and in the middle of each is a small stone.

The pumplenose is also a very fine fruit, and has an agreeable taste; it is bigger than the largest orange, and has a thick tender rind. The inside contains abundance of seeds of the size of a barley-corn, and full of juice; but it has no partitions like the orange.

The most valuable plant, with respect to commerce, produced in this island, is that of pepper, which grows in a flat soil, and is planted by a thorny tree, round which it creeps and winds like ivy, which it resembles in its leaf, though it is something larger, and of a paler green. Having run up a considerable height, the twigs on which the berries hang bend down, and the fruit appears in clusters nearly as large as bunches of grapes, and of much the same figure; but are distinct like our currants or elder-berries. They produce no fruit till the third or fourth year; after which they bear for the three following years six or seven pound weight of pepper. In the three next years they decrease one-third, both in the quantity and size of the pepper, and thus continue decreasing for four or five years longer. When the plant begins to bear, the branches of the tree, through which it creeps, must be lopped off, lest they intercept the rays of the sun, which this plant stands most in need of. When the clusters of the fruit are formed, care must also be taken to support them with poles, lest the branches should be drawn down by their weight. The plants should likewise be pruned after the fruit is gathered, to prevent their growing too high, and bearing the less fruit.

The pepper-plant has commonly a white flower in April, which knots in June; and the next month the fruit being green and large, the natives make a rich pickle of it, by steeping it in vinegar. In October it is red, in November it begins to grow black, and in December it is all over black, and consequently ripe. This is generally the case, though in some places it is ripe sooner.

The fruit being ripe, they cut off the clusters, and dry them in the sun, till the berries fall off the stalk, which, notwithstanding the excessive heat, it does not do in less than fifteen days; during which the clusters are turned from side to side, and covered up by night. Some of the berries neither change red nor black, but continue white: these are used in medicine, and sold at double the price of the other. But the inhabitants, finding that foreigners want them for the same use, have discovered a way of whitening the others by taking them while they are red, and washing off the red skin with water and sand, so that nothing remains but the heart of the pepper, which is white. Nothing can be kept neater than those pepper plantations, no rubbish, not so much as a stick or straw is to be found upon the ground; and if it happens to be a dry season, they are indefatigable in watering the plants, almost their whole subsistence depending on the crop.

Cotton and cabbage-trees also grow here, though they are not very common; and near the city of Achen the silk cotton-tree flourishes. These trees are large, and have a smooth ash-coloured rind, and are generally full of fruit, which hangs down at the ends of the twigs like purses three or four inches long. No tree can grow more regular and uniform; the lower branches being always the largest and longest, and the upper gradually lessening to the top. When the cotton is ripe, the cods drop off the tree, for the cotton is so short, that it is not thought worth gathering, though they will sometimes take the pains to pick it off the ground to stuff their quilts with.

In the woods they have oaks, and other large timber trees, straight, tall, and fit for any uses; but few of them are known in Europe.

Scarce any country affords more canes and bamboos, particularly near Jamby, where are found those fine taper walking-canes called dragons-blood.

In this island is also found the plant called bang, which very much resembles hemp; they infuse it in their liquors when they would raise their spirits, and it has much the same effects as opium.

The animals found in this island are a small kind of horses, elephants, buffaloes, goats, hogs, deer, bullocks, and hog-deer. This last is an animal something larger than a rabbet; the head resembles that of a hog, and its shanks and feet are like those of the deer. The bezoar-stone found in this animal has been valued at ten times its weight in gold: it is of a dark brown colour, smooth on the outside, and the first coat being taken off, it appears still darker, with strings running underneath the coat; it will swim on the top of the water. If it be infused in any liquid, it makes it extremely bitter: the virtues usually attributed to this stone are cleansing the stomach, creating an appetite, and sweetening the blood.

There are several kinds of wild beasts, as tygers, wild boars, and monkies: they have also porcupines, and squirrels, which are esteemed good eating: there are likewise aligators, lizards, guanoes, and several sorts of snakes and serpents, with ants, musketoes, and other troublesome insects.

They have great plenty of dunghill-fowls and ducks, and their cocks are esteemed the largest in the world. In the woods are wild pigeons, and doves of several sorts, with parrots, paroquets, and mackaws; and a great variety of small birds different from ours, and distinguished by the beauty of their colours.

They have great plenty of sea and river fish, so that two or three nets and a boat will procure a man a very comfortable livelihood: they have also a way of catching fish, by fixing a wooden grate at the mouth of the small brooks and creeks at high water, and this detaining the fish that have entered the creeks, they take them when the tide ebbs out. Among other fish they have mullets, cat-fish, eels, old-wives, craw-fish, shrimps, oysters, and green turtle, with several other kinds not known in Europe.

SECT. III.

Of the different Inhabitants of Sumatra, their Persons, Dress, Food, Customs, Manners, and Skill in mechanic Arts.

THE inhabitants of this country consist of two different people. Those of the inland mountainous parts are the original natives, and like those of the other islands, are Pagans; while those on the coast are of the Mahometan religion, and probably came from Arabia and Persia.

As to the Malayans, who inhabit the coast, they are generally said to be proud and lazy, and like the Spaniards, have most of their business done by foreigners; for they seldom apply themselves to cultivate their grounds, or to improve in any mechanic arts.

They are of a swarthy complexion, and their features not very engaging. Their faces pretty nearly resemble those of the inhabitants of the other islands we have already described. They have black eyes, and straight black hair, with high cheek bones, and little noses. They are of a middle stature, straight, and well limbed, and, like the inhabitants of most hot countries, smear themselves with oil, which is probably intended to close up their pores, and prevent that profuse perspiration which would exhaust their strength; and at the same time preserve them from being bit, or stung by the insects, which are ever troublesome in hot countries.

Some of them wear caps of woollen cloth just fitted to their heads, but they more generally tie a piece of blue or white linnen about their heads, letting the ends hang down, and leaving no other covering for the top of their heads, but their hair, part of which falls upon their shoulders. The poorer sort wear only a cloth about their loins, to cover what modesty teaches them to conceal; but people of rank have a kind of drawers, and a piece of silk or calicoe thrown loose about their bodies. They also wear a sort of wooden clogs or sandals, when in their towns; but they all travel bare-foot.

Their ordinary food, as in other parts of India, is rice and fish; but the people who can afford it, also eat fowls, venison, buffaloe beef, mutton, and goats flesh. They season their meat very high with pepper, garlic, and onions, and generally colour their rice yellow with turmeric.

Their

Their buffaloe bee is very coarſe food, and the little fat that is upon it is as yellow as ſaffron. When their meat has hung a few hours in the market it turns black, and is little better than carrion: their fowls and mutton are alſo dry and inſipid; and though pork is the beſt meat they have, there are but few hogs. Their veniſon, however, is pretty good, eſpecially the hog-deer, which we have juſt deſcribed, for its fleſh is as white as a chicken. Their ducks are alſo much better than their land fowls. They have a kind of liquid butter like oil, brought from Bengal, which is ſaid to be made of buffaloes milk, and mixed with hogs lard; with this they butter their rice. They have alſo mangoes and other fruits pickled when green.

Their meat is ſerved up in ſilver, brazen, or earthen veſſels, according to the circumſtances of the maſter of the houſe, and is always either boiled or broiled, and cut into ſmall pieces, and as they uſe only their fingers in eating, they waſh both before and after their meals.

They uſually drink fair water or tea; but they have likewiſe palm wine, and toddy, which is drawn from the cut branches of the cocoa-tree: they likewiſe drink the ſoft liquor found on the inſide of young cocoa nuts, which is very cooling and pleaſant; arrack is alſo very common here.

The natives are as fond of chewing betel and areka, and of taking opium, as thoſe of the other iſlands already mentioned. They alſo take bang, which raiſes the ſpirits almoſt as ſoon as opium; this plant, which reſembles hemp, they infuſe in their liquors. Tobacco is ſeldom ſmoked in pipes, but a leaf of it being rolled up to about the length and thickneſs of a man's finger, is lighted at one end, and ſmoked at the other, till about two thirds of it is conſumed, and then it is thrown away. They ſeldom drink when they ſmoke.

Like other Aſiatics, they ſit croſs-legged on the floor at their meals, and whenever they meet to converſe with each other. Their ordinary ſalutions are performed by lifting up one or both hands to their head; but before the great, they proſtrate themſelves with their faces to the ground.

The people are immoderately fond of gaming, both with cards and dice, which were probably introduced by the Chineſe; as they are alſo of cock-fighting. Inſtead of trimming their cocks, they produce them with all their gay plumage, and faſten ſuch ſharp inſtruments to their heels, of the ſhape and length of the blade of a penknife, that the battle is over in an inſtant, one ſtroke frequently bringing down the ſtouteſt cock. They ſtake their whole fortunes upon one of theſe battles; but the conqueſt is not admitted, unleſs the victor peck or ſtrike his enemy after he has diſpatched him; for if he does not they draw ſtakes.

Stag-hunting is one of the chief of their rural ſports: the game is rouzed by ſome little yelping dogs, and the huntſmen, who are almoſt naked, run it down on foot, darting their lances at the deer, when they come within their reach. One of our governors of Bencoolen relates, that the company's ſlaves being one day ſeeking for game, inſtead of a ſtag, happened to rouſe a tyger, who coming behind one of them, leaped upon him, and with his claws tore the poor fellow's fleſh off his back, and the calves of his legs, in a terrible manner; but the brave fellow ſuddenly turning, pierced the beaſt with his lance, as did ſome of the reſt of his fellow ſlaves with theirs, and though they did not quite kill him, he was glad to retire with ſeveral lances in his body. The wounded ſlave was brought to the fort ſo mangled, that his recovery was thought impoſſible; but being of a ſtrong conſtitution, and uſed to a temperate life, his wounds were ſoon healed.

Elephants, horſes, and buffaloes, are ſometimes uſed for carriage; but they commonly employ porters, when they have not the convenience of a navigable river, and for the moſt part travel on foot.

Their mechanics are, in general, but indifferent workmen, their carpenters, indeed, will run up one of their cane tenements in a few days; but both the model and materials being always the ſame, this requires but little ingenuity.

Their flying proas are the moſt admired of any of their workmanſhip; they are very long, but ſo narrow, that two men cannot ſtand a-breaſt in any part of them. The keel is only a large tree hollowed, and the ſides are raiſed with a plank about three feet above it, and each end left as ſharp as poſſible, the keel projecting beyond the other part of the veſſel, though, when loaded, it is quite under water. Inſtead of a rudder they ſteer with a long piece of wood not broader than one's hand. Theſe veſſels carry a great ſail, and have outlayers on each ſide, with planks of light wood at the ends, and when it blows hard, they ſend out a man or two to ſit at the extremity of the windward outlayer to keep the veſſel from overſetting. Thus managed, they will bear the greateſt ſea; and when an Engliſh pinnace, with two ſails, makes five miles an hour, theſe will run ten or twelve; however, they are never uſed but in fiſhing, or to ſail to ſome neighbouring iſland. They have larger proas that carry fourteen or fifteen ton, with which they trade to Siam, Malacca, Pegu, and other places; but they have no large ſhips or veſſels of force.

They have alſo blackſmiths, but their work is not much admired, and their taylors are ſtill greater bunglers. The Chineſe are the beſt mechanics among them. Some of that nation live at Achen all the year round; but there uſually arrives ten or twelve ſail of Chineſe ſhips in June, with great quantities of rice, and all ſorts of merchandize. Theſe take up a whole ſtreet at the end of the town next the ſea. With this fleet come over various kinds of mechanics, as carpenters, joiners, and painters, who immediately ſet themſelves to work, making cheſts of drawers, cabinets, tables, and all ſorts of toys and utenſils, which are preſently expoſed to ſale; ſo that for two or three months this part of the town is like a fair, all manner of people reſorting thither. If the Chineſe can meet chapmen to their minds, they will even ſell their ſhips too, reſerving only ſo many as are neceſſary to carry them home. But though the people of Sumatra are, in general, ſuch indifferent mechanics, there is hardly any great man or even a ſovereign prince, upon the weſt coaſt, but learns ſome handicraft trade: their favourite employment is that of a goldſmith, in which they excel, for the people are very expert in making all ſorts of gold plate with very few tools, and yet with ſuch extraordinary dexterity, that whatever is of their workmanſhip, ſells at a very high price throughout the Indies.

The old women are the only phyſicians. Some of theſe have obſerved the nature of their ſimples and drugs, and found their ſkill on their own experince. The flux is the moſt common diſtemper in theſe countries, and the moſt fatal to foreigners; there are however many kinds of fruit and herbs that would be of ſervice to the Europeans, were they to take them when firſt ſeized by this diſtemper; particularly the guavas and pomagranates: they ſhould alſo avoid being too free with ſome other fruits, or with unboiled water, and ſherbert is ſtill more unwholeſome. There is alſo a diſtemper called the Mortcluchin, or a perpetual vomiting and looſeneſs, which frequently proceeds from too plentiful meals, and ſuddenly carries off the patient; but dropſies, the gout, and the ſtone, are ſeldom heard of in this part of the world.

All their learning conſiſts in writing, reading, and ſome traditional accounts of their hiſtory and religion. The Mahometans, who poſſeſs the greateſt part of the iſland, generally ſpeak and write the Malayan tongue; but there are ſome offices of their religion in Arabic, and there are ſchools at Achen where the children are taught the languages. The inhabitants of the mountains have a language peculiar to themſelves, and as the Malayans write from the right hand to the left, the mountaineers write like us, from the leſt hand to the right, and inſtead of pen, ink, and paper, write, or rather engrave, with a ſharp pencil on the ſmooth outſide of a bamboo; but the Malayans uſe ink, and write upon a thin browniſh paper that will hardly bear. They are very indifferent accomptants; but the Banians and Guzarats, who reſide among them, and whom they employ when they have any conſiderable accounts to ſettle, are ſaid to be a match for any European.

The greateſt part of the people are Mahometans, but they are not ſo zealous as thoſe in other parts of the world. Their moſques are mean and poorly built; at Achen, however, they are of brick or ſtone; but in the ſouthern part of the iſland they are hardly to be diſtinguiſh-

ed

ed from the common houſes. Yet their prieſts, and particularly the cady or high-prieſt at Achen, is held in high veneration, and they ſeem to have a great hand in conducting the affairs of ſtate.

Polygamy and concubinage are allowed here, as in other Mahometan countries; but the prieſt muſt be conſulted, he being eſteemed the only judge of its expediency; for as he at firſt ratifies the contract, none but one of the ſame order is allowed to diſſolve it.

SECT. IV.

A Deſcription of the City of Achen, with ſome Account of the Palace. A diverting Incident, ſhewing the ſagacity of an elephant.

ACHEN, or Achém, the moſt conſiderable port of the iſland, and the metropolis of a kingdom of the ſame name, is ſituated at the north-weſt end of Sumatra, in five degrees, thirty minutes north latitude, and ſtands in a plain ſurrounded with woods and marſhes, about a mile and a half diſtant from the ſea, near a pleaſant rivulet. It is an open town, without either wall or mote, in the middle of which ſtands the king's palace. This is of an oval form, about a mile and a half in circumference, encompaſſed by a mote twenty-five feet broad, and as many deep, and by great banks of earth well planted with reeds and canes, that grow to a prodigious height and thickneſs. Theſe cover the palace, and render it in a manner inacceſſible; they are continually green, and not eaſily ſet on fire. The gates are not defended by a ditch and drawbridge, but only by a ſtone wall about ten feet high, that ſupports a terras on which ſome gums are planted. A ſmall rivulet lined with ſtone runs through the middle of the palace, and has ſteps leading to the bottom, for the convenience of bathing.

Four gates, and as many courts, are to be paſſed before you can reach the royal apartments. In ſome of the outer courts are the magazines, and the elephants; but the inward courts are hardly ever entered by foreigners, or even by the natives, ſo that no juſt deſcription can be given of them. The avenues to this palace or caſtle, as it is ſometimes called, are well defended by nature; for all the country round Achen is full of rivulets, marſhes, and thick woods of bamboos, which are in a manner impenetrable, and very hard to cut. Several little forts are alſo erected at proper diſtances in the marſhes, where guards are planted to prevent any ſurpriſe. Some authors tell us, that in the king's magazines are depoſited a numerous artillery, and a multitude of fire-arms; but that his greateſt ſtrength conſiſts in his elephants, who are trained up to trample upon fire, and to ſtand unmoved at the report of a cannon.

The city contains ſeven or eight thouſand houſes, which are not contiguous, every perſon's dwelling being encompaſſed by pales at ſome yards diſtance from it, except in two or three of the principal ſtreets where the markets are kept, and alſo in the Chineſe and European ſtreets, where the inhabitants chuſe to live pretty cloſe together, the better to defend themſelves from the thieves with which this city is much infeſted.

Moſt of the houſes are built upon poſts nine or ten feet above the ground, to ſecure them from the annual inundations. The ſides, floors, and partitions are all of ſplit cane, or bamboo, and the roofs covered with palmeto leaves; but to ſave the beſt of their goods from fire, they have a warehouſe of brick or ſtone in the form of an oven, and as large as an ordinary room. The entrance is not above three or four feet high, and very narrow, and they have a large ſtone ready fitted to ſtop it up in caſe of fires, which often happen, and ſpread with ſuch fury through theſe ſlight buildings, thar they have hardly time to ſave themſelves.

There are a great number of moſques in the city built with ſtone, and roofed with tile; but they are neither large nor lofty, nor have any towers or ſteeples belonging to them. Beſides the natives, the city is inhabited by the Dutch, Danes, Portugueſe, Guzarats, and Chineſe, of whom the latter are the moſt numerous, and carry on a conſiderable trade.

Elephants are very plentiful in this city, and captain Hamilton obſerves, that in 1702, he ſaw one that had been kept there above a hundred years; but by report was then three hundred years old; he was about eleven feet high, and was remarkable for his extraordinary ſagacity, as an inſtance of which he relates a comical piece of revenge he took on a taylor. In the year 1692, ſays he, a ſhip called the Dorothy, commanded by captain Thwaits, called at Achen for refreſhments, and two Engliſh gentlemen in that city went aboard to furniſh themſelves with what European neceſſaries they had occaſion for, and amongſt other things, bought ſome Norwich ſtuffs for cloaths, and there being no Engliſh taylor to be had, they employed a Surat, who kept a ſhop in the great market place, and had commonly ſix or ten workmen ſewing in his ſhop. It was the elephant's cuſtom to reach in his trunk at doors or windows as he paſſed along the ſide of the ſtreet, as begging for the decayed fruits and roots, which the inhabitants generally gave him.

One morning as he was going to the river to be waſhed, with his rider on his back, he chanced to put his trunk in at this taylor's window, and the taylor, inſtead of giving him what he wanted, pricked him with his needle. The elephant ſeemed to take no notice of the affront: but went calmly on to the river, and was waſhed; after which he troubled the water with one of his fore feet, and then ſucked up a good quantity of the dirty water into his trunk, and paſſing unconcernedly along the ſame ſide of the ſtreet, where the taylor's ſhop was, he put in his trunk at the window, and blew his noſe on the taylor with ſuch a force and quantity of water, that the poor taylor and his journeymen, were blown off the table they worked on, almoſt frightened out of their ſenſes; but the Engliſh gentlemen had their cloaths ſpoiled by the elephant's comical, but innocent revenge.

SECT. V.

Of the Government of Achen, and the other Parts of the Iſland of Sumatra. The Revenues of the Princes. The Arms uſed by the Soldiers, and the Puniſhments inflicted on Criminals at Achen.

THE moſt ancient accounts we have of the iſle of Sumatra, mention its being divided into a multitude of little kingdoms, and principalities, which when the Europeans firſt arrived there, were moſtly united under the king of Achen; but that the king of Bantam, in the iſland of Java, claimed the ſovereignty over ſome diſtricts on the ſouth coaſt of Sumatra, and particularly of Jamby and Palambam; whoſe governors, however, ſtill enjoyed the title of Pangarans, or ſovereign princes, and continued in the adminiſtration of their reſpective governments, though ſubject to the controul of the king of Bantam.

The ſeveral kingdoms and ſtates in this iſland ſeem to be very differently conſtituted, and moſt of them have experienced great revolutions and alterations in the laſt century.

We ſhall begin with the kingdom of Achen, which is by far the moſt conſiderable, and includes all the northern part of the iſland. Some travellers ſay, that this is a mixed, and others that it is an unlimited monarchy; ſome that it is governed by a man, and others that none but women are ſuffered to reign. That they have not always been governed by queens is evident from the letters ſent by their kings to queen Elizabeth and king James I. and it appears moſt likely that they have been governed by both, and that the ſex is no bar to the ſucceſſion. In this kingdom are twelve oran cayas, or great lords, who exerciſe ſovereign authority in their ſeveral diſtricts, and yet are in ſome reſpects ſubject to the king, and are the principal officers of his court. Theſe oran cayas have ſometimes depoſed the king, elected another, and reſtrained his authority. At other times the regal power has prevailed, and the oran cayas been aſſaſſinated or made dependant on the court; and then the prince was abſolute. As to the eldeſt

eldeſt ſon's ſucceeding to the throne, this does not ſeem to be much regarded by the Eaſtern princes, who generally diſpoſe of their crowns to which of their children they think fit, whether he be the ſon of a wife or a concubine; though this ſometimes occaſions a ſtruggle after their death, but that competitor who can make the greateſt intereſt among the perſons of higheſt diſtinction uſually carries it, and hence the crown is frequently thought to be elective.

The king of Achen is repreſented by ſome authors as the moſt voluptuous prince in the world; his palace is filled with an incredible number of women: ſome remain continually about his perſon, either to cool and refreſh the air with large fans, to amuſe him with their converſation, to divert him with their ſongs, or to ſatisfy his deſires. There are about thirteen hundred in the halls and courts of entry, where they mount guard by turns night and day. Others are in the kitchens and the offices, where they prepare every thing that is for the king's immediate ſervice. It has been obſerved, that his palace is the theatre of jealouſy, hatred, and perpetual complaints. The ſeverity of the laws, and the rigour of the puniſhments, are the only barriers capable of containing them within bounds.

His revenues are acknowledged to be very great, there being ſuch plenty of gold in the iſland: for the cuſtoms of Achen are very conſiderable, and the crown-lands, which are cultivated by the king's ſlaves, ſupply his court with proviſions.

That part of the iſland which lies to the ſouth of the equator is divided into ſeveral petty kingdoms, the princes of which ſtile themſelves ſultans as well as the king of Achen, but they are frequently called pangarans and rajahs. Each of theſe has his nobility, of which his council is compoſed; and almoſt every town and village has a governor, who is uſually choſen by the inhabitants of the diſtrict, and confirmed by the ſultan. There are alſo ſome free towns upon the coaſt, governed by their own magiſtrates, who are called datoos: of theſe Bencoolen has twelve, and Silebar four, who do not ſeem to be under the dominion of any neighbouring ſultan, but to have the ſupreme power lodged in themſelves; though they generally pay great reſpect to the princes that are near them.

The revenues of the kings of the ſouthern provinces chiefly ariſe from the duties on pepper and the gold-mines. Their forces are ſeparately inconſiderable; but upon certain occaſions, they have expelled both the Dutch and the Engliſh from very conſiderable ſettlements.

The arms uſed by theſe people are a broad-ſword, a dagger, which they wear naked in their girdles, and a long ſhield made of tough rattans, interwoven and covered with the ſkin of a tyger, or ſome other beaſt: and both in the kingdom of Achen and ſome other parts of the country they have great guns and muſkets. They have alſo ſome war-elephants, but theſe ſeem rather to be kept for ſtate than uſe.

They have no written laws, except thoſe recorded in the Koran. They proceed upon immemorial cuſtom; and in doubtful caſes the moſt ancient people are conſulted; and if a precedent be remembered, it is thought ſufficient to regulate the ſentence. Murder and adultery are puniſhed with death, and a crowd of executioners ſtab the criminal with their daggers; but female offenders are uſually ſtrangled. For robbery and theft they cut off one or more joints of the criminal's fingers or toes, and ſometimes an arm or leg, according to the nature of the crime; and the third offence is puniſhed with death. This cruel puniſhment of diſmembering is performed in a very rude and aukward manner. They have a block with a broad hatchet fixed in it, with the edge upwards, and the limb being laid upon it, is ſtruck with a wooden mallet till the amputation is made. They alſo uſe beheading and impaling; and ſome of the ſultans of Achen are charged with inflicting the moſt inhuman tortures on their ſubjects of the higheſt rank for very trivial offences: for perſons of all conditions, who have fallen into a fault, are liable to puniſhment; and in ſome reigns perſons of the royal family have been ſeen at court without either hands or feet, and have been treated in that manner for faults which would hardly have deſerved notice in any other country. The ſultan is frequently the ſpectator, and even the executioner of the puniſhments inflicted; and is ſaid to have elephants trained to torment criminals, who underſtand by the leaſt ſigns what the prince requires of them. He has been ſeen to paſs coolly from that ſpectacle to that of cock-fighting, in which many of the Indian kings take great pleaſure. This was probably the caſe under ſome of their tyrants. Admiral Beaulieu relates a dreadful ſcene of cruelties committed by the king in his preſence: but theſe monarchs have behaved with greater moderation ſince the Engliſh have traded to that city; and later travellers give us no formidable idea of their power and grandeur:

All offenders are brought to a ſpeedy trial; and ſentence is no ſooner paſſed than it is executed. As to civil cauſes, they are decided by the opinion of the magiſtrate, and ſuch precedents as tradition or his own experience has furniſhed him with. Thoſe of their magiſtrates who live in the neighbourhood of the Engliſh, where the affair is intricate, frequently deſire the opinion of the principal perſons among the Engliſh, and pay an uncommon regard to an European who is a man of ſenſe and temper, when they are ſo happy as to meet with him; but nothing endears the Engliſh more to this people than their learning the Malayan tongue; they having been greatly impoſed on by linguiſts.

SECT. V.

A conciſe Account of the firſt Settlement of the Trade to Sumatra by the Engliſh; with the Reception they met with from the King of Achen.

BEFORE we give a particular account of the Engliſh and Dutch factories on the coaſt of Sumatra, for purchaſing pepper and other valuable articles of commerce, it may be expected that we ſhould give the reader a view of the manner in which that trade began; which is the more neceſſary, as Sumatra was the firſt country to which the Engliſh Eaſt-India company traded in the Indies.

Captain Lancaſter, who, according to the cuſtom of that age, was ſtiled general, commanded the Engliſh fleet, and arrived in the road of Achen on the fifth of June, 1602, where he found the ſhips of ſeveral nations; and the fame of queen Elizabeth's victories over the Spaniards having reached that part of the world before him, made way for his favourable reception among the Indian princes.

Soon after the general's arrival, he ſent captain Middleton, who had the title of vice-admiral, with four or five Engliſh gentlemen, to wait upon the king of Achen, and ſolicit for his obtaining the honour of delivering the queen of England's letter into his majeſty's hands.

Captain Middleton not only met with a favourable reception, but was entertained by the king, preſented with a habit of the country, and was ordered to aſſure the general, that he might come on ſhore with the ſame freedom and ſecurity as if he was in her majeſty's dominions; and if he was under any apprehenſions, ſuch hoſtages ſhould be ſent on board as he deſired.

Two days after the general went on ſhore, and there being two Dutch factors at Achen, they invited him to their houſe: here a nobleman from the king came to attend the general, and aſk for her majeſty's letter; but being informed that it was not cuſtomary in Europe to deliver letters of this kind to any but the king in perſon, ſix elephants, with drums, trumpets, ſtreamers, and a vaſt retinue, were inſtantly ſent to bring the general to court. The largeſt of theſe elephants was about fourteen feet high, and carried a machine upon his back that had ſome reſemblance to the body of a coach covered with crimſon velvet, and in the middle of it ſtood a golden baſon, in which the queen's letter was put, and covered with a piece of rich ſilk. The general was mounted on another elephant, ſome of his retinue on the reſt, and others walked on foot.

On their coming to the gate of the palace, a nobleman, who appeared as maſter of the ceremonies, deſired them to ſtay till the king was informed of their approach. They were ſoon after diſmounted, and admitted to his majeſty's preſence, whom the general ſaluted after the manner of the country, and, declaring he was ſent from the moſt mighty

queen of England to propose an alliance and friendship between her and his majesty, was going on with a long harangue, he not being informed of the aversion of the Indian princes to long speeches; but the king, interrupting him, desired him to sit down, and told him that he was welcome to his country, and might depend upon all the favours he could reasonably ask, in behalf of that noble princess of whom fame had uttered many great things.

The general then delivered the queen's letter to his majesty, who gave it to an officer that stood by him, and the queen's present was set before the king, consisting of a large silver bason, with a fountain in the middle of it, weighing upwards of two hundred ounces, a large silver cup, a fine looking-glass, an embroidered sword-belt, a very handsome pair of pistols, a plume of feathers, and a fan made of feathers. He seemed most pleased with the fan, and immediately bid one of the women fan him with it.

Soon after the company were ordered to sit cross-legged, after the manner of the East, and an entertainment was served up in dishes of gold, or tamback, which is a mixture of gold and brass. The king was seated in a gallery raised about six feet above the hall of audience, and frequently drank to the general a glass of arrack; who, having pledged him in that liquor, was afterwards allowed to drink what liquor he pleased.

After dinner the king's women were called in, and danced after the manner of the country. The king then ordered the general to be presented with a habit of the country, which he put on in his majesty's presence; and then withdrawing, went with his retinue on board the ships.

His majesty having ordered two of his noblemen to treat with the general on the alliance with the queen, and settling articles of commerce, it was at length agreed, that the English should enjoy a free trade, and no customs be paid for goods imported or exported: that in case of shipwreck, assistance should be given to the English, and the goods restored to the owners; and, in case of death, the English should have liberty to bequeath their effects to whom they pleased: that all contracts with the king's subjects should be punctually performed; and if the English received any injury from the natives, the king should do them justice: that they should determine all differences among their own people, and enjoy the freedom of their religion.

These articles being settled, the English factors proceeded to purchase pepper; but the Portuguese using all arts to obstruct their trade, the general resolved to cruise in the streights of Malacca for their ships; and, on the third of October, 1602, took a large Portuguese carrack of nine hundred tons burthen, with above six hundred persons on board, and laden with nine hundred and fifty bales of chints, and calicoes, with abundance of rice and rich merchandize sufficient to freight all the English vessels.

The general, on his return to Achen, made the king a present of some of the most valuable things he had taken in the prize: upon which his majesty congratulated him, and seemed rejoiced at his success; for the Portuguese had behaved with such insolence, that all the Indian princes were exasperated against them.

The general having finished his affairs, and settled several factors at Achen, had his audience of leave, when he received from the king a letter to her majesty in the Arabic tongue, and also two habits for the queen of rich silks embroidered with gold, and a ring set with a fine ruby. The general himself was presented with another ring of the same kind; and, on his taking leave of his majesty, that prince assured him, that whenever any English ships came into his ports, they should meet with the same kind usage he had found there. This our countrymen long experienced, no other nation enjoying the same privileges as the English at the city of Achen.

The general now sending one of his ships laden with pepper to England, directed his course to Bantam, in the isle of Java, where he met with a very favourable reception; and having taken a house in the city, brought goods ashore, which he sold to the natives, and bought pepper and other spices with the money: then leaving eight factors in his house at Bantam, to manage the affairs of the company there, he took leave of the king, and setting sail for England, arrived in the Downs on the eleventh of December, 1603, after having made a very advantageous voyage for the company.

In short, the English had a factory many years at Achen; but at length, the company finding that it did not answer the expence, it was recalled. In that city all other foreigners pay five, and sometimes eight per cent. custom; while the English made only the usual presents to the king and court, amounting in the whole to sixteen or seventeen tael. These presents consisted of two pieces of fine cotton cloth, presented to the king at the ship's first coming to land, and two more at their departure; two or three tael to the eunuch who delivered the first present, and two more to him that carried the last: and when the four first boats, loaded with goods, were sent ashore, a tael and a half was paid instead of all customs. A piece of silk, or calicoe, was also presented to the sabandar, or governor of the port of Achen; and another to the chief orari caya, or minister of state, when the first present was sent to the king.

SECT. VII.

A concise Account of the English Factories in the Isle of Sumatra, particularly of Bencoolen, Marlborough-Fort, and Sillebar.

BENCOOLEN is situated on the south-west coast of Sumatra, in three degrees ten minutes south latitude, and one hundred and three degrees east longitude from London, and, from the year 1685, to the year 1719, was the principal settlement of the English upon that island. It is known at sea by a high slender mountain, called the Sugar Loaf, that rises in the country twenty miles behind it. Before the town of Bencoolen a small island, called Rat Island, breaks the swell of the sea, and with the point of Sillebar, which extends two or three leagues to the southward, forms a large bay: Within this island the ships usually ride; but this road is inconvenient, especially during the south-west monsoons. On the north-west side is a river, which brings the pepper out of the inland country; but there is great inconvenience in shipping it, on account of a dangerous bar at the river's mouth.

The town is near two miles in compass, and was chiefly inhabited by the natives, who build their houses upon pillars of bamboo, as in other parts of the island; and formerly the English, Portuguese, and Chinese had each a separate quarter, in which the houses of the English were erected after their own model. Though there was no want of brick or stone, they found themselves under the necessity of building with timber, on account of the frequent earthquakes, to which the island is subject; but the Chinese, after the manner of their country, had low houses that had only the ground-floor.

As Bencoolen is situated on a stinking morass, its unhealthy situation proved fatal to great numbers of the English: besides, the natives had for several years appeared very uneasy, and seemed to threaten the destruction of the English settlement; which is the less wonderful, as the English, who were unhappily sent thither, were so void of understanding as to treat the natives like their slaves; for Dampier observes, that while he was there, the English chief who governed Bencoolen had so little discretion as to put two of the neighbouring rajas, or kings, in the stocks, because their people did not bring down pepper so fast as he expected. In short, the badness of the air, and the ill conduct of the English company's servants, made it necessary to fix upon a situation that was at once more healthy, and would admit of a more regular fortification than the place where the old fort stood.

Accordingly a fort was marked out upon a rising ground about two or three miles to the southward of Bencoolen, the foundations were laid, and the walls, which are of brick, began to rise, when the country being ripe for an insurrection, assembled in arms against the English, cut off part of the garrison, and the rest escaped in their boats to sea, and got on board one of the company's ships.

But though the natives had thus driven the English from Bencoolen, in about a year's time they suffered them to return, and complete the fortifications at Marlborough-fort, as it is now called, without opposition; and there the factory enjoy the advantages of a pure air, sound health, and

and flourishing trade, though it is only two or three miles distant from Bencoolen.

About ten miles to the southward of Bencoolen is Sillebar, which is situated in a bay at the mouth of a large river of the same name, in four degrees south latitude. But this place has no good fresh water; for if that which proceeds from the springs there be drank for a considerable time, it occasions gripings and fluxes. The town is encompassed by large woods and rocky mountains, and, with the adjacent country, was formerly subject to the king of Bantam. The English have a small colony there, which is a detachment from Marlborough-fort, to receive the pepper brought thither by the natives.

Besides these English settlements we have Lattoun, which is situated about forty miles to the northward of Bencoolen; Bentall, which lies at least an hundred miles to the northward of Bencoolen; and Mocho-Mocho, which is situated near Indrapour, and is now the most northerly of all our settlements.

SECT. VIII.

Of the Settlements of the Dutch at Sumatra, particularly of Padang, Pullambam, and Bancalis.

ON a part of the coast of Sumatra, called the Gold Coast, the Dutch have a factory at Padang, under the management of a chief, who has his council and fiscal; and this is considered as a very profitable as well as honourable post.

The Dutch have likewise a factory at Pullambam, about eight leagues from the sea, on the banks of a very large river which empties itself by four different channels into the sea. The great trade carried on there is that of pepper, which the Dutch endeavour to monopolize in the same manner as they do cloves, nutmegs, and cinnamon; and are therefore at a very great expence in keeping several armed barks cruizing at the mouth of this river, to prevent what they are pleased to call smuggling. They have indeed contracted with the king of Pullambam to take off all the pepper in his dominions at the rate of ten pieces of eight, or fifty shillings, for a bahaar, or four hundred pounds weight, which is esteemed a fair price; they have, however, introduced a clause in their contract, by which it is agreed, that half the purphase of the pepper shall be paid in cloth, at such a price as greatly reduces the value of their cargoes; and on this account they are so much afraid of smuggling: yet, it is said, that in spite of their armed barks, on paying a thousand florins to the king of Pullambam, and the same sum to the Dutch chief, a cargo of a thousand bahaars of pepper may be carried off the island without any great difficulty.

Though the country is mountainous, this is not considered as a great inconvenience, since most of the mountains abound with gold, silver, lead, and other metals; and the company are possessed of some gold mines, which are extremely rich, and great care is taken both to secure and conceal the profits that are made of them.

The chiefs of Padang have, however, been so unfortunate as to have their honesty always suspected. This, says commodore Roggewein, is chiefly owing to their management of the mines, that do not turn out greatly to the advantage of the company, while all their officers get immense estates out of them; which the council at Batavia can neither understand nor digest; and for this reason they very often change the chief, but to very little purpose.

The principal places where gold is found by the natives, are Triou and Manicabo, where they obtain it in the following manner. They dig at the bottom of the mountain ditches, where the water being stopped, when rolling down the sides of the mountains in the winter, they, in the summer, draw it off; and by washing the mud which remains at the bottom, obtain from thence considerable quantities of gold dust. Indeed it is generally thought by those, who are best acquainted with the commerce of the Indies, that this island furnishes annually five thousand pounds weight of this precious metal, yet very little, if any, of this gold is ever brought to Europe, the Dutch disposing of it in other places, where gold is highly valuable, to purchase other commodities, which in Europe turn to a better account.

Besides Padang and Pullambam, already mentioned, the Dutch have a strong fort and a great factory at Jamby, and another at Siack; but this last place is very unhealthy. It stands on the great river Andraghira, into which, at a certain season of the year, come vast quantities of shads of a very large size, whose roots being accounted a great delicacy, are taken out; and the rest of the fish thrown away, which, lying in great heaps, corrupt and exhale pestilential vapours that infect the air. The persons therefore that are sent to Siack, are much of the same stamp with those that are sent to Banda, that is, men of abandoned characters and desperate fortunes.

The above roes they pickle with salt and tamarinds, and then dry them in smoke; after which they wrap them up in large leaves, and carry them to all the countries from Achen to Siam. These roes, when dried, are called Turbaw, and captain Hamilton thinks their taste far exceeds that of caviar.

They have another considerable factory on the banks of the river Bancalis, that produces large profit from the sail of cloth and opium, which are constantly paid for in gold dust. This was discovered by a factor in the company's service, who, after he had carried it on privately for about ten years, and acquired by it upwards of one hundred thousand pounds sterling, resolved to secure what he had got, by making a free discovery of this branch of commerce to the company, who then took it into their own hands.

About Bancalis there are prodigious numbers of wild swine, and in the months of December and January their flesh is very sweet and fat. In those months great numbers of people resort thither in small proas. Some go into the woods, and drive them towards the river, while others are ready with dogs to drive them into it, and when one goes, all the herd follow; others are ready with lances in their proas, to pursue them in the water, and lance them. They are taken up on the opposite shore, and immediately carried to places appointed, where there are many fires made of brush wood, with which they singe off the hair, and then taking out the entrails, cut them in proper pieces, and salt them in the proas, each proa having a share in proportion to the number of men it brings. After the pork has lain three or four days in salt, they wash it, hang it in smoke, and then put it in casks with some dry salt; after which it is sold by the cask to the best bidder.

There are likewise several other Dutch plantations on this island, which are all comprehended under the general title of the west coast.

SECT. IX.

Of the Coin, Weights, and Measures used at Sumatra.

IN this country there are but two sorts of money of their own coining; the first is of lead, which they call cash, of which fifteen hundred make a mass, or fifteen pence, which is their gold coin: a quarter of a mass is called a pollam, or copong, which is imaginary: sixteen mass make one tael, which is likewise imaginary, and equivalent to twenty shillings English. Dollars and other Spanish money are current almost all over the island: but though fifteen hundred cash are commonly reckoned the value of a mass, they rise and fall as the money-changers think proper, only there are seldom less than a thousand, or more than fifteen hundred, reckoned to a mass.

At Achen pieces of gold are oftener used in merchandize than their coin, especially in considerable bargains; it is therefore necessary to express at what rate you intend to receive and pay gold, as well as what catty you buy and sell by. The receiving a thousand pounds in their gold mass would be attended with inconceivable trouble, for brass, mixed metals, and silver gilt, are frequently found among them, and even the money-changers, who are employed in examining them, are sometimes deceived, though, if they receive any bad, they are obliged to make them good to the person by whom they are employed.

A merchant may likewise be greatly imposed on by receiving their gold dust, for they will mix small bits of other metal with it, which are not easily distinguished, and make it necessary to employ the money-changers upon

ch theſe occaſions. Great numbers of theſe people are to be found in the ſtreets of Achen, and they are generally either Guzarats, or natives of the Hither India.

As to the weights uſed at Sumatra for money and goods five tael make a buncal, twenty buncal make a catty, and one hundred catty a pecul, or one hundred and thirty-two pounds Engliſh weight. Three peculs are a China bahar, or three hundred and ninety-ſix pounds China weight, and of Malayan weight at Achen, four hundred and twenty-two pounds, fifteen ounces; and upon the weſt coaſt, particularly at Bencoolen, a bahar is five hundred pounds weight, or five hundred and ſixty pounds Engliſh.

The uſual meaſure for corn or liquids is the bamboo, which holds about a gallon, and it does not appear that there is any other meaſure for cloth, beſides the natural cubit and fathom.

SECT. X.

Of the Nicobar and Andoman Iſlands.

THE Nicobar iſlands extend northward from the end of Sumatra into the entrance of the bay of Bengal, and lies from the ſeventh to the tenth degree of north latitude, and between the ninety-ſecond and ninety-fourth degrees of longitude. The largeſt of them, at which ſhips uſually touch, and that gives name to the reſt, is ſituated moſt to the ſouthward, and is about forty miles long, and twelve or fifteen broad.

The ſouth end of this iſland is mountainous, and has ſteep clifts towards the ſea; but all the reſt of the iſland is low uneven land, covered with woods, in which are a great number of tall trees fit for building, or any other uſes. The ſoil is a rich black mould, and might produce any grain was it cultivated. The iſland does not appear to produce any valuable commodities, nor has any nation attempted to make a ſettlement upon it, or to bring the people under their dominion.

The iſlands are neither divided into kingdoms, nor provinces, nor does it appear that any towns have been built upon them: but in every creek or bay are ſeen four or five little houſes ſtanding by the ſea-ſide, on poſts about eight feet from the ground. Theſe have but one room, which is about eight feet in height; but, inſtead of being ridged like a barn, they are nearly arched with bended canes, and covered with palmeto leaves.

The country is over-run with wood, for they have only a few plantations of cocoa-nut-trees near the ſea-ſhore, from which they draw their beloved liquor toddy, and the nuts afford them meat and drink; for they are ſaid to have neither rice, nor any other grain growing in the country. Inſtead of bread they uſe the fruits of the melory tree, which grows wild in the woods: it is of the ſize of a large apple-tree, has a blackiſh bark, and a pretty broad leaf. The fruit has the ſhape of a pear, and, in the largeſt part, is twelve or thirteen inches round. It has a tough ſmooth rind, of a light green colour, and the fruit within it is much like an apple, but full of ſmall ſtrings or fibres. They ſcrape the pulp from the ſtrings with a wooden knife, and making it up in great lumps as big as threepenny loaves, boil them in earthen pots: they will keep a week, but afterwards turn ſour. This is their chief food, for they have no roots, except a few yams, nor do they ſeem fond of hogs-fleſh or poultry, though they are in no want of either; but fiſh is eaten more plentifully, every houſe keeping a fiſhing-boat or two.

The natives are tall, clean limbed, and of a dark tawny complexion: they have ſtraight hair and black eyes, their viſage is pretty long; their noſes are well turned and proportioned, and their faces, taken altogether, tolerably handſome; but the women pull the hair off their eyebrows, which renders them not quite ſo agreeable as they otherwiſe would be.

The men only wear a narrow piece of linen tied round their waiſts, to which they faſten another cloth of about a hand's breadth, and bringing it up between their legs, juſt cover their nakedneſs; but the women have a cloth about their loins, which reaches as low as their knees, and ſerves inſtead of a petticoat.

The natives are a peaceable, harmleſs people; and being friendly, and not inclined to quarrel, murder and robbery are ſeldom heard of among them. They confine themſelves to one woman, and live as man and wife, without any prieſt to tie the nuptial knot. As to their religion, we only know that they have ſome caves dug in the rocks, towards which, the miſſionaries obſerve, they pay a kind of adoration. It is alſo ſuppoſed that they worſhip the moon, from their great rejoicings at its firſt appearance. They are not divided into caſts or tribes, like the natives of the continent of India, but eat and drink, and mingle with each other, and with ſtrangers, without the leaſt ſcruple.

Their language is peculiar to themſelves: they have, however, ſome few Portugueſe and Malayan words, which are of uſe to them in bartering with the foreigners who touch upon their coaſt: for when any ſhips paſs by, both men and women come on board, bringing with them, hogs, poultry, fruit, and other proviſions. They alſo ſometimes bring ambergris, but oftener a mixture, which looks very like it, and with which the Europeans are ſometimes impoſed upon. They uſually take in return tobacco, iron, linen, and old cloaths.

The Andoman iſlands are ſituated in the bay of Bengal to the northward of the Nicobar iſlands, extending from the eleventh to the fifteenth of north latitude. As the manners and cuſtoms of theſe people are the ſame with thoſe of the inhabitants of the Nicobar iſlands, the above deſcription will ſerve for both. Several writers have charged the natives of all theſe iſlands with being canibals, and would perſuade us, that they have a particular fondneſs for human fleſh, but this is ſo far from being the caſe, that like the people of the firſt ages, they live chiefly on fruit, and are found to be as harmleſs and inoffenſive as any people upon earth.

CHAP. XIV.

Of CEYLON.

SECT. I.

The Iſland poſſeſſed by the Portugueſe, who are expelled by the Dutch. The Situation and Extent of Ceylon. Its Climate, and Seaſons. With a Deſcription of the Face of the Country, and of the Mountain called Adam's Mount.

WE ſhall now take a view of the delightful iſland of Ceylon, the moſt weſterly of thoſe beyond the great peninſula of India, and then return back to the continent. The antients, to whom it was known by the name of Taprobane, conſidered it as a plentiful ſource of all ſorts of riches and curious merchandize; and the learned Bochart was of opinion, that this was the country of Ophir and Tarſis, with whoſe treaſures Solomon's fleets were loaded.

The Portugueſe diſcovered this fine iſland, and conſidering the advantages that might be drawn from it, landed here in 1506, under the conduct of Laurence Almeida, who took poſſeſſion of it in the name of Emanual, king of Portugal, by erecting a column with an inſcription, importing, that it had no maſter, though he at the ſame time treated with one of the kings of Ceylon, whom he promiſed the protection of Emanuel, on condition of his paying a yearly acknowledgment of two thouſand five hundred quintals of cinnamon. "The Dutch, ſays the author of "the

"the New History of the East Indies, jealous of so lucrative an establishment, begun in 1602 to make attempts "to take it from them. The violence they exercised "rendered them as odious to the Cinglasses (for so the "inhabitants of Ceylon are called) as the Portuguese "already were on the same account. But they accomplished their designs fifty-five years afterwards. They "declared war against the Portuguese; they drove them "from the places they had fortified and possessed for a "hundred and fifty years before; they seized on the "cities of Colombo and Negombo; they placed a garrison "in the fort of Punto Gallo; they made themselves absolute masters of the coasts and harbours, but did not "enter into the dominions of the king of Candy, who "possesses the middle of the island; and they are so anxious "to engross the trade of Ceylon, that they suffer no foreign vessels to approach it."

The island of Ceylon is situated between the sixth and tenth degree of north latitude, and between the seventy-ninth and eighty-second of east longitude from London. It is therefore about two hundred and fifty miles in length from north to south, and near two hundred in breadth from east to west; and the Dutch observe, that in its shape it resembles a Westphalia ham. It is seated about forty-five miles to the south-east of the hither peninsula of India, and is one of the finest countries in the world.

The monsoons and seasons are the same as on the neighbouring continent; for the rains begin to fall much sooner on the Western coast than on the Eastern, just as they fall sooner on the Malabar side of the coast of India, than on the coast of Coromandel, which probably proceeds from the same cause, Ceylon, as well as that great peninsula, being divided by very high mountains. The northern part of the island is subject to great droughts of very long continuance, an affliction that is the more sensibly felt as there are scarce any springs or rivers in that part of the island, and the inhabitants are obliged to be supplied with water as well as food from the South.

There are, however, several rivers in the island, which fall down from the mountains, but are generally so rapid and full of rocks as not to be navigable; the largest is that of Mavillagonga, which has its source in a mountain called Adam's Mount, and running north-east falls into the sea.

As to the face of the country, it is for the most part covered with fragrant woods and groves, and between the mountains are little fertile vallies watered by fine springs. In short, this island not only produces gold and other metals, but topazes, rubies, saphires, granates, and crystal.

In the southern part of the island, about twenty leagues from the sea, is a vast plain, in the middle of which is the above mountain covered with a fine turf, on which rises a rock of a pyramidical form; but so rugged, that, it is said, it can only be ascended by means of an iron chain, which hangs from the top to the bottom. It is supposed to be two leagues from the plain to the topmost summit; but the way so bad, that setting out early in the morning, one cannot arrive thither till two hours after mid-day; and the height is so prodigious, that the sailors begin to descry it twenty leagues out at sea. Though the summit of the rock, when viewed from the bottom in the plain, appears like a point, yet it forms a terrass two hundred paces in diameter; in the center of which is a large and deep lake of some of the best water in the world. From thence proceed several rivulets which fall in torrents down the sides of the mountain, and, after being reunited, form three great rivers in the plain. Near the lake is a large stone, on which is the print of a man's foot, as perfectly engraved as if the impression had been made on wax. The Cinglasses are perswaded that it is a vestige of the first man, and therefore have called that mountain Hamalel, or Adam's mountain; which the Portuguese have translated Pico de Adam, or the Peak of Adam. The people believe, that the first man was created here; that the lake arose from the tears which Eve shed at Abel's death; and that Ceylon was part of the terrestrial paradise. This tradition, which could only be received from the Jews, it is said came from king Vigia Raia, who, according to the common opinion, lived five hundred years before Christ.

SECT. II.

Of the Trees and Plants of Ceylon, with a particular Description of the Tallipot-Tree, the Reffule, the Cinnamon-Tree, the Jaka, the Orula, and the Dounekaia. Of the different Kinds of Grain, and the Method of Husbandry practised by the Natives.

ONE of the most remarkable trees in Ceylon is the tallipot, which grows straight and tall, and is as big as the mast of a ship: the leaves are said to be so large as to cover fifteen or twenty men, and keep them dry; they are round, and fold up like a fan. The natives wear a piece of the leaf on their heads when they travel, to shade them from the sun; and they are so tough, that they are not easily torn, though they make their way through the woods and bushes with these kind of umbrellas. Every soldier carries one, which also serves him for a tent to lie in; and, without these leaves, it would be impossible to live abroad in the rainy season. This tree bears no fruit till the last year in which it lives, and then has plenty of a hard fruit of the size of a nutmeg. Its trunk contains a pith, which is sometimes eaten like the pith of the sago tree, and bread is made of it as well as of sago.

They have a tree called reffule, that is as straight and as tall as the cocoa-tree, and is also full of pith. From this tree the natives draw a cool pleasant liquor that is very agreeable, though it is no stronger than water, and an ordinary tree yields three or four gallons a day. By boiling this liquor they obtain a kind of brown sugar, which in India is called jaggory; and, it is said, that they can refine it, and make it fit to answer all the purposes of sugar. They obtain this liquor in the following manner: on the very top of the tree grows a bud, which they cut off, and bind about it pepper, salt, limes, garlick, and leaves: under this bud they hang an earthen-pot to catch the liquor, and every day cut a thin slice from the end where the bud grew. The leaves of this tree fall off, and are renewed every year till it arrives at its full growth, and then the same leaves continue on it for several years together. As the bud at the top ripens and withers, others come out lower every year, till they reach to the bottom of the boughs, and then the tree has done bearing, and dies within seven or eight years after. The wood of this tree, which is very hard and heavy, is black, and of this the inhabitants make the pestles with which they beat the rice out of the husks in mortars.

There are here whole forests of oranges, citrons, and cinnamon-trees; and the last are so common, that the smell of them spreads eight leagues round. Salmon says, that in his voyage to India, when the ship was judged by the best seamen on board to be a hundred miles from that or any other land, the air was so extremely sweet, and so replenished with fragrant smells, that he was morally certain they must be near some land. "I called up, says he, several "of my travellers, who regaled their smelling faculty in "the same manner; and it was the general opinion, that "this must proceed from the cinnamon-groves in Ceylon. "However, it is observable, that when people have been "long at sea, and draw near any coast, if the wind sets off "of it, it will bring a very refreshing smell along with "it, though not comparable to that perfumed air we "meet with on the coast of Ceylon."

The cinnamon-tree is peculiar to this island, and is of inestimable value to the Dutch. This tree grows on the south-west part of the island, where it is as common as any other in the woods; but there are few or none to be found towards the northern coast; yet the Dutch have secured all the bays and the mouths of the rivers round the island to prevent other nations settling there, or having any commerce with the natives.

The cinnamon-tree is of the middle size, not very large, and its leaf in thickness, shape, and colour, resembles the laurel.

When the leaves first sprout they are as red as scarlet, and on being rubbed between the fingers smell like a clove. The tree bears a fruit in September that is like an acorn, but neither its taste nor smell has any resemblance to that of the bark. By boiling the fruit in water

they obtain an oil which ſwims on the top, and has a very agreeable ſmell; and when it is cold is white and as hard as tallow. This is ſometimes uſed as an ointment for aches and pains; and as it is very common they alſo burn it in their lamps. Some people aſſert, that the cinnamon-tree has three barks; but all agree that it has two, and that the cinnamon is the ſecond. The beſt is that ſtripped from trees of a middling growth; for neither thoſe that are very young, nor thoſe that are old, are proper for peeling. Having ſtripped off the outward bark, they cut the next round the tree in ſeveral places with a pruning-knife, and cutting them lengthways in ſlips, peel them off, and lay them in the ſun to dry, on which they roll up together as we ſee them brought to Europe.

Whether the tree be killed by cutting the inward bark, as ſome affirm, is not very material, ſince there are abundantly more of them in this iſland than are neceſſary to ſupply the whole world; and therefore the Dutch do not care into how narrow a compaſs the cinnamon-groves are brought, ſince, as they have monopolized this ſpice, they can ſet what price upon it they pleaſe; and the leſs extent theſe woods have, the better they will be able to defend them. The body of the tree under the bark is perfectly white, and ſerves for building and other uſes; but it has neither the fragrant ſmell nor taſte of the bark.

Among the other extraordinary trees of this iſland, is the Orula, which is of the ſize of an apple-tree, and bears a fruit like an olive; this they ſometimes take as a purge: they alſo uſe it to dye their cloaths black, by dipping them into water, in which this fruit has been infuſed; and it is ſaid, that if a piece of ruſty iron be thrown into this water, it will eat off the ruſt, and the iron become bright; but that the water will be ſo black, that it will ſerve for ink.

Here are a great variety of fruits; but the natives ſeldom eat them ripe, or cultivate any but thoſe which ſerve for pickles. The fruit called jack, or jaka, is a part of their food, it grows upon large trees, is round, and of the ſize of a peck-loaf: it is covered with a green prickly rind, and has ſeeds or kernels within it, that reſemble a cheſnut, both in ſize, colour, and taſte. This fruit they gather before it is ripe, and when boiled it has the taſte of cabbage: but when mellow it is eaten raw, and is very good. The kernels roaſted in the embers ſerve them for food when on a journey.

There is another fruit called jambo, which is very juicy, and has the taſte of an apple: the colour is white, ſtreaked with red, and it looks very beautiful. They have alſo ſome fruits that reſemble our plums and cherries; nor do they want any of the common Indian fruits, as pine-apples, cocoas, limes, melons, pomegranates, and mangoes.

The kitchen-gardens of this iſland are well ſupplied with roots and herbs; the roots they eat are known by the general name of yams, though they have a great variety of them. They have alſo ſeveral ſorts of vegetables, which they eat with butter, ſome of which are nearly equal to aſparagus. They alſo dreſs ſome of their green fruit with rice. The Portugueſe and Dutch have introduced almoſt all the herbs and roots uſed in our kitchens, as coleworts, lettuce, ſage, mint, roſemary, radiſhes, and carrots; and their woods afford plenty of medicinal herbs, which are well known to the natives, who, by applying them, perform conſiderable cures.

The country alſo abounds with flowers of the fineſt colours, and the moſt fragrant ſmells, but the natives never cultivate them, or take any delight in fine gardens; yet the young fellows and girls adorn their hair with them: among others they have white and red roſes, that ſmell as ſweet as ours, and alſo a white flower that reſembles jeſſamine, of which a noſegay is brought every morning to the king, who claims the property of them wherever they grow.

There is another flower called the hopmaul, that grows upon trees. Theſe have a very fine ſcent, and are particularly uſed by the young people in their hair. They have likewiſe a flower called the ſindricmal, which is remarkable for opening every evening at about four o'clock, and cloſing again about four in the morning.

The downekaia is a ſhrub that bears a leaf that is only about two fingers broad, and yet is ſix or eight feet long, and on both ſides full of thorns. Theſe leaves they ſplit, and make mats of them. This ſhrub bears a bud that opens into a bunch of fragrant whitiſh flowers, like a noſegay, and the roots being full of ſmall fibres, they make their cordage of them.

They have ſeveral kinds of rice, ſome of which require ſome months before the corn is ripe, ſome ſix, others five; and there are other kinds that will be ripe in three or four months from the ſeed-time: that which ripens faſteſt has the beſt taſte, but yields the leaſt increaſe. As all ſorts of rice grow in water, the inhabitants take great pains in levelling the ground they deſign for tillage, and in making channels, for their wells and reſervoirs to convey the water to the fields. If they apprehend they have water enough, they ſow that kind of rice which yields moſt, and is the longeſt in growing; but if they apprehend the water will not hold out, they ſow that which ripens ſooneſt. They alſo contrive to have all their rice ripe together; for as their fields are common, they turn in their cattle after harveſt; and if any huſbandman is much later than his neighbours, his corn is eaten up by the cattle.

As there are but few ſprings in the north part of the iſland, the natives, during the rainy ſeaſon, ſave the rain-water in great ponds a mile in extent; and when their fields are ſown, let it gradually flow into them a little at a time, that it may hold out till harveſt.

Their uſual ſeed-time is in July or Auguſt, ſoon after the beginning of the rains, and their harveſt in January or February; but where they have always plenty of water, they pay little regard to the ſeaſons, but ſow and reap almoſt at any time.

Their plough has a handle and foot ſhod with iron, much like our foot ploughs; but they are both of a piece, and much leſs and ſhorter on account of their turning on the ſide of hills where they are cramped for want of room. A ſmall beam is let into that part which the ploughman holds in his hand, and to which the geers of the buffaloes are faſtened: theſe ploughs do not, like ours, bury the ſward, but only ſerve to break up the ground that is ſoon after overflowed with water, which rots the graſs and weeds. The lands are indeed ploughed twice; after the firſt they make up the banks, which ſerve to keep in the water, and for cauſeys to walk upon from one field to another; for the fields, when overflowed, are knee-deep in water and mud. When the weeds and graſs are rotted, they drag a heavy board, edge-ways over the land to make it ſmooth, that it may every where be equally overflowed.

Before they ſow their ſeed they ſoak it in water, and then let it lie four or five days on a heap till it grows. When the ſeed is ready they drain the water off the land, and then with ſquare boards faſtened to poles again ſmooth the mud; after which they ſow the rice as our huſbandmen do wheat and barley, and ſuffer it to ſtand without water till it riſes a ſpan above the ground. The women then come to weed the rice, and tranſplant it where it grows too thick; after which they again let in the water, and the rice grows half a foot or a foot deep in water till it is ripe.

Inſtead of threſhing their corn they tread it out with oxen and buffaloes, which is frequently done in the fields where it grows. When it is reaped they lay out a round ſpot of ground for this purpoſe, about twenty-five feet in diameter, and dig it a foot and half deep. This method is ſo expeditious, that half a dozen oxen will trample out forty or fifty buſhels in a day. It is remarkable, that the people, before they begin this work of treading out the corn, always perform ſome religious ceremony, and apply to their idols for a bleſſing on their labours.

There are ſeveral other kinds of grain which the people eat towards the end of the year, when rice begins to grow ſcarce, particularly curacan, which is as ſmall as muſtard-ſeed; this they beat or grind into flower, and make cakes of it. This grain grows on dry ground, and is ripe within three or four months after it is ſown.

They have another grain called tanna, which is as ſmall as the former. Every ſeed ſhoots out four or five ſtalks, each of which has an ear, and it is ſaid to multiply

a thou-

a thouſand fold. The women who perform moſt part of the harveſt-work cut off the ears when it is ripe, and carry them home in baſkets. This is very dry food, and is only eaten when rice is not to be had.

There likewiſe grows here a ſeed called tolla, of which they make oil, with which they anoint themſelves.

SECT. III.

Of the Beaſts and Inſects of Ceylon, particularly the Elephants, the Ants, and the Bees. Of the Birds and Fiſhes.

IN this iſland there are plenty of buffaloes, oxen, deer, goats, and hogs; they have likewiſe elephants, monkies, bears, tygers, jackalls, hares, and dogs; but no lions, wolves, ſheep, horſes, or aſſes, except ſuch as are imported by Europeans. Some of their deer are larger than our red deer; but there is another animal that is in all reſpects like them, except in the ſize and colour, it is no bigger than a hare, and is grey ſpotted with white.

This iſland is moſt famous for its elephants, which are ſo numerous, that they do incredible damage to the huſbandmen by breaking their trees, and eating and trampling down their corn. Hence the country people are obliged to watch thoſe of their own fields that lie near the woods every night, and they are not ſecure of their corn when it is placed in their yards. It is with great difficulty that, with lighted torches and making a great noiſe, they can frighten them away; ſometimes they ſhoot at them, and wound them with their arrows; but the enraged elephant frequently kills them. Their tygers and bears are far leſs troubleſome, for they do no damage to the corn, and ſeldom attack people without provocation.

The Abbé de Guyon obſerves, that the tame elephants of Ceylon are more eſteemed than any other in the Indies, not only on account of their prodigious bulk, and the beauty of their ivory, but alſo for their remarkable docility: "They uſe no other animals but theſe, he adds, "in the carriage of hogſheads, and other ſuch burthens. "The elephant takes hold of the rope with his trunk "and his teeth, he draws it, twiſts it about, throws the "load on his back, and ſo goes off with it. He draws "with equal eaſe a caravel, or half-galley, on dry "ground."

Their monkies are alſo very numerous, and theſe are of ſeveral kinds, ſome are of a dark grey and very large, with black faces, and white beards that reach from ear to ear, which make them reſemble old men. There is another ſort like the former, and as large, but both their bodies and faces are milk-white; neither of theſe are miſchievous: but there is a third ſort that is very troubleſome, theſe have white faces, and no beards, but have long hair on their heads like men: about harveſt-time theſe come in large companies, and not only eat up a great deal of corn, but carry a conſiderable quantity of it away in their hands; they likewiſe plunder the gardens about the houſes.

In ſome part of the iſland are alligators, and they have alſo a great variety of ſerpents, ſome of which are ſaid to be of an incredible ſize. They have abundance of polecats, ferrets, weazels, and other vermin, which are ſo numerous, that they deſtroy almoſt all the wild rabbits.

The ants ſwarm here in an amazing degree, and ſting ſo ſharply that there is no bearing them; they devour almoſt every thing they come at, and people can ſcarce ſet down a diſh of meat but it will be filled with them. They run up the walls of the houſes, building arches or covered paſſages as they go; and if an arch happens to break, they come down and aſſiſt in repairing it. The Cinglaſſes take great care in watching every thing they value, leſt they ſhould be ſpoiled by theſe inſects, which they diſcover by theſe arches of dirt, which they always build wherever they go. At a diſtance from the houſes theſe ants raiſe hillocks, five or ſix feet high, of a pure refined clay, ſo firm and hard that it will require a pick-ax to break it, and under theſe they contrive their neſts in the manner of an honey-comb. Theſe inſects increaſe prodigiouſly, and great numbers of them alſo die at a time; for when they have arrived at their full growth, and have obtained wings, they iſſue out of an evening after ſun-ſet in ſuch vaſt numbers, that they darken the ſky; and having flown out of ſight, in a ſhort time fall down dead, when the birds which are gone to rooſt frequently pick up a great many of them. The poultry live almoſt entirely upon theſe ants, which muſt greatly decreaſe their number.

They have one ſort of bees like thoſe common in England, theſe build in holes in the ground, and in hollow-trees. They have alſo a larger ſort of a brighter colour, and that make much thinner honey: theſe fix their combs upon the boughs of trees at a great height, and as they may be eaſily ſeen, whole villages at the proper time of the year go into the woods to gather the honey, and come home loaded with it. They ſometimes hold torches under the bees till they drop down from the trees, and then boil and eat them, thinking them very good food.

In this iſland are leeches of a reddiſh colour, of about the thickneſs of a gooſe quill; theſe appear about the time when the rains begin to fall, and ſoon after the graſs and woods are full of them. At firſt they are almoſt as ſmall as a horſe-hair, and creeping up the legs of travellers, who always go without ſhoes or ſtockings, make the blood run down their heels; and if they have any ſore, will be ſure to get to it. To avoid this ſome rub their legs with lemon and ſalt, to make them drop off, and others uſe a flat ſtick to ſcrape them off; but they are ſo ſoon ſucceeded by others, that it is almoſt in vain, and they moſt commonly let them alone till they reach the end of their journey; for though their legs ſmart a little, this bleeding is eſteemed ſalutary. When they come to their houſes, they get rid of them at once by rubbing their legs with aſhes.

As to fowls they have plenty of them; but it is ſaid the king prohibits the people's keeping tame turkies, geeſe, ducks, and pigeons, though he himſelf keeps them: they have likewiſe a water fowl that is black, and as big as a duck; it lives upon fiſh, and will remain under water a long time, and at length will come up at a vaſt diſtance. There is another fowl that haunts the ponds and marſhes; it lives on fiſh, and is larger than a ſwan.

There are a few partridges and woodcocks, ſome ſnipes, wood-pigeons, and ſparrows; but wild peacocks and green parrots are very numerous.

The macowda ſpeaks very plain, when taught, and is of the ſize and colour of a black-bird. There is another ſpecies of a very beautiful gold colour, and theſe too may be taught to ſpeak.

The fineſt bird of this country is of the ſize of a ſparrow; it is as white as ſnow, except its head, which is black, with a plume of feathers ſtanding upright, and the tail is a foot long. There are others of a deep yellow, but in every other reſpect like the former; neither of them have any muſical notes, or are good for any thing but to look at.

There is great plenty of fiſh in the rivers and ponds, which the natives eat with their rice much oftener than they do fleſh. They take them with a wicker baſket made in the form of a bell, which they put down in the water, and ſoon feel if there be any fiſh, by their beating againſt the walls of their little priſon, and putting their arms in at the top, they take them out with their hands. They ſeldom uſe nets, except on the ſea-coaſt. In ſeveral places fiſh are kept for the king's uſe, who diverts himſelf with feeding them: and in thoſe places people are prohibited to take them, which renders them ſo tame, that they will ſwim after any body to the ſides of the pond to be fed.

SECT. IV.

Of the Perſons, Dreſs, Manners, and Cuſtoms of the Cinglaſſes, or Inhabitants of Ceylon.

THE Cinglaſſes are well ſhaped, of a middle ſtature, and have long black hair. Their features are regular, their complexion dark, but leſs ſwarthy than that of the Malabars, and their eyes, like thoſe of all other Indians, are black.

Among the people of rank the young men wear their hair long and combed back; but when they are on a journey they tie it up. Elderly people wear a cap, that has ſome

ſome reſemblance to a biſhop's mitre. They ſuffer their beards to grow long, and wear a waiſtcoat of blue or white calicoe, and a piece of blue or ſtained calicoe round their waiſt, over which they have a ſaſh, in which they ſtick their knife, which has generally a fine wrought handle: they alſo wear a hanger by their ſides, the hilt of which is frequently inlaid, and the ſcabbard almoſt covered with ſilver. They walk with a cane, which ſometimes has a tuck in it, and are followed by a boy, who carries a little bag, in which there is betel and areka. The common people are naked to the waiſt, about which they wrap a piece of calicoe that reaches down to their knees.

The women have their hair combed back and hanging on their ſhoulders, ſhining with cocoa-nut oil; a waiſtcoat, fixed cloſe to their bodies ſhews their ſhape, and a piece of calicoe being wrapped about them falls below their knees, and is longer or ſhorter according to their quality. They wear jewels in their ears, in which they bore great holes: they alſo wear necklaces, and have bracelets on their arms, abundance of rings on their fingers and toes, and a girdle or two of ſilver wire or plate about their waiſts. Though they have a ſtately mien, they are very obliging to their inferiors, with whom they freely converſe. When they go abroad, they throw a piece of ſtriped ſilk over their heads.

They ſalute an acquaintance by holding out both their hands, with the palm upwards, and bowing their bodies; but a perſon of ſuperior quality holds out but one hand, or perhaps only nods his head. The women ſalute by clapping the palms of their hands together, and lifting them to their foreheads; and the firſt enquiry is about their health, as it is here. When the neareſt relations viſit, they ſit ſilent and reſerved; for they are not fond of talking much. It is uſual for them to carry proviſions and ſweetmeats with them to the houſe of their friend, who, however, makes an entertainment for them the firſt day; and if the gueſt ſtays longer than a night, he begins to aſſiſt the maſter of the houſe in his buſineſs; for they think it unreaſonable that idle people, who have nothing to do, ſhould diſturb and hinder others as long as they pleaſe. But the people in general are not very able to make entertainments; for when they go abroad, they are obliged to borrow a great part of the cloaths and ornaments they then wear; which is ſo common, that they do not eſteem it any diſgrace.

The Cinglaſſes are ſaid not to want courage, they have quick parts, are of a complaiſant inſinuating addreſs, and are naturally grave: they are of an even temper, and not eaſily moved; and, when they happen to be in a paſſion, are ſoon reconciled: they are temperate in their diet, neat in their apparel, ſomewhat nice in their eating, and do not indulge themſelves in ſleep; but, though they commend induſtry, they, like the natives of other hot countries, are a little inclined to lazineſs: they are not given to theft, but are intolerably addicted to lying, and pay little regard to their promiſes: they allow their women great liberty, and are ſeldom jealous: they are extreamly ſuperſtitious, and great obſervers of omens. If at their firſt going out in a morning they ſee a white man, or a great bellied woman, they promiſe themſelves ſucceſs in what they are going to undertake. Sneezing is an ill omen; and if they hear the cry of a certain little animal, like a lizard, they think it ſo unlucky, that they will defer what they were about till another opportunity.

Their principal food is rice, with ſome ſavoury ſoups made of fleſh or fiſh. Thoſe in affluent circumſtances have ſix or ſeven diſhes at their table; but moſt of them are ſoup, herbs, or other garden-ſtuff, and they have ſeldom above one or two of fleſh or fiſh; and of theſe they eat very ſparingly. The meat is cut in ſmall pieces and laid by the rice; and inſtead of knives and forks they uſe ſpoons made of the ſhell of the cocoa-nut. They have braſs and china-plates on which they eat; and the poor who want theſe, are contented with making uſe of broad leaves. If they have rice and ſalt in the houſe, the poor think themſelves well ſupplied with food; for with rice, a ſallad, and the juice of a lemon, inſtead of vinegar, they will make a good meal. The eating of beef is prohibited, and they chooſe to ſell their pork and fowls to the foreigners who come amongſt them; and would think themſelves hardly uſed, were they compelled to make a meal of either. The wife dreſſes the food, and waits on her huſband; and when he has done ſits down with her children, and takes what is left.

Their uſual drink is water, for they have neither wine nor beer, and drink but little arrack. They pour the water into their mouths, holding the veſſel at a diſtance from their heads, without ever touching it with their lips.

Cock-fighting, and the game of draughts, are their uſual diverſions. The cocks of this iſland are larger, and their ſpurs much longer than in any other part of the known world; they fix to them large gaffs, and bet upon theſe occaſions gold, ſilver, orchards, lands, and many other things, which are gained by the maſters of that cock which is victorious. Their paſſion for play is carried to ſuch an extravagant length, that at the game of draughts, it is even ſaid, they venture not only all they have in the world, but even their very limbs. When they have nothing more to loſe, they ſet a veſſel full of ſeſame, or oil of nuts, for they have no olives, on the fire, and by its ſide a ſmall ax, but very ſharp. He who loſes lays his hand upon a ſtone, and they cut off the joint of a finger, which is immediately dipt in the boiling oil, in order to cauterize the wound. This cruel operation cannot cure them of their bad habit of gaming, and ſometimes they are ſo obſtinate, that they will not give over till all their fingers are cut off.

SECT. V.

Of their Marriages and Divorces. The Treatment of their Wives; their Cruelty to their Children occaſioned by their ſuperſtitious Regard to Aſtrology; and of their Funerals.

MARRIAGES, in this country, are uſually concluded by the parents while their children are very young, without conſulting them: but the ſame care is taken as in India, that the married couple be of the ſame caſt or tribe. When every thing is concluded, and it is thought proper for them to cohabit, the young man ſends his wife ſix or ſeven yards of calicoe, and a flowered linnen waiſtcoat: if he carries them himſelf, they ſleep together that night, and appoint a time for the ſolemnization of the wedding, or bringing her home. The evening before he takes her from her father's, he comes with his friends, bringing ſweatmeats and other proviſions, and they have a ſupper ſuitable to their rank, after which the bride and the bridegroom ſleep in the ſame apartment. The next day after dinner the proceſſion begins from the wife's father's to the huſband's houſe, the wife at theſe ſolemnities always going before the huſband. A few days after their friends and relations make them a viſit, bringing proviſions, and rejoicing on the happy occaſion; but it does not appear that the prieſt is called in, even ſo much as to bleſs the marriage.

Theſe contracts are far from being conſidered as indiſſoluble, for the parties, after trying one another's temper, are at liberty to part and match elſewhere, and this they will ſometimes do two or three times over, before they fix on thoſe they like; but as they give with their daughters portions of cattle, ſlaves, and money, either theſe, or an equivalent muſt be returned with the woman, the man keeping the male children, and the woman the girls.

Though no man is allowed more than one wife, it is ſaid to be common for a woman to have two huſbands, and thoſe brothers, who keep houſe together, and the children acknowledge both for their father.

If their daughters are grown up, and marriageable, they make no ſcruple of letting young fellows lie with them, in hopes they will take them off their hands by marrying them.

The men are ſo complaiſant after marriage, that if they are viſited by a friend, they will offer him their wife or daughter to ſleep with them, eſpecially if he be of a ſuperior caſt; though it would be an unpardonable crime to proſtitute either to a man of lower rank; and lying with a man's wife without his leave is even here, where they allow ſuch liberties, eſteemed ſo great a crime, that the huſband is indemnified if he kills both the adulterer and the adultereſs, when he finds them together.

It

It is ſaid the women are very dexterous at procuring abortion, which they think no crime. They have no midwives, but the good women of the neighbourhood perform that office. The child is no ſooner born than the aſtrologer is conſulted to know whether it comes into the world under a lucky planet, and if they ſay that the hour is unfortunate, the child is expoſed, thrown into a river, or given to ſomebody elſe; for though they ſuppoſe the child would bring misfortunes on the parents, they imagine, that he may procure happineſs to a ſtranger. In ſhort, from the prevailing ſuperſtition of the country, with reſpect to aſtrology, many people, who are afraid of the charge of children, are ſo cruel as to diſpatch them, under the pretence that they are born under an unlucky planet. They give their children what names they pleaſe to diſtinguiſh them in their infancy; but when they grow up they take the name of the family or place to which they belong, or the employment or office they hold.

A perſon of rank no ſooner dies than his corpſe is laid out and waſhed, and a linnen cloth being thrown over it, it is carried out upon a bier to ſome high place and burnt; but if he was an officer of the court, the corps muſt not be burnt without the king's orders, which are ſometimes not ſent till a conſiderable time after. His friends in this caſe hollow the body of a tree, and having embowelled and embalmed the body, they put it in, filling up the hollow with pepper, and having made it as cloſe as poſſible, bury the corpſe in ſome room of the houſe, till the king ſends an order for its being burnt. The corps is laid upon a pile of wood three feet high, and then more wood is heaped upon it; but if it be a perſon of diſtinction an arch is built over it, adorned with colours and ſtreamers, and the whole is conſumed together in the flames. Afterwards the aſhes are ſwept up, the place fenced in, and a kind of arbour raiſed over it. The poor are uſually wrapt in the mats they lay on, and attended by two or three friends, who bury them without ceremony in the woods.

Some days after a prieſt is ſent for to the houſe of the deceaſed, who ſings ſeveral funeral ſongs, and prays for the repoſe of his ſoul. The women, who are preſent, then let looſe their hair, wring their hands, and vent the moſt paſſionate exclamations for the loſs of their relation, enumerating all his good actions, and bewailing their own unhappy lot, in being forced to live without him; and this they repeat morning and evening for ſeveral days, the men ſtanding by, and expreſſing their grief by their ſighs and groans.

SECT. VI.

Of the Languages of the Ginglaſſes, and their Skill in the Arts and Sciences.

THE Cinglaſſes have a language peculiar to themſelves, and alſo a learned or dead language, underſtood only by their bramins or prieſts, in which is written every thing relating to the rites and ceremonies of their religion. Their common tongue is copious, ſmooth, and elegant, and in all their addreſſes to their ſuperiors, is a great mixture of compliment: they are ſo exact in the titles they give to men and women, that they are varied at leaſt a dozen ways, according to the quality or circumſtance of the people to whom they ſpeak, and it is an unpardonable miſtake to give any perſon a wrong title or epithet. Their very peaſants are ſaid to be as well verſed in theſe praiſes as the men of rank, and make handſome ſpeeches to ingratiate themſelves where they have a favour to aſk: to this they are uſed from their infancy, their parents taking all opportunities of introducing them into the company of their ſuperiors, with whom they are taught to converſe; ſo that they are ſeldom guilty of the rudeneſs or aukward baſhfulneſs obſervable in the clowns of other countries.

Inſtead of paper they uſe the leaf of the tallipot-tree, which they cut into ſlips of about two feet long, and three fingers broad, and upon it form their letters with a ſteel bodkin, writing from the left hand to the right. Their children are firſt taught to write by making letters in the ſand of the ſtreets.

They are fond of aſtronomy, which they probably learned firſt from the Egyptians and Arabs, who have long had a correſpondence with this iſland. They even foretel the eclipſes of the ſun and moon, and make almanacks, in which they give the age of the moon, the lucky or unlucky times for ploughing, ſowing, taking a journey, or entering on any buſineſs; and, according to the poſition of the planets, pretend to determine whether the ſick ſhall recover, or a child at its birth prove fortunate or not. Their parents, it is ſaid, always conſult their aſtrologers on theſe ſubjects.

Their year, like ours, has three hundred and ſixty-five days, and they begin it on the twenty-ſeventh, twenty-eighth, or twenty-ninth of March. They alſo divide the year into twelve months, and theſe into weeks; the firſt day of which they imagine to be fortunate, for the undertaking of any new affair. Their day is divided into thirty parts, and the night into as many, beginning the one at ſun-riſe, and the other at ſun-ſet, which is here about ſix o'clock all the year round, ſo that their fifteenth part, or pay, as they call it, anſwers to twelve o'clock at noon. They have no clocks or ſun-dials, but inſtead of them uſe a copper diſh, which holds about a pint, with a little hole at the bottom: this is put empty into a veſſel of water, and having filled itſelf in the ſpace of one of their pay, it ſinks, and then is ſet upon the water again, to meaſure another pay.

As to medicine, every body appears to underſtand common remedies, though none have any great ſkill. Theſe remedies are compoſed of herbs, leaves, roots, or the bark of trees found in the woods, with which they purge or vomit themſelves as they think proper; they alſo cure green wounds, and though the bite of ſome of their ſnakes be followed by certain death, if a ſpeedy remedy be not adminiſtered, they apply an herb, which effectually cures the patient, and at the ſame time ſing to him, which they call charming the patient. They have alſo many antidotes againſt poiſon taken inwardly; for as they abound in poiſonous plants and herbs, providence has graciouſly ordained that they ſhould have remedies of the ſame kind to prevent their dangerous effects.

The diſeaſes to which the people are ſubject, are the ſmall-pox, agues, and fevers, the bloody-flux, and pains in their limbs; for the laſt they uſe certain ointments with great ſucceſs.

They ſeem perfect ſtrangers to anatomy and bleeding, except bleeding with leeches, which, as hath been already obſerved, is in a manner unavoidable, and they acknowledge that they receive great benefit from it.

As to hiſtory, that of this iſland is recorded in the learned language; but inſtead of conveying any real inſtruction, it contains little elſe but fabulous accounts of their gods and ancient heroes removed to a ſtate of bliſs, and theſe they make the objects of their worſhip. Theſe records are kept by their bramins in a language unknown to the vulgar, who know no more of them than what is communicated to them in ſongs and ballads, which they are always repeating.

SECT. VII.

Of their Houſes, Furniture, Temples, and Fortifications.

THEIR towns are extremely irregular, and not laid out in ſtreets; for every man encloſes a ſpot of ground with a bank or pale, in which he builds his houſe. The dwellings of the generality of the people are low thatched cottages, conſiſting of one or two ground rooms; the ſides are formed of ſplintered rattans, or canes, which are not always covered with clay, and when this is done they are not permitted to whitewaſh them, this being a royal privilege. The more wealthy people have a ſquare in the middle of their houſes, round which are banks of earth raiſed a yard high, on which they ſit croſs-legged, and eat or converſe with their friends. They have no chimnies, but their meat is frequently dreſſed in the yards, or in the corner of a room.

Their furniture only conſiſts of a mat, a ſtool or two, on which they ſet the ſtrangers, to whom they would ſhew particular reſpect, a few china plates, and ſome earthen and brazen veſſels, to hold their water, and in which they dreſs their proviſions. They have one bed-

ſtead, for the maſter of the houſe to ſit or ſleep on, and this is platted with ſmall canes, and has a mat or two, and a ſtraw pillow, but neither teſter nor curtains. The women and children lie by the fire-ſide on mats, covered only with a cloth they wear in the day-time; but they have a fire burning all night at their feet; for the pooreſt people never want fewel, there being ſuch plenty of wood, that no-body thinks it worth his while to claim any property in it.

In the inland country are reckoned five capital cities. Theſe are Candy, the metropolis of the iſland, and the reſidence of moſt of the kings, till it was taken and burnt by the Portugueſe; but being too much expoſed, the royal ſeat was removed to Nellemhyneur a city, in the heart of the country. The third city is Alloutneur, which lies to the north-eaſt of Candy. The fourth is Badoula, which is ſeated between three and fourſcore miles to the eaſtward of Candy, and Digligineur, which is ſituated between Candy and Badoula.

Their ancient pagodas, or temples, are of hewn ſtone, with a multitude of images, both on the inſide and without; but they have no windows. Their modern temples are little low buildings with clay walls, nearly in the form of a dove-houſe. They have likewiſe ſmall chapels in their yards, that are ſometimes not above two feet ſquare. Theſe are ſet each upon a pillar four feet high, and having placed in it their favourite image, they light candles and lamps before it, and every morning ſtrewing flowers about the idol, perform their devotions.

The inland country, called Conde Uda, is ſo well defended by nature, that it ſtands in need of no artificial fortifications, for on every ſide it is protected by mountains of a prodigious height, covered with thick woods, in which is left only a narrow path fenced at proper diſtances, where centinels are placed day and night. Theſe fences are made of a tree, whoſe branches are ſet with thorns as long and thick, and almoſt as hard as a tenpenny nail; theſe form a kind of gates, which are not made to ſhut like ours; but to lift up, like ſome old faſhioned ſhop windows. They are of the nature of a portcullis; for when the natives are cloſe purſued they ſuddenly let them fall, and then making a ſtand, fire through them, as well as from the thickets to the right and left; ſo that the ſhot and arrows ſometimes fly as thick as hail, when there is not an enemy to be ſeen.

There are no wheel carriages in the country, at leaſt among the Cinglaſſes; for if they had them it would be impoſſible to uſe them in the woods and mountains, while their ways are ſo narrow that two men can ſcarce go abreaſt. The king directs the roads to be kept in this manner, as the greateſt ſecurity he has againſt the Dutch. The baggage of people of condition is carried by their ſlaves, and by others on their backs. There were no horſes in the country till they were brought thither by the Portugueſe, and it ſeems the king thinks it too great an honour to permit his ſubjects, or even foreigners, to ride on them in his territories; but they have oxen with bunches on their backs, which ſerve for carriage, and when the king and his court go a journey, the baggage is carried both by elephants and oxen.

SECT. VIII.

Of the Power, Forces, and Revenues of the King of Candy; with the Puniſhments inflicted on Criminals.

THE king of Candy, who poſſeſſes all the middle part of the iſland, is formidable to his ſubjects, by the abſolute empire he has over their poſſeſſions, their actions, and their lives. The ſucceſſion to the crown is hereditary, where the reigning prince does not limit it in his life-time, for he has the power of appointing any of his children to ſucceed him, and, if he ſees fit, of dividing his dominions amongſt them, as hath been ſometimes practiſed.

The palace, where the king of Candy uſually reſides, is in the moſt retired and inacceſſible part of the mountains near the town of Digligineur; it is compoſed of ſeveral buildings incloſed within a wall, and is ſo contrived, that it is not known in what diſtinct houſe or apartment he lies. His generals and great officers guard the inner courts, where they have every night their fixed ſtations; and there they are obliged to remain without having any converſation with each other; and their troops lie without the walls. The guards neareſt his perſon are compoſed of negroes, in whom he places the greateſt confidence, and every night ſends out parties at uncertain times, to ſee if the officers and centinels are at their reſpective poſts.

He is chiefly attended by beautiful boys, whom the governors of the ſeveral provinces ſend to court, as they do young girls, who ſerve him for concubines, and to dreſs his meat for his table. Mr. Knox obſerves, that when he was in the country the king ſent for all the handſome Portugueſe women without diſtinction that could be met with, and having made choice of thoſe he liked beſt, he ſent back the reſt, or had them placed in certain villages to be kept till called for.

When he goes abroad he is attended by a numerous body of guards, and among others has a company of Dutch, and another of Portugueſe, under the command of officers of their reſpective nations: he is alſo proceeded by drums, trumpets, and other inſtrumental muſic, together with ſinging women, and has his elephants, led horſes, and huntſmen with hawks, in his train. All this company frequently aſſemble by his majeſty's order at the gates of his palace, in expectation of his going out, when he has no ſuch deſign.

He eats by himſelf, ſitting on a ſtool with a little table covered with white callicoe placed before him. Twenty or thirty diſhes are brought into the room, by perſons who have mufflers before their mouths, and the king having a deep gold plate with a plantain-leaf at the bottom of it, calls for what he chuſes, which is alſo brought him by a perſon muffled to prevent his breathing on the meat.

When his ſubjects enter into his preſence they fall three times on their faces, and then ſitting on their legs, addreſs him in terms little inferior to thoſe they uſe in their religious worſhip. One of their uſual expreſſions is, "May "your majeſty be a god;" at the ſame time ſtiling themſelves the limb of a dog, or ſome animal, which, they ſay, is unworthy to approach him, and when they retire from his preſence, they creep backwards till they are out of ſight.

He intruſts the management of moſt of his affairs to two great officers, ſtiled Adigars, to whom his ſubjects may appeal from the judgment of the inferior judges or governors. Next to the Adigars are the Diſſauvas, or governors of provinces, who are entruſted with the civil as well as military power. Theſe reſide at court, and manage their reſpective governments by a deputy, who has ſeveral inferior officers under him; but in every province ſome towns and villages are exempt from the governor's juriſdiction, as the lands which belong to the king, and the poſſeſſions of the prieſts.

The power of the king is reſtrained by no laws, ſo that he may do whatever he pleaſes. The lands are all holden of him by one tenure or other, ſome to ſerve him by their labours, others in his wars, and the reſt pay certain quantities of their manufactures, cattle, grain, or fruit. In many villages this prince reſerves the produce of the ſoil to himſelf, allowing only a bare ſubſiſtance to the huſbandman; and theſe villages are frequently beſtowed upon his officers, who enjoy them as long as they retain their poſts. The reſt of their lands are hereditary, deſcending from father to ſon, being only ſubject to the tenures by which they were held by their anceſtors.

Three times a year the people bring their rents to court; and all who have any poſts or offices in the government make preſents to the king every New Year's-day of gold, precious ſtones, plate, arms, or callicoe. The great men ſtrive to procure ſome valuable jewel, or extraordinary rarity, as the moſt certain way to procure their advancement, or, at leaſt, to ſecure what they already poſſeſs. Beſides theſe rents and annual preſents, the king ſends for whatever he pleaſes from any of his ſubjects; and if his officers appropriate any of their fruit-trees, or other produce of the earth to the king's uſe, the proprietor dare not touch them. Thus he commands the revenues and produce of all the lands in his dominions, whenever the exigences of the ſtate induce him to call for them.

The king has no ſtanding troops, beſides his Coffree guards and a few Europeans. The common ſoldiers, who hold

hold their lands by a military tenure, mount the guard by turns, and the diſſauvas and generals are conſtantly upon duty, either about the palace or in the field. Theſe militia are all foot, and divided into bodies of about a thouſand men each, under the command of one officer, called a moteral. The king ſeldom truſts the command of the whole army to one general, but they act in ſeparate bodies, which has ſometimes proved very prejudicial, eſpecially in his wars againſt the Dutch; but he chuſes this as the leſſer evil, from the apprehenſion that if any man ſhould be intruſted with the command of all his forces he might dethrone him.

The ſoldiers are armed with muſkets, broad-ſwords, pikes, bows and arrows; beſides they have ſome little pieces of artillery, ſo light that three or four men may carry them on their ſhoulders.

Their tents are made of the leaves of the tallipot-tree, which they ſet up with tent-poles in much the ſame manner as the tents of our common ſoldiers. Every one carries his own proviſions and baggage, and when their food is ſpent, they are allowed to go home for more; ſo that when they have been a month in the field, the army is generally ſcattered over the country to provide themſelves with food: but, it is ſaid, the Dutch, Portugueſe, and other Europeans in this prince's ſervice, have of late cauſed better diſcipline to be introduced.

They are not eaſily brought to venture a general engagement, without having an apparent advantage; therefore, in their wars with the Dutch, when the latter invaded any part of their country, they uſually retired till they had drawn them into the defiles and difficult paſſes of the mountains, where they frequently ſurprized and cut them off, when they thought there was no enemy near. They had no ſooner diſcharged their muſkets and arrows, than they ran up into the rocks and woods, where no European could follow them, and waited till they found their enemy again entangled in the woods, and then never failed to renew the charge.

Though they have no other laws than the arbitrary will of the prince, he never ſuffers his governors to inflict capital puniſhments on the offenders; this he reſerves to himſelf. He tries offenders in a ſummary way, and thoſe whom he thinks guilty muſt ſuffer, let the proof be ever ſo ſlight. His elephants are frequently his executioners, by breaking the bones of the offender, or cruſhing him to pieces as they are directed: others are impaled; and thoſe whom he ſuſpects of having conſpired againſt him are tortured, and not only the criminal but his father and the whole family are ſometimes put to death, or reduced to a ſtate of ſlavery.

For ſlight offences the greateſt officers are frequently laid in irons, and afterwards reſtored to their poſts, this being thought no diſgrace; but the moſt uſual way of puniſhing thoſe who are intended to be reſtored, is baniſhing them to ſome diſtant village, where they remain confined till they are made ſenſible of their faults; but ſometimes they are forgotten, and it proves an impriſonment for life.

SECT. IX.

Of the Religion, Temples, Idols, and ſolemn Feſtivals of the Cinglaſſes.

THE Cinglaſſes pay their adorations to one ſupreme God, the Creator of heaven and earth; and alſo proſtrate themſelves before the image of their ſaints and heroes, who, they ſuppoſe, have dwelt upon earth, and are now the miniſtering ſpirits of the Almighty Creator. The principal of theſe inferior deities they call Buddou, whom they imagine deſcended from heaven to procure the eternal happineſs of mankind, and at length re-aſcended from the top of that mountain called by the Portugueſe Pico de Adam. They likewiſe worſhip the ſun, moon, and other planets, which they imagine influence their fortunes. Every town has its tutelar deity, whoſe power is imagined to be only exerciſed over the inhabitants of the place; and beſides theſe almoſt every perſon has his houſhold gods, for whom they erect little chapels in their yards, placing lamps and ſtrewing flowers before them, and offering them rice and other food. Theſe little mediators they addreſs at leaſt every morning, ſuppoſing that the perſon repreſented by the image has a powerful intereſt in the court of heaven. They alſo believe there are wicked ſpirits whom God permits to afflict mankind, and their anger they endeavour to avert by prayers and ſacrifices.

It ſeems there are neither prieſts nor temples dedicated to the ſupreme God; theſe only belong to the inferior deities, of which they reckon three claſſes, and have ſeveral orders of prieſts to officate at their reſpective altars.

The firſt are the tirinanxes, or chief prieſts of the god Buddou, who live in his vehars, or temples, which are endowed with great eſtates in land. Theſe prieſts are always choſen out of the higheſt caſt or tribe, and are ſuperior to all others. They wear a yellow garment plaited like a veſt, and a piece of the ſame cloth thrown over their left ſhoulder. They have long beards; but their heads are cloſe ſhaved, and both their head and arms bare. They likewiſe wrap a large yellow ſaſh about their loins, and carry in their hands a round fan faſtened to a ſtick to ſhade them from the ſun. The people bow down to the ground to theſe prieſts, in the ſame manner as to the images or their prince; and whoever they viſit, a white cloth is laid upon a ſtool for them to ſit on, an honour that is ſhewn to none beſides, except thoſe of the royal blood: their eſtates are alſo exempted from taxes.

As they are ſolely devoted to the ſervice of their god, they are not allowed to have any ſecular employment. They are likewiſe debarred from having wives, or any commerce with women: they muſt neither drink wine, nor eat more than one meal a day; nor kill any animal. They are allowed to quit the prieſthood, which ſome do in order to marry; on which occaſion they only pull off the yellow garment, and throwing it into the river, waſh themſelves from head to foot: after which they become perfect laymen. Theſe prieſts are ſtiled the ſons of the god Buddou, and their perſons held ſo ſacred that the king would be deemed an infidel ſhould he preſume to call them to an account for any crimes whatever; but, notwithſtanding this, one of the kings cauſed ſome of theſe prieſts, who were found in arms againſt him, to be put to death. There are inferior prieſts of the god Buddou, who are called Gonni, and wear the ſame habit.

The ſecond order of prieſts attend the temples of other ſaints and heroes, to which lands are likewiſe appropriated. Theſe prieſts are alſo taken from the higheſt caſt; but are not diſtinguiſhed by their habit from the laity, except in having their cloaths always clean, and waſhing themſelves whenever they officate. They are allowed to follow huſbandry and other employments, their revenues alone not being ſufficient to maintain them. They however attend the ſervice of the temples morning and evening, when the people bring boiled rice and fruit to the door of the temple, which the prieſt takes and preſents before the idol: after it has ſtood ſome time the prieſt brings it out again, when the muſicians who ſing and play before the idols, and the other ſervants of the temple, with the poor who attend, feaſt together upon the offering.

The third order of prieſts are named jaddeſes, and their temples covels; theſe have no revenues, for any perſon that pleaſes may erect one of theſe temples, and be himſelf the prieſt, without any conſecration. Theſe ſeem to be the prieſts of their evil genii, and therefore, when the people are ſick, they ſend for their jaddeſe, and dedicate a cock to the demon, whom they ſuppoſe the cauſe of their illneſs; but the owner keeps the cock till the prieſt thinks fit to ſacrifice him. The people alſo apply to theſe genii as oracles, when the prieſt perſonating a fury, the people think him inſpired, and propoſing their queſtions, receive his anſwers as the voice of infallibility.

Whatever they ſacrifice they never eat of themſelves, it being diſtributed among the ſervants of the temple, the muſicians, ſinging girls, and the poor.

The Cinglaſſes aſſemble together for divine worſhip only at their ſolemn feſtivals, for at other times every one goes to the temple whenever he thinks fit; but on Wedneſdays and Saturdays they particularly apply themſelves to their deities, from the opinion that on thoſe days they will be moſt propitious to their prayers.

A ſolemn feſtival is annually performed at the new moon in June, or July, called Perakar, and laſts till the full moon,

moon. In their principal cities there are at this time no leſs than forty or fifty elephants magnificently adorned and hung with braſs bells, which march round the place and through all the principal ſtreets, followed by people dreſſed up to repreſent the giants, who they ſay formerly inhabited the earth: then come drums, trumpets, and other wind muſic, with the dancing-men and women, who ſerve in their temples, in ſeveral companies; and after them two prieſts mounted on a ſtately elephant covered with white cloth and rich trappings, one carrying on his ſhoulders a painted ſtaff, to which is fixed ſilk ſtreamers and ſtrings of flowers, and the other prieſts ſitting behind him holds an umbrella over his head: then come two other elephants, on each of which are mounted two prieſts of the inferior deities, followed by the ſervants of the prieſts in all their finery: then advance ſome hundreds of women of the higeſt rank, richly dreſſed, and marching three a-breaſt. The ſtreets are all the way adorned with flags, branches of cocoa-nut trees, and lighted lamps whether it be day or night; and the proceſſion is cloſed by the generals with their troops and the great officers of ſtate, who make the whole tour of the city, once in the day-time, and again at night, and this they repeat every day, from the new to the full moon. In the intervals nothing is to be ſeen but dancing, ſinging, and ſuch ſports as are ſuitable to great feſtivals.

Another annual feſtival is celebrated on the full moon in November, when they plant long poles before their temples, which they hang full of lights to a great height, as they alſo do before the king's palace. This feſtival laſts only one night.

At the new and full moon they preſent offerings to their god Buddou of rice and fruits; and on New Year's-day, which is in March, they perform a ſolemn feſtival to him on the mountain called Hammalella, or Adam's peak, or elſe under a certain great tree; and to one of theſe places all the people in the country think themſelves under an indiſpenſable obligation to go annually with their wives and their children, unleſs prevented by ſickneſs, or any other accident. On that mountain, which is the higheſt ground in the whole iſland, they worſhip, and ſet lighted lamps round the print of the foot, which ſome ſay that Buddou, and others that Adam, left on his aſcending to heaven, and lay their offerings on the top of the rock, which bears the impreſſion, as upon an altar.

The ſacred tree we have juſt mentioned grows in the north part of the king's dominions, at a place called Annurodgburro. This tree, like the chapel of Loretto, has travelled from one country to another, and at length planted itſelf at Annurodgburro. Under the branches of this tree, it is ſaid, Buddou uſed to repoſe himſelf; and near this place are the remains of temples, hewn with incredible labour out of the rocks, and ſuch as the people imagine could only be made by the race of giants they annually commemorate.

They eſteem it a moſt pious act to procure temples to be erected to the honour of Buddou, and to offer ſacrifices to him. Women of the beſt quality will ſend out their ſervants to beg the contributions of the people towards this ſacrifice, and others for the ſame purpoſe will carry about his image, and to theſe the people are very liberal. On receiving any thing, they cry out, "Let the bleſſing of "the gods and the Buddou go along with you; may "your corn ripen, your cattle increaſe, and your life be "long."

Others cauſe a temple to be built, and an image to be made, and then beg for money to pay the builder or founder. Before the eyes of the image are made, it is thrown about the work-ſhop as an ordinary piece of metal; but the eyes are no ſooner finiſhed than the idol is complete and ſacred, and is removed from the work-ſhop to the temple, where it is attended with muſic, dancing, and ſacrifices.

They have here, as well as upon the continent, idols of monſtrous ſhapes and forms, made of ſilver, braſs, and other metals, and ſometimes of clay; but thoſe in Buddou's temples are the figures of men ſitting croſs-legged in yellow habits, like his prieſts, repreſenting ſome holy men, who, they ſay, are teachers of virtue and benefactors to mankind.

A prodigious number of idol temples of all kinds are diſperſed over the country, ſome built of hewn-ſtone, and of excellent workmanſhip. Theſe muſt have ſtood many ages, the people being entirely ignorant of this kind of architecture, and do not even know how to repair the decays occaſioned in them by time. One at Vintane is one hundred and thirty feet in circumferrence, and of a very great height; at the bottom it is of an oval form; it riſes to a point like a pyramid, and is gilt at the top.

SECT. X.

Of their Trade and Manufactures; the Settlements of the Dutch; and the Coins, Weights, and Manufactures of Ceylon.

THE people of Ceylon have a little home trade, one part of the iſland ſupplying the other with what they want of the produce of their reſpective countries. There are however no markets held in the iſland; but they have a few ſhops in the great towns, where are ſold rice, callicoe, braſs, copper, and earthen veſſels; ſwords, knives, and other inſtruments of iron and ſteel, in which they work very well; making all manner of tools for carpenters and huſbandmen, and pretty good fire-arms. Their callicoes are ſtrong, but not ſo fine as thoſe of the coaſt of Coromandel: goldſmiths-work, painting, and carving, they likewiſe perform tolerably well.

The Dutch Eaſt India company are poſſeſſed not only of the whole coaſt of Ceylon, but of ten or twelve leagues within land. And as the Dutch, ſays commodore Roggewein, take great pains to preſerve a good underſtanding with the king, they obtain from him almoſt every thing they can deſire. The company ſend to him every year an ambaſſador with preſents, and, in return, his majeſty ſends the company a cabinet of jewels of ſuch value, that the veſſel which carries it home is thought to be worth half the fleet. The governor-general of Batavia takes care himſelf to have it ſo packed up among the reſt of the merchandize, that not only none of the ſhip's company, but even the captain of the veſſel that carries it, knows not whether it be on board his ſhip or no.

The two principal places in this iſland belonging to the Dutch Eaſt India company are Punta de Galo and Columbo; which laſt is the reſidence of the governor and his council. This city the Dutch have contracted into one quarter of its ancient bounds, and have fortified it with a wall and baſtions. It is now about a mile in length, and three quarters of a mile in breadth. The ſtreets of the New Town are wide and ſpacious, and the buildings in the modern taſte. The governor's houſe is a noble ſtructure, and ſeveral other houſes are very beautiful.

The natives however do not pay any great reſpect to the Dutch, but rather treat them with contempt, ſcornfully ſtiling them their coaſt-keepers. The Dutch give themſelves little trouble about this, but, like good politicians, take all poſſible care to keep up a perfect correſpondence with the king, that he may never be tempted to quarrel with and refuſe them his aſſiſtance, which would deſtroy a moſt valuable part of their commerce. This, however, his majeſty might do if he thought fit, without being under any great apprehenſions from their power, ſince his dominions, as hath been already obſerved, are ſeparated from theirs by ſuch thick foreſts, that it is in a manner impoſſible to penetrate them.

The Dutch Eaſt India company, beſides the advantage they make of the cinnamon, gain conſiderably by the precious ſtones found in this iſland; particularly rubies, white and blue ſaphires, and topazes: they alſo receive conſiderable profit from the manufactures of muſlin, chints, and other ſtuffs; but the greateſt part of the muſlins they ſend into Europe come from the coaſt of Malabar.

The Cinglaſſes have very little coin, and therefore uſually barter one commodity for another. When the Portugueſe were eſtabliſhed in the iſland they coined ſome ſilver, which the Cinglaſſes call tangum maſſa; theſe are about the value of nine pence, and are ſtill current all over the country. There is another coin which the common people themſelves make, in the ſhape of a fiſh-hook, of a finer

finer silver than dollars: and there is a third coined by the king, which being very thin, seventy-five of them make a piece of eight, or Spanish dollar; and it is death for any person to coin or counterfeit these.

Their smallest weight is the colonda, six of which weigh a piece of eight, and twenty colondas make a pollam.

Their usual measure for cloth is the cubit; and the least corn-measure is the potta, which is as much as a man can hold heaped up in his hand: four pottas make a measure called bonder nellie, or the king's measure: four measures make a courney, and ten courneys a pale, which is forty measures; four pales are an ommonah, by which they usually reckon their stock of grain. People, it is said, are not punished for making their measures too small, but for having them too large; for corn frequently passing instead of money, the usurers make their measure as large as they can, that when they are paid they may receive the more from their debtors.

We have now surveyed the various islands rich in spices, gems, and gold, from the Ladrones to the east of Coromandel, and shall therefore return to the continent, and beginning with Tibet, proceed to Tonquin and the countries of India beyond the Ganges.

CHAP. XV.

Of TIBET.

SECT. I.

Its Situation and Extent; the Coldness of the Climate proceeding from the Height of the Land. The Country divided into the Provinces of Lassa, Great Tibet, and Little Tibet. The Boundaries of Lassa, the Produce of the Country, and a particular Description of the Roe-buck that produces Musk, and the Manner in which it is generated.

THE country called by the Europeans Tibet, or Thibet, is named by the orientals Tibt, and by the Tartars is called Barentola. This country, which some authors call Butan, is situated between the twenty-sixth and thirty-ninth degree of latitude, and is supposed to extend seventeen hundred and thirty-five miles in length from east to west, and where broadest seventeen hundred and eighty from north to south, though in some places it is not above half that breadth, in others scarcely a fourth part, and in others is still less. It is bounded on the north by the country of the Mongols and the desart of Kobi, on the east by China, on the west by Indostan, and on the south by the same empire, the kingdom of Ava, and other countries belonging to the peninsula of India beyond the Ganges.

The land of Tibet is in general very high. A mandarine, who had been there as envoy, informed a missionary, named Gerbillon, that in passing from China to Tibet he found a sensible ascent, and that the mountains, which are very numerous, are much more elevated on the east side towards China than on the west of Tibet: "Certainly, "continues he, the little hills whence the golden river "takes its rise must be vastly higher than the sea, since "this river, which is sufficiently rapid, discharges itself "into the lakes of Tsing-su-hay, and from those lakes the "river Whangho has a very swift current for two hun"dred leagues before it falls into the Eastern Ocean. This "elevation of the land renders the country very cold, con"sidering the latitude; but on descending the mountains, "and entering farther into Tibet, the air is much more "temperate."

On the western part the air is also extremely cold, especially on the tops of the mountains which divide Indostan from Great Tibet. These mountains appear extremely dreadful, and naturally strike the mind with awe and terror; they are heaped upon one another, and their summits are so contiguous, that they are scarcely separated by the torrents which rush impetuously down, and fall from the rocks with a noise sufficient to stun and terrify the boldest travellers. The road over them is commonly so narrow that the passenger can scarce find room to set his foot, and at the least false step he is precipitated down the precipices, where there are no bushes or shrubs to stop his fall, there not being so much as a plant or even a blade of grass on these desart mountains. Sometimes over the impetuous torrents that separate one mountain from another is a bridge, formed of a narrow tottering plank, or ropes stretched across, and a bottom formed of twisted boughs.

The country generally comprehended under Tibet is usually divided into Great Tibet, Little Tibet, and Lassa. We shall begin with the last, which is bounded on the south by a vast chain of mountains covered with snow, and are no less difficult to pass than those already mentioned to the west of Great Tibet; for the torrents, by which they are separated, are passed on planks laid on ropes stretched across them. On the east it is bounded by the countries of Kokonor and Tusan, which border on China; on the north by the desart of Kobi; and on the west by Great Tibet. The towns, both in this and in all the other parts of Tibet, are in general small, and none of them in a state of defence.

According to Tavernier the soil of this country is good, and produces rice and pulse; and the chief commodities in which the inhabitants trade with other nations, are furs, particularly those of martens, musk, rhubarb, and wormseed.

The creature which produces musk resembles the roe-buck; his skin and colour are the same; he has also slender legs, and a split smooth horn, but somewhat bending. On each side he has two white teeth, which are straight, and rise above his muzzle, each about half a finger in length, resembling in form the teeth of the elephant. This is the mark which distinguishes this from other roe-bucks. The musk produced by these creatures in Tibet is much preferable to that of China and other countries, from this animal feeding on aromatic pastures, and also from the inhabitants of Tibet preserving the bladders of musk in the natural state, while the Chinese adulterate all that come into their hands.

The most excellent musk is what the roe-buck leave behind them, when they rub themselves against the rocks and mountains; for the humour whence it is generated falling down towards its naval, gathers like a bile or any other tumour; and when the swelling is ripe, the creature feeling a painful itching, searches for stones and rubs himself against them, till opening the sore, the matter runs out and coagulates. The wound closes, and the same kind of humour gathers to a head again as before.

There are men at Tibet who make it their business to collect this musk, and having gathered a quantity, put it up in bladders. The musk that has ripened in the skin of the roe-buck surpasses all others in goodness, just as fruit is better when it is gathered ripe from the tree, than when it is pulled green.

There is another method of getting musk by ensnaring the roe-buck in toils, and shooting him with arrows; but these hunters frequently cut the tumours before the musk is elaborated, and in this case it has at first an ill scent, that prevails till the matter is thickened, which sometimes does not happen in a great while; but as soon as it coagulates it turns to musk.

 The

The moſt excellent rhubarb comes from hence. This roots they cut in pieces, and ſtringing them, hang them up to dry.

SECT. II.

The Perſons and Dreſs of the Natives. Their Cuſtoms, Manners, and Religion; with a particular Account of the Dalay Lama, or Sovereign Pontiff.

THE inhabitants, according to Tavernier, are ſtrong and well proportioned, but their noſes and faces ſomewhat flat. Both ſexes are cloathed in ſummer with a large piece of fuſtian or hempen cloth, and in the winter with a thick cloth reſembling a felt; on their heads they wear a kind of bonnet, much like our drinking-cans, which they adorn with boars teeth and pieces of tortoiſe-ſhell; but the wealthy intermix with them coral and amber beads, of which their women make necklaces. They all wear bracelets upon their left arms, and none upon their right: the women have them tight, and the men looſe. About their necks they wear a ſilk twiſt, at the end of which hangs a bead of yellow amber, coral, or a boar's tooth, which dangles on their breaſt; and, on their left ſides, their girdles are buttoned with amber or coral beads. Grueber ſays, the courtiers are very expenſive in their dreſs, which conſiſts of cloth of gold brocade. Some wear a habit in all reſpects reſembling that of the women, except its being red like thoſe of the lamas: but the common people are very ſlovenly.

With reſpect to their food, Tavernier obſerves, that they feed on all ſorts of fleſh, except that of cows, which they adore as the common nurſes of mankind; and that they are fond of ſpirituous liquors.

The men are ſaid to be reſtrained to one wife; and yet according to Regis, the women are allowed ſeveral huſbands, who are generally related, and even ſometimes brothers. The firſt child belongs to the eldeſt huſband, and thoſe born afterwards to the others, according to their ſeniority. When the lamas are reproached with this cuſtom, they pretend that it is neceſſary in Tibet, on account of the ſcarcity of women.

The language of Tibet is ſaid to differ entirely from that of the Mongols and Manchews, but that their characters reſembles thoſe that are in uſe among the people from the Caſpian Sea to the gulph of Bengal; and conſiſts of four vowels, twenty conſonants, ten double letters, and ninety-ſix characters compounded with vowels.

The grand lama, who is alſo called dalay lama, or univerſal prieſt, was formerly ſovereign of all Tibet; but as he now diſclaims any concern with temporal affairs, he chooſes one whom he conſtitutes governor in his ſtead, by the name of tipa. This officer wears the lama habit, which is generally of frize, with a yellow or red hat, but is under no obligation to obſerve the rules of the order, which are both ſevere and numerous: indeed no one lama undertakes to fulfil them all; but they divide the load among them. One adheres to the obſervance of particular precepts; another makes choice of other rules, and ſo of the reſt; yet there are ſome prayers in common which they ſing agreeably enough: but they are all obliged to live unmarried, and not to interfere with trade.

The principal city has the name of Liſſa, as well as the province; but the grand lama does not live in it, his place of reſidence being one of the fineſt of the pagods, which are very numerous upon the mountain Putala. He ſits croſs-legged upon a large and magnificent cuſhion, placed upon a kind of altar, in which poſture he receives the reſpects or rather adorations, not only of the people of the country, but of a ſurprizing multitude of ſtrangers who undertake long and painful journeys to offer him their homage upon their knees, and receive his bleſſing. Bentink ſays, that above twenty thouſand lamas reſide in ſeveral circles that extend round the foot of this mountain, according as the rank and dignity they poſſeſs render them more worthy to approach the perſon of the ſovereign pontiff.

On the tops of the mountains trophies are erected to his honour, that he may preſerve man and beaſt; and all the kings who pay obedience to him, before their inauguration, ſend ambaſſadors with rich preſents to obtain his bleſſing, as the means of diffuſing happineſs over their reigns.

Princes are even no more freed from the ceremony of kneeling at his feet, than the meaneſt of the people; nor does he treat them with more reſpect; for the grand lama thinks himſelf above returning any ſalute; he therefore never pulls off his bonnet, nor riſes from his ſeat out of complaiſance to any who approach him, let their dignity be ever ſo great; he only puts his hand upon the head of his adorers, who believe that by this means they receive the remiſſion of their ſins.

Grueber aſſerts, that the grandees of the kingdom have ſuch veneration for this living god, that they are very eager to procure his excrements, which they wear pulverized in little bags about their necks as ſacred relics, and that the lamas make great advantage by the large preſents they receive from the great for helping them to this precious powder. Tavernier alſo declares, that thoſe about the dalay lama preſerve his ordure, dry it, and reduce it to powder, like ſnuff: then putting it into boxes, go every market day, and preſent it to their chief traders, who, having recompenſed them for their kindneſs, carry it home as a great rarity, and when they feaſt their friends, ſtrew it upon their meat. Theſe accounts appear at firſt ſight highly improbable; we cannot without difficulty believe human nature ſo degraded, and it appears much more natural to ſuppoſe, that thoſe travellers were miſtaken, and led into an error by their little knowledge of the language of the Tibetians; eſpecially as the greateſt errors may be occaſioned by the dubious ſound, or equivocal meaning of a word.

The high opinion which both the princes and people of this large country entertain of the power and holineſs of the dalay lama, make them readily ſubmit to the moſt ſervile rites. They believe that the god Fo lives in him, and that he knows all things, ſees all things, and penetrates into the very ſecrets of the heart; and that if at any time he condeſcends to aſk any queſtions, he does it only for form ſake, that he may leave the infidels without excuſe. They are even perſuaded that when he ſeems to die he only changes his abode, being born again in a new body, and that nothing more is to be done than to diſcover what body he is pleaſed to inhabit. The Tartarian princes ſometimes engage in this ſearch, yet after all are obliged to refer it to the lamas, who alone underſtand the marks by which he is to be known, or rather know the child whom the ſucceeding grand lama had appointed to be his ſucceſſor.

The principal image worſhipped by theſe people is named Manippe, and is repreſented with nine heads, placed ſo as to form a cone, with only one head at the top. Before this idol the people perform their ſacred rites, with many odd geſticulations and dances, often repeating, O Manippe mi-hum! O Manippe mi-hum! that is, O Manippe, ſave us! To appeaſe and conciliate the favour and eſteem of this deity, they frequently place before this idol, various ſorts of meat.

Grueber mentions a moſt deteſtable cuſtom introduced into this country and Great Tibet. They chuſe, ſays he, a luſty youth, to whom, on certain days they grant the liberty of killing without diſtinction whomſoever he meets; for thoſe whom he thus ſlays, being conſecrated to Manippe, are ſuppoſed to obtain immediately eternal happineſs. This youth, whom they call Fut or the Slayer, is cloathed in a gay habit, adorned with little banners, and armed with a ſword, quiver, and arrows. At the time appointed he ſallies furiouſly out of the houſe, and wandering through the ways and ſtreets, kills people at his pleaſure, none making any reſiſtance.

The number of lamas in Tibet is incredible, there being hardly a family without one, either from devotion, or expectation of preferment in the ſervice of the dalay lama. This dignity, however, is not confined to the inhabitants of Tibet, other nations may arrive at that honour, and there are Tartars, and even Chineſe, who reſort to Liſſa to obtain it; and thoſe that arrive at the rank of the diſciples of the dalay lama, who are not to exceed two hundred,

dred, conſider it as a great happineſs. From among theſe the khutucktus or ſuperior dalay lamas are choſen, and they no ſooner obtain that honour, than plenty pours in upon them from a croud of adorers, who come to them from all the neighbouring countries.

As to their character, the miſſionaries, who are their great enemies, ſay, that they are debauched, and yet govern princes, who give them the chief place in aſſemblies. Some of them, they add, are tolerably ſkilled in medicine; others have ſome notions of aſtronomy, and can calculate eclipſes. But only a few of them can read or underſtand their ſacred book, or even ſay their prayers, which are in an ancient tongue and character, no longer ſpoken, though there are ſaid to be in Tibet univerſities and colleges for teaching their law, and the principles of their religion.

But Bentink gives a much more favourable account of them, and ſays, they both teach and practiſe the three great and fundamental duties of honouring God, offending nobody, and giving to every one his due; and that he was informed by ſome travellers of credit, that they ſtrenuouſly proteſt againſt adoring more than one God; that the dalay lama and khutucktus are his ſervants, to whom he communicates knowledge for the inſtruction and good of mankind; that the images which they honour are only repreſentations of the deity, or of ſome holy men; and that they ſhew them to the people only to remind them of their duty.

After all it is acknowledged, that the religion of Tibet reſembles that of the Roman church in ſo many particulars, that one would imagine the church of Rome borrowed her ceremonies from them, or that they borrowed theirs from Rome. Gerbillon ſays that they uſe holy water, a ſinging ſervice, and praying for the dead; that their dreſs reſembles that in which the apoſtles are painted; that they wear the mitre and cap like the biſhops, and that their dalay lama is nearly the ſame among them, as the ſovereign pontiff among the Romans. Grueber goes much farther, and maintains, that though no European or Chriſtian was ever there before him, yet their religion agrees with the Romiſh in all eſſential points; among other things he mentions extreme unction, making proceſſions in honour of reliques, their ſeveral faſts, their undergoing ſevere penances, and, in particular, ſcourging themſelves; their conſecrating lamas, who have a kind of epiſcopal juriſdiction, and their ſending out miſſionaries, who live in extreme poverty, and travel bare-foot through the deſarts as far as China. To conclude, friar Horace ſays, that the religion of Tibet is the counterpart of the Romiſh. They offer, ſays he, alms, prayers, and ſacrifices for the dead, have a vaſt number of convents, filled with monks and friars, amounting to thirty thouſand, who, beſides the three vows of poverty, obedience, and charity, make ſeveral others. They have their confeſſors, who are choſen by their ſuperiors, and have their licences from their lamas, without which they cannot hear confeſſions, or impoſe penances. To theſe may be added the uſe of beads, and of holy water.

The reader will find, in the proſecution of this work, that the pagans, or, as they are uſually called, gentoos of India, alſo reſemble the church of Rome, and that they practiſed the ſame ceremonies before the more enlightened parts of the earth were bleſſed with the knowledge of Chriſtianity.

Before we conclude this ſection it will be proper to add, that the Kalka Mongols were formerly ſubject to the dalay lama, and that the reader may find ſome particulars that have a relation to the ſuperſtitions of this country, in our account of the religion of that people, in the ſeventy-fourth and ſeventy-fifth pages of this volume.

What has been ſaid above, more particularly relates to the province of Laſſa. We ſhall therefore now proceed to deſcribe Great and Little Tibet properly ſo called.

SECT. III.

Of the Provinces of Great and Little Tibet.

THE bounds of Great and Little Tibet none have undertaken to define: only Deſideri the jeſuit obſerves, that Great Tibet lies to the north-eaſt of Kiſhmar, and begins at the top of a frightful mountain, named Kantel, that is covered with ſnow. The weather, as in the province of Liſſa, is very ſevere, and from the ſame cauſe, the great elevation of the land, which, however, produces wheat and barley, but ſcarce any trees, fruit, or roots.

The inhabitants are naturally gentle and teachable; but ignorant and unpolite; and though they are not deſtitute of genius, are unacquainted with arts and ſciences. They wear nothing but woollen: their houſes are ſmall, narrow, made of ſtones piled rudely one upon another, and trade is uſually carried on among them by exchanging proviſions. They coin no money, and the only ſpecie current among them is the Mogul's coin.

Great Tibet carries on a ſmall trade with the neighbouring kingdoms; its principal commodities are very fine wool of two ſorts, one of ſheep; but the other, which is called tour, is rather a kind of hair, like the fur of the caſtor: the other commodities are muſk, cryſtal, and jaſhen, which is a blueiſh ſtone with white veins, ſo hard that it muſt be cut with a diamond: this ſtone is highly eſteemed at the court of the Great Mogul: they make of it cups, and other veſſels, which are ſometimes inlaid with gold.

As to the religion of Great Tibet, a ſmall part of the country is inhabited by Mahometans, and the reſt by pagans, who are ſaid to be leſs ſuperſtitious than thoſe in other idolatrous countries. They call the ſupreme god Conchock, and adore another deity whom they name Urghien, and ſay, that he was both god and man, without father or mother, but born of a flower, and yet they have the ſtatue of a woman, who holds a flower in her hand, who they ſay is Urghien's mother. They likewiſe adore ſaints, and make uſe of beads. No ſort of meat is forbidden them; they reject the doctrine of the tranſmigration of ſouls and polygamy, in which points they differ from the Indians. Their lamas wear a different habit from that of the laity. They neither braid their hair, nor wear pendants in their ears, like the others, but have the tonſure, like Romiſh monks, and are obliged to practiſe perpetual celibacy; they ſtudy the books of their law, which are written in a language and character different from the vulgar. They chant their prayers, and preſent their offerings in the temples, conſiſting of wheat, barley, dough and water, in neat little veſſels; and theſe offerings they eat in a religious manner. They are held in great veneration, and uſually live in communities. They have local ſuperiors, and over them a ſuperior general, whom the king himſelf treats with great reſpect.

There is only one abſolute prince in this country; he who reigned in 1715, was named Nima Nanjal, and had under him a tributary king. The miſſionaries who were then there firſt viſited the prime miniſter, who was intitled the king's right hand, and afterwards had ſeveral audiences of his majeſty, who received them ſitting on his throne.

Little Tibet is a mountainous country, ſituated to the north-weſt of Kaſhmir, a northern province of Indoſtan, and is bounded on the eaſt by Great Tibet. According to De l'Iſle, it is one hundred and eighty miles in length, and one hundred and ſixty in breadth. It is mountainous, and the ſnows lie deep during the winter; but in ſome places it produces very good fruit, eſpecially melons. Its capital city is named Eſkerdu; the inhabitants are chiefly Mahometans, and the princes, who govern them, are ſaid to be ſubject to the Great Mogul. In ſhort, the people are poor, and their only articles of commerce are a little cryſtal, muſk, and wool.

CHAP.

CHAP. XVI.

SECT. I.

A general View of the Peninsula of India beyond the Ganges. Of the Situation, Extent and Climate of Tonquin. Why the Countries just within the Tropics are better than those under the Line. A particular Account of the wet and dry Seasons, and of the Typhons, or periodical Hurricans.

WE are now entering the farther peninsula of India beyond the Ganges, which is situated between the ninety-second and hundred and ninth degree of east longitude, and between the first and thirtieth degree of north latitude, extending two thousand miles in length, and one thousand in breadth. It is bounded by China and the Chinese sea on the east; by Tibet and part of China on the north; by the bay of Bengal and Hither India on the west; and by the Chinese sea and the streights of Malacca on the south: and contains on the north-east Tonquin and Laos; on the south-east Cochin-China, Cambodia, and Chiampa; on the north-west Acham, Ava, and Aracan; and on the south-west Marraban and Siam.

A range of mountains extends from north to south thro' almost the whole length of the country; but near the sea the lands are low, and in the rainy season are annually overflowed. Its bays are those of Cochin-China, Siam, and Malacca; its streights those of Malacca and Sincapora; its promontories those of Ranfac, Romana, and Siam. Its principal rivers are the Domea, in Tonquin, which running from north to south discharges itself into the gulph of Cochin-China; the Mecon, which rising in the north, runs through the kingdoms of Laos and Cambodia, and falls by two channels into the Chinese sea; the Menan, which also runs from north to south, and passing through Siam, falls into the bay of Siam; and the river Ava, which falls into the bay of Bengal.

Tonquin is a kingdom situated to the east of China, from which it is separated by inaccessible mountains; it is also bounded on the east by the bay of Cochin-China; by that kingdom on the south; by the kingdom of Laos on the west; and by part of China on the north, where it is also bounded by lofty mountains. It extends from seventeen degrees north latitude to twenty six degrees thirty minutes, and between the hundred and first and hundred and eighth degrees of east longitude; being five hundred miles in length, and four hundred in its greatest breadth; but in some parts it is not half so broad.

This kingdom is divided into eight provinces, which are Cachao, North Province, West Province, Ngeam, Tenhoa, South Province, East Province, and the Province of Tenan.

The climate is excessive hot, the fields and woods have always the appearance of spring, and the air is for the most part extremely healthful. The seasons of the year, as in other countries between the tropics, instead of winter and summer, are divided into wet and dry. The weather does not alter all at once, but at the close of the dry season, gentle showers falling now and then precede the violent rains, and towards the end of the wet months several fair days shew the approach of the dry season.

As to heat and cold, it is worthy of remark, that the countries which lie near the tropics, and particularly those that are three or four degrees within them, are much hotter than those which lie under the line; for which Mr. Dampier justly assigns the following reasons: Under the equator the days and nights are always twelve hours long; but near the tropics the longest day is thirteen hours and a half, and an hour and a half being taken from the night create a difference of three hours. Secondly, at those places which lie three degrees within the tropic, the sun comes within two or three degrees of the zenith in the beginning of May; and having passed the zenith, does not proceed above three degrees farther before it returns again; so that it is at least three months within four degrees of the zenith, and the sun is almost vertical from the beginning of May to the latter end of July. On the other hand, when the sun enters the equator it immediately shifts north or south, and his stay being so short the heat cannot be so intense as near the tropic, where he continues so long almost vertical, and is every day so much longer above the horizon, while the nights are so much shorter than they are under the line.

The wet season commences at the end of April, or the beginning of May, and continues till about the end of August: during this time there are violent rains, sometimes for many hours, and at others for many days, without ceasing, but there are considerable intervals of fair weather. These rains occasion great land floods in all the countries between the tropics. In August the weather begins to be more moderate, both as to rain and heat; though some showers then fall. The air is more temperate in September and October, and yet between the beginning of August and the end of October are the violent storms called typhons, and vulgarly tuffoons, which usually happen about the full or change of the moon, and are preceded by very fair weather, gentle winds, and a clear sky. These small winds veer from the common trade-wind, which at this time is south west, and flutter about to the north or north-east. A dreadful cloud is seen sometimes twelve hours before the storm begins; but when the cloud moves swiftly, the storm may suddenly be expected. It usually blows twelve hours with great violence to the north-east, attended with claps of thunder, great flashes of lightning, and excessive rains; but suddenly abating falls quite calm, and having continued so about an hour, the wind veers to the south-west, and blows with as much fury from that quarter as it did from the other.

November and December are dry, healthful and very pleasant months. January, February, and March are for the most part dry; but in the mornings there are thick fogs, and sometimes cold drizzling rains: the air is likewise very sharp in January and February, especially when the wind is in the north-east; and in April the weather is moderately dry and exceeding temperate.

Though this be the general state of the year, yet the seasons sometimes alter a month or more, and the rains are some years more lasting and violent than in others, nor have they always sufficient rain for the rice. Tonquin, like other countries between the tropics, depends on the annual floods to moisten and enrich the earth; and if these fail they have hardly any crop, and the poor are reduced to such distress, that they are forced to sell their children to preserve their own and their lives. But this is not so often the case here as it is on the coasts of Coromandel and Malabar.

The low lands also sometimes suffer by too great rains, particularly if they happen unseasonably; but as their dry lands yield better crops, they are not in such danger of famine; and indeed the poor, who are very numerous, oftener perish for want of employment, and a proper care being taken of them, than from a scarcity of provisions.

SECT. II.

Of the Vegetables and Animals of Tonquin.

THE country has but little other grain besides rice. If the rains are seasonable they have two crops every year, and the floods save them the labour of watering their rice fields. They are not much concerned if their grounds are overflowed in harvest; for, notwithstanding this, they will reap their corn and hang it up in little bundles till it is dry, which it will soon be in this hot country.

Their up-lands are over-run with purslane, which they are forced to weed out of their grounds, because it prevents

vents the growth of other herbs and plants. They have yams, potatoes, and onions in their gardens; and among their fruits they have pine apples, guavas, mangoes, plantains, bonanoes, cocoas, limes, and two sorts of oranges, large and small. The large oranges have a fragrant smell and most delicious taste, and may be freely eaten without danger; these are admired by some travellers as the best in the world. The other is a small round fruit, with a smooth thin rhind, and a deep red both on the inside and without. Their taste is almost as agreeable as that of the other; but they are said to be very unwholesome and to occasion the flux. In this country oranges are in season from October to February. The limes, which are round, have smooth thin skins, and are as large as an ordinary lemon: they are full of juice, but it is not near so sharp as that of the lesser limes of other countries.

The betel leaf, so much valued all over India, is very common in this country. There is great plenty of mulberry-trees, for the people plant young slips every year, the tender leaves of which being esteemed much better for the silk-worms than those of old trees. They seldom mind the fruit, which is small, and worth but little.

Here is also good timber for shipping, the building of houses, and other purposes; and pine-trees, which serve for masts.

In the woods towards the north of this country are elephants of an extraordinary size: they have few horses; but plenty of cows, buffaloes, and an abundance of hogs. There are no lions, asses, or sheep, except a few of the last that are kept for the king's use. The deer and harers of this country are very scarce.

This country affords great plenty of wild and tame fowl, but there are few small birds. The natives used formerly to catch their wild ducks in nets, till the English and Dutch coming amongst them, taught them the method of shooting.

There are here a kind of locusts, about as large as a man's finger; these breed on the banks of their rivers and ditches, and are esteemed good food by the natives. There are also great swarms of gnats, which are extremely troublesome, and a species of ants that are very mischievous.

SECT. IV.

Of the Persons, Dress, Food, Manners, and Customs of the Inhabitants; with a particular Account of the Manner of chewing the Betel Leaf, with Areka, or Arek. Of their Marriages and Funerals.

THE Tonquinese are of a tawny complexion, but not so dark as many of their Indian neighbours; they are clean limbed, of a middle stature, and have long black hair, which grows very thick, and hangs down upon their shoulders; their nose and lips are well made, and their faces are of an oval form, but somewhat flattish. When they are about twelve or thirteen years of age they dye their teeth black, or of a very dark colour; this is an operation that takes up three or four days, during which they hardly dare to take any nourishment, the composition being so nauseous, and some say poisonous. It is observed, that they are ashamed of having white teeth, like the brutes; on which Mr. Salmon observes, that the true reason of their blacking them is doubtless the prevailing fashion of the country, which, how ridiculous soever it may appear to foreigners, must constantly be followed by the inhabitants, unless they would be pointed at and insulted by the vulgar, as well as by people of better fashion.

The sexes are not distinguishable by their habits. Their outer garment is a long gown, bound round the waist with a sash. The quality usually wear silk, but prefer English broad-cloth, either red or green, with caps of the same stuff. The inferior people and the soldiers usually wear cotton cloth, dyed of a dark colour, and the upper garment of the latter reaches no lower than their knees; but they wear drawers which come down to the middle of their legs. The poor generally go bare-headed, except in the rainy season, when those who are exposed to the weather use broad brimmed hats made either of palm leaves or reeds. The poor seldom wear any thing but a doublet and a pair of drawers, without either shirt, shoes, or stockings. They sit cross-legged, and round the rooms where they make their entertainments, they have a sort of couches covered with fine mat, and raised about two foot from the ground. On these their friends sit, having a cushion under them, another at their backs, and an alcove over their heads. They are said to be remarkable for their social disposition and hospitality.

As to their food, their most common dish, except boiled rice, consists of small pieces of pork spitted together and roasted. They also eat beef, buffaloes flesh, and the flesh of horses, goats, dogs, cats, fowls, and locusts; with all sorts of fish, eggs, herbs, and roots.

They sometimes mince their raw pork, and making it up in balls like sausage-meat, eat it without any other dressing. They singe their bullocks, and having steeped slices of raw beef in vinegar, eat it with a particular relish. They think horse-flesh as good as beef, and the poor make no scruple of eating the flesh of elephants that die a natural death, and often make a present of the trunk to some great man, as a delicious morsel. Frogs are also esteemed a great dainty.

They have plenty of turtle, crabs, craw-fish, shrimps, and prawns; and have a fish like an anchovy, which they pickle. They throw their small fish and shrimps into a jar of water and salt made very weak, and after it has stood a little time it is reduced to a mash, which they call ballachaun; afterwards they draw off the liquor, which both the natives and Europeans use as sauce. The poor eat the ballachaun with their rice, which would be very insipid without something to relish it; and therefore, when they have no ballachaun, they eat salted eggs or dried fish with it.

People of distinction have generally flesh, fowl, and fish at their tables every day. Their meat is served up in little trenchers of lackered wood, ten or twelve of which are brought in a kind of voider, of the same lackered ware. They cut the meat into small square pieces, and eat it with their chop-sticks as in China, using neither linen, spoons, knives, nor forks.

The people have a method of keeping their eggs several years, by inclosing them in a paste made of ashes and salt brine, and kept in an earthen-pot close stopped. These they eat with their rice, when they live upon the water, taking about the quantity of a hazle-nut with every mouthful of rice.

Their most usual liquor is tea: they have also a kind of arrack, which they sometimes drink with their tea, and sometimes by itself; but it is the worst and most unpalatable that is to be found in India: they however, 'tis said, think it a great cordial, especially after they have infused scorpions and snakes in it; for thus rectified they esteem it an antidote against poison, and think they shew the greatest respect to their friends when they treat them with this liquor.

When any one comes to visit them, betel and areka are immediately presented: in the leaf called betel they wrap several slices of areka-nut, and having daubed it over with chinam, or lime made into mortar, they chew it as our people do tobacco.

The dose, if I may so call it, says Mr. Grose, must necessarily consist of these three ingredients, the betel-leaf, the areka, arek, or betel-nut, and chinam; for wanting any of these that deep red colour which results from their mixture in mastication would also fail.

The betel-leaf is something like that of a laurel, and grows upon poles like hops. The leaf is full of large fibres, which, with that of the middle, they generally strip off with the nail. It has a hot biting taste, not unpleasing when one is used to it.

The areka, or arek nut, is exactly of the form and size of a nutmeg, only harder; marbled in the inside with white and reddish streaks; insipid to the taste, and must be shredded with a kind of sciffars, which they are never without for that purpose, so as to wrap it up with the leaf. They use it both raw and boiled, which last they say preserves and adds strength to it. But I will not advise any one to taste it green, since it affects the animal spirits so powerfully,

powerfully, that inſtantaneouſly, as it were, thoſe who are not uſed to it fall down as in a trance; it is true they recover preſently, and without any ill conſequences.

Chunam is only a lime burnt, and made of the fineſt ſhells. For uſe it muſt be wetted, exactly as if to ſerve for mortar, and is kept in gold, ſilver, or metal round boxes.

To theſe three articles is often added, for luxury, what they call cachoonde, a Japan-earth, which, from perfumes and other mixtures, chiefly manufactured at Goa, receives ſuch improvements as to be ſold to advantage when re-imported to Japan. It is made up in little round cakes of ſcarce the breadth of half a crown, but ſomewhat thicker. The ſurface is a dark dingy brown, the ſmell of a bliſde gritty texture, and breaks white. The taſte is at firſt little better than that of common chalk; but ſoon turns to a ſavour that dwells agreeably upon the palate.

Another addition to their uſe, of what they call cachoo, a blackiſh, granulated, perfumed compoſition, of the ſize of ſmall ſhot, which they carry in little boxes on purpoſe. It has a pleaſant taſte, and is reckoned a provocative when taken alone, which is not a ſmall conſideration with the Aſiatics in general.

They pretend that this uſe of betel ſweetens the breath, fortifies the ſtomach, though the juice is rarely ſwallowed, and preſerves the teeth, though it reddeſts them; but, we are apt to believe, there is more of a vicious habit than any medicinal virtue in it; and that it is like tobacco, chiefly matter of pleaſure.

The great men have fine gilt lackered boxes for theſe doſes of betel and areka, which are conſtantly offered to the ſtranger as ſoon as he enters, and muſt be accepted on pain of being thought unmannerly; and this muſt be taken with the right hand, the left being ſeldom employed but in the vileſt offices. Among this people, and indeed all over India, a man's being left handed is the greateſt misfortune; for it would be impoſſible for him to gain their eſteem, though his qualifications were ever ſo extraordinary.

The Tonquineſe, eſpecially the trading part of them, are courteous and obliging to ſtrangers: they are fair dealers, and not, like the Chineſe, addicted to cheating and tricking; yet their magiſtrates are ſaid to be proud and imperious, their ſoldiers inſolent, and their poor are far from having that honeſty which is ſo amiable in the merchants and tradeſmen: theſe poor are a numerous body, and ſo given to thieving, that ſtrangers are forced to watch their goods with great care. The Tonquineſe, however, are eſteemed good mechanicks, and faithful and obliging ſervants: they are patient in labour, but dejected in ſickneſs; and, from the higheſt to the loweſt, are ſo fond of gaming, that nothing can reſtrain them.

Their uſual diverſions are fiſhing and hunting, but principally the latter; their rivers and ſea-coaſts abounding with excellent fiſh. The country is the leſs proper for hunting on account of the many rivers that run through it, and the little cover there is for game.

The people generally travel by water, on account of their enjoying the convenience of the many rivers; however their highways and bridges are kept in very good repair; and though they have no public inns, yet the traveller is ſure to meet with water and fire by the road-ſide, and to find other conveniences proper for dreſſing his meat and refreſhing himſelf.

When their generals and great men take the field, their baggage is uſually carried by elephants, and it does not appear that they make uſe of any other beaſts of burthen.

Men purchaſe their wives, and the people are allowed to have what number of them they pleaſe; but, in time of ſcarcity, the poor are frequently compelled to ſell both their wives and children for food. Men of the beſt quality in Tonquin offer their daughters to the merchants and officers who come to trade there, though they are ſenſible they will ſtay only a few months. One great inducement is ſaid to be the hopes of mending the breed, and having their poſterity of a whiter complexion than themſelves; for they think the nearer they approach to white, the greater is their beauty. The women make no objection, and think this as lawful a way of getting money as any other; and if their children ſhould prove burthenſome, and they in circumſtances that will not admit of their ſupporting them, they make no ſcruple of ſelling them.

The people are very jealous of their wives, that the men muſt be poor indeed who have not ſeveral; does for half their days, and pay very dearly for a very ſlight offence: but the woman has no ſuch privilege, for the caſtor get rid of the huſband, however he be guilty of ſome very notorious crime; however, the huſband is obliged to redeem the goods he had with his wife, and to keep the children. If a woman be convicted of adultery, ſhe is expoſed to the diſgrace, bred up for the moſt abandoned; and her having killed her ſpouſe in the act, ſhe no ſooner falls than the tramples her to pieces.

The Tonquineſe do not bury their dead, but they have no common burying-places, for every one is interred in his own ground; and within a month after a great feaſt is made at the grave, at which the prieſt is preſent. If the deceaſed was a man of quality a wooden tower is erected over his grave, ſeven or eight feet ſquare, and about twenty-five feet high: thither the country people repair, and find great plenty of proviſions in little ſheds, or booths, built at about twenty yards diſtance from the tower. The people being aſſembled, the prieſt aſcends that ſtructure, and makes a ſpeech upon the occaſion; after which he comes down, and the people ſet fire to the tower, which, being ſlightly built and covered with thin painted boards, is ſoon conſumed. This being done the people eat and drink, and are very merry. Dampier ſays, he was at one of theſe ſolemnities, where he ſaw fifty or ſixty huge cut up, and the greateſt quantity of oranges brought for the entertainment of the gueſts that he had ever ſeen at Tonquin.

SECT. V.

Of the City of Cachao; the Form of the Houſes, and their Furniture; the King's Palaces; with the other Towns and Villages of Tonquin.

THE city of Cachao ſtands upon a riſing ground on the weſt ſide of the river Domea, and is defended by neither bank, wall, nor ditch. It contains about twenty thouſand low built houſes, raiſed with mud walls, and thatched roofs; with a very few built with brick and tile. The rooms are only divided by partitions of ſplit cane, and have no other light than what they receive from a little ſquare hole. Their furniture conſiſts of cabinets, tables, and ſtools; and, in their innermoſt rooms, an ordinary bed or two. Every man has in his houſe a ſmall altar, upon which is an image and two incenſe-pots, and before it he performs his devotions. They uſually dreſs their meals in their yards, or before their doors; but in the rainy ſeaſon make uſe of one of their outer rooms, where, for want of a chimney, they are almoſt blinded with ſmoak. The principal ſtreets are wide, but in wet weather are very dirty, and there are ſeveral ponds and ditches, which in the dry ſeaſon become very offenſive: but, notwithſtanding this, the town is eſteemed very healthful. In every man's back-yard, or in ſome convenient part of his houſe, is a ſmall arched building, in the form of an oven, about ſix feet high, to ſecure his beſt goods in caſe of fire, to which their thatched houſes are very ſubject; but the government obliges every man to keep a great jar of water at the top of his houſe, with buckets; and if the fire cannot be extinguiſhed this way, they throw off the thatch, which is contrived in large panes of ſeven or eight feet ſquare, that can be removed at once: they alſo keep hooks, like thoſe uſed by our firemen, to pull down the buildings that are in flames. Thoſe perſons are ſeverely puniſhed who neglect to have their jars of water, their buckets, and hooks in order.

In the city of Cachao are three palaces, in the chief of which the boua, or king, reſides. This ſtructure is ſaid to be of a prodigious extent, and has a wall about fifteen feet high, and as many in thickneſs, faced on both ſides with brick; beſides the buildings and apartments of the king and his courtiers, there are within the wall, parks, gardens, and canals, as at the palace of China.

The two other palaces in this city are but meanly built; in one of them the choua, or general, reſides: before it is a ſpacious ſquare parade, with a building that runs along one

one side of it, in which the generals and other officers fit to see the soldiers perform their exercise. Opposite to it is another low building, in which is kept the train of artillery, consisting of about forty or fifty iron guns, and some iron mortars. Near this place is a stable of two hundred elephants kept for war, and to carry the generals and their baggage; there is also another stable, in which are about three hundred horses.

These are the only buildings worth notice in the city of Cachao. The English factory, which stands at the north end of the city, is but an ordinary low built house, and yet is one of the best in the town. The Dutch factory joins to it, but is not quite so large.

The other cities of Tonquin are but few in number. Kean is one of the chief, and consists of about two thousand houses, and, like all the rest, has neither wall nor ditch. They have no market-towns, but every five or six villages have the market in each by turns. These villages consist of thirty or forty houses; they are scattered pretty thick all over the country, and are always surrounded by groves, and in the flat country high banks are thrown up beyond these groves to prevent their houses and gardens being overflowed in the wet season. When the dry season returns, the moats, which surround the villages, serve to fill those canals with water, that separate their grounds, and every house standing in the midst of a garden, thus surrounded by trees and water, enjoys a very agreeable situation. In the hilly country the people have no moats or banks thrown up about their villages, and therefore may be supposed to be much more healthful in the wet season than those who live in the plains.

SECT. VI.

Of the Temples, Religion, and Superstition of the Tonquinese.

THEIR religion nearly resembles that of the Chinese, and they express the same reverence for Confucius, which is not at all surprising, as Tonquin was anciently a province of that kingdom. They have a great variety of idols, the most common of which are the horse and the elephant. Their pagodas, or temples, in the country, are mean wooden buildings, covered with thatch, and sometimes but just big enough to hold the idol placed in them; but in their great towns they are something handsomer.

Their priests lead a very austere life, to which they are in a manner compelled by their poverty, they having but little to subsist upon but the offerings of the people, which frequently are no more than two or three handfuls of rice, a little betel, or some such trivial present. They dwell in mean houses near the temples, in which they offer up the prayers of the people, who bring them their petitions in writing. These the priest reads aloud before the idol, and afterwards burns them in the incense pot, the petitioner lying all the while prostrate upon the ground.

People of distinction seldom attend the pagodas; but chuse some open court about their own houses, where they offer up their prayers, one of their attendants reading the petition instead of a priest, while the master lies prostrate on the earth. This paper contains an account of all the blessings he has received, as health, riches, honour, the favour of the prince, and if he be old, long life, concluding with a prayer for the continuance and increase of these blessings. The reader having finished, sets fire to the paper, with burning rushes that stand lighted in an incense pot, and then throws three or four small parcels of gilt paper into the fire, which are consumed with it. As there are a great quantity of provisions dressed upon these occasions, the master no sooner rises than he orders his servants to eat, and make their hearts merry; for these people seldom perform any act of worship, without either giving the poor, or their attendants reason to bless them: their devotions being always attended with acts of charity and benevolence.

They annually observe two public feasts, the chief of which is at the beginning of their new year, which commences at the first new moon after the middle of January, when they spend ten or twelve days in rejoicing. There is during this time a cessation from all business; people put on their best cloaths, and spend their time in drinking, gaming, and other diverhons, and the common people, on these occasions get extremely drunk.

The other great festival is after their having brought in their first harvest. The first and fifteenth day of every moon are likewise holidays, in which they perform their devotions with extraordinary zeal. At these times they bring meat and drink to the sepulchres of their deceased friends, and after they are gone, the bonzes regale themselves with it. Their great men and civil magistrates also solemnize their birth-days, when they are complimented by all their friends and relations. At every entertainment a comedy is acted, and in these they are said to excel other nations. They are usually exhibited in the night-time, and last from sun-set to sun-rise; but their playing does not hinder the audience from eating and drinking; for they are generally as intent upon the feast, as upon the play that is acting.

The people are fond of astrology, and on every occasion consult the pretenders to that art. They are strict observers of times and seasons, of lucky and unlucky days, and as they give names to every hour in the day, as the horse, the bear, the tyger, &c. the beast which gives name to the hour in which a person is born is always avoided, from the apprehension that this beast will some time prove fatal to him.

A man's meeting a woman when he first goes out in a morning, is esteemed ominous, and on such an occasion they return home, and will not stir out for several hours.

SECT. VII.

A concise History of Tonquin, the extraordinary Form of its Government; the Ceremonies observed at the Funeral, and Coronation of the Bouas; the Power of the Choua; the Forces of the Kingdom; and of the Magistrates, Laws, and Punishments.

TONQUIN was formerly subject to the vast empire of China, when a famous robber called Din, put himself at the head of a body of men of his own profession, whom he inspired with the resolution of taking up arms, and throwing off the yoke of servitude. He succeeded, and those whom he had engaged in the revolt, out of gratitude, placed him upon the throne. The happiness which the Tonquinese flattered themselves they had acquired by their independence, became to them a source of miseries and cruel wars, still more pernicious than their antient subjection to the Chinese emperors. For seven centuries after their revolt, they were almost continually in arms one against another, in support of the different factions, which ambition and jealousy raised up among them; and the families on the throne were six times changed.

The last civil war introduced a new and very extraordinary form of government. Cochin China had, for some time, been subject to the king of Tonquin, who used to create a general with an almost unlimitted power in each kingdom; but at length the general, who commanded the forces in Cochin-China, prompted by ambition, and perhaps also incited by resentment, threw off his allegiance, and made himself king; when the general of Tonquin, equally ambitious, observing his success, followed his example, and seized all the revenues of the kingdom: but being less desirous of the title of sovereign than of real power and real authority, he left the king the external splendor of a monarch, on condition that he should have the absolute command of the army, with the greatest part of the revenues of the kingdom, and that their descendants should succeed to the same privileges.

By virtue of this agreement there are two sorts of kings; he who receives the honours of royalty is called boua, and the choua has all its advantages. The boua is a kind of prisoner of state in his own palace, where he is allowed to indulge himself in luxurious indolence, and to take his diversions with his women and children. He is almost every day taken up in giving audience to his subjects, hearing their complaints, and determining their private differences. At certain times he receives the homage of the great officers, and is honoured with the acclamations of the people, who are so devoted to him as to pray for

for his profperity, imagining that nothing can be of worfe conſequence to them than his dying without iſſue. The choua himſelf pays him the moſt profound reſpect before the people, declaring, that he has aſſumed the adminiſtration of the government, only to eaſe him of the trouble, that he may enjoy his pleaſure without interruption or reſtraint. He is alſo addreſſed by the foreign ambaſſadors, as if he was ſtill veſted with ſovereign power. But except theſe ſhadows of royalty, which he only receives on certain occaſions, he has little reaſon to think himſelf a king; for he has few attendants, and none but thoſe who are choſen by the choua.

The princes his ſons partake of his ſervitude. They never leave the palace above four times a year, and that only ſix days each time, and they are beſides attended by officers appointed by the choua. In the firſt of theſe ſix days of liberty they viſit the temples; in the two following they take the diverſion of hunting; and during the three laſt, they ſail upon the river in gallies magnificently adorned. The right of primogeniture does not regulate the ſucceſſion to the crown; the will of the father decides it in favour of him whom he moſt loves or eſteems. As ſoon as he is declared, the choua, followed by his principal officers, the counſellors of ſtate and the eunuchs, do him homage, and take an oath to place him on the throne after his father's deceaſe.

It would be tedious were we fully to deſcribe the pomp and magnificence of the ceremonies obſerved at his funeral. During the fifty five days following his death, he is ſerved as if ſtill alive, and proviſions are diſtributed amongſt the bonzes, and the poor. The whole nation puts on mourning, and every one wears it a longer or a ſhorter time according to his rank: the civil and military officers, for three years; the king's houſhold, nine months; the nobility, ſix; and the people three. Theſe three years are times of ſadneſs, during which no rejoicings are allowed, except at the coronation of the ſucceeding prince. The cuſtom is to carry the body of the deceaſed king into the deſarts lying beyond Bodego. It is two day's journey from Cachao, the capital of the kingdom, to that city: but as the king and all the court go thither on foot, it takes up fifteen or ſixteen days. All the road is covered with ſtuff of a violet colour, and at the diſtance of every quarter of a league there are places for refreſhment. The choua takes care that there ſhall be lodgings for every night. In the midſt of an immenſe and magnificent retinue of officers, elephants, and horſes, is the chariot which carries the boua's coffin, drawn by ſix harts, trained for that purpoſe. After the corpſe comes to Bodego, it is put into a galley, and attended only by the ſix principal eunuchs of the court, who inter it in a remote place, after having obliged themſelves by oath never to reveal it. This ſecrecy is perhaps an article of their religion, or a precaution to prevent the treaſures buried with him from being carried off, and which they imagine he may have occaſion for in the other world. It is ſaid, that the princes and princeſſes give orders for their being buried near him, from a principle of gratitude, that in the other world they may continue to render him their ſervices.

After theſe funeral ceremonies are over comes on the coronation of the new boua, which diffuſes pleaſures and diverſions over the city of Cachao and the ſurrounding country. He is carried upon an elephant into the great court of the palace, which is covered with rich tapeſtry in form of a tent, where he receives the oath of fidelity from the great men of the kingdom, to whom he makes a preſent of ſeveral pieces of gold, worth about a hundred piſtoles, and ſmall bars of ſilver. Afterwards a large camp is erected in the midſt of a vaſt plain. The king goes thither, with all the officers of his houſhold, and a great part of the army, and there receives the oaths of the deputies of his kingdom and of his people. One half of the month paſſes away in rejoicings, every day is remarkable for the diverſity of feſtivals, and the generoſity of the prince; even the darkneſs of the night is not unemployed, for then are furniſhed new amuſements by letting off continual fire-works, which are ſaid to be infinitely finer and more curious than thoſe we have in Europe.

Theſe are the honours that chiefly diſtinguiſh the boua, who, during his reign, has not even a guard; while the choua has his guards of horſe and foot, and near three hundred elephants, with an army of thirty thouſand men quartered in and about the city of Cachao, and ſeventy or eighty thouſand in other parts of the kingdom. Theſe are chiefly foot, armed with match-locks and broad-ſwords.

The ſoldiers are taught to make their own gun-powder themſelves, in ſmall hand-mills given them for that purpoſe; but they are ignorant of the art of corning it. Every ſoldier has a cartouch-box, in which are little hollow canes filled with powder, each holding a charge; and, it is ſaid, that no people will load and fire quicker. Their arms are kept very bright, and in bad weather are covered with lackered cane.

Shooting matches are frequently appointed to make the ſoldiers good markſmen, and every one is rewarded according to his ſkill: he that ſhoots the wideſt from the mark is obliged to do double duty the next time he mounts the guard.

Moſt of the forces are kept on the frontiers of Cochin-China, the natives of which are almoſt their only enemies; and between the out-guards of each kingdom there happen frequent ſkirmiſhes: but they very ſeldom come to a general engagement.

The troops can never take the field but in the dry ſeaſon; for during the rains there is no marching or encamping. When the army marches, the generals and principal officers are mounted in little wooden apartments fixed on the backs of the elephants. They take no field-pieces with them, but ſome long guns that are about ſix or ſeven feet in the barrel; theſe, when they fire them, are reſted upon crutches, and uſed to clear a paſs, or to fire acroſs the rivers. The ſoldiers take little baggage with them, and ſeem prepared rather for ſlight ſkirmiſhes, than a pitched battle.

The naval forces of the kingdom are very inconſiderable, they only conſiſting of narrow gallies ſixty or ſeventy feet long: the head and ſtern are raiſed ten or twelve feet above the water, but the middle is not above two feet from it. The captain ſits in the ſtern, which is painted and gilt; and the ſoldiers who row theſe veſſels have a covering over them, to preſerve them from the rain: they puſh their oars from them, and in the ſame inſtant they all plunge them into the water, there being a perſon who keeps time and gives the word, and the rowers anſwer in a hoarſe voice. Theſe veſſels do not draw above two feet and a half water, and are of no ſervice at ſea, except in very calm weather.

The ſoldiers are alſo employed both upon the rivers and the roads to prevent the running of goods; they likewiſe keep watch in the towns and villages, particularly at Cachao: while they are on the watch they have only long ſtaffs, but they are very inſolent and troubleſome to thoſe who paſs by them; and it is in vain to complain of their ill uſage, for their officers, to whom alone they are accountable, are not very ready to receive complaints againſt them: however, for a little money a man may paſs their watch pretty quietly in the night.

None are capable of being preferred to any offices or poſts in the government, unleſs they have taken their degrees, and gone through a courſe of ſtudy, as in China; their manner of taking their degrees, and their examinations, are alſo performed in much the ſame manner.

Yet moſt of their magiſtrates are eunuchs. Every governor is abſolute in his province; and they are ſaid to be exceeding covetous and imperious. At the death of an officer who is an eunuch, all his wealth falls to the government, on which account little notice is taken of their extortions. To the oppreſſion and injuſtice of theſe officers is imputed the poverty and want of trade that is extremely conſpicuous in the country.

An oath of fidelity is once a year adminiſtered to the ſubjects of every province, and upon this occaſion every one drinks a cup of the blood of ſome fowl mixed with arrack, which is eſteemed the moſt ſolemn oath by which they can bind themſelves.

Here are no courts of juſtice, but any magiſtrate may cauſe an offender to be brought before him, and inflict ſuch puniſhments upon him as is allowed by the laws of the country; but there is no formal trial, and conſequently the innocent

innocent muſt ſometimes ſuffer for the guilty; nor is any time allowed for an appeal, ſentence being immediately executed.

The uſual puniſhment for murder and other capital crimes is beheading, which is generally performed before the offender's own door, or where the fact was committed: the criminal is ſeated upon the ground, with his legs ſtretched out, and the executioner, with a back-ſword, ſtrikes off his head at a blow.

Theft is not puniſhed with death, but with cutting off a part or a whole member, according to the nature of the offence; ſometimes one joint of a finger, and ſometimes the whole finger; and for greater crimes the whole hand.

For ſome other offences criminals are loaded with iron chains and great wooden clogs; and ſometimes, as in China, they have large heavy boards made like a pillory, and hung about their necks for a month together; but people are more commonly puniſhed by receiving a number of ſtrokes with a ſplit bamboo. A perſon, after having ſuffered any of theſe puniſhments, is conſidered as infamous.

Debtors are frequently condemned to become priſoners to their creditors, and to work for them till their debts are paid; during which time they live on rice and water, and undergo ſuch other hardſhips as the creditor chuſes to inflict.

SECT. VIII.

Of their Trades, Manufactures, and Commerce.

THE Tonquineſe are, in general, pretty good mechanics, and have many kinds of working trades amongſt them, as painters, bell-founders, potters, weavers, taylors, turners, carpenters, ſmiths, and paper-makers. One ſort of their paper is made of ſilk, and the other of the bark of a tree, which is pounded in large troughs with wooden peſtles. Money-changing, which is a great profeſſion here, is managed by the women, who are very dexterous at it; and, 'tis ſaid, will raiſe the price of their cash with as much art as our ſtock-brokers do their ſtocks.

The Tonquineſe make great quantities of ſtuffs from ſilk of their own produce, as ſooſees, pelongs, hawkins, peniaſcoes, and gawz: the pelongs and gawz are ſome plain and others flowered. Beſides theſe they make ſeveral other ſorts, but theſe are chiefly bought up by the Engliſh and Dutch.

But though Tonquin abounds in ſilk, they ſeldom apply themſelves to weaving it till the ſhips arrive; for the people are kept ſo miſerably poor by the great lords, to whom the lands belong, and whoſe vaſſals they are, that they have not even money enough to purchaſe materials; and therefore foreign merchants are frequently obliged to advance it for them, and to wait ſeveral months till their goods are made. But the Dutch traders remedy this inconvenience by contracting a kind of temporary marriage with the women of the country, whom they make their factors to buy up ſilk and other materials at the dead time of the year, and employ the poor people when work is cheapeſt; and, by this means, they have their goods ready when the ſhips arrive. Many of the Dutch, it is ſaid, have raiſed good eſtates by theſe female factors, who are faithful to them, and the women alſo enrich themſelves; and when the Dutch huſbands have left trading thither, have married the greateſt lords.

Lackered-ware is another great manufacture of this kingdom, that of Tonquin being eſteemed the beſt in the world next to that of Japan. The cabinets which are lackered there are made of pine-tree; however their cabinet-makers are but indifferent artiſts.

The Tonquineſe make great quantities of a coarſe kind of earthen-ware of a grey colour, which is exported to ſeveral parts of India. From hence alſo is brought rhubarb, muſk, turpentine, and ſeveral other drugs; but theſe they are ſaid to have from China. They have alſo lignum-aloes, and a dying wood not much unlike Campeachy logwood, but not ſo large.

They make no long voyages, nor do they export any merchandize in their own bottoms, except fiſh and rice to ſome of the neighbouring countries; moſt of the trade is carried on by foreign ſhipping, and indeed they have few veſſels that will bear the ſea: thoſe they uſe are chiefly fiſhing boats, or a ſet of long gallies, only fit for their rivers or the coaſts in fair weather; and as they have a very large ſea-coaſt, and many fine rivers well ſtocked with fiſh, their fiſhery employs a multitude of hands, and many of them live with their whole families upon the water.

The goods imported into Tonquin are Engliſh broad-cloth, lead, ſulphur, ſalt-petre, great guns, pepper, and other ſpices. It does not appear they have any coin of their own, but they make uſe of foreign coins, particularly Spaniſh reals; they alſo make payments with little pieces of ſilver, which paſs by weight, and therefore have always their ſcales about them.

CHAP. XVII.

Of the Kingdom of LAO, or LAOS.

SECT. I.

The Situation and Produce of the Country, with the Manners and Cuſtoms of the Inhabitants.

LAOS is bounded on the north by part of China, and on the weſt is divided by high mountains from the kingdoms of Siam and Ava, and by another chain on the eaſt from Tonquin and Cochin-China. It extends from about the fifteenth to the twenty-ſecond degree thirty minutes north latitude; and ſome ſay that it is not above fifty miles broad from eaſt to weſt. At the foot of the above mountains are foreſts of lofty trees that ſeem to have been planted as a rampart againſt the great torrents of water which in the rainy ſeaſon ruſh with fury from the mountains, and to which alone is owing the harveſt in a country that would otherwiſe be burnt up with heat.

This country produces a great quantity of benjoin, of a better kind than is found in any other country of the Eaſt; the ſelling it to ſtrangers is prohibited; but for what reaſon is not known. Lacque is alſo found here, it is uſed in making Spaniſh-wax, and is a kind of earth that lies about the ant-hills in ſome foreſts. There is no country where more ivory is to be had; elephants being ſo numerous, that the inhabitants have thence taken their name; for it is ſaid, that the word Langians ſignifies a thouſand elephants. There are great herds of buffaloes, hogs, and wild cattle of ſeveral ſorts. The fields abound with rice, and the rivers with fiſh of an extraordinary ſize. The country alſo produces a great variety of flowers, with plenty of cotton, honey, and wax; and the inhabitants carry on a great trade in muſk and amber. They have likewiſe mines of iron, lead, and tin; and in the rivers are found gold-duſt.

The natives, who are called Langians, are very tractable and good natured, faithful and honeſt. They are well ſhaped, robuſt, inclining to fat, and of an olive complexion; but ſomewhat fairer than their neighbours.

Their principal food is rice, buffaloes flesh, and pulse of several sorts. They seldom eat cow-beef or fowls, and when any of the latter are wanted, they knock them on the head with a stick, thinking it the greatest crime to shed their blood while they are living, and they roast them without plucking their feathers. They apply themselves only to agriculture and fishing, yet it is very extraordinary to hear of a robbery or murder among them, which whenever it happens, and the criminal cannot be found, the neighbours are obliged to make satisfaction to the family of the sufferer. Fornication is permitted to the laity, but never to the talapoins, or priests; but an adultress loses her liberty for ever, and becomes the slave of her husband. They allow polygamy, but the first wife has the pre-eminence. When they marry, both the bridegroom and bride promise before a couple that has been long married, that they will behave well to each other till death, and yet they frequently part on very trifling occasions. While the women lie-in all the relations repair to her husband's house, and divert themselves with dancing and other pastimes. They have another festival which lasts a month at the decease of their kindred, whose funerals they celebrate with great splendor; and the talapoins who are invited sing certain songs, which they pretend puts the soul into the right way to heaven. When the month is expired they burn the corps, and carry the ashes to a pagoda; these structures are encompassed by stately tombs, upon which the rich expend very considerable sums.

SECT. II.

Of the Government of Laos, the Splendor of the Court, and a concise Description of the Capital of that Kingdom; and of the Religion of the Langians.

THE sovereign is absolute and independant; for he disposes of all honours and employments, and has the property of all estates, so that no family can enjoy them by virtue of any testamentary bequests: and he leaves nothing to orphans but the moveable goods, so that no other man in the country can properly call a foot of land his own.

In order to impress on the minds of his subjects a high veneration for his person, he appears in public but twice in a year, when he shews himself three days each time. His ears, by being bored in his infancy, are so distended by the weight of his ear-rings, that they reach down to his shoulders, which is the characteristic of his pre-eminence above his subjects: who also bore their ears, but do not stretch them to such an immoderate length. He wears, instead of a crown, a fillet of gold round his head; and when he appears in public the people bring a number of elephants and wild beasts, with wrestlers and gladiators, into a large field, or spacious area, to divert him with their tricks and with their combats.

But the court appears in its greatest splendor when he goes with his grandees to make a present to some idol temple. The officers of state begin their cavalcade with bands of music playing before them; but the king makes the most splendid figure, he being mounted on one of the tallest and most beautiful elephants, which is adorned with embroidered trappings that hang down to the ground; and the monarch, upon this occasion, is so loaded with precious stones, that he may be said to wear the wealth of a kingdom. His numerous followers are all richly dressed, and being mounted on fine horses ride in great order, with carbines that glitter with precious stones. The women, who are not permitted to go into the streets on that day, generally look out of the windows, and scatter scented waters both on the king and his present, which is carried on cattle richly decorated with trappings. The talapoins come out of their convent to meet the king, and attend him; while he, as the representative of both sexes, sacrifices to the idol.

The great officers of the kingdom are seven viceroys, who govern its seven provinces; the principal of these, who is called the viceroy general, eases the king in his burthen of government; and, upon his decease, summons the states, and disposes of every thing till his successor is placed on the throne. These seven viceroys constantly attend the king as companions and counsellors, and depute their lieutenants to discharge their office in the several provinces. In every province is a militia of horse and foot, whose officers are dependant on the viceroy, and the forces are subsisted by the revenue of each.

The different rank of the courtiers are distinguished by gold and silver boxes of betel, of various forms and sizes, that are carried by the pages who attend their masters to all the public assemblies. The viceroy-general in all public processions rides on an elephant richly accoutred; the other viceroys have chairs lined with cloth of gold, and are accompanied by servants in rich liveries. All the other officers go on foot, without shewing their boxes.

As the king is absolute, and the people have little foreign trade, they have few laws, but every family is under vassalage to one who is their head and superior; by which means the king can assemble a numerous army in a very short time, by only giving notice to the chiefs: but if one of these chiefs is found guilty of any remarkable crime, all his kindred are deprived of their rights and prerogatives, and obliged to engage in the mean employment of serving the king's elephants. Crimes are here severely punished, especially breaches of the peace; and in all civil affairs, the judge has a right to condemn the parties without appeal.

The capital of Laos is called Leng, or Langione, which is situated on the banks of the river Mecon, in one hundred degrees fifteen minutes east longitude, and in latitude twenty-one degrees forty-five minutes. Marini says, that the palace, which is of great extent, has many of the apartments adorned with basso relievos richly gilt; that the great men's houses are lofty, beautiful, and built with timber, but those of the common people are meer huts; and that none but the talapoins have leave to build their houses of brick and stone.

The talapoins are under the class of noviciates till they are twenty-three years of age, when they pass their examination, and are incorporated. Some of the Langians believe that the souls of the wicked, on leaving the body, are annihilated; but that those of the virtuous assume an etherial body, as clear as the light; and, after passing through sixteen heavens, and enjoying the pleasures of all, return to earth, and again inhabit the human body.

CHAP.

CHAP. XVIII.

Of COCHIN-CHINA, and CAMBODIA.

SECT. I.

The Situation and Extent of Cochin-China; its Climate, Vegetables, and Animals; with a particular Account of the edible Birds-Nests.

COCHIN-CHINA, or Weſt China as the name imports, was thus called by the Portugueſe to diſtinguiſh it from Cochin on the Malabar coaſt; and if we include Chiampa, which is a province of Cochin-China, or at leaſt tributary to it, extends from eleven degrees thirty minutes north latitude to ſixteen degrees ten minutes, and is about three hundred miles in length from north to ſouth, and one hundred and fifty where broadeſt from eaſt to weſt. It is bounded on the north by Tonquin, on the eaſt by the ſea of China, on the ſouth by the Indian ocean, and by the kingdom of Cambodia and the mountains of the Kemois. Captain Hamilton obſerves, that it extends along the coaſt of the ſea ſeven hundred miles from the river of Cambodia to that of Quambin.

This kingdom, which is called by the natives Anam, or the Weſt Country, is ſaid to be more temperate than Tonquin, from its lying more open to the ſea, and being refreſhed by the ſea breezes. However, both countries lie upon a flat, and are annually overflowed about the ſame time: the ſeaſons are conſequently the ſame, and the lands equally fruitful in rice, which requires no other manure but the mud left by the waters, which renders it ſo fertile, that they have three harveſts in a year. This inundation happens once a fortnight for three days at a time, during September, October, and November; and not only gives fertility to the ſoil, but drowns vaſt numbers of the rats with which the rice-fields are peſtered. At this time they have their greateſt fairs and markets, on account of the eaſe with which they can tranſport goods from one place to another by their boats, in which they alſo take up the drowned cattle, which ſerves them for food.

Cochin-China is divided into the following five provinces, Renan, Pulocambi, Quamgum, Cachiam, and Sinuva; this laſt joins to Tonquin, and in it the king keeps his court; but travellers neither give any account of the ſituation of the other provinces, nor deſcribe any of their towns.

The country produces ſugar-canes, and the ſame fruits as are found in Tonquin all the year round, particularly oranges, durions, ananas, bananas, melons, and ſeveral others; but they have no grapes, nor ſcarcely any other European fruits. They have, however, vaſt woods of mulberry trees, and others that afford excellent timber, particularly iron-wood of ſeveral ſorts: they have alſo the aquila-tree, the wood of which has a very fragrant ſmell and grows upon the Kemois mountains. The wood of the old trees has the fineſt ſcent, this is called colamba, and is reſerved for the king's uſe. It is ſuppoſed to be the ſame with lignum-aloes, and is highly valued in China and Japan, where a block of it is uſed for a pillow; and among the Indian nations that burn their dead, great quantities of it are conſumed in the funeral piles.

The ſame animals are to be found here as in Tonquin, eſpecially rhinoceroſes and elephants of an extraordinary ſize, and the country abounds with wild and tame cattle, fowl, and fiſh.

In treating of the produce of this country it will not be improper to give here a deſcription of the edible bird's-neſts, which have already been ſo often mentioned in this work, and which are admired as an extraordinary dainty over all the Indies. Theſe neſts are chiefly found in Cochin China: they are built by a ſmall bird like a ſwallow, in the rocks upon the ſea-coaſts, and are compoſed of the ſea-froth, and a juice from the bird's ſtomach, which hardens with the ſun, and is almoſt tranſparent: this being ſoftened with water is pulled in pieces, and by being put into ſoup, is eſteemed extremely nouriſhing, and is by many people accounted very delicious.

SECT. II.

Of the Perſons, Dreſs, Manners, Cuſtoms, Buildings, Religion, and Trade of the Cochin-Chineſe.

THE natives reſemble the Chineſe in their ſtature, complexion, and features; but all of them wear their hair at its full length, like the Tonquineſe.

Their dreſs conſiſts of ſilk gowns or veſts of various colours one upon another; the men ſwathe their legs and thighs with ſilk inſtead of breeches, and they have ſlippers or ſandals, which, when they viſit, they leave at the door, where a pan of water is always ſet to waſh their feet. Their dreſs is, in ſhort, the moſt modeſt of that of any people in the Indies. The women wear a waiſtcoat cloſe to their bodies, and ſeveral petticoats, with a veil over all. The coat next their bodies trails on the ground, and the reſt are ſhorter than each other by half a ſpan. Both ſexes wear fans, and never uncover their heads by way of ſalutation. The men of learning wear above the reſt of their cloaths a gown of black damaſk; they have a ſtole about their necks, a blue ſilk handkerchief round their arms, and high caps reſembling mitres. But the other perſons of both ſexes wear broad caps embroidered with ſilk and gold, and never cut their beards and nails any more than their hair, becauſe nature, they imagine, deſigned them for ornament; but the mechanics, and all perſons concerned in manual labour, are obliged to pare their nails for the ſake of convenience.

Their food, and manner of eating and drinking, is the ſame as the Tonquineſe, but they reckon it a ſin to drink milk, becauſe it is the food of the young. They eat at little round tables, adorned with ſilver and gold, according to the quality of the owner, and their diſhes are placed upon them in frames made of ſugar-canes.

They are ſtrong, active, and naturally more courteous and polite than their neighbours, and though they are ſaid to be better ſoldiers, have a great command of their paſſions. They are very liberal and charitable, yet they are ready to aſk for any thing that pleaſes them, and to take a denial as an affront.

Their houſes, which are of wood, and two ſtories high, are well carved on the inſide, and erected upon lofty pillars with boards betwixt them, which they can remove at pleaſure, to leave a free paſſage for the water during the time of the inundation, when they retire into the upper apartments, and have a communication with one another by boats. In theſe houſes are three degrees of ſeats; the firſt is a mat on the floor, upon which the common people ſit croſs-legged; the ſecond is a low ſtool covered with a fine mat for thoſe in genteel circumſtances, and the other is a kind of couch raiſed againſt the wall, two or three feet above the floor, for the nobility and prieſts.

Their phyſicians, like thoſe of China, are ſkilful in the cure of diſeaſes. They feel the patient's pulſe, and immediately pronounce whether he be curable or not. If the latter, they give him nothing; but if the former, they bargain with the patient to perform the cure in ſuch a time, or elſe to have nothing for their attendance. The ſurgeons are alſo ſaid to be maſters of ſome extraordinary ſecrets.

Their language has ſome reſemblance to that of the Chineſe; and they have a learned language different from that commonly ſpoken.

As to their religion, they believe the immortality of the ſoul, and eternal rewards and puniſhments, and are firmly perſuaded that the ſpirit paſſing from one body to another more noble, is a part of its future reward. They make entertainments for the deceaſed, who they imagine feed on the immaterial ſubſtance of the proviſions, which they

they diſtinguiſh from the accidents of quantity and quality. They worſhip the ſouls of men reputed holy, and place their images among their idols in the temples. Their high altar is kept empty, with a dark vacant ſpace behind for the ſupreme God, whoſe chief attribute is according to them inviſibility, and they only pray to the reſt to intercede with him. Borri obſerves, that when he was here, one of their governors died, and as he lay on his death-bed, a multitude of armed men made thruſts in the air with their ſcymeters, threw darts, and fired muſkets in the palace, and that men on each ſide continually beat the air about his mouth with their ſcymeters, to hinder the evil ſpirits from hurting his departing ſoul. Then finding that his death was cauſed by the fall of a beam in his palace, they burnt the whole fabric; for the Cochin-Chineſe always burn the ſuppoſed cauſe of death, whether a houſe, a man, or beaſt. The governor's body was attended to its interment by a multitude of people dancing, who had built a new palace far more noble than the old one, and as many gallies as he uſed to keep, which run on wheels; they alſo prepared wooden elephants, horſes, and other moveables, and erected a kind of temple in the midſt of the palace, in which was an altar whereon they placed the coffin. No governor was appointed during the ſpace of three years, becauſe they imagined the ſoul of the deceaſed ruled till that time was expired.

Several authors have given a very romantic deſcription of theſe people, particularly the Abbé Choiſi, who attended the French Ambaſſador to Siam, and in his journal has a long and florid deſcription of their cuſtoms. "Nothing, ſays he, can be finer than the galleys of the "Cochin Chineſe. All without is black varniſh, and within red, ſhining like a mirror. Every one of them "has ſixty oars, all gilt. The rowers, who are alſo "ſoldiers, have at their feet a muſket, a poniard, a bow "and quiver. They are forbid, on pain of death, to "utter ſo much as a word. They conſtantly keep their "eyes on the commander, who delivers his orders by the "motion of a wand, and every thing is ſo nicely ad-"juſted, that a maſter of muſic, when he beats time, does "not make himſelf better underſtood by all his muſici-"ans.—The ſailors commonly wear only drawers of "white ſilk, and a hair cap: but when they prepare for "battle, they put on their heads a ſmall gilt head-piece, "and on their body a fine cloſe coat. They have the "right arm ſhoulder and ſide entirely naked." Were theſe cloſe coats then glewed on? If not, how were they faſtened? He proceeds, "The land army, con-"ſiſts of thirty thouſand men: the king's houſhold of "nine thouſand, and the firſt princes of five.—The "guards of the king and prince are cloathed in velvet, "and have arms of gold and ſilver: the officers are more "or leſs magnificent, according to their degrees; and on "the day of battle, or a review, the common ſoldiers are "dreſſed in an uniform of green, red, or yellow ſattin." Few romances are filled with ſuch marvellous and extravagant deſcriptions; but in this ſtile ſeveral other of the French authors have written, who have viſited theſe countries, and their abſurdities render even what is moſt probable, when aſſerted by them, ſuſpicious. Theſe countries are, indeed, but little known by any Europeans; nor have we materials from authors of acknowledged veracity, ſufficient to deſcribe them in a proper and judicious manner.

We may, however, add from captain Hamilton, that their laws are ſevere, and a painful death is not only inflicted on thoſe guilty of treaſon, but alſo on their relations within the bounds of conſanguinity. Their cities and towns are divided into wards, and at the ends of each ſtreet are railed gates, placed to confine each ward within its own limits. Theſe gates are locked every night, ſo that the people of different wards can have no communication.

As to their trade, they give little encouragement for ſtrangers to traffic with them; but as their country abounds in gold, raw ſilk, and drugs, they carry them to Cambodia, and diſpoſe of them there, except what they annually ſend to Canton in China, and ſome of their junks trade to Johore and Cambodia.

SECT. III.

Of CAMBODIA, *or* CAMBOYA.

Its Situation, Extent, and Produce.

THE kingdom of Cambodia is ſituated to the eaſt of Cochin-China and Chiampa, and is bounded on the north by the kingdom of Laos, and the Kemois mountains; on the ſouth by the Indian Ocean, and on the weſt by the kingdom and gulph of Siam, it extending from the eighth degree of north latitude to about the fifteenth. It makes near four hundred miles in its greateſt length, and about two hundred and ten where broadeſt; but it becomes very narrow towards the north.

The weſt part of this country is mountainous and deſart, but in the middle it lies low, and is watered by the river Mecan, which runs through its whole extent, and beginning to ſwell on the firſt of June, riſes ten or twelve feet, and in July and Auguſt overflows the neighbouring lands. This river riſes in Tibet, and after running a courſe of fifteen hundred miles, falls by two mouths into the ſea, forming an iſland: the moſt eaſtern of theſe ſtreams is called the Cambodia river, and that to the weſt is named Ocbequane, or Bona de Carangera.

In this country are found amethiſts, ſaphires, cornelians, chryſolites, garnets, and cats-eyes, properly called acates, and milk and blood-ſtones. It alſo produces gold.

The country likewiſe abounds in rice, and other corn, cocoas, oranges, citrons, mangoes, and other Indian fruits. Here is alſo plenty of Japan wood, ſandal wood, aquila wood, cambogia or gamboge, a yellow gum uſed in medicine, and in painting, and ſold in rolls; ſtick-lac, lac for japanning; raw ſilk, and elephants teeth.

Captain Hamilton ſays, that fleſh and fiſh are the only things to be bought without a permit from the king; and that theſe are ſo plentiful and cheap, that he purchaſed a bullock of between four and five hundred weight for a Spaniſh dollar, and that one hundred and forty pounds weight of rice may be bought for eight-pence: but poultry are ſcarce, becauſe the country being for the moſt part woody, the chickens as they grow up, betake themſelves to the woods. In theſe woods grow certain trees with a thick bark, of ſo poiſonous a nature, that the inhabitants, who go in ſearch of wild elephants for the ſake of their teeth, take with them a piece of iron with a ſharp end, which they drive into the bark of this tree, and after it has ſtayed a ſhort time, take it out, and put it into their gun charged with powder, and when they come within reach, ſhoot it into the elephant's body. The wounded beaſt immediately flies, while the men following, keep him in ſight till he drops down dead. With the ſame poiſoned ſlugs they alſo kill wild cows and buffaloes for the ſake of their tongues. 'Tis ſaid this ſubtile poiſon has a very ſurpriſing quality; for if the men are hungry or thirſty, as is often the caſe while they are hunting in the woods, they ſqueeze a few drops of it on a leaf, and by nearly licking it, are inſtantly refreſhed; but if the ſkin be broke, and the juice touch the part, it proves mortal without remedy.

The woods alſo abound with lions, tigers, wild boars, horſes, and plenty of deer, all which every body are at liberty to catch, or to kill.

SECT. IV.

The Perſons and Dreſs of the Cambodians; and the different Manufactures of the Country. A conciſe Deſcription of the City of Cambodia; with an Account of the Reception the King gave to the Supercargo ſent to him by Captain Hamilton, and the Manner in which that Kingdom became tributary to Cochin-China.

THE Cambodians are of a brown complexion; they have long hair, thin beards, and are very well ſhaped; their women may be eſteemed handſome; but are not diſtinguiſhed by their modeſty. Both ſexes dreſs their hair.

The

The men wear a veſt; but nothing on their heads and feet. The women have a petticoat that reaches below their ankles, and a jacket that fits cloſe to their bodies and arms.

The people are ingenious, and have manufactures of ſeveral ſorts of cotton, muſlins, buckrams, calicoes, white and printed dimities, and other ſtuffs. They alſo adorn their rooms with carpets, and weave a ſort for the common people, that reſembles the Scots plaids. They likewiſe weave ſilk, and both weave and work with the needle rich hangings, coverings for the low chairs uſed by the women of quality, and for the Indian litters and palanquins, the wood-work of which is adorned with ivory and tortoiſeſhiel. They make beads, bracelets, necklaces, and other ornaments of cryſtal, which is found in the mountains. They have likewiſe indigo, which they prepare and ſell to the neighbouring countries.

Cambodia, the capital, is ſituated on the river Mecon, about fifty or ſixty leagues from Ponteamaſs, and is the only city in the kingdom worthy of notice. The prince reſides in a mean palace, ſurrounded with a paliſade that reſembles a partition-wall; but is defended by a great number of Chineſe cannon, and by ſome other pieces of artillery that were ſaved from the wreck of two Dutch veſſels thrown upon the coaſt. There is a temple here of a very particular ſtructure, whoſe beauty is much commended. It is ſupported by wooden pillars varniſhed with black, and adorned with gilded foliages and reliefs, and the pavement is covered with mats. The prieſts who ſerve in it hold the firſt rank in the ſtate.

There are about two hundred Topaſſes or Indian Portugueſe ſettled and married in Cambodia, ſome of whom have pretty good poſts in the government: but they have no prieſt, nor will any venture to go among them; for in the year 1710, ſays Mr. Hamilton, a poor capuchin going there to officiate, and finding that one of the richeſt of his congregation had two wives, he, by virtue of his ſacerdotal authority, ordered him to put one of them away; but his pariſhioner diſregarding this injunction, the prieſt made uſe of the weapon of excommunication againſt him, at which the other was ſo exaſperated that he knocked out the prieſt's brains. Since that time they have wrote for more ghoſtly fathers, but none will come amongſt them.

When captain Hamilton arrived at Ponteamaſs, which is ſituated on a pretty deep, but narrow river, an officer came on board, who could ſpeak a little Portugueſe, and bringing him a preſent of refreſhments, adviſed him to ſend to the king, in order to give him an account of his arrival, and to let him know that he intended, by his permiſſion, to trade with his ſubjects. This he did, and received for anſwer, he might ſend a perſon with goods, that the king and his merchants might ſee them, and two Portugueſe were ſent him for interpreters, one to ſtay with him on board his ſhip, and the other to accompany the perſon he ſhould ſend to court. On their arrival he ſent his ſecond ſupercargo with twenty-five men well armed with fuzees and bayonets, with two ſmall bales of patterns, and preſents for the king, ordering him to let him hear from him once a week.

The ſupercargo no ſooner arived at the city than a large houſe was given for the accommodation of himſelf and his retinue; plenty of proviſions was ſent him, and he was viſited by many people of diſtinction; but ten days paſſed before he could ſee his majeſty, who, at laſt, received him in great ſtate, ſeated on a throne like a pulpit: his face was veiled below his eyes, and after many gracious ſpeeches, he gave him leave to trade.

Captain Hamilton, having ſtaid about three weeks without hearing any news of his ſupercargo, began to be very uneaſy, and at laſt reſolved to depart by a certain day, and leave his people, if they were alive and at liberty, to follow him to Malacca; the goods he had ſent up with them being ſufficient to enable them to hire a veſſel to carry them thither. He told his reſolution to the interpreter, and informed him that he ſhould be obliged to carry him and ſome more of the king's ſubjects with him as hoſtages for the civil treatment of his people at Cambodia. The interpreter, ſurpriſed at this reſolution, ſent a perſon in haſte to the city, to give an account of his impatience and deſign, who returned in fourteen days; about two days before the time the captain had fixed for his departure. He was accompanied by three Portugueſe, who brought letters from the ſupercargo, to inform him that he had taken leave of the king, and was coming in all haſte. Three days after the ſupercargo arrived with all his retinue, and a letter of compliment from the king to Mr. Hamilton in the Portugueſe tongue, and one directed to the governor of Bombay, to invite the Engliſh to ſettle in his country, and to build factories or forts in any part of his dominions.

The reaſon why he was kept ſo long in ſuſpence was the king's being unwilling to enter into any correſpondence with him without the knowledge and conſent of the king of Cochin-China; who at length conſented to allow the Engliſh to trade both in Cambodia, and in his own dominions.

When the king is diſpoſed to do a ſingular honour to a perſon, which he never does without a handſome preſent, he gives him two ſwords, which are to be conſtantly carried before him when he publicly goes abroad, one of which is the ſword of ſtate, and the other that of juſtice. All who meet him when theſe ſwords are borne before him, muſt give him place, and compliment him in a ſet form of words; but if he meets with another who has the ſame privilege, they compare the dates of their patents, and the firſt ſalutation muſt be paid to the ſenior patentee.

Whenever theſe perſons go into the country they hold courts of juſtice both civil and criminal, and have the power of impoſing fines, which are, however, paid into the king's treaſury. In capital caſes their ſentence is law, and is followed by a ſpeedy execution.

We ſhall now give a conciſe account of the manner in which Cambodia became tributary to Cochin-China. About the year 1716 the king of Siam threatening to invade Cambodia, the king, ſenſible of his being unable to oppoſe ſo powerful a prince, ordered thoſe of his ſubjects who lived near the borders of Siam to remove towards the city of Cambodia, and to deſtroy whatever they could not bring with them. This was performed, and the country, for the ſpace of fifty leagues, was rendered a mere deſart. He then applied to the king of Cochin-China for aſſiſtance and protection, which he obtained, on condition that Cambodia ſhould become tributary to that kingdom; fifteen thouſand men accordingly marched by land to his aſſiſtance, while three thouſand galleys, well manned, were fitted out for the ſea: yet the Siameſe army amounted to above double the number of the united forces of Cambodia and Cochin-China, and their fleet was above four times as numerous. But the Siameſe, in their march through Cambodia, finding the country deſolate, were ſoon in ſuch diſtreſs, for want of proviſions, that they were obliged to kill their elephants and horſes; and the ſoldiers feeding on their fleſh, to which they had never been accuſtomed, the whole army was ſeized with a flux and fever, which in two months time carried off half thoſe troops, and the reſt were obliged to retreat back towards Siam; while the Cambodian army being conſtantly at their heels, harraſſed them in their march.

Mean while the Siameſe navy ſteering to Ponteamaſs, the ſmall galleys were ſent to plunder and burn the town. This they accompliſhed, and above two hundred tons of elephants teeth were conſumed in the flames. While this was performing the ſhips of burthen lay in the road above four miles from the town, when the Cochin-Chineſe leizing this opportunity, attacked the large veſſels, burning ſome, and forcing others on ſhore; while the galleys, detained by the ebb of tide, could not come down the river to their aſſiſtance. The Cochin Chineſe, having now fulfilled their engagement, retired; and the Siameſe, fearing a famine in the fleet, returned with diſgrace to Siam.

SECT. V.

Of PULO CONDORE.

The Situation of thoſe Iſlands, with an Account of the Deſtruction of the Engliſh Fort on the largeſt of them; its Produce, and the Manners of the Inhabitants.

THERE are ſeveral iſlands that lie off the coaſt of Cambodia, among theſe are thoſe of Pulo Condore, or the iſlands of Condore, which are ſituated in eight

degrees forty minutes north latitude, and are twenty leagues ſouth-by-eaſt from the mouth of the river Cambodia. The largeſt, which is the only one of theſe iſlands that is inhabited, is between four and five leagues long, and three broad in the wideſt part. The next in ſize is about three miles long and half a mile over, and with the other forms a commodious harbour. The Engliſh ſettled on the largeſt of theſe iſlands in 1702; but having bargained with ſome Macaſſers, natives of the iſland of Celebes, to ſerve for ſoldiers and help to build the fort, and not diſcharging them at three years end according to their contract, but threatening them for letting two ſlaves eſcape out of their cuſtody, they roſe in the night, and murdered every Engliſhman they found in his bed, then ſet fire to the fort, in which nineteen Engliſhmen had been ſlain, among whom was Mr. Lloyd, the governor; eleven or twelve made their eſcape in a ſloop to Malacca; and of ſixteen who ſtaid behind, with the hopes of ſaving the money in the fort, all were murthered by the Cochin-Chineſe, except one or two who were taken priſoners, and afterwards ſuffered to eſcape: for in the iſland are two or three ſmall villages, with whom the Engliſh had not been upon good terms, and therefore would not ſuffer the inhabitants to have any arms in their houſes.

The cottages in theſe villages are raiſed ſeveral feet above the ground: they are built with bamboos, and thatched with long graſs, which they cut by the ſides of their brooks; but in theſe ſtructures are neither doors nor windows, one ſide of them being left open both for the entrance of the people and of the light.

The inhabitants, who are of a ſwarthy complexion, go almoſt naked, except at certain ceremonies, when they are dreſſed, and ſome of them very neatly. As moſt of them are deſcended from the Cochin-Chineſe, they affect black teeth and long hair, which in ſome of them hangs down below their knees.

They have a little rice, ſome potatoes, and very good bananas. On the mountains grow fine trees, which afford timber for maſts and other uſes, particularly a large one called the damar-tree, which is about three or four feet in diameter; its leaves and bark reſemble thoſe of the cheſnut, and the wood is very hard. From this tree they draw a kind of turpentine, by making a cavity in the trunk three or four feet above the ground. This matter is at firſt a liquid, and of the colour of the oil of nuts, though it afterwards turns whitiſh, has the conſiſtence of butter, and a very agreeable ſmell. Of this they make flambeaux, which they burn in their rooms inſtead of candles. The iſland alſo produces mangoes, wild nutmegs, which reſemble the true only in ſhape, and a fruit like grapes, which grow on large trees. Here is alſo found the cabbage-tree.

The animals found in this iſland are hogs, lizards, and guanoes: there are alſo parrots, parroquets, pigeons, and wild cocks and hens of about the ſize of a crow.

The inhabitants chiefly employ themſelves in fiſhing; in making brine for ſalting little fiſh like anchovies, which abound in the ſea; in drawing off turpentine from the above trees; and in catching turtle, of which they make oil, and ſell it to Cochin-China. Dampier tells us, that when he was there the men brought their women on board and offered them to the ſailors, which, as he obſerves, is very common in this and the neighbouring countries. As to their religion, he obſerved a ſmall pagoda in the iſland, on one ſide of which was the image of an elephant above five feet high, and on the other the figure of a horſe not quite ſo large. This temple was a low wooden building, thatched like the other houſes.

CHAP. XIX.

Of SIAM.

SECT. I.

The Name, Situation, Extent, Provinces, Rivers, and Seaſons of Siam. The Nature of the Soil, and the Minerals found in the Country.

THE Portugueſe, and from them the reſt of the Europeans, call this country Siam; but by the natives it is ſtiled the country of Tai, or of Freemen, tho' they have long loſt their liberty. Thus the French, who were once free, were originally called Franks, from their bravely oppoſing all encroachments on their native freedom.

The opinions of geographers are extremely various with reſpect to the ſituation and extent of moſt of the inland countries of Aſia and Africa, particularly of Siam Proper: for it is not exactly known in what part of the peninſula of Malacca it begins, nor how far it extends above that peninſula, the preciſe boundaries either of that or the neighbouring kingdoms not being determined by the few European travellers who have viſited them. All we know, with reſpect to Siam, is the exact ſituation of its capital, which is of the ſame name. However, according to the opinion of the Sanſons, the moſt ſoutherly part of the kingdom is in about the eleventh degree of north latitude, and it is ſuppoſed to extend at leaſt five hundred and fifty miles in length, and two hundred and fifty in breadth, though in ſome places it is not above fifty miles broad.

Siam Proper, by ſome called the Upper, to diſtinguiſh it from the Lower Siam, under which ſeveral authors include Laos, Cambodia, and Malacca, is bounded on the north by the kingdom of Pegu and Laos, on the eaſt by Cambodia and Cochin-China, on the ſouth by the kingdom of Malacca and the bay of Siam, and on the weſt by the ocean; and contains ſeven provinces, which receive their names from their reſpective capital cities, Proſelouc, Sanguelouc, Lacontai, Campengpet, Coconrepina, Pechebonne, and Pitchia.

The principal rivers of Siam are the Menan, the Mecon, and the Tenaſerim: the firſt diſcharges itſelf into the gulph of Siam, in the fourteenth degree of north latitude; the ſecond, having paſſed though Laos and Cambodia, falls into the Indian ſea in the ninth degree of north latitude; and the laſt falls into the bay of Bengal, in the thirteenth degree of latitude, and forms an iſland called Merguy, which is one of the beſt harbours in India. The chief cities of Siam are ſituated near the ſea-coaſt, or upon ſome of theſe rivers, for the mountainous part of the country is almoſt covered with woods, and that which is not, is parched up by the heat of the ſun, and is leſs fit for tillage than the low lands, particularly for rice, the common food of the inhabitants.

As to the ſeaſons, the winds blow from the ſouth upon the coaſt of Siam in March, April, and May: in April the rains begin, and in June they continue almoſt without ceaſing. In July, Auguſt, and September the winds blow from the weſt, and the rains continuing, the rivers overflow their banks nine or ten miles on each ſide, and for more than one hundred and fifty up the ſtream. At this time, and more particularly in July, the tides are ſo ſtrong as to come up the river Menan as far as the city of Siam, which is ſituated ſixty miles from its mouth; and ſometimes as far as Louvo, which is fifty miles higher. The winds blow from the weſt and north in October, when the rain ceaſes. In November and December the winds blow dry from the north, and the waters being in a few days reduced to their ancient channels, the tides become ſo inſenſible, that the water is freſh at the mouth of the river. At Siam there is never more than one flood and one ebb in the ſpace of twenty-four hours. In January the wind blows from the eaſt, and in February from the eaſt and ſouth. When the wind is at eaſt, the current ſets

to

to the weſt; and, on the contrary, when the wind is at weſt, the currents run to the eaſtward.

As this country is ſituated near the tropic, it muſt certainly be very hot; but yet, as in other places between the tropics, when the ſun is vertical and ſhines with a moſt intenſe heat, the inhabitants are ſo ſkreened by the clouds, and the air ſo refreſhed by a deluge of rain that overflows the plains which the people chiefly inhabit, that the heat is very ſupportable. Hard winters are not to be expected in a ſituation ſo near the equator; but there, as well as here, the cooleſt wind blows in December and January.

As the ſoil of Siam has been gradually formed by the clay and other earth waſhed down from the mountains, they have little ſtony ground, and there is ſcarce a flint to be found in the whole country. Loubiere obſerves, that it was antiently rich in mines, and the multitudes of caſt-works, as well as the old pits that have been diſcovered, ſhew that formerly there were more wrought than at preſent; indeed the gold, with which their images and the roofs of their temples are covered, render it evident that they antiently found great quantities of that metal. But a king, who reigned towards the cloſe of the laſt century, was unable to diſcover any vein of either gold or ſilver, that was worth the expence of working, though he employed ſeveral Europeans in the ſearch, particularly a Spaniard who had been concerned in the mines of Mexico. After all their endeavours, they were only able to find ſome inconſiderable veins of copper, intermixed with a little gold and ſilver. But Mr. Vincent, a phyſician, ſhewed them a mine of cryſtal, one of antimony, and another of emery: he alſo found a gold mine, which he believed to be very rich; but did not diſcover it to the king. Several of the talapoins, and others, came ſecretly to him to learn how to puriſy and ſeparate metals, bringing him ſpecimens of very rich ore. The Siameſe have, however, long wrought very plentiful mines of tin and lead.

As to precious ſtones, there are found diamonds, ſaphires, and agates, in the mountains; but as the king's officers ſeize theſe for his majeſty's uſe, the people have no encouragement to ſearch for them. There are alſo loadſtones in a mountain near the city of Louvo, and alſo in the iſland of Jonſalam, which is ſituated in the Malacca coaſt, in the bay of Bengal.

SECT. II.

Of the Method of Huſbandry practiſed by the Siameſe; and of the Trees, Plants, and Animals of Siam.

IN the plains the earth is rendered fertile by the mud which the river leaves behind; but all the higher grounds are dried up and burnt by the ſun, ſoon after the rains are over: and though ſome of their lands are naturally fertile, yet they are ſo ſubject to droughts, and ſo ravaged by inſects, that the natives are ſometimes deprived of their harveſt for ſeveral ſucceſſive years; and theſe times of famine are generally ſucceeded by peſtilential diſeaſes.

The natives ſometimes ſow wheat upon the land which the inundation never reaches, and water it by little channels cut through the fields. They have annually two crops, but not on the ſame ſpot of ground.

They uſe oxen and buffaloes in plowing their ground, and guide them with a rope run through their noſe. They uſe a plain plough without wheels, that has a ſhare, and a ſtaff to hold it by; in other reſpects, it is not much unlike our foot-ploughs, only inſtead of nails they faſten the pieces together with pins and thongs.

Inſtead of thraſhing the rice, the cattle tread it out, and the people ſeparate the duſt and chaff by pouring it down by degrees from a high place, when the wind performs the office of winnowing it; but as the rice has ſtill a hard thick ſkin, they beat it in a wooden mortar to get it off, and make it fit for boiling.

The Siameſe prepare the land for tillage as ſoon as the earth is ſufficiently moiſtened by the floods. They plant their rice before the waters riſe to any conſiderable height, and as the waters riſe ſlowly, the rice keeps pace with it, and the ear is always above the water. They reap their corn when the water retires, and ſometimes go in boats to cut it, while the waters are upon the ground. They alſo ſow rice in ſeveral parts of the kingdom that are not overflowed, and this is thought better taſted, and will keep longer than the other; but they are forced to ſupply theſe fields conſtantly with water, while the rice is growing, from baſons and ponds that lie above them.

Formerly the king of Siam annually plowed a piece of land like his neighbours of Tonquin and China; but this ceremony is at preſent performed by an officer in his majeſty's room, when a great ſacrifice is offered to Sommona Codom, whom they implore to be propitious to their labours.

In their gardens they have pulſe and roots, but they are for the moſt part different from ours; they have alſo garlic, potatoes, and radiſhes; but no onions, turnips, carrots or parſnips, nor any lettuces, coleworts, or any of the herbs uſed in our ſallads. They have cucumbers, which are very wholeſome, and may be eaten freely without any inconvenience, and garlic in this hot country loſes much of its rankneſs. After the time of the inundation, they cover their garden plants from the heat of the ſun, as we do from the cold.

There are here none of the fruits known in Europe, except oranges, lemons, citrons, and pomegranates. The oranges of one kind or other continue all the year; but moſt other fruits have their ſeaſon. They have bonanas Indian figs, jaques, durions, mangoes, mangoſtans, tamarinds, ananas, and cocoa nuts: they alſo abound in ſugar-canes and pepper. As great part of their food conſiſts in the produce of their gardens, they extend for ſeveral leagues together upon the Menan, between Siam and Bancock.

They have ſome of the flowers common in Europe, as the tuberoſe, gillyflower, and a few roſes; but they are not ſo ſtrong ſcented as in Europe. They have likewiſe ſome jeſſamines, amaranthuſes, and tricolets, but no other European flowers, though they have ſome peculiar to the country, that are very beautiful and fragrant, but it is obſervable, that ſome of them ſmell only in the night-time, the heat of the day entirely deſtroying the ſcent.

As the hilly part of the country is almoſt entirely uncultivated, it is covered with woods, but the tree, or rather reed of greateſt uſe in this country, is the bamboo, which grows chiefly in marſhy ſoils, and like reeds and ſedge, is found on the ſides of ponds and rivers: it alſo reſembles them when young, but grows to a prodigious ſize, and hardens ſo as to be applied to any uſe, though, when it is green and tender, the Siameſe pickle it for ſauce. It is hollow, and the ſhoots are ſeparated by knots: but it has branches and thorns, which our reeds have not, and each root ſhooting out ſeveral ſtems, nothing is more difficult to paſs than a foreſt of bambooes, eſpecially as the wood is hard to cut, though nothing will more eaſily cleave: the Siameſe are ſaid to ſtrike fire with it, and, like other canes, it has a ſweet pith.

This country affords timber for building ſhips, and for maſts, and their cordage is made of the huſk that covers the cocoa-nut. They have likewiſe timber for houſes and wainſcoting, and a wood that will not cleave, called by the Europeans, woodmary, ſaid to be fit for the ribs of ſhips. Cotton trees are in great plenty, and others, that yield capoc, a very fine cotton wool, but ſo ſhort as to be unfit for ſpinning, and is therefore uſed in ſtuffing mattreſſes and pillows. From ſome of their trees they alſo extract oil, and there are others which yield lacker and gums. Cinnamon-trees are found here; but they are inferior to thoſe of Ceylon.

They have elephants and a few horſes, ſheep and goats; but theſe laſt are not good eating any more than their oxen and buffaloes, which are chiefly uſed for tillage. Their hogs are ſmall but fat, and the wholeſomeſt fleſh meat in the country. They have a few hares, and no rabbits. Deer are very plentiful, though great numbers are deſtroyed by wild beaſts; and many of them are killed by the inhabitants only for their ſkins, which they ſell to the Dutch, who carry them to Japan.

Ducks are plentiful, and extremely good; they have pigeons, and wild peacocks, grey partridges, turtle-doves that have a variety of gay plumage; excellent ſnipes, and

and abundance of wild fowl, which the natives will neither kill nor take; but it is ſaid the Mahometans here have faulcons, which they bring from Perſia to fly at the game.

They have vultures, parrots, crows, ſparrows, and many kinds of ſmall birds, moſt of which are very beautiful, but have diſagreeable notes, and there are ſeveral that imitate the human voice. The ſparrows are ſo tame that they enter the houſes, and pick up the inſects. Vultures and crows alſo come into the houſes, where they are fed by the people. Loubiere ſays they give the children, who die before they are three years old, to be devoured by theſe fowls; for in this country it is ſo far from being thought a curſe to have their carcaſſes eaten by birds of prey, that, next to burning, it is eſteemed the moſt honourable method of diſpoſing of the dead.

There are many ſnakes, lizards, ſcorpions, and millepides, and their ants and gnats are very troubleſome. Theſe ants to avoid the inundation, make their neſts, and lay up their ſtores on the tops of the trees. In the waters are a multitude of inſects unknown to us, and they have a fine ſhining fly like a locuſt, that gives a conſiderable light in the dark.

SECT. III.

Of the Perſons, Dreſs, Temper, and Food of the Siameſe; their Ceremonies, and moſt remarkable Cuſtoms, particularly their Manner of Travelling.

THE Siameſe are ſmall of ſtature, but well proportioned; their complexions are ſwarthy: the faces of both the men and women are broad, and their foreheads, ſuddenly contracting, terminate in a point, as well as their chins. They have ſmall black eyes, hollow jaws, large mouths, and thick pale lips. Their teeth are dyed black, their noſes are ſhort and round at the end, and they have large ears, which they think very beautiful. Their hair is thick and lank, and both ſexes cut it ſo ſhort, that it reaches no lower than their ears. The women make it ſtand up on their foreheads, and the men ſhave their beards.

People of diſtinction wear a piece of callicoe tied about their loins, that reaches down to their knees. The men bring up this cloth between their legs, and tuck it into their girdles, which gives it the appearance of a pair of breeches. They have alſo a muſlin ſhirt without a collar, with wide ſleeves, no wriſtbands, and the boſom open. In winter they wear a piece of ſtuff, or painted linen over their ſhoulders, like a mantle, and wind it about their arms.

The king of Siam is diſtinguiſhed by wearing a veſt of brocaded ſattin, with ſtreight ſleeves that reach down to the wriſt, under ſuch a ſhirt as we have juſt deſcribed, and it is unlawful for any ſubject to wear this dreſs, unleſs he receives it from the king. They wear ſlippers with picked toes turned up, but no ſtockings. The king ſometimes preſents a military veſt to the generals: this is buttoned before, and reaches to the knees; but the ſleeves are wide, and come no lower than the elbows. All the retinue of the king, either in war or in hunting, are clothed in red. The king wears a cap in the form of a ſugar-loaf, encompaſſed by a coronet or circle of precious ſtones, and thoſe of his officers have a circle of gold, ſilver, or of vermillion gilt, to diſtinguiſh their quality; and theſe caps are faſtened with a ſtay under the chin: they are only worn when they are in the king's preſence, or when they preſide in courts of juſtice, and on other extraordinary occaſions. They have alſo hats for travelling; but in general few people cover their heads, notwithſtanding the ſcorching heat of the ſun.

When people enter the houſe of a perſon for whom they have any reſpect, they always pull off their ſlippers and go in bare foot.

The women alſo wrap a cloth about their middle, which hangs down to the calf of their legs. They cover their breaſts with another cloth, the ends of which hang over their ſhoulders. They have no ſhift, for this is only worn by the men; nor any covering for their heads but their hair. The common people are almoſt naked, and wear neither ſhoes nor ſlippers. The women wear as many rings on the three laſt fingers of each hand as they can keep on, and bracelets upon their wriſts and ankles, with pendants in their ears ſhaped like a pear.

The men bathe two or three times a day, and never make a viſit before this is performed: ſometimes they go into the water, and at others have water poured on their heads for an hour together; after which they perfume their bodies, and uſe a ſweet pomatum that adds to the natural paleneſs of their lips.

The women alſo bathe in the rivers, and ſwim like the men, but never without the cloth that hangs from the waiſt. Loubiere commends them for their modeſty, and ſays, that ſmutty ſongs are prohibited by law.

The Siameſe have a ready and clear conception, and their rapartees are quick and ſmart. They imitate any thing at ſight, and in one day are ſaid to become tolerable workmen; but through their invincible lazineſs never riſe to great perfection in any art or ſcience, not even in aſtronomy and chemiſtry, in which they ſeem to take moſt delight.

They are neither laſcivious nor intemperate: theſe vices they hold in abhorrence, and therefore wanton diſcourſe never paſſes among them for wit or a mark of extraordinary genius. The better ſort of people are ſo far from being addicted to drunkenneſs, that they eſteem the drinking of arrack and brandy infamous, and adultery is hardly ever heard of at Siam. They have an averſion to blood; but if their rage and revenge excite them to ſpill that of an enemy, they do not care to hazard their own perſons by a duel, but proceed by aſſaſſination; however, moſt of their quarrels end in ill language, and ſometimes, but very ſeldom, come to blows.

Yet they are in general polite and courteous; but they are too apt to be haughty to thoſe who ſubmit to them, and ſubmiſſive to thoſe that treat them with arrogance. They are timorous, careleſs, and indolent; fond of the cuſtoms of their anceſtors, and but little inclined to alter their faſhions, or to admire the curioſities of foreign nations. Their minds are as calm as their heaven, which changes but twice a year, and that inſenſibly from rain to fair weather, and from fair weather to rain. In ſhort, ſays Loubiere, they have naturally the command of their paſſions, which we, with all our religion and philoſophy, find ſo difficult to conquer. When they would profeſs the ſincereſt friendſhip, they do it by drinking out of the ſame cup.

They are fond of their wives and children, and are as well beloved by them. Their children are ſaid to be of a ſweet temper, and ſo engaging, that even the king makes it a great part of his diverſion to play with them till they are about ſeven years old; but when they loſe their childiſh innocence, he diſmiſſes them for others.

Their principal food is rice and fiſh. The ſea affords them ſmall oyſters, turtles, and lobſters, and ſeveral excellent kinds of fiſh unknown in our ſeas: they have likewiſe great plenty of river fiſh, particularly eels; but they do not much admire them, for they prefer dry ſalt-fiſh, even though it ſtinks, to that which is freſh; and they are very fond of balachaun made of ſmall fiſh reduced to a maſh, which has been already deſcribed in treating of Tonquin. They have no averſion to rats, mice, lizards, and locuſts, any more than the Chineſe.

A Siameſe will live a whole day upon a pound of rice, which may be bought for a farthing, and as much ſalt-fiſh as he can purchaſe for a farthing more, and be extremely well ſatisfied; and as a pint of arrack is not worth more than two-pence, the meaneſt of the people are under little care about their ſubſiſtance, and nothing is heard in their houſes of an evening but ſinging.

They milk the female buffaloe, and this milk it is ſaid affords more cream than cows milk; but they make little butter, and no cheeſe: they ſeldom eat fleſh; but when they do, chooſe the inteſtines, and what is moſt diſagreeable to us. The land-fowls, and all butcher's meat, is dry and tough, and the Europeans who reſide at Siam ſoon leave off eating them.

Their ordinary drink is river water, for there are few ſprings in the flat country, which is moſt inhabited, and they are fond of drinking it perfumed. When the waters retire the rivers are filled with mud, and the water cannot be drank without ſtanding three weeks or a month in jars; for

for if it be drank when firſt taken up, it occaſions dyſenteries and other diſorders. The water drank by the king of Siam is taken out of a great ciſtern that ſtands in the fields, and is conſtandy guarded by ſoldiers: there is alſo a lake about three leagues in circumference, which they call the Rich Sea, where the rain-water is preſerved, of which the king ſometimes drinks; for it being deep, the waters are accounted wholeſome.

The Siameſe drink tea at their entertainments, and uſe it alſo as a remedy againſt the head-ach: they ſip it with little bits of ſugar-candy in their mouths, and put no ſugar into the diſhes. The Siameſe poor make no ſcruple of drinking wine or ſtrong drink, though it is forbidden by their religion; but their country affords no ſtrong liquors except arrack and toddy. As they are exceſſively fond of fruit, they eat it all day long.

A perſon's ſtanding before a man of quality, or before his maſter, is eſteemed inſolent; and therefore ſlaves and people of inferior rank ſit upon their heels, with their heads a little inclined, and their joined hands lifted up to their foreheads. In paſſing by a ſuperior they bend their bodies, joining their hands, and lifting them towards their heads in proportion to the reſpect they would ſhew. When an inferior pays a viſit, he enters the room ſtooping, proſtrates himſelf, and then remains upon his knees, ſitting upon his heels without ſpeaking a word, till he is addreſſed by the perſon whom he viſits; for he that is of the higheſt quality muſt always ſpeak firſt. If a perſon of rank viſits his inferior, he walks upright, and the maſter of the houſe receives him at the door, and waits on him ſo far when he goes away, but never farther.

The higheſt part of the houſe is eſteemed the moſt honourable, and no perſon cares to lodge under another's feet. The Siameſe indeed have but one ſtory, but the rooms riſe gradually, and the innermoſt, which are the higheſt, are always the moſt honourable. When the Siameſe ambaſſador came to the French court, ſome of his retinue were lodged in a floor over the ambaſſador's head; but they no ſooner knew it, than they were ſtruck with the greateſt conſternation, and ran down tearing their hair at the thoughts of being guilty of ſo unpardonable a crime.

The right hand is eſteemed the moſt honourable at Siam, as well as in Europe; and the firſt place in a room is that oppoſite to the door, which is always offered to ſtrangers. A perſon's coming unexpectedly into company frequently occaſions a general remove, for every one muſt ſit in a place ſuitable to his quality; and the poſture is alſo different according to the reſpect they are to pay. In ſome caſes they may ſit upright, in others their bodies muſt bend a little; ſometimes they may ſit croſs-legged, but one much inferior to the company muſt remain on his knees, reſting on his heels. Before the king they fall upon their knees, bowing their faces to the ground, and lie in that poſture, reſting upon their elbows. In ſhort, a man would be cudgelled in any company who ſhould not obſerve the poſture preſcribed him.

The Siameſe never allow of the familiarity practiſed by gentlemen in Europe. Eaſineſs of acceſs and affability to inferiors is in that part of the world thought a ſign of weakneſs, and yet they take no notice of ſome things which would be looked upon as ill breeding among us; ſuch as belching in company, which no man endeavours to prevent, or ſo much as hold his hand before his mouth. They have an extraordinary reſpect for the head, and it is the greateſt affront to ſtroke or touch that of another perſon: nay, their cap muſt not be uſed with too much familiarity; for when a ſervant carries it, it is put on a ſtick and held above his head; and when the maſter ſtands ſtill the ſtick is ſet down, it having a foot to ſtand upon. They alſo ſhew their reſpect by lifting their hands to the head; and therefore, when they receive a letter from any one for whom they have great reſpect, they immediately hold it up to their heads, and ſometimes lay it upon their heads.

The perſons who are intruſted with the education of youth, teach them to expreſs all the modeſty and ſubmiſſion imaginable towards their ſuperiors, and particularly not to be too noiſy or talkative; for in the king's court, and in the houſes of the great, a profound ſilence is almoſt conſtantly obſerved. They are ſo cautious of ſaying any thing that is ſhocking, that they will not relate a known truth which they apprehend will diſguſt any of the company. They rather ſeem deſirous to learn and be inſtructed by their ſuperiors, than rudely to offer their opinion without being in a manner compelled to give it. They are ſo far from inſulting any for their ignorance, that they think it very ill manners to pretend to be wiſer than the company. In ſhort, they, like the Chineſe, ſeldom ſpeak in the firſt perſon: thus the words I and You ſeem to be baniſhed from converſation. When they ſpeak to women or their ſuperiors they always uſe ſome reſpectful epithet, particularly in their addreſſes to the ſofter ſex; they not only ſtile her lady, or princeſs, but, let her be ever ſo old, add young to it; for they imagine that none of the ſex can with patience think themſelves aged, or, which is the ſame thing, ſubject to the infirmities that render them diſagreeable to the other.

As to their manner of travelling, they not only ride on the elephant, but on the ox and the buffaloe; yet uſe neither horſes, aſſes, nor mules; however, the Mahometans have ſome camels, which are brought from other countries. The male elephants are trained for war, and the females chiefly uſed for carriage. Every man is at liberty to hunt elephants, and to take and uſe them, but not to kill them.

Their more commodious method of going abroad is in a kind of chair, placed on a ſort of bier carried by four or eight men on their ſhoulders, one or two to each end of the poles, while others run by to be ready to relieve them. Some of theſe chairs have a back and arms, but others are only encompaſſed with a rail about half a foot high; they are generally open at top, and the Siameſe ſit croſs-legged on a cuſhion at the bottom. The king only ſuffers a few of the great men to ride in chairs. The Europeans are allowed the uſe of palanquins, or couches covered with a canopy, carried on mens ſhoulders.

SECT. IV.

Of the Marriages of the Siameſe. The Ornaments of the Bride. The Cuſtoms in relation to Divorces. The Induſtry and Chaſtity of the Wives. Their Funeral Ceremonies different according to the Circumſtances of the Relations.

IF a perſon intends to marry his ſon into any family, he employs ſome woman to make the propoſal to the girl's relations; and if it be accepted, an aſtrologer is called in to calculate the nativity of the young man and his miſtreſs, to know if it will prove a happy match, and to aſk him whether the family they marry into is rich; for the tyranny of the government induces every one to conceal his wealth. Upon the aſtrologer's anſwer both ſides form their reſolutions; and if the parents be agreed, the youth is allowed to viſit his miſtreſs three times, and make her a preſent of betel or fruit. The relations are preſent at the third viſit, and then the lady's portion is laid down; and the marriage being looked upon as complete, preſents are made them by their friends. Soon after they proceed to conſummation, without performing any religious ceremony, for the talapoins are prohibited by their law from being preſent at theſe ſolemnities: however, ſome days after they go to the houſe where the wedding is kept, and ſprinkling the married couple with holy water, repeat ſome prayers for their happineſs.

The wedding, as in other parts of the world, is attended with mirth and feaſting, and perſons are hired to dance and divert the company; but neither the married couple nor their relations ever dance upon theſe occaſions. The entertainment is made at the houſe of the bride's father, where the bridegroom has an apartment built on purpoſe; and there the new-married couple remain ſome months, and then remove to a dwelling of their own.

The ornaments worn by the daughter of a magiſtrate at her wedding are a circle of gold like that worn by the magiſtrate on his cap of ceremony; her cloaths are richer than ordinary; ſhe has more rings than uſual on her fingers, and her pendants are of greater value.

They are allowed more wives than one; but this liberty is ſeldom taken, unleſs by the great men, and that is ſaid

to be chiefly done for ſtate. When they have ſeveral wives one is intitled the chief or great wife, and the others are purchaſed and attend upon her. The children of their inferior wives call their father lord as well as father; and the other only call him father. None but the children of the chief wife inherit the huſband's eſtate; for thoſe of the inferior wives are eſteemed ſlaves, and both they and their children may be ſold by the heir.

The wives of the Siameſe work for their huſbands, and maintain them all the time they are in the king's ſervice, which is at leaſt ſix months in the year; and ſometimes they are compelled to ſerve the prince two or three years together. The liberty of divorce is allowed; but it is only in the huſband's power to divorce his wife, and then he reſtores the portion ſhe brought: the children are equally divided between them, unleſs there be an odd one, which falls to the woman's ſhare; for ſhe takes the firſt and third and all the odd numbers, and the huſband the reſt. After the divorce they are both at liberty to marry again, on the very day if they think fit. But though theſe divorces are allowed, the people think them very diſreputable.

The huſband has an abſolute authority in his family, and may ſell all his wives and children except the chief; and after his death the widow has the ſame power, except the children of the even number, which the father's relations may oppoſe her ſelling.

There is no ſcandal in unmarried people, who have the diſpoſal of themſelves, lying together. The women of Pegu who live at Siam offer themſelves to foreigners, and continue faithful to them while they remain there. They are proud of being pregnant by a white man, and are not the leſs eſteemed on that account; but Loubiere obſerves, that the Siameſe women will not eaſily admit foreigners to their bed.

Though the Siameſe women manage all the trade, and enjoy perfect liberty, it is ſaid they will not admit viſits from men, and are more jealous of their huſband's honour than the huſbands themſelves. The wives of people of diſtinction ſeldom ſtir abroad but to the temples, or to make a family viſit. This does not proceed from their being reſtrained by their huſbands, but from their placing their glory in their chaſtity, which renders them extremely cautious of giving the leaſt colour for ſcandalous reports: and it is obſerved of the Indian women in general, that they had rather die by the hands of their huſbands, than be taken priſoners by their enemies.

Though this is the character of the women in general, there are inſtances of ladies who have hazarded their lives to gratify a laſcivious diſpoſition; but this principally happens among the wives of the great, or the royal concubines, who are perhaps ſlighted and neglected by their tyrants. However, the Indian princes ſeldom fail to puniſh with the moſt cruel death thoſe who prove unfaithful to their bed, though the unhappy creatures, perhaps, whom they have thus impriſoned in their ſeraglio, are hardly known to them; and, as a late author juſtly obſerves, only ſeek to gratify that propenſity heaven has implanted in them, and to propagate their ſpecies in a way which they cannot be ignorant nature deſigned they ſhould. Loubiere mentions one of theſe unhappy creatures, whom the king ordered to be thrown to the tygers; and on their refuſing to ſeize on her, his majeſty offered her a pardon; but ſhe choſe to die rather than live any longer under his tyranny: upon which the tygers were ſet upon her, and he had the inhumanity to ſtand and ſee her torn to pieces. The penances of the ſeraglio muſt ſurely be great, when theſe unfortunate creatures rather chooſe to be devoured by wild beaſts than to endure them. The king, it ſeems, is leſs cruel to the gallant, who frequently atones for his crime by ſuffering the baſtinado.

When a Siameſe dies, his corpſe is immediately put into a coffin lackered and gilt, which is placed upon a table in the houſe, till the preparations are made for the funeral, and the head of the family can attend the ſolemnity: in the mean while they burn perfumes, and ſet up lighted tapers before it. The talapoins alſo range themſelves round the ſides of the room every night, and entertain the family with hymns and diſcourſes ſuitable to the occaſion.

Mean while a ſquare ſpot of ground near ſome temple is incloſed with a bamboo pale, on which are hung painted and gilt paper, made by the family in the form of houſes, goods, animals, and the like. In the middle of the ſquare is erected the funeral pile, which, beſides other wood, has yellow ſanders, lignum-aloes, and other ſweet woods, according to the ability of the family; and the pile is raiſed of earth as well as wood to a great height.

The body is always carried to the pile in the morning, with the ſound of ſeveral kinds of inſtruments, attended by the family of the deceaſed; both men and women are cloathed in white, and wear white veils, all the way uttering their lamentations: theſe are followed by their friends and relations. Being got to the place, they take the body out of the coffin, and lay it on the pile: the talapoins ſing doleful hymns for about fifteen minutes, and then retire, it being unlawful for them to be preſent when the ſhews and plays are exhibited, as they always are on theſe occaſions, when there is likewiſe a kind of feſtival. The relations of the deceaſed ſeem not at all moved by theſe repreſentations, but continue uttering their lamentations.

A ſervant belonging to a talapoin ſets fire to the pile about noon, which having burnt about two hours, is utterly conſumed; but the painted papers, which ſhould have been burnt with the deceaſed, are frequently ſeized by the talapoins, in order to be ſold at ſome ſucceeding funeral, not regarding the occaſion the deceaſed is ſuppoſed to have for them in the other world. All the company are entertained by the family during three days, and they alſo beſtow alms on the talapoins of the convent near which the funeral is ſolemnized, and are likewiſe at the expence of fire-works. This can only be underſtood of the funerals of the great; but when a ſon is not in circumſtances to perform all this at the time of his father's deceaſe, he cauſes the body to be buried; and if he afterwards grows rich, he will ſometimes have it dug up to make his father a noble funeral, and to have the corpſe burnt with all thoſe ceremonies which, they imagine, beſt ſhew their reſpect to his memory.

The remains of the corpſe that is unconſumed is put into the coffin, and interred under one of the pyramids that ſtand about the temple; and ſometimes they bury with it precious ſtones and other treaſure. Theſe pyramids ſerve inſtead of tombs, but have no epitaphs upon them; and the pyramids are ſo ſlightly built, that they ſeldom laſt above one century. Theſe burying-places are ſaid to be held ſo ſacred, that none dare touch the treaſure depoſited there; but Loubiere aſſerts, that he has known people borrow files of the Europeans to cut the iron bars which ſecure them.

Perſons of quality uſually erect a temple on purpoſe near the place where they deſign to have their tombs; and thoſe who cannot be at that expence, preſent ſome idol to a temple ready built. Thoſe who are poor bury their parents, as hath been already hinted, without being at the expence of a funeral pile; but if they cannot afford to hire the talapoins to ſing the uſual hymns, which is the loweſt degree of reſpect they can pay to their deceaſed parents, they expoſe them on a ſcaffold to be devoured by birds of prey.

Thoſe who die for their crimes, children ſtill-born, women who die in childbed, ſuicides, and others who come to an untimely end, are never buried, it being thought that they have drawn the judgment of heaven upon them by their crimes.

SECT. V.

Of their Languages and their Skill in the Sciences.

THERE are two languages ſpoken in this country, the Siameſe and the Baly. The Siameſe tongue has thirty-ſeven letters, and the Baly thirty-three, all of which are conſonants. The vowels and diphthongs in both languages have peculiar characters, ſome placed before the conſonant, and others after; ſome above, and others underneath; and theſe vowels and diphthongs, thus variouſly diſpoſed, are always pronounced after the conſonant. Loubiere thinks it probable that, like the Hebrews, they at firſt wrote without vowels, and afterwards proceeded to mark the conſonants with ſtrokes foreign to their alphabet, like the points which the modern Jews have added to the Hebrew.

The

The Siamese tongue chiefly consists of monosyllables, that have neither conjugation nor declension. The Baly is a dead language, known only to the learned: yet the terms of their religion and laws, the names of offices, and all the ornaments of the vulgar Siamese tongue, are taken from the Baly; and in this language too their best songs are composed.

As the Siamese have not the invaluable art of printing, they have but few books. Their histories do not go far back, and those they have are filled with fables, and deserve little credit.

When their children are seven or eight years of age they send them to school to a convent of talapoins or priests, where they assume the talapoin's habit, which they can quit at pleasure. They subsist upon the food sent them by their friends; and those who belong to families of distinguished rank have a slave or two to attend them. They are there taught reading, writing, and arithmetic. They also learn the Baly tongue, with some principles of morality and the mysteries of their religion; but are not instructed in history, the laws, or any speculative science.

They write, as in Europe, from the left hand to the right; and their works, like those of other eastern nations, abound in lofty figures and metaphorical expressions.

As to arithmetic, they have, like us, ten characters, one of which is a cypher; and they likewise reckon by units, tens, hundreds, and thousands.

They are unacquainted with the charms of oratory, and are said to have no orators among them; for there are none whose profession or interest lead them to that study, every man pleading his own cause without a counsellor. His allegations and proofs are taken down by a register, after which the magistrate determines upon them. The making of set speeches is not at all in fashion at Siam; for it is ill manners to address a superior in any terms, though they are ever so respectful. When a person appears before a superior, he must only answer such questions as are proposed to him. Even the compliments and words of ceremony are, like those of the Chinese, all prescribed: so that a man of wit has no room to display his talents.

Their poetry consists in a certain number of syllables properly ranged, to which, it is said, they add rhymes: but their poems are extremely difficult to translate. Some of their songs are historical, others contain rules of morality, and others are on subjects of love and gallantry.

They have little idea of philosophy; nor do they study the laws of their country, till they are preferred to some post, and then a copy of instructions is put into their hands, as rules to be observed in the discharge of their office.

Their astronomy is very imperfect, for they have no knowledge of the true system of the world; they, as well as the Chinese, imagine that eclipses are caused by some dragon, who stands ready to devour the sun and moon; and make a great clattering with pans and kettles to frighten him away. The earth they believe to be square, and of a vast extent, and that at each corner there is a solid basis on which rests the arch of heaven.

Neither the king nor any of his subjects will undertake any affair of importance without consulting their astrologers, nor will he venture to stir abroad if they declare it to be an unlucky hour: but if they deceive the king when he consults them, he orders them to be bastinadoed, not as impostors, but for their carelessness.

They are also governed by presages and omens. Thus the howling of wild beasts and the cries of apes are ominous; and a snake's crossing the way, or any thing falling down without any apparent cause, is sufficient to fill them with terror.

They have very little skill in medicine; the king has Chinese, Peguans, and Siamese physicians; but when any of them administer a remedy to his majesty that has not the promised effect, he orders him to be well drubbed. They have not the least skill in surgery, and are forced to make use of European surgeons when they would be let blood, which has been but lately practised amongst them. The physicians seldom vary their receipts, but follow those they received from their ancestors, by which means they cure many distempers; but when the disease is too strong for them, they always pretend that the patient is inchanted. The physicians sometimes make use of purging, but never of vomiting: they cure most diseases by sudorifics, and are said to advise bathing in fevers; but it is observable, that they never allow the patient to eat any thing but conge, or rice-gruel, till his disease has left him; and this regimen may possibly conduce to their recovery more than all the remedies they prescribe.

The principal diseases of the country are dysenteries and fluxes, to which foreigners are much more subject than the natives; but agues, the gout, the stone, phthisic, scurvy, and dropsy, are seldom heard of here, or in any other hot countries. The small-pox, however, frequently proves very fatal, and is almost as mortal as the plague in other countries: to prevent infection, they bury those that die of this loathsome disease, but three years after dig up the remains of their bodies, and burn them on their funeral pile.

Notwithstanding the heat of the country, they keep lying-in women continually before a great fire for a whole month, in order to purify them, and during this time they are almost suffocated, there being only a hole in the roof to let out the smoke. At their first sitting up they return thanks to the fire for purifying them, and the meat with which they treat their friends is, on these occasions, offered to the fire. They will not suffer the lying-in women to eat or drink any thing that is not hot.

They have no greater skill in music than in the other sciences: they neither sing nor play by notes, nor do they know what is meant by playing in parts. Most of their instruments are very harsh and disagreeable to the ear: they beat upon small ill-sounding drums, and have a trumpet that makes a still more disagreeable noise: they have some shrill hautboys, and a little disagreeable violin with three strings: they likewise beat on brass basons; and when the king goes out, and upon other solemn occasions, all these sound together, and the noise is said to be not disagreeable on the river.

Their calendar has been twice regulated by able astronomers, who have taken two remarkable epochas; the most ancient is the 545th year before the birth of our Saviour, which they say commences from the time in which their saint Sommona Codom was translated to heaven. The last epocha commences from the year of our Lord 638.

The year is divided by them into three seasons; the cold months, which answer to those of December and January; the little summer, or the beginning of heat, which is their spring, and answers to February, March, and April; and the great summer, or the time of their great heats, which includes the other seven months, when the heat strips some of their trees of their leaves, as the cold does ours.

They begin the year at the first moon of November or December; their months for the most part consist of thirty days, but they have no names for their months, but reckon them in order, as the first, second, and third month: they have likewise no word to express week; but, as in Europe, call the seven days by the names of the planets.

Their days are divided into twenty-four hours, as in Europe, and they have four watches for the night, the last of which ends at broad day-light. They have no clocks; but as the days are always of an equal length, they easily know the hour by looking at the sun. In the palace they have a hollow copper vessel with a little hole in it, which being set upon the water, lets it in by degrees, and it sinks when the hour is out. This enables them to distinguish the hours of the night, which they make known by striking on copper basons.

SECT. VI.

Of the City of Siam, and its Temples. Of the Streets, Houses, and their Furniture.

THE city of Siam, the metropolis of the kingdom of the same name, is sometimes called Odioa, and by the natives Siyothiya. It is situated on the river Menan, which signifies the sea of rivers, in about fourteen deg. thirty minutes north latitude, and in the hundred and first

firſt degree of eaſt longitude from London. It is nine miles in circumference, and being encompaſſed by ſeveral branches of the river, is rendered almoſt an iſland, only towards the eaſt there is a cauſey to paſs out of the town. By land it is ſurrounded by a wall fortified with towers, and is called by the natives the admirable, and the excellent city, becauſe they believe it impregnable; and indeed it is ſaid to have reſources within itſelf ſufficient to ſupport a ſiege of many months againſt an army fifty thouſand ſtrong; and has an infallible ſuccour which never fails; this is the river overflowing every ſix months; for there are no lines which it will not carry off, nor army which it will not oblige to retire. But the city itſelf does not take up above a ſixth part of the ground within the walls, for there are between two and three hundred pagodas, ſurrounded by as many convents of talapoins. Round theſe temples are alſo their burying-places, with pyramids erected over them, which, with their ſpires, and the glittering towers of the pagodas, form a very agreeable proſpect.

The riches of the country are chiefly diſplayed in theſe pagodas and the prince's palace, by the workmanſhip in gold with which they are adorned, by their prodigious bulk, their admirable ſtructure, and incredible number of jewels.

The magnificence of the pagodas ſurpaſs every thing of the kind to be ſeen in the Indies. The moſt celebrated of theſe is that in the king's palace. While the ſpectator is ſtartled at ſeeing on one ſide of the portal an horrible monſter, and on the other a cow, his eyes and imagination all at once loſe ſight of the objects, and are dazzled with the ſplendor of the walls, the cieling and pillars, and of an infinite number of figures ſo properly gilt, that they ſeem covered with plates of gold. Having advanced ſome ſteps, a ſmall elevation appears in the form of an altar, on which are four figures ſaid to be of maſſy gold, nearly as big as the life, ſitting croſs-legged; beyond it is a kind of choir, where there is the richeſt pagod or idol in the kingdom. This ſtatue is about forty-five feet in height, and being in a ſtanding poſture, touches with its head the vault of the choir. But what is moſt aſtoniſhing, it is ſaid to be of ſolid gold. This thoſe who accompanied the French ambaſſador were told, and this they believed; but it is only finely gilt. It is alſo pretended, that this rich coloſſus was caſt in the place where it ſtands, and that afterwards they built the temple about it. On its ſides are others of leſs value, which are alſo gilt, and enriched with jewels.

At an hundred paces from the palace is another temple, which, though not ſo rich, is a regular and beautiful ſtructure, adorned with five cupolas, of which that in the middle is larger than all the reſt; the roof is covered with gilt pewter. Forty-four pyramids ſurround and adorn the temple; theſe are placed in three rows, and in different ſtories. In the circuit which incloſes theſe buildings, all along the galleries, are above four hundred clay ſtatues gilt.

The principal pagoda in the city contains near four thouſand idols all guilt, beſides the three principal ones falſely ſaid to be of maſſy gold. That which paſſes for the ſecond is ſix leagues from the city, and is only open for the king and the prieſts; the people remain proſtrate before the gate, with their faces to the earth. The third is in the Dutch iſland, where the principal idol is ſurrounded by above three hundred others of different dimenſions, and in all manner of poſtures.

The ſtreets of this city are large and ſtraight, ſome of them are even paved with brick, and have canals cut through them; ſo that there are few houſes to which there is not acceſs with a boat. The convenience of tranſporting their effects, and landing them quite from the ſea at the magazines, and the other advantages of the kingdom, have drawn traders thither from all parts of the world. Over theſe canals are many arched bridges built of brick or ſtone, and ſome of wood, on which account this city has been compared to Venice. Moſt of their houſes are built with bamboos, and erected upon pillars of the ſame wood thirteen feet above the ground, the lower part underneath the houſe not being of any uſe.

Their floors are alſo made of ſplit bamboos, and covered with mats; their walls are of the ſame materials. They have no glazed windows; their roofs are ſhaped like thoſe of a barn, and inſtead of ſtairs they aſcend by a ladder; but in the time of the inundation make uſe of boats, every man having one tied at the door, for they are all very expert at rowing. They have neither chimneys nor hearths, for they ſeldom light a fire but to dreſs their meat, and then a baſket of earth ſerves them inſtead of a hearth, and a hole in the roof inſtead of a chimney.

Theſe buildings are not contiguous, nor do all the family, if it be very large, dwell under the ſame roof; but every man's ground is paled in with bamboo, and within this incloſure are ſeveral ſmall tenements erected on pillars, according to the quality of the perſon, and the number of his dependants and ſlaves. Their cattle are alſo kept in upper rooms to preſerve them during the inundation. A few houſes are built by foreigners with brick, and the king has erected others of the ſame ſort for the accommodation of foreign ambaſſadors. The Chriſtians, Mahometans, and Chineſe, inſtead of building their houſes on pillars, raiſe the ground on which they build high enough to be ſecure from the annual inundation.

Neither the palace, nor any private houſes, exceed one ſtory high, yet there is frequently a great difference between the height of the front and that of the inward rooms, both in the floors and the roofs. The firſt or outward room is always the loweſt, and from this you aſcend by two or three ſteps to another, then to a third, and ſo on in a direct line, the roofs riſing proportionably.

The palaces of the great officers of ſtate have uſually three floors and roofs riſing one higher than the other; and in that of the king there are at leaſt ſeven. The entrance to the firſt room is by very ſtraight ſtairs, and a narrow door to the right or left of the building.

As to their furniture, ſome have couches covered with a mat, only broad enough for one perſon to lie on; for they all lie ſingle, except the poor, who ſleep together on the floor. Theſe beds, or couches, have but one curtain, which is drawn before them, that the people may not be ſeen ſleeping. Inſtead of a feather-bed they make uſe of a mattreſs ſtuffed with cotton, and have alſo a pillow and one ſheet to lie upon, with a quilt over them.

As they ſit upon the ground they have little lackered tables, with a border round them, but no feet; and every man at his meals has one to himſelf. They have alſo cabinets, cheſts of drawers, China-ware, copper, and earthen veſſels.

Theſe are the principal furniture of their houſes, unleſs we reckon their tools; for as there are no particular trades, every family has a ſet of working tools; but there being no iron nails, all the beams, rafters, boards, and wooden work are faſtened together with wooden pins.

Their bricks, with which ſeveral of their temples, palaces, and pyramids are built, are ſaid to be tolerably good; and their cement greatly exceeds ours, for a wall that is plaiſtered with it looks like poliſhed marble; but as their buildings are without foundations, none of them will ſtand long.

SECT. VII.

The King's Palace, his Guards, Elephants, and Horſes. His Inſolence and tyrannic Power; his Revenues, and the Manners of his Court.

THE perſons who accompanied the French ambaſſador ſay, that the king's palace, both within and without, is even more ſplendid than the temples. It is ſituated on a ſmall eminence, and extends to the banks of the river. Though in extent it may be compared to a city, all its towers, pyramids, and elevated buildings are gilt. The apartments of the king and queen contain inconceivable riches; gold and precious ſtones are ſaid to ſhine on all ſides.

This edifice is on the north ſide of the city; it is built with brick, and ſurrounded by a treble incloſure, with large courts between each wall. The inner court, which contains the king's apartments, includes ſeveral gardens, adorned with groves and canals, in which are airy rooms,

each encompaſſed by a low wall, and the roof ſupported by pillars; in theſe rooms ambaſſadors are entertained. The Siameſe fall proſtrate on the ground whenever they enter or leave this inner court, and never paſs by the gates of the outer court of the palace but at an awful diſtance.

The gates of the palace are uſually kept ſhut; and if any one deſires admittance, the officer who commands the guard is informed of it, and ſuffers no perſon to enter armed, or who has drank any ſpirituous liquor, and therefore he ſmells the breath of every one who enters. Between the two firſt walls ſtand a guard of unarmed ſoldiers, who alſo ſerve the king in the office of executioners: theſe amount to about ſix hundred. They have arms ready for them in the palace; but they are never truſted with them, except on extraordinary occaſions.

The horſe-guards are compoſed of the natives of Laos and Meen, and are divided into two bodies commanded by their reſpective officers. The king has likewiſe another guard of horſe, compoſed of one hundred and thirty gentlemen, two troops of which, conſiſting of thirty men each, are natives of Indoſtan. Another troop conſiſts of twenty Chineſe Tartars, armed with bows and arrows; and two other troops of Raſboots, who are natives of India Proper, and conſiſt of twenty-five men each. All the horſe-guards attend the king when he goes abroad, but none are ever ſuffered to enter the gates of the palace. The king finds every trooper his horſe and arms.

After mentioning the guards, it will not be improper to take notice of the king's elephants and horſes, which have their ſtables within the firſt incloſure, on entering the palace. Every elephant has ſeveral men to look after him, and is treated with more or leſs honour according to the name he bears, which is given him by his majeſty. They never ſtir out without their trappings and ornaments; and are ſo tractable and ſagacious, that the people imagine them animated by illuſtrious ſouls that had formerly inhabited the bodies of great men. The white elephant, which they pretend is the only one in the world, they believe to have the ſoul that once reſided in the body of ſome prince, and for this reaſon the king never rides upon him. He is not entirely white, but of a ſort of fleſh colour, and therefore ſome call him the white and red elephant. They have almoſt as much reſpect for a white horſe as for an elephant of that colour, and theſe are the favourites of the king. Next to the white elephants they eſteem thoſe that are black, they being the ſcarceſt, except white; and they frequently colour them, when they are not naturally ſo black as they would have them. It ought not to be omitted that there is ſeldom more than one white elephant, and that he is ſerved in gold plate, and treated as the ſovereign of the reſt of his ſpecies.

The king's barges and gallies are kept in an arſenal on the ſide of the river oppoſite to the palace.

Haughtineſs, deſpotic power, and an abſolute government, are the only marks by which the king of Siam chooſes to be diſtinguiſhed from other ſovereigns. The reſpect he requires from his people reaches almoſt to adoration; and the poſture in which they muſt appear in his preſence is a teſtimony of it. Even in the council, which ſometimes laſts four hours, the miniſters of ſtate and the great officers are continually proſtrate before him. They never ſpeak to him but on their knees, with their hands raiſed to their heads, making at every moment profound reverences, and accompanying their diſcourſe with pompous titles, celebrating his power and goodneſs. They receive his anſwers as oracles, and his orders are inſtantly executed without the leaſt oppoſition. When he goes abroad all are obliged to keep within doors. His ſubjects are ſlaves, who poſſeſs nothing but what belongs to him. Even nobility is not hereditary; it only conſiſting in honours and employments, which the prince beſtows, and whenever he pleaſes may withdraw.

His revenues ariſe both from lands and goods: he has a quarter of a teal, or about nine-pence per annum, for every forty fathom ſquare of all the cultivated lands he lets out to his ſubjects. He likewiſe receives one teal, or three ſhillings per annum, of each boat for every fathom it is in length; and receives not only the cuſtoms on goods exported and imported, but alſo a certain ſum for the ſhip itſelf, according to its capacity; he has beſides a duty upon arrack, and lays an annual tax on all the moſt valuable fruit-trees, as cocoa-trees, durions, mangoes, oranges, and thoſe that afford betel. He has alſo demeſne lands and gardens in moſt parts of the kingdom, which are cultivated by his ſubjects, without any expence to himſelf, and ſupply the court with proviſions. Another part of the revenue ariſes from the preſents he receives from his ſubjects, and what falls to him upon the death of his officers: the fines and confiſcations he receives on the condemnation of criminals is another valuable article; as is alſo the ſix months ſervice paid him by the people, for which he frequently compounds; for the rich are willing to avoid performing this drudgery. Beſides all this the king, as will hereafter be ſhewn, engroſſes moſt part of the trade of the kingdom.

However, all that part of his revenue which he receives in money does not amount to more than ſix hundred thouſand crowns; but what he receives in kind, and by the produce of his demeſne lands, for the proviſion of his houſhold, keeping his ſlaves, and his elephants, is prodigious; and, beſides, all his officers maintain themſelves, as do alſo his troops: he has likewiſe the ſervice of one-half of his ſubjects annually, without any expence to himſelf; and he ſometimes levies taxes for the ſupport of ambaſſadors, the erecting of public buildings, and on other extraordinary occaſions.

From theſe ſeveral articles he receives an immenſe revenue: hence the riches of the royal treaſury are worthy of a great king; but the vaſt collection of gold, ſilver, and jewels depoſited there has been accumulated by a long ſucceſſion of monarchs, the Siameſe valuing their kings in proportion as they have enriched the treaſury, while at the ſame time they are not permitted to touch it, whatever neceſſity they may have for it.

In ſhort, the principal wealth of the kingdom is depoſited in the royal treaſury, the palaces, and the temples; and there is none rich but the king. Count Forbin ſays, that the ſituation in which he found the perſons who compoſed the court of Louvo ſurprized him extremely: they were ſeated in a circle on mats of ſlender oſier; they had only one lamp before them, and when one of them wanted to read or write, he took the end of a yellow candle out of his pocket, and lighting it at the lamp, put it on a piece of wood, which, turning from ſide to ſide on a pivot, ſerved them for a candleſtick.

Forbin himſelf had the honour to be made lord-high-admiral and general of the forces of his Siameſe majeſty; but his fortune ill ſuited the pompous titles beſtowed on him. They gave him a houſe as plain as it was little, whither they ſent thirty-ſix ſlaves to ſerve him, and ſix elephants. The maintaining of his houſhold coſt him only five ſols a day, ſo temperate are the men, and ſo cheap the proviſions. He himſelf had his table at the miniſter's; his houſe was furniſhed with a very few inconſiderable moveables; to which were added twelve ſilver plates and two ſilver cups, all very thin; four dozen of cotton napkins, and two yellow wax-candles a day.

The king uſually ſhows himſelf to his courtiers from a window, which looks into the hall of audience, at the entrance of the inward palace, and is ſo high, that the French ambaſſador was forced to ſtand upon three ſteps to deliver the king's letter, which was preſented in a gold cup, as every thing elſe is which he receives from his officers.

Within this hall are conſtantly forty-four pages, or young gentlemen divided into four companies under their reſpective officers. Theſe proſtrate themſelves at the time of audience, half on the right hand, and half on the left. It is their office to diſpatch the king's orders to his officers, and they have alſo ſeveral employments within doors: ſome ſerve his majeſty with betel, others take care of his books, and others read to him.

He has one officer, who never proſtrates himſelf before him, but has his eyes conſtantly fixed upon him, to receive his orders, which he underſtands by certain ſigns, and by ſigns alſo communicates them to the officers who wait without.

All the officers of the king of Siam's bed-chamber are his women; for none elſe are admitted there. They make his bed and dreſs him, but he alone puts on his cap; for none muſt touch his ſacred head, or put any thing over it. His women alſo dreſs his proviſions, and wait on him at table. The meat is carried in to the eunuchs, who deliver it to the women; and it is ſaid the very ſalt and ſpices are put in by weight.

Though the women alone dreſs his majeſty, there are gentlemen of his wardrobe, the moſt conſiderable of whom is the perſon who has the care of the king's cup.

The queen is generally one of the royal blood; and the French ambaſſador ſays, that in the year 1688, when he was there, the queen was the king's daughter by his own ſiſter, and that the reſt of the women treated her as their ſovereign. She had the command of the black and white eunuchs, who were not above ten or twelve in number, and puniſhed both them and the women, as ſhe thought proper. The queen has her elephants and her barges to attend her when ſhe goes abroad, but her chair is incloſed with curtains, through which ſhe can ſee every thing, without being ſeen, and all the people get out of the way, or proſtrate themſelves, when ſhe paſſes by. She has alſo her magazines, her ſhips, and treaſure diſtinct from the king's, and carries on trade on her own account.

The queen's ſon does not always inherit the crown; but uſually the king's eldeſt ſon by the firſt woman that brings him a child, and if his majeſty does not think him qualified to ſucceed him, he has the power of appointing another.

When the king goes abroad he is either carried upon his elephant, or in a chair, and is ſeldom ſeen on horſeback, though he keeps two thouſand horſes in his ſtables. Great care is taken to prevent his being ſeen on foot, he therefore comes immediately out of his apartment, either from ſome terrace or a window of a proper height, to ſeat himſelf on his elephant, and is never lifted upon him. The king's ſeat on his elephant is uncovered, and open before, and therefore when he ſtands ſtill, he is ſheltered from the ſun by a man on foot, who holds a high umbrella. The man who guides the elephant ſits on his neck, and governs him by pricking him on the head with an iron inſtrument. But though he is ſeldom ſeen in the city, he frequently hunts at Louvo, when his concubines, it is ſaid, run on foot by him; and he has alſo a guard of two or three hundred men, who march before him to clear the way, and if he ſtops, all the company inſtantly proſtrate themſelves on the earth.

It is an eſtabliſhed rule, that no officer preſume to enter into his majeſty's preſence without leave. The great officers are allowed to viſit each other only at weddings and funerals, and then muſt ſpeak aloud, and in the preſence of a third perſon, to prevent any conſultations againſt the ſtate; beſides, every man that hears any thing that may endanger the government, is obliged to turn informer, upon pain of death, and there are alſo a number of ſpies to inform the prince of what is ſpoken in all companies. On the other hand, there is great danger in bringing him ill news, or on letting him know the weakneſs of his government. No officer dare be ſo bold as to tell him that it is impoſſible to execute what he commands; they therefore endeavour to fulfil his orders, and to excuſe the miſcarriage afterwards, which they do gradually, in the ſofteſt terms, and with all poſſible precautions; for he ſeldom fails to puniſh with extraordinary rigour thoſe who offend him.

He frequently examines his officers on their proficiency in the learned language, and on the precepts of their religion, and puniſhes the ignorant with the baſtinado.

The vulgar are in many reſpects more ſafe and happy than their ſuperiors, for the leſs a man is known to the prince, and the greater diſtance he is from the court, the greater is his ſecurity. Honour here leads to danger, not only through the caprice of the prince, but from the encouragement given to informers. Hence the great uſe every artifice to prevent any accuſation reaching the ears of the king.

The eaſtern princes are indeed ever in danger of being depoſed; for as they endeavour to inſpire all about them with terror, and think it beneath them to take ſuch meaſures as will gain the affections of their ſubjects, there are none of their immediate dependents on whom they can confide; and as the people have no ſecurity for the enjoyment of their property, they never give themſelves much concern about the title or fortune of their ſovereign. They know they ſhall be no better than beaſts of burthen whoever governs, and accordingly very readily ſubmit to him who poſſeſſes the regal power. Thus the men, who have been taken priſoners by the king of Pegu, contentedly cultivate the lands he gives them within twenty miles of their own country, without ever attempting to eſcape back to Siam; and though the Siameſe are taught to conſider their princes as the ſons of heaven, and imagine their ſouls as much exalted above thoſe of the vulgar as their rank exceeds theirs, yet a ſubject no ſooner uſurps the crown than they entertain the ſame opinion of the uſurper they had of their prince, and they are ready to believe that heaven has adopted the rebel in his room.

The great officers of ſtate appear almoſt under the neceſſity of oppreſſing the people, for they have no ſalaries, and have only their lodgings, a barge, and a few moveables allowed them by the crown; with elephants, horſes, buffaloes, and ſlaves ſuitable to their rank, and as much land as will keep their families in rice; all which return to the crown upon their being diſplaced: preſents are therefore publickly made them by thoſe under their command, and a judge is not puniſhed for taking money of the parties, except it can be proved that he has been alſo guilty of injuſtice.

Councils of ſtate are held twice a day; at ten in the morning, and at ten in the evening. At theſe councils any member to whom his majeſty has referred the management of an affair, reads his inſtructions, and gives an account of what he has done. The ſeveral members then deliver their opinion in his majeſty's abſence: afterwards, when the king is preſent, their debates and reſolutions are reported to him, which he examines and then determines as he thinks fit. If the affair be attended with any difficulty, he orders it to be reconſidered, and ſometimes conſults the ſuperior of the talapoins. As he frequently puniſhes thoſe who give him what he thinks ill advice, his miniſters offer ſuch opinions as are likely to pleaſe him, which is ſafer than their declaring their own.

SECT. VIII.

Of Ambaſſadors, the Manner in which they are received, and of thoſe ſent by the King.

THERE is no addreſſing this prince without conſiderable preſents, and, in return, he expreſſes the higheſt value for what is given. If it be any thing to wear, he puts it on in the preſence of the ambaſſador, and if they preſent horſes, ſtables are immediately built for them.

Before the ambaſſadors have delivered their preſents, the king's officers come and take a very exact account of them, and enquire the value and uſe of the minuteſt articles, in order that they may be able to anſwer all the queſtions the king may aſk them; but their principal deſign is to diſcover their true value.

An ambaſſador at Siam is only regarded as a royal meſſenger, and much greater honour is paid to the letter he carries than to him. When the French ambaſſador went to Siam the king of France's letter and preſents were carried in the royal barge, with ſeveral of the king's veſſels to guard it; while the ambaſſador and his retinue were carried up the river in ordinary veſſels.

Foreign ambaſſadors are lodged and maintained at the king's expence, and are allowed to trade during their ſtay; but they are not ſuffered to tranſact any affairs till they have had their public audience, or to continue in the city after their audience of leave; and therefore the evening before the king aſks, if they have any thing farther

farther to propoſe; and, at the audience of leave, if they are ſatisfied. Publick audiences are in the capital, when the court appears in all its ſplendour. Thoſe given at Louvo and other places are eſteemed private audiences, there being few guards and attendants.

The Siameſe never ſend ambaſſadors to reſide at any court, but only to diſpatch ſome particular affair, which generally relates to trade; and upon theſe occaſions they ſend three, one of whom has the ſole management of the affair, and on his death is ſucceeded by the ſecond, and the ſecond by the third.

SECT. IX.

Of the Laws of Siam, and the Manner in which Cauſes are tried. Of the ordeal Trial, as practiſed by the Siameſe, and the Puniſhments inflicted on Criminals.

THE governor of every province has the ſole command, both in civil and military affairs; and though others are joined with him, when he ſits in a court of juſtice, he only conſults them, after which he determines all cauſes by his ſole authority.

As to the laws of Siam, they require an unlimited obedience to parents, and, like thoſe of China, ſubject children entirely to their juriſdiction; and ſhould one preſume to oppoſe and contradict his parents, he would be thought a monſter. A more than ordinary reverence is alſo paid to old age.

Where a man is found guilty of lying to his ſuperior, he may immediately puniſh him; and the king is ſaid to puniſh it with greater ſeverity than any other crime.

Theft and robbery are eſteemed ſo infamous, that when a perſon is accuſed of them their friends will not interpoſe in their behalf. This is thought the more ſcandalous, as one day's labour will furniſh a man with proviſions for many.

All the proceedings in law are in writing, and none is ſuffered to exhibit a charge againſt another, without giving ſecurity to proſecute it, and anſwer the damages if he does not prove the fact againſt the perſon accuſed. When a perſon intends to proſecute another, he draws up a petition, in which he ſets forth his complaint, and preſents it to the nai, or head of the band to which he belongs, who tranſmits it to the governor; and if the complaint appears frivolous, the proſecutor, according to the laws of the country, ſhould be puniſhed; but the magiſtrates generally encourage proſecutions on account of the perquiſites they bring to their office. If the ſuit proceeds, the governor refers the charge to the examination of his aſſociates, and theſe again to their clerks, who examine the witneſſes at their houſes, hear what each party has to ſay in his behalf, and take it down in writing; and if a perſon does not care to ſpeak in his own cauſe, one of his relations may ſpeak for him and ſupply the place of a counſellor; but no relation more remote than a firſt couſin is allowed to perform this office.

Every thing being prepared for hearing, the parties are ſeveral days called into court, and perſuaded to agree; but this appears to be only a matter of form. At length the governor appoints a day for all parties to attend; and being come into court, the clerk reads the proceſs and opinion of his aſſociates, and then the governor examines upon what reaſons their opinions are founded, which being explained to him, he proceeds to paſs judgment.

When ſufficient proofs are wanting they have recourſe to an ordeal trial, like that of our Saxon anceſtors; both the plaintiff and defendant walk upon burning coals, and he that eſcapes unhurt is adjudged to be in the right; ſometimes the proof is made by putting their hands in boiling oil; and in both theſe trials, by ſome peculiar management, one or the other is ſaid to remain unhurt: they have alſo a proof by water, in which he who remains longeſt under it is eſteemed innocent. They have another proof by ſwallowing pills, which their prieſts adminiſter with ſevere imprecations, and the party who keeps them in his ſtomach without vomiting is thought to be innocent.

All theſe trials are made in the preſence of the magiſtrates and people, and the king himſelf frequently directs them to be performed, when crimes come before him by way of appeal. Sometimes he orders both the informer and priſoner to be thrown to the tygers, and the perſon that eſcapes, by his not being ſeized upon by thoſe beaſts, is ſufficiently juſtified.

The intrepidity with which the people expoſe themſelves to theſe ſuppoſed proofs is very ſurprizing.

The preſident of the tribunal at Siam may reverſe a judgment given in any of the provinces, and there is an appeal from him to the king, ſo that were the parties are able to bear the expence, which is very great, the ſuit may be carried from one court to another: but when the poor meet with a powerful adverſary, innocence is but a ſlight protection.

Judgment is never executed in any of the provinces without a ſpecial commiſſion from the king; and yet the baſtinado and other puniſhments, frequently followed by death, are inflicted by every governor. It is remarkable that he who unjuſtly obtains the poſſeſſion of another's lands is eſteemed guilty of robbery, and the perſon lawfully convicted is obliged not only to beſtow the lands, but to forfeit the value of them, one half to the party he had injured, and the other to the judge; and thus are all other forfeitures divided.

To prevent the oppreſſion of the governors, an office, is appointed in every province to report to the king every thing that paſſes, particularly in the courts of juſtice; but as the officers generally connive at each other's extortions, the people receive little benefit from this inſtitution.

As to the puniſhments inflicted on criminals, they are ſometimes trampled to death by elephants; at other times they are toſſed by one elephant to another without killing them, for the elephants are ſaid to be ſo extremely tractable as to do this upon a ſign made to them. But their puniſhments are uſually adapted to the crime; thus lying is puniſhed by ſewing up the mouth; and a perſon guilty of extortion, or of embezzling the publick money, has melted gold or ſilver poured down his throat. Beheading is alſo ſometimes practiſed, and it frequently happens that a priſoner ſuffers death by the baſtinado.

For ſmall crimes people are puniſhed, as in China, by hanging a heavy pillory-board about their necks for ſeveral days; and ſometimes a criminal is ſet into the ground up to the ſhoulders and buffeted about the head. This is the higheſt indignity that can be offered to a Siameſe, eſpecially to if it be inflicted by a woman; however, it is ſaid, that no puniſhment is infamous longer than it laſts; and that he who has ſuffered one day frequently enters into the higheſt employments the next.

SECT. X.

Of the ſix Months Service which all the Siameſe are obliged annually to perform; and the Manner of their mak ng War.

THAT none may eſcape the perſonal ſervice he owes his prince ſix months in the year, every man is inrolled and divided into bands or companies, which have each their nai or governor. Theſe companies, do not always conſiſts of the ſame number of men, nor does every nai lead his own men either to war or to the ſix months ſervice; but is obliged to furniſh for each ſuch a number out of his band as the king requires; and the children are of the ſame band with their parents. The nai frequently lends his men money, and pays off their other creditors; and, if they become inſolvent, he may make them his ſlaves.

The commanders of the barges have a certain number of rowers, who are marked with a hot iron in the wriſts; and theſe their commander diſmiſſes every year, either ſix months at a time, or by ſingle months, as he thinks proper.

When the Siameſe and the Peguans are at war, the armies ſeldom face each other: they only make excurſions, and ſeizing great numbers of people, retire with all poſſible expedition. If the armies meet they avoid ſhooting directly at each other, except in the greateſt extremity; if the enemy advances they fire ſomething ſhort,

and then if any of them are killed or wounded, they ſay it is their own fault; for when the king of Siam's troops take the field, he orders them not to kill, by which they underſtand that they are not to fire directly upon the enemy; and whenever the bullets or arrows begin to fly pretty thick, either one ſide or the other never fails to diſperſe.

When the body is broke they fly into the woods, where their enemy is ſeldom ſo bold as to follow them; and as the armies are very numerous, and conſequently find it difficult to procure ſubſiſtence, the conqueror is ſoon forced to retire; and then the vanquiſhed rallying again, perhaps returns the viſit. Their greateſt ſtrength conſiſts in the elephants; but as they cannot be managed with a bit and bridle like a horſe, when they are wounded they frequently turn back upon their maſters, and throw the whole army to which they belong into confuſion; and it is almoſt impoſſible to make them proof againſt wild fire, though the men fire ſhort guns upon their backs that carry a ball of a pound weight.

The Siameſe have ſome artillery which the Portugueſe caſt for them; but they have no horſe, except thoſe in the king's ſtables: their army chiefly conſiſts in elephants, and a naked half-armed infantry. They uſually draw up in three lines, each conſiſting of three ſquare battalions: the general is poſted in the center of the middle battalion, which is compoſed of their beſt troops; and the reſt of the commanding officers place themſelves in the center of their reſpective bodies. Where theſe nine battalions are thought too large, each is ſub-divided into leſſer bodies. Every battalion has ſixteen male elephants in the rear, and two female elephants to attend each, without which it would be difficult to govern them.

As their artillery has no carriages, it is carried in waggons drawn by buffaloes or oxen, with theſe the fight begins and uſually ends; if not they draw ſomething nearer, and make uſe of their ſmall ſhot, in the manner already mentioned; but they ſeldom come to a cloſe engagement: and if it be neceſſary to make a ſtand, the officers place themſelves behind their men, and threaten them with immediate death if they turn their backs. It is ſaid that the Siameſe do not, like moſt other Indian nations, take opium to inſpire them with courage; they are unwilling to run ſuch hazards, for they think death is equally to be dreaded, whether they be drunk or ſober.

SECT. XI.

Of the principal Places in Siam.

HAVING given the moſt material particulars in relation to the manners, cuſtoms, and government of Siam, with a deſcription of its capital, we ſhall take a view of the ſituation of the principal places of that kingdom, ſome of which have been curſorily mentioned in the courſe of this chapter.

Chantebon, or Liam, is ſituated at the mouth of a broad river, on the weſt ſide of the gulf of Siam, in the twelfth degree of north latitude, at the foot of a chain of mountains that ſeparates Siam from Cambodia.

Bancock is ſituated in an iſland formed by the river Menam, about twenty leagues to the ſouth of Siam; between this place and the laſt mentioned city are numbers of villages on both ſides of the river, with huts of bamboo erected on pillars. At this place there is a flat, where it is cuſtomary for ſhips to put their guns aſhore. All ſhips bound to Siam put in here to give an account from whence they came, as well as of their lading and complement; and to pay the cuſtoms, an acquittance for which they ſhew at another place up the river, called Canon-Bantenau, within a league of the city of Siam; and then they have liberty to trade any where through the kingdom, paying only for their cocket, which they are obliged to do on the penalty of forfeiting the ſhip.

Louvo, where the king ſpends nine or ten months in the year, is ſituated in about the latitude of fifteen degrees, thirty minutes, nine or ten leagues from Siam. Between theſe two cities a canal is cut for the convenience of paſſage, on each ſide of which are vaſt plains abounding with rice. The king's palace here is of brick, and of great extent, it conſiſting of two ſeparate piles of building, whoſe roofs are covered with yellow tiles that glitter in the ſun like gold; this edifice is pleaſantly ſituated on an eminence a little to the eaſt of one of the branches of the Menam. The town is well ſupplied with proviſions, but is ſo populous that they are dearer there than in any other part of the kingdom.

Prabat, a town which lies near ſixty-five miles to the north-eaſt of Louvo, is only famous for a mark in a rock, which is pretended to be an impreſſion made by the foot of their great ſaint Sommona Codom, and thither the king of Siam annually goes in great pomp to pay his devotions.

Tenacerin, a populous city, and the capital of a province of the ſame name, is ſituated on a river alſo called Tenacerin, which falls into the bay of Bengal. It is ſeated in a country that abounds with all the neceſſaries of life, and carries on a conſiderable trade.

Merjee is ſeated in an iſland near Tenacerin, one hundred and forty miles to the ſouth-weſt of Siam, and is ſaid to be one of the beſt forts in the Indies; but of this place we ſhall give a more particular account, when, on treating of the trade of Siam, we ſhall mention the deſtruction of that commerce which was formerly carried on by the Engliſh in this city.

Jonſalam is an iſland within a mile of the continent, between which is a good harbour for ſhipping.

Martaban, once an independent kingdom, but now ſubject to Siam, has Pegu on the north, Siam on the ſouth and eaſt, and the bay of Bengal on the weſt; it is ſaid to extend three hundred miles from north to ſouth, and an hundred and fifteen, where broadeſt, from eaſt to weſt. It has mines of gold, ſilver, copper, iron, and lead, and abounds with corn, medicinal herbs, oil of jeſſamine, oranges, lemons, figs, and other fruit. The inhabitants make a ſort of porcelain veſſels, varniſhed black, which is much eſteemed. The capital is a well-built populous town, ſituated in the bay of Bengal, in about the ſixteenth degree of north latitude: it has one of the beſt havens in the country, and was a rich trading place before ſhips were ſunk at the entrance of the harbour, in order to choak it up; and beſides the whole country is ruined by the wars carried on between the kings of Pegu and Siam.

SECT. XII.

Of the Religion of the Siameſe, containing a particular Account of the Convents of the Talapoins of both Sexes; the Rules of their Order, and Articles of their Belief.

IN the Siameſe language a temple is called pihan; but the Portugueſe, from the Perſian word Poutgheda, which ſignifies a Pagan temple, call both theſe and the idols themſelves pagodas or pagods, and thus they are generally called by the Europeans in India.

Every Siameſe temple is ſeated in the midſt of a ſquare piece of ground encompaſſed with pyramids, and incloſed by a wall. Without this wall is another ſquare, which incloſes the former, and round it are the cells of the prieſts and prieſteſſes, which are frequently very numerous. Thoſe cells, which the miſſionaries term a convent, are a number of ſingle houſes erected upon bamboo pillars at a ſmall diſtance from each other, and the whole are incloſed with a fence of bamboo pales. The ſteeple of the pagoda is a wooden tower that ſtands by itſelf near the temple, and has a bell without a clapper, which inſtead of ringing they beat upon with wooden hammers. Of the ſplendor of theſe ſtructures we have already given ſome account in treating of the city of Siam.

The talapoineſſes or nuns are in the ſame convents with the men, but being never admitted till they are of an advanced age, there is not ſuppoſed to be any danger of a criminal correſpondence. Indeed the conſtitution of a pagan convent ſeems in ſeveral reſpects preferable to thoſe of the church of Rome; for in the firſt place neither ſex is teized, and in a manner compelled to enter into a cloyſter againſt their free conſent; young women are not admitted into them at all, and liberty is given to

to any perſon to return into the world, when they are tired of that ſtate of life.

All the youth being educated by the talapoins, each of them has two or three nens or pupils, who alſo ſerve him while they continue in the convent: there are others who do not go in for education, but live and grow old there in the character of a kind of lay-brothers. Theſe weed the gardens, and perform other ſervile offices, which it would be criminal for the talapoin himſelf to execute. Theſe nens have a common room in the convent for their ſchool, and there is another to which the people bring their alms on the days when the temple is ſhut, and here the talapoins aſſemble, and hold their conferences.

To every convent there is a head or maſter, who in ſome houſes has greater privileges than in others, and are called ſancrats: theſe have the ſole power of admitting perſons into the order of talapoins, and of giving them the habit; but they have no juriſdiction over any of the talapoins who do not belong to their reſpective convents. The king, however, gives a new name to ſome of the principal ſancrats, on whom he alſo beſtows an umbrella, a chair, and ſome ſlaves to carry it; though the ſancrats never uſe them, but when they wait upon his majeſty.

The talapoins are obliged to lead auſtere lives, by which it is ſuppoſed they atone for the ſins of the laity. They live on alms, but muſt not eat in common; for every one lives upon what he himſelf procures by begging, yet they are very hoſpitable to ſtrangers, and even to ſuch Chriſtians as come to their convents, and on each ſide their gate have lodgings for the accommodation of travellers.

Of theſe talapoins there are two ſorts, one of the woods, the other of cities, the former lead much the ſevereſt lives. Both of them are, however, obliged to celibacy, on pain of being burnt, which the king takes care to have ſtrictly executed; for they enjoy great privileges, and being exempted from the ſix months ſervice, he takes care to ſee that they ſtrictly obſerve the rules of their profeſſion, and have their ſhare of hardſhips, leſt the greateſt part of his ſubjects, tempted by the advantages they enjoy, ſhould become talapoins, and be thus rendered of no uſe to the ſtate. He therefore has them ſometimes examined as to their ſkill in the Baly language, in which are written the precepts of their religion, and juſt before the arrival of the French ambaſſador at Siam, the king had diſmiſſed ſome thouſands of them for their ignorance; they being examined by one of his officers of ſtate; but the talapoins of the woods refuſe to ſubmit to the examination of any one who is not of their order.

They not only educate children, but every new and full moon preach and explain the precepts of their religion to the people in their temples, and during the time of the inundation, they preach every day from ſix in the morning till noon, and from one in the afternoon till five in the evening. The preacher ſits croſs-legged on a couch or high bench, and when one is weary he is relieved by another, the people ſhewing their aſſent to the doctrine, by ſaying, "That is right, or fit to be done." After which they preſent their alms to the preacher, many of whom become very rich with the preſents they receive from the people.

The Europeans call the time of the inundation the lent of the talapoins, for they eat nothing from noon, and when they do not faſt they eat only fruit in the afternoon. It is pretended that ſome of the Indians will faſt thirty or forty days without taking any thing beſides ſome ſmall liquors, in which a certain powder is infuſed: however, it is much eaſier to faſt in a hot country than in a cold one, nor are the effects of an empty ſtomach ſo pernicious there as among us.

When the rice harveſt is over the talapoins of the towns go every night for three weeks together to watch in the fields in ſmall huts made of the branches and leaves of trees, and in the day-time live in their cells. They encamp in a ſquare nearly in the ſame order with that in which their cells ſtand by the temples, and have the hut of their ſuperior in the center. They do not like travellers, make fires in the night to frighten away wild beaſts; for it is imagined that their ſanctity is alone ſufficient to preſerve them. Indeed they take care to pitch their tents at a diſtance from the woods where wild beaſts chiefly haunt, and they who inhabit thoſe dangerous places, make fires like other people to keep off the wild beaſts; though the laity impute their ſafety to their great holineſs. They imagine that a tyger will ſmell a ſleeping talapoin, and only lick his hands and feet, and if they find the remains of one that has been killed, they either deny it to be a talapoin, or if that cannot be diſputed, they pretend that he had tranſgreſſed the rules of his order; for they imagine that the very brutes can diſtinguiſh a ſaint from another man by the ſmell. Loubiere, however, obſerves, that their woods are not ſo dangerous as is imagined, ſince many families of the laity, as well as the talapoins, have been forced by the rigour of the government to take refuge in them.

Theſe talapoins go bare-headed, and bare-foot, notwithſtanding the heat of the ſun; but have a yellow linen cloth thrown over their left ſhoulder, like a ſhoulder-belt, and over all a large yellow cloth, that has its name from the rags and patches of which it is compoſed. This hangs down both before and behind, and is girt about with a ſaſh four or five inches broad. They ſhave the hair of their heads, beards, and eye-brows, and have a broad leaf, which ſerves them inſtead of a fan or umbrella. The ſuperior is obliged to ſhave himſelf, becauſe no perſon is worthy to touch his head; and, for the ſame reaſon, a young talapoin muſt never ſhave an old one, though an old one may ſhave him: but when a talapoin grows too old to handle the razor, which is there made of copper, another may ſupply that office, but then he muſt firſt aſk a thouſand pardons, and declare how unworthy he is of ſuch an honour.

The talapoins waſh themſelves in the morning when they can but juſt diſcern the veins of their hands, and do not do it ſooner for fear they ſhould unknowingly drown ſome inſect. They are no ſooner dreſſed than they attend their ſuperior to the temple, where they ſpend two hours in chanting their devotions. Their hymns, if we may be allowed to call them ſo, are engraved with an iron pencil in the Baly tongue, on long leaves, about two fingers broad, and ſeveral of theſe being tacked together at one end, make a book; but the people have no books of devotion and prayers. The talapoins, while they ſing, keep time with their leaf, or fan, as if they were fanning themſelves. Both the prieſts and people at their entering and leaving the temple proſtrate themſelves three times before the great idol with their heads to the ground.

At the new and full moons the people waſh the talapoins; and in every private family the children, without regard to age or ſex, waſh both their father and mother, grandfather and grandmother naked.

The talapoins, after their morning's devotions, go into the city to beg, carrying with them an iron bowl in a linen bag, which they hang over their ſhoulders with a rope. They thus ſtand at the door of a houſe without aſking any thing, but the people ſeldom let them go away empty handed. At their return to the temple they offer what they receive to the idol, and having then ate their breakfaſt, ſtudy till dinner, and ſleep as is cuſtomary in hot countries. They afterwards inſtruct their pupils, and towards the evening, having ſwept and cleaned their temple, they ſpend two hours in ſinging their devotions, as in the morning, and then retire to reſt, ſeldom eating any thing but a little fruit.

They never go out of their convents without poſtrating themſelves before their ſuperior, and kiſſing his feet. Their convents have gardens belonging to them; they are alſo endowed with cultivated lands, and the talapoins have ſlaves to manure them. Beſides theſe ſlaves they have, as hath been already obſerved, a kind of lay-brothers, who wear the ſame habit, only it is white, theſe receive the money given to the talapoins, it being a ſin for them to touch any of it. Theſe ſervants alſo look after their gardens and huſbandry, and tranſact all ſuch affairs as it is unlawful for a talapoin to be concerned in.

When a ſuperior of a convent dies, another is elected by the ſociety, on account of his age and learning. When a perſon erects a temple, he appoints the ſuperior of the

convent, but builds only a cell for him. The reſt are afterwards erected, as other members are admitted. When a perſon deſires admiſſion, he firſt applies himſelf to the ſuperior of the convent, but receives his habit from ſome ſancrat: none are ever oppoſed in aſſuming the habit, that being eſteemed highly criminal, and their parents are commonly ſo far from being againſt it, that they hire people to ſing and dance before them, when they lead their ſons to the convent to aſſume the habit; but neither the muſick nor the women muſt enter with them. The new elected talapoin has his head, beard, and eyebrows ſhaved, and the ſancrat having pronounced ſome pious ſentences on his devoting himſelf to religion, he is ſhut up in his cell, and is never to ſee a dance, or hear muſic more.

The talapoineſſes, who are eſteemed partly ſecular, and partly religious, may receive the habit from the ſuperior of any convent, or even from the young pupils, without the conſent of a ſancrat, and if any of them are ſurprized with a man, they are not burnt as the talapoins are for entertaining a criminal commerce with women, but in this caſe are delivered to their relations to be baſtinadoed; for the talapoins muſt not ſtrike or chaſtiſe any perſon.

Though all the Indian prieſts believe the doctrine of the metempſychoſis, or the tranſmigration of ſouls, yet in many other things they are not agreed. Some allow of marriage, others do not: ſome think it a ſin to deprive any animal of life, other makes no ſcruple of it, and a third ſort kill them only for ſacrifice: ſome will eat any animal that dies of itſelf, or is ready killed to their hands, though they would no more put an animal to death than they would murder one of their own ſpecies.

The Indians believe that all nature is animated, and informed by a rational ſoul, and ſuppoſe the heavens, the earth, fire, water, rivers, woods, mountains, cities, and houſes are animated by ſome ſpirit, or genius, and all of them firmly believe that each man has paſſed through innumerable ſtates, and that every ſoul that poſſeſſes a human body, was confined to it in order to be puniſhed for miſdemeanors committed in ſome former life. This they infer from the obſervation, that the happieſt mortal has his pains and diſappointments; whence they conclude, that the higheſt felicity is found in a ſtate of ſeparation from the body: and the better to ſtrengthen their opinion of the ſoul's pre-exiſtence, ſome of the talapoins pretend to remember their ſeveral tranſmigrations. They alſo believe that the heavens, the earth, the plants, and every thing elſe have their period, and will be ſucceeded by new heavens and a new earth; and they do not even ſcruple to affirm that they have ſeen the decay and revival of all nature.

They imagine that the ſoul conſiſts of matter ſo ſubtile, as to be free from touch, and yet that after death it retains the human form, with ſomething analogous to the ſolid and liquid ſubſtances of which our bodies are compoſed, and that if a perſon dies by a wound he has received it may be ſeen in the aerial body, with the blood flowing from it; but though the ſoul be in their opinion material, they will not allow that it is periſhable, but that it animates ſome other creature, and is ſenſible of pleaſure and pain, and that it will at length re-enter an human body in a ſituation ſuitable to the behaviour of the ſoul in its ſeveral tranſmigrations.

They not only maintain that departed ſouls ſucceſſively animate plants and animals; but believe that there are certain places beyond the viſible world where they ſhall be rewarded or puniſhed: that the happy ſhall aſcend far above the ſtars, while the miſerable ſhall be doomed to dwell as far beneath them. They uſually aſſign nine different regions, both of happineſs and miſery, each differing in degree, the higheſt and loweſt being moſt exquiſite in their kind; and as they do not imagine that ſouls paſs immediately from one ſtate to another, but are new born into whatever place they happen to go, ſo they are perſuaded that they ſhall want the ſame things as in this life, and therefore in ſome places burn their moſt valuable moveables, and even animals and ſlaves with them.

As the Siameſe imagine that they can contribute to the relief of the deceaſed by thus ſupplying their wants, ſo they alſo believe that the dead are capable of doing them good or hurt, and accordingly pray to their departed friends, and do them all the honour they poſſibly can at their funerals, eſpecially to the ſpirits of their anceſtors, as high as their great grandfathers, imagining, that thoſe beyond them have ſuffered ſo many tranſmigrations, that they can hear them no more.

They are not allowed to kill, to ſteal, to commit uncleanneſs, to lie, or to drink intoxicating liquors: the firſt precept they extend ſo far, that they think it criminal not only to kill men and animals, but even vegetables, and therefore do not deſtroy the ſeed of any plant; but as the fruit does not affect the life, they think themſelves at liberty to eat it, but always preſerve the ſtone or kernel; nor will they eat the fruit before it is ripe, becauſe then the ſeed would never come to maturity. As they think every thing animated they will not cut down a tree, or break off the branches, leſt they ſhould diſpoſſeſs a ſoul of its habitation; but when it is cut down, or a beaſt be killed, they make no ſcruple of uſing the one or eating the other, becauſe they imagine no miſchief can proceed from it.

As they imagine the ſoul reſides in the blood, they think it unlawful to open a vein, or to make any inciſion by which the blood may be ſpilt; and ſome carry this ſcruple ſo far, that they will not wound a plant to let out its juices.

The Siameſe, however, have ways to evade moſt of the precepts enjoined by their religion: thus they ſay, that in war they are not the occaſion of the death of an enemy, but their enemies themſelves in advancing upon their ſhot; for, as hath been obſerved, they always ſhoot ſomething ſhort of them. When the talapoins eat rice, which is a ſeed, they do not boil it themſelves; but allow their ſervants to boil it, and kill the ſeed; and then they think they may eat it without being guilty of any crime.

The talapoins are not permitted to hear muſic, or to ſee plays or dancing; they muſt uſe no perfumes, nor muſt they touch gold or ſilver, or meddle with any thing that has not an immediate relation to religion. A talapoin muſt never borrow of a layman, or contract a friendſhip with him in hopes of receiving preſents; he muſt not lend upon uſury, nor muſt he judge or cenſure his neighbours: he muſt neither buy nor ſell, nor muſt he ſet by what he begs one day for the next, but give what he does not eat to ſome animal. He may not look upon a woman with complacency, ſpeak to one in private, or ſit near her; nor muſt he receive any thing from the hand of a woman, and therefore ſhe lays down her alms for the talapoin to take up. He is not to enjoy the indulgence of riding in a palanquin, or upon an elephant, or a horſe; nor muſt he wear rich cloaths, or any colour but yellow; nor eat in gold or ſilver. If he laughs aloud, if he boaſts of his deſcent or learning, or viſits any but his father, mother, brothers, or ſiſters, they eſteem it criminal. He is not to be angry; he muſt not return railing for railing, nor threaten any man; but muſt behave with the greateſt decorum and modeſty, and in his dreſs be diſtinguiſhed by his neatneſs.

It has been obſerved, that the Siameſe think there are nine degrees of happineſs or miſery to which departed ſouls may paſs; but in all theſe ſtates they imagine that they are born and die, they not being yet arrived at their ultimate happineſs: but after ſeveral tranſmigrations, in which a ſoul has performed a multitude of good works, they believe that it ſhall be at length exalted to an unchangeable ſtate of felicity, and, being exempted from future tranſmigrations, ſhall enjoy eternal reſt. This is properly the heaven of the Indians; but they do not imagine that any ſouls will be eternally puniſhed in the diſmal abodes appointed for the evil genii; but ſuppoſe that if the ſoul be never ſufficiently purified, it will be deſtined to an eternal tranſmigration.

When a perſon has merited this ſtate of endleſs felicity, they attribute to him invincible ſtrength of body, a perfect ſkill in all ſciences, and think he will become a moſt perfect preacher of righteouſneſs; after which they ſay he

he is taken out of their ſight, like a ſpark that is loſt in air; and to the memory of theſe imaginary perfect men they dedicate their temples. But the perſon who they ſuppoſe has ſurpaſſed all the men that ever lived in holineſs, and whom they therefore worſhip with the higheſt devotion, is Sommona Codom. Sommona ſignifies a talapoin of the woods, and Codom is his proper name. The books of the talapoins ſay, that he was the ſon of the king of Ceylon, and not only beſtowed all his eſtate in charity, but pulling out his eyes, and killing his wife and children, gave them to the talapoins for food. They alſo imagine, that before his entrance into the ſtate of bliſs, he acquired a prodigious ſtrength of body, and had the power of working miracles, being able to enlarge his body to what ſize he pleaſed, and then reduce it to ſo ſmall a point as to become inviſible. They ſay he had two principal diſciples, whoſe images they place behind his on their altars; theſe are of a much inferior ſize; he that is placed on his right hand is called Pra Mogla, and he on his left Pra Scarabout; and behind them, on the ſame altar, they place other images, repreſenting the officers of Sommona Codom's palace. They pretend that Pra Mogla, at the deſire of the evil genii, overturned the earth, and took hell-fire into the hollow of his hand, in order to extinguiſh it; but finding it out of his power, he prayed to Sommona Codom to put it out; but he denied him, from the apprehenſion that mankind would abound in wickedneſs if the dread of this puniſhment was removed.

It is remarkable that whatever power they preſcribe to Sommona Codom, they imagine he exerciſes it only over the Siameſe, without interfering with the concerns of other nations, and that every kingdom has its peculiar deity. It is alſo obſervable, that they do not conſider Sommona Codom as the perſon who firſt inſtituted their religion, but that he reſtored it after mankind had forſaken thoſe rules which were originally enjoined them.

One of the moſt extraordinary particulars of the religion of the Siameſe is their believing that all religions are good; and that though they are extremely tenacious of the principles of their own, they allow an unbounded indulgence to others: but of this ſpirit of toleration we ſhall give a more full and particular account in treating of the Gentoos of India.

We ſhall conclude this ſection with obſerving, that how extravagant ſoever the doctrine of the tranſmigration of ſouls may appear, it is attended with ſeveral conſequences favourable to the cauſe of virtue. The prohibition of eating animal food is in that climate wholeſome advice, and its creating a horror at the ſight of blood makes them tender of ſhedding it. The aſſurance that they ſhall ſome time revive in a happier ſtate is a great ſupport to the Indians under any calamity, and leſſens the dread of their diſſolution; hence the eunuchs, who there conſider themſelves as the moſt unhappy of mankind, are extremely fond of this doctrine.

SECT. XII.

Of the Trade of Siam in general; now engroſſed by the King. An Account of the Engliſh Settlement at Merjee, and the Trade carried on by the Dutch at Siam. The Skill of the Siameſe in mechanic Arts, and of the Coins, Weights, and Meaſures of Siam.

THE liberty of commerce which was formerly granted to Siam invited great numbers of foreigners to ſettle among them; every nation was poſſeſſed of a different quarter of the city, and had a chief or conſul of their own chooſing, and a perſon appointed by the king to tranſact affairs with him; but nothing of conſequence was determined without the prime miniſter. The Mahometans of the Mogul's dominions had formerly the beſt eſtabliſhment here, one of the miniſters being of that religion: the principal offices and governments were in their hands, and the king cauſed ſeveral moſques to be erected at his own expence: the Siameſe who embraced the religion of Mahomet were alſo exempted from the ſix months perſonal ſervice; but this miniſter falling into diſgrace, the credit of thoſe of his religion ſunk with him, and all Mahometans were turned out of their employments; but they are ſtill allowed their moſques and the exerciſe of their religion. It is computed that there are now about four thouſand Mahometans at Siam, and as many Indian Portugueſe, or of the mixed breed, which are very numerous on all the Indian coaſts. The number of the Chineſe are at leaſt equal to the others, and there are about as many Malayans: beſides, there are ſome of other nations; but ſince the king has engroſſed the foreign trade, the richeſt merchants have retired from Siam.

Moſt part of the trade of Siam is engroſſed by the king, who even deſcends ſo low as to ſell goods by retail in ſhops by his factors. Thus he ſells to his ſubjects all their cotton cloths, which is the common wear of the people. He claims all the ore in the mines, and ſells it to foreigners. His ſubjects are obliged to ſell him all their ivory and arrack, which he likewiſe diſpoſes of to foreigners. Sapan-wood, lead, and ſalt-petre, alſo belong to him; and ſulphur, gun-powder, and arms can only be had at the king's magazines. He ſometimes agrees with the Dutch to ſell them all the ſkins and furs the country affords at a ſet price, upon which his ſubjects are obliged to ſell to him firſt; but ambergris, brown ſugar, and ſugar-candy the merchants may, without reſtraint, purchaſe of his ſubjects.

Formerly a thouſand veſſels, at leaſt, annually traded to Siam, yet there are now hardly any beſides a few Dutch barks, for none care to deal with the king, who will make his own terms; and as the produce of the country is not very conſiderable, and foreigners are not allowed the liberty of trading either with one another, or with the natives, till the king has had the preference of all the beſt merchandize, it is not very advantageous trading thither.

At Merjee, a town ſituated on the banks of the Tenacerian, in the dominions of the king of Siam, were formerly ſettled a conſiderable number of Engliſh free merchants. This place enjoys a good harbour, and the adjacent country produces rice, timber for building, tin, and elephants teeth, in which the above merchants drove a conſiderable commerce, till they were ordered from thence by the old Eaſt India company, who threatened the king of Siam with a war if he continued to harbour them. One Weldon was diſpatched to Merjee with this meſſage, who added the outrageous murder of ſome of the Siameſe to the inſolence with which he provoked the government. The people reſolving to be revenged for this barbarity, lay in wait for Weldon by night when he was aſhore. But he receiving notice of their deſign made his eſcape on board his ſhip; and the Siameſe miſſing him, vented their fury upon all the Engliſhmen, without exception, that fell into their hands. Seventy-ſix were maſſacred in this manner, and ſcarce twenty eſcaped to the ſhip. Till this time the Engliſh had been greatly careſſed by the Siameſe, and promoted to places of the higheſt truſt in the government; one was advanced to be head of the cuſtoms at Tenacerian and Merjee, and another promoted to the rank of admiral of the royal navy; but a great revolution which fell out at this time in the Siameſe ſtate, and the jealouſies of the Engliſh company, cauſed moſt of the Engliſh merchants to diſperſe, ſome to Fort St. George, others to Bengal, and others to Achen.

The Dutch company carry on a conſiderable trade here in tin, lead, elephants teeth, gum-lack, and deer ſkins. They have a factory about a mile below the city of Siam on the ſide of the river: the factor's houſe is extremely large, beautiful, and ſtrong; the lodging-rooms are ſtately, and the warehouſes ſpacious, and ſtored with all ſorts of commodities. It was firſt built in the year 1634, and is moated round. Mallet obſerves, that it is one of the fineſt houſes belonging to the Dutch Eaſt India company in theſe parts.

Here are no particular handicraft trades, but every man underſtands ſomething of all; for as the king employs half his ſubjects in any buſineſs indifferently for ſix months in the year, ſhould any perſon be perfectly ignorant of what he is ſet about, he would ſuffer the baſtinado. On the other hand, none ſtrive to excel, for fear of being retained in the king's ſervice as long as he

lives. The moſt dreadful diſcouragement to all induſtry is the tyranny of the government, which will not permit a man to enjoy a fortune, ſhould he be able to acquire it; for whenever he is thought to be rich, his effects are ſeized.

The Siameſe are however indifferent carpenters; they know how to burn bricks and make the hardeſt cements, and are not unſkilful in maſonry. They are ſkilled in caſting metals, and in covering their idols, which are monſtrous maſſes of brick and lime, with plates of gold, ſilver, and copper: they alſo cover the hilts of ſwords and daggers, and ſome of the king's moveables, with theſe metals, and can gild a veſſel tolerably well.

The people here are but very bad forgemen and only make uſe of caſt iron. Their horſes are never ſhod, and have but poor ſaddles and furniture; for they have not the art of tanning leather. They make a little ordinary cloth, but no kinds of ſtuffs, either of wool or ſilk; and yet they embroider very well. They have an extravagant method of painting, and, like the Chineſe, repreſent animals that never had any exiſtence, and give men the moſt abſurd and hideous proportions.

The moſt common employment of the people is fiſhing, and thoſe who have money follow merchandize; but the ſimplicity of manners, and neglect of ſuperfluities that appear very remarkably in the Siameſe, reſtrain them from following ſeveral mechanic arts and employments in which the Europeans buſy themſelves.

Their retail traders in ſhops and markets are ſo diſtinguiſhed by their honeſty, that the ſeller hardly counts the money he receives, or the buyer the goods he purchaſes by tale; and when they obſerve the European buy every trifle with caution, they laugh at their ſuperabundant care.

Their markets begin at five in the evening, and laſt till eight or nine at night.

They have but one ſort of ſilver coin, called a tycal; theſe are all made in the ſame form, and have the ſame impreſſions, but ſome are leſs than others; they are of the figure of a cylinder, and have a ſtamp on each ſide, with odd characters, which none of our travellers have been able to explain. Thoſe on one ſide are included in a ring, and thoſe on the other in the figure of a heart. The tycal is worth three ſhillings and three half-pence. They have no gold or copper money, the former is reckoned among their merchantable commodities, and is twelve times the value of ſilver.

The ſhells called cowries, or what we call black-moors teeth, ſerve to purchaſe little matters, and differ in their price according as they are more or leſs plentiful; but their value at Siam is generally eight hundred for a penny. They buy muſlin and linen by the piece, and none but thoſe who are very poor buy it by the ken or cubit. They have, however, a fathom, which they uſe in building, and in meaſuring their roads and canals; and their roads are marked with a ſtone at the end of every mile.

For grain and liquors they uſe the ſhell of the cocoa-nut, and as theſe are very unequal, they meaſure their capacity by the number of cowries they contain. They have likewiſe a kind of wicker meaſure, called a ſat, with which they meaſure corn, and a pitcher for liquids; but there being no ſtandard for them, the buyer ſometimes meaſures their capacity by his cocoa-ſhells. Their weights are no more certain than their meaſures; for theſe are uſually pieces of money, which are often light.

CHAP. XX.

Of the Peninſula of MALACCA.

SECT. I.

Of the Situation and Extent of the Peninſula, and of the Vegetables and Animals of the Kingdom of Malacca, with ſome Account of its Inhabitants.

THIS peninſula ſome authors ſuppoſe to have been formerly joined to the iſland of Sumatra, and to be the Aurea Cherſoneſus of Ptolomy. It is bounded on the north by the kingdom of Siam Proper, which extends into the peninſula, the ſouthern part being ſubject to the king of Siam; on the weſt by the ſtreights of its own name, which divide it from Sumatra; and on the eaſt and ſouth by the Indian ſea. It extends from about the ſecond to about the eleventh degree of north latitude, and is ſuppoſed to be about four hundred and ſixty miles from the north-weſt to the ſouth-eaſt.

The peninſula of Malacca is divided into ſeveral petty kingdoms, ſome of which are tributary to the king of Siam, and others are independent ſtates.

The above kingdoms, which are ſo diminutive as ſcarcely to deſerve the name, are Malacca, Jahore, Sincapour, Patana, Pahan, Tringano, Pera, Queda, and Ligor. We ſhall begin with the kingdom of Malacca, which gives name to the peninſula, and is ſituated on its ſouthern extremity.

The coaſts of the kingdom of Malacca are flat, marſhy, and unwholeſome; and the inland part of the country is covered with mountains and deſarts that produce nothing for exportation but elephants teeth, a little tin, and few neceſſaries for the ſubſiſtance of the inhabitants, except what is planted in the gardens, and ſome rice and peaſe among the mountains. The people are, however, daily ſupplied with proviſions from Sumatra and Bengal; and all the wheat is brought from Java, Cambodia, and Siam.

Beſides the fruits common in India, they have the mangoſtane, a delicious fruit nearly reſembling an apple; the rind is thick and red, and when dried is a good aſtringent; its kernels reſemble cloves of garlic, and are of an agreeable taſte, but very cold.

The ramboſtan is about the ſize of a walnut, and has a tough ſkin beſet with capillaments, within which is a very agreeable pulp.

The durian is alſo an excellent fruit; for though it has a diſagreeable ſmell, it is grateful to the palate: the rind is thick and yellow, and its pulp reſembles thick cream, but is more delicious. It is eſteemed hot and nouriſhing to ſuch a degree as to be eſteemed a provocative, and, inſtead of cauſing a ſurfeit, it fortifies the ſtomach.

Here is alſo plenty of cocoas, oranges, lemons, limes, ſugar-canes, and mangoes, particularly a ſpecies of the latter called by the Dutch a ſtinker, from its being very offenſive to the ſmell and taſte. Here is a tree called the mourning-tree, becauſe its flowers cloſe in the night. The pine apples of this country are eſteemed the beſt in the world, and are beſides not ſo apt to give a ſurfeit as others. There is alſo plenty of aloes, and a few cinnamon-trees; but they are inferior to thoſe of Ceylon.

There are here tygers, elephants, wild boars, and plenty of ſwine; but the other cattle are few, and being generally lean, they are ſupplied from other countries. They have wild and tame fowl, ſeveral ſorts of game, and plenty of fiſh.

The inhabitants both of the kingdom and peninſula of Malacca are called Malayans, and are very tawny. The men go naked, except wearing a piece of ſtuff round their

their waiſt, to hide what modeſty teaches them to conceal, and yet they adorn themſelves with gold, bracelets and ear-rings, ſet with precious ſtones. The women wear ſilk ſkirts, which are ſometimes embroidered with gold; and have long hair, which they anoint with the oil of the cocoa-nuts, and adorn with jewels. They are extremely proud, and demand more reſpect than other Indian women, yet are ſaid to be very wanton.

Some authors ſay, there is a people here who ſleep moſt part of the day, and do all their buſineſs by night. Theſe reſemble the Europeans, both in their ſhape and complexion. Their hair is of a yellowiſh colour, and their feet turn inwards. Theſe are probably the inland inhabitants, called by captain Hamilton the Monocaboes, which are much whiter than the Malayans of the lowlands, and are eſteemed a ſavage and barbarous people: their greateſt pleaſure is ſaid to conſiſt in doing miſchief to their neighbours; for which reaſon the peaſants about the city of Malacca ſow all their grain in gardens, incloſed with hedges, and deep ditches.

The Malayan language is eſteemed the fineſt in all the Indies, where it is at leaſt as common as the French in Europe. It is very eaſily acquired, becauſe it has no inflections either in the nouns or the verbs. This renders the Malayans well known in the Eaſt, though their country is only rich on account of their commerce with the Chineſe. A dictionary of this language has been publiſhed in London by captain Bowry.

SECT. II.

Of the City of Malacca; its being taken by the Portugueſe, and the Manner in which the Dutch made themſelves Maſters of it. A Deſcription of the City, and its Inhabitants.

THE city of Malacca is ſituated at the bottom of a bay, where the ſtreights of Malacca are not above three leagues broad; and though the oppoſite ſhore of Sumatra be very low, it may be ſeen from thence in a clear day; the ſea which ſeparates that iſland being generally as calm as a pond, except when ruffled with ſqualls of wind, which are generally very violent, but not laſting. It is ſituated in two degrees thirty minutes north latitude, and one hundred degrees eaſt longitude from London; and, according to Martiniere, is three hundred and forty Spaniſh leagues from Ceylon, three hundred and eighty from China, and one hundred and fifty from Achen. It received its name from a fugitive prince, who, after being expelled by the kings of Sincapora and Siam, put himſelf at the head of the Saletes who lived by fiſhing on the coaſt, and the Malayans who inhabited the mountains; and, by their aſſiſtance, planted a colony here, to which he gave the name of Malakka, which ſignifies the wanderer.

According to Nieuhoff it was founded about two hundred and fifty years before the arrival of the Portugueſe, who diſcovered this country in 1509, and in 1511 Alphonſo Albuquerque made himſelf maſter of the city, after a brave reſiſtance, and plundered it of effects to the value of one million two hundred and fifty thouſand pieces of eight; and, not contented with this booty, had the cruelty to put the king to death. This was ſo reſented by the king of Siam, and the other neighbouring princes, that they afterwards took the city by ſtorm, but ſuffered the Portugueſe to eſcape by ſea. They, however, afterwards retook it, and built the caſtle, with three churches and a chapel within the fort, and one without; a conſiderable number of monaſteries, and a noble college for the jeſuits: and in their time the inhabitants were ſaid to amount to twelve thouſand, including the places under the juriſdiction of the city. In 1606 the Dutch, ſupported by the forces of the king of Johore, began to diſturb the Portugueſe in their poſſeſſion; and, after thirty-five years of continual hoſtilities, took it from them in 1641. But as the manner in which they obtained the poſſeſſion of this city was ſomewhat extraordinary, it will be proper to give a particular account of this event.

The Dutch, being informed that great diſputes had ariſen between the Portugueſe inhabitants and the king of Johore, immediately conceived hopes of reducing it. For this purpoſe they fitted out a ſtrong fleet at Batavia, for the ſtreights of Malacca, with a conſiderable body of land-forces on board, and ſtruck up an alliance with the king of Johore, offenſive and defenſive, as long as the ſun and moon gave light to the world; on which that prince laid ſiege to the fort by land with twenty thouſand men, while the Dutch blocked it up by ſea; but finding that they were unable to take it by force, and that reducing it by famine would take up conſiderable time, they had recourſe to fraud. Hearing that the governor was a ſordid avaricious fellow, and much hated by the garriſon, the Dutch, by ſecret conveyance, tampered with him by letters; offering him great wealth, on condition of his contributing towards the reduction of the fort. At length the price was fixed; eighty thouſand pieces of eight were to be the reward of his treachery; he was to be ſafely carried to Batavia in their fleet, and be made a free denizen of that city. Upon this he ſent ſecret inſtructions to the Dutch to make an attack upon the eaſt ſide of the fort, and then calling a council, declared he had a mind to circumvent the Dutch by ſuffering them to come cloſe to the walls of the fort, and then to fire briſkly on them from all quarters, and deſtroy them at once. Accordingly the Dutch made their approaches without moleſtation, and even placed their ladders. The garriſon ſent meſſage after meſſage, to let the governor know the danger they were in for want of orders to fire, and to make a ſally as was agreed in council; but he delayed till the Dutch, getting into the fort, drove the guard from the eaſt gate, and, opening it, received the reſt of their army; who were no ſooner entered, than they gave no quarter to any that were in arms, and marching towards the governor's houſe, where he thought himſelf ſecure by the treaty, they baſely murdered him to ſave the eighty thouſand pieces of eight.

The city of Malacca is large, populous, and encompaſſed with a ſtone wall and baſtions; the houſes are cloſe built, and ſeveral of the ſtreets are handſome, ſpacious, and planted with trees on both ſides. Some of the houſes are of ſtone, but they are principally built of bamboos. The Dutch have demoliſhed the noble college which belonged to the jeſuits, but have preſerved the church belonging to it for the exerciſe of their religion: this being placed on the top of a hill may be ſeen up or down the ſtreights at a good diſtance, and a flag-ſtaff is placed on the ſteeple, on which a flag is hoiſted on the appearance of any ſhip. Another of the churches, which had the name of Miſericordia, they converted into a magazine. Near the church on which the flag is fixed is a fort, which commands both the town and road, and is commonly garriſoned by two hundred Europeans. The only paſſage to it is by a draw-bridge. It is both large and ſtrong, one-third of its walls being waſhed by the ſea, and the reſt ſecured by the river, which runs through a deep ditch. The houſe of the governor is both beautiful and convenient; and there are ſeveral other good houſes both in the fort and in the city. The harbour being one of the beſt in that part of the world, on account of its being ſafe in all ſeaſons, is frequented by veſſels from moſt parts of the Indies. While it was in the poſſeſſion of the Portugueſe, it was, next to Ormus and Goa, the richeſt city in the Indies, and a place of rendezvous for their ſhips from China, Japan, the Spice Iſlands, &c. as well as a great mart for gold and precious ſtones. Before the Dutch made Batavia the emporium of their trade, it was the ſtaple of theſe parts for all the rich commodities of Coromandel, Pegu, Siam, Banda, the Moluccas, and all the neighbouring countries and iſlands, and was therefore frequented by vaſt numbers of foreign merchants: but now it has no great trade; yet Mr. Lockyer ſays, they have two or three ſhips a year from the Engliſh ſettlements on the coaſt and bay of Bengal with opium, ſlight ſilks, calicoes, &c. which they ſell here and make profitable returns in long-pepper, benjamin, canes, rattans, and gold, which laſt is had here at reaſon-

able rates; but this trade is carried on by the connivance of the governor, council, and fiscal, whose business it is to prevent it: however, the ordinary charges of the fort and garrison are said to be equal to the profits made here by the Dutch.

The other inhabitants are the Chinese, Moors, Portuguese, and a few Americans. The best shops are those of the Chinese; these are well stocked with the produce of their own country: there are three or four great Mahometan merchants; but the natives live very meanly in the suburbs. They resemble those of Achen, and are very negligent in their affairs. The river is very broad, and at high water is brackish; but is fresh at low-water, when the shore is so muddy that there is no landing. The inhabitants have store of fowl, fish, fruit, and roots, but there is little pasturage.

SECT. III.

Of the Kingdom of Johore.

Its Situation, Extent, and Produce. Its Inhabitants, and an Account of Johore Lami, the Capital. Of the Town and Island of Sincapora, and the Johore Islands.

THE next country to the north of Malacca is the territory of the king of Johore, which is washed both on the east and west by the Indian ocean, and is about eighty leagues broad and one hundred in length, from the town of Pera on the north to Point Romano, the southern cape of all the continent of Asia, it being situated in one degree north latitude.

This is a very woody country, and has plenty of lemons, very large citrons, pepper, and the other common fruits of the Indies; it has also aquila-wood and canes: the country likewise produces gold, tin, and elephants teeth; and among the cattle are buffaloes, wild boars, cows, and deer.

The common people wear only a piece of stuff hanging down before, but those in better circumstances have calicoe shifts, with a silk head-band and girdle, and by their sides have poniards adorned with precious stones. They paint their nails yellow, and those of the greatest quality wear them longest.

The people who inhabit the inland part of the country live chiefly on sago, on fruits that are ripe at all seasons of the year, on roots of which they have great plenty, and on poultry. But those who live on the sea-coast feed chiefly upon fish and rice brought thither from Siam, Cambodia, and Java.

They are said to be naturally brave, but lascivious and proud; the only people among them remarkable for their industry are the Chinese, who reside in their great towns, of whom there are supposed to be about one thousand families settled in the Johore dominions, besides a much greater number who carry on a foreign trade with them.

The capital of this kingdom, which is called Johore Lami, is situated on a river twenty-one leagues south of Malacca. This was a considerable city before it was destroyed by the Portuguese in 1603, when the king, being driven from it, built another city in 1609 higher up the river, which he called Batusabar, and to which the Dutch contributed out of the spoils they had taken from the Portuguese on their driving them out of the country. At the entrance of the river are two islands in the form of sugar-loaves. The town is divided into two parts, the one thirteen hundred paces and the other five hundred in compass, and contains about four thousand fighting men. The houses, which are built along the bank of the river, are of free-stone, raised on piles eight or ten feet high, and have a noble appearance.

The natives are a mixture of Pagans and Mahometans, who are supplied with priests from Surat. Their money is a gold coin, called macy, worth about three shillings and six-pence sterling, and a coupang, which is one quarter of a macy.

The town and island of Sincapour, or Sinapore, are situated at the southermost point of the peninsula, and give name to the south-east part of the streights of Malacca. Nieuhoff says, that it is twenty leagues, but others say that it is a hundred miles to the south-east of Malacca. Before the building of this last city Sincapour had a king of its own: it was then the principal trading town on the coast, on account of its lying in the center of trade, and its having good rivers and safe harbours, so conveniently situated, that all winds serve shipping to come in and go out of them. It has a mountain of the same name, which produces excellent diamonds. The soil of this country is black and fat, and the woods abound in timber fit for masts and for building. Large beans grow wild, and are not inferior to the best in Europe; as do also sugar-canes of a prodigious size.

To the north east of Cape Romano lie the Johore islands, which are the principal of those on the eastern coast: these are Pulo-Tingi, Pulo-Aure, Pulo-Pisang, Pulo-Timoun, and Linga; which last, Nieuhoff says, abounds with sago, but has no rice, and has about three thousand inhabitants: and all these islands in general produce goats, poultry, and some fruit; but no commodities proper for exportation.

Pulo-Aure, or the island of Aure, is inhabited by Malayans, who profess the religion of Mahomet, and are said to form a kind of republic; at the head of which is a captain, or leader, of their own choosing. The island abounds with refreshments of every kind, and chiefly consists of five or six mountains, in which are many plantations of cocoa-trees. It is extremely populous; settlements are dispersed through the country; but the married women and maids are never seen abroad. Commodities are here not purchased with money, but with iron, with which the inhabitants make military weapons; and more especially tools for building houses, and tilling the ground. They have canoes formed only of three pieces of wood, and have the character of being an humane, friendly, and sincere people, remarkable for their honesty.

Pulo-Timoun, or Timon, borders on the country of Pahan, and is the safest as well as the largest and highest of all the Johore islands; it is extremely pleasant, its mountains being covered with trees, and its valleys watered with clear streams. It produces the best betel, of which the Javans fetch great quantities.

Pulo-Pisang, or the island of Pisang, is three leagues south-east from Timoun, and has a town of the same name, where there is good anchoring. The island is well supplied with refreshments and good water.

SECT. IV.

Of Patana.

Its Situation, Extent, and Produce. Its Capital of the same Name described, and the Manners of the Inhabitants. The Power of the King, and the Trade carried on there.

PATANA is situated on the eastern coast of the gulph of Siam, and had once an English and Dutch factory. It abounds with wild buffaloes, and is about sixty leagues in length. It is governed by its own magistrates, yet pays the king of Siam a kind of annual homage by presenting him a gold flower worth fifty crowns. The port, which is about two leagues from the town, had formerly a very great trade; it being the staple for Surat shipping, and carrying on a considerable commerce from Goa, Malabar, Coromandel, China, Tonquin, Cambodia, and Siam; but the merchants, finding that robbers and murderers were under no restraint, turned their trade into another channel, which was of singular advantage to Batavia, Siam, and Malacca.

Patana abounds with all the grain and fruits of the Indies, besides some transplanted from China, and each month has its peculiar fruit.

Here are tygers, elephants, apes, wild boars, and other wild and tame beasts, fowls, ducks, and beautiful turtle-doves that have as fine colours as the peacock: they have plenty of turtle, oysters, and craw-fish. The apes and wild boars do incredible mischief to the fields; the inhabitants therefore kill as many of the latter as they can; but, as they eat no swine's flesh, they bury the carcases.

The

The town, which is encompaſſed on the land ſide by bogs, is about half a league in length, but is narrow and fortified with wooden paliſadoes as tall as the main-maſt of a ſhip. The houſes are built of cane and wood. The ſuburbs, which are alſo long and narrow, are watered by a fine ſtream, and here the king has a palace incloſed with paliſadoes. In this town the Mahometans have ſtately moſques, and the Gentoos ſeveral temples.

The inhabitants of this city are of a ſwarthy complexion, well ſhaped, proud, but obliging to their friends; but they have an averſion to wine and ſtrong drink. They have as many wives and concubines as they can maintain, and let out their daughters and female ſlaves to foreigners for ſo much a month; and by this infamous commerce the nobility make great profit.

According to Nieuhoff, the king is able to bring eighteen thouſand men into the field: This country has more ſhips than any of the neighbouring nations. The Chineſe are the chief manufacturers and traders: they bring here porcelain, ſtoves, kettles, lock-ſmith's-ware, dry and ſalt-fiſh, calicoes, &c. in return for which they receive ſeveral ſorts of wood, cordage made of cocoa-nut-ſhells; the ſkins of buffaloes, oxen, rabbits, and hares; cocoa-nut oil, rice, green-peaſe, ſeveral ſorts of fruit, and edible birds-neſts.

SECT. V.

Of the Kingdoms of PAHAN *and* TRANGANO. *Their Situation and Produce. The Capitals of thoſe Countries deſcribed.*

PAHAN, which is ſituated one hundred and fifty miles north-eaſt of Malacca, is the capital of a kingdom to the ſouth of Patana, ſituated twelve miles up a river of the ſame name, which has a pretty large iſland at its mouth that divides it into two channels. This river is a mile broad, but ſo full of ſhoals that it is difficult, even at high water, for a ſhip of thirty tons burden to get up to the town. This river, in which there is abundance of gold-duſt, waſhes the foot of Malacca-hill, and along the ſides of it pepper is planted, for exportation. The country on its banks is low, woody, and ſtored with wild game and fruits, and in the river and the ſea are excellent fiſh, but the air is not reckoned very healthful.

The nobility alone live in the city of Pahan, and the common people in the ſuburbs; the city is therefore very ſmall, and is ſurrounded with a fence formed of the trunks of trees joined together about four fathoms high, and has a baſtion at each corner; the ſtreets, being hedged in with reeds, and planted with cocoas and other trees, reſemble ſo many gardens. The houſes are generally built of reeds and ſtraw, but the king's palace is of wood.

Captain Hamilton informs us, that the king earneſtly expreſſed his deſire that the Engliſh would ſettle there; and told him, that Pahan might be made a place of great trade, were there ſhipping to carry off the pepper and tin which his country could furniſh; adding, that one hundred and fifty men would be ſufficient to curb his own rebellious ſubjects and their allies the Bougies; but that none in that country ever put themſelves under the protection of the Dutch, who would not be glad to ſhake it off again.

The next country to this is Trangano, which is extremely pleaſant and healthful, and affords a fine landſcape from the ſea. The hills, which gently riſe, and are of a moderate height, are covered with ever-greens that bear a variety of delicious fruits, as durions, oranges, lemons, limes, mangoſtans, ramboſtans, mangoes, and jacchees; and in the valleys are corn, pulſe, and ſugar-canes; but the Malayans, being too lazy to cultivate the earth, this is performed by the Chineſe. The country alſo produces pepper and gold, which are chiefly exported by the Chineſe.

The fineſt fiſh come from the neighbouring ſeas into the river, and are caught in the months of July and Auguſt: but from October to March the river is ſhut up by a bar formed by the impetuoſity of the great ſeas, which the north-eaſt monſoons produce near that ſhore. Their poultry are large, plump, and ſweet; but beef is ſcarce, except that of the buffaloe, of which there is plenty.

The city of Trangano, in which the king of the country reſides, is pleaſantly ſituated on the ſide of the above-mentioned river near the ſea. The houſes, which amount to about a thouſand, are not formed into regular ſtreets, but ſcattered ten or twenty in a place at a ſmall diſtance from each other, forming many ſeparate villas. Above half of the inhabitants are Chineſe, who trade to ſeveral of the neighbouring countries.

SECT. VI.

Of PERA, *the Iſland* PULODINGDING, QUEDA, *and* LIGOR. *Their Situation, Produce, and the Manners of the Inhabitants.*

PERA, or Perach, is ſituated at the bottom of a bay one hundred and fifty-four miles north-weſt of Malacca, in four degrees forty minutes north latitude, and one hundred and two degrees ten minutes eaſt longitude from London, near a river that diſcharges itſelf into the ſtreights of Malacca. This is the capital of a kingdom of the ſame name, and abounds with more tin than any country in India. It has very high mountains, thick woods, and frightful deſarts, which abound with rhinoceroſes, wild elephants, buffaloes, tygers, and ſerpents; and the rivers are infeſted by crocodiles. According to captain Hamilton this is properly a part of the kingdom of Johore; but the government, when he was there, was a kind of anarchy; and the people, who are Mahometans, are ſo untractable, treacherous, and barbarous, that no European nation can keep a factory there with ſafety, as the Dutch experienced when they ſettled a factory and erected a fort at Pulodingding, an iſland at the mouth of the river Pera, but were all cut off.

According to Dampier and Nieuhoff, this iſland is mountainous, and well ſupplied with ſprings of water. It has large timber, and trees proper for maſts and ſail-yards. Theſe trees are tall, and have a red wood, valued for its beauty by the Indians, who make curious works of it. The iſland has ſeveral good bays, excellent water, and plenty of fowl and fiſh, particularly turtle, and a ſmall ſort of very good oyſters, which often hang in cluſters to the branches of trees that grow by the ſides of the water. Here are likewiſe many wild boars, that ſwim hither from the neighbouring continent to feed on the roots; but the coaſt is infeſted with a venomous flat fiſh, called a ſea-qualm, that is dangerous to thoſe of the inhabitants who waſh in the ſea, by cauſing inflammations wherever they touch: they are about the ſize of a common plate; their fleſh is ſoft like a jelly, on their backs are red and purple ſpots, and there are eight teats on their bellies.

Queda, or Keda, is a ſea-port town, one hundred and thirty miles from Patana, on the weſt ſide of the Peninſula, and is the capital of a country which has alſo the title of a kingdom; but its territory is ſmall, and the people poor. It is ſituated in a good ſoil, watered by ſeveral brooks that come from a navigable river, ſaid to abound with crocodiles. The poor, proud, and beggarly king, ſays captain Hamilton, never fails to viſit foreign merchants as ſoon as they arrive in this port, and expects preſents from them when they repay his viſit; in return for which his majeſty will honour the foreigners with a ſeat near his ſacred perſon, and chewing a little betel put it out of his mouth on a little gold ſaucer, which his page hands to the foreigner, who muſt take it with all poſſible reſpect, and chew the royal morſel after him, for the refuſal would be attended with danger.

Ligor, the capital of a country of the ſame name, is ſituated in one hundred degrees twenty-five minutes eaſt longitude from London, and in eight degrees north latitude. It is ſubject to Siam. On the coaſt is a ſmall

iſland

iſland alſo called Ligor. The Dutch have a factory here that carries on a conſiderable trade in tin and pepper; the country producing abundance of the former, all of which they engroſs to themſelves. The town, which is ſituated about two miles above the factory, is built of bamboos and thatched with reeds, and has many Pagan temples with lofty and ſlender ſteeples.

CHAP. XXI.

Of the Empire of AVA, including PEGU, ARACAN, and TIPRA.

SECT. I.

Its Situation and Boundaries: the Manner in which Pegu was ruined and rendered ſubject to the King of Ava. A ſhort Deſcription of the Cities of Pegu and Syriam.

THE empire of Ava is placed by Monſieur de Liſle between the latitude of fifteen and twenty-eight degrees north, and is bounded by Tibet on the north, on the eaſt by the kingdoms of Laos and Siam, on the weſt by Bengal and its gulph, and on the ſouth by the Indian ſea.

The greateſt part of this territory was formerly poſſeſſed by the king of Pegu; but that monarchy has been deſtroyed by two powerful kings of Ava and Siam; the former of whom is abſolute ſovereign both of Ava and Pegu, and has ſeveral of the neighbouring ſtates tributary to him.

Thoſe who have travelled through the Eaſt give but little information about the kingdom of Ava, though they pretend it is twice as large as that of France. They only obſerve, that the immenſe riches of the king appear in the ſplendor of his palace, which, though of vaſt extent, is for the moſt part adorned with gilding.

Whatever is related by hiſtorians of the kingdom of Pegu is drawn from Gaſpar Balbi, a rich Venetian merchant, who traded thither in 1576; and ſuppoſing him endowed with ever ſo great a portion of judgment and veracity, his account of that country can give but little idea of its preſent ſtate: we ſhall therefore take our account of Pegu chiefly from captain Hamilton, who viſited that kingdom, and became inſtructed in the manners of the people, partly by the inhabitants themſelves, and partly by the informations he obtained from ſome of the Engliſh company at Fort St. George who traded thither. The cauſe which produced the ruin of the kingdom of Pegu, with Martavan, and ſome others under its dominion, was told to Mr. Hamilton by ſome Peguans, in ſeveral diſcourſes he had with them on that ſubject.

A ſtrict friendſhip for a long time ſubſiſted between the kings and ſubjects of Pegu and Siam, who being next neighbours, carried on a great trade with each other, till the ſixteenth century: but a Pegu veſſel being at Siam, the metropolis of the kingdom, when ready to depart, anchored one evening near a ſmall temple a few miles below the city, when the maſter and ſome of the crew going there to worſhip, ſaw a little well-carved image of the god Samſay, and finding the talapoins negligent, ſtole that idol, and carried it to Pegu. Thoſe prieſts miſſing the little idol, lamented their loſs to all the neighbouring talapoins, and by their advice carried their complaints to the king of Siam; and there happening to be a ſcarcity of corn that year, the calamity was imputed by the prieſts to the loſs of the god Samſay. The king of Siam now ſent an embaſſy to his brother of Pegu, deſiring the reſtitution of the image, whoſe abſence had been attended with ſuch fatal conſequences: but the king of Pegu refuſing to comply with his requeſt, a bloody war enſued between the two kingdoms, in which the king of Siam ravaged the country, and annexed the inland countries of Pegu to his own dominions.

The king of Pegu, in this diſtreſs, invited the Portugueſe to his aſſiſtance, whoſe name began to be dreaded in India, and by the great encouragement he gave them, got about one thouſand volunteers into his ſervice: the uſe of fire-arms being then unknown in thoſe parts, they ſpread terror wherever they came, and drove the Siameſe out of the country. The king of Pegu then made one Thoma Pereyra, a Portugueſe, general in chief of all his forces, and ſettled his court at Martavan, near the borders of Siam, to be ready on all occaſions to repel the Siameſe troops.

Though the Portugueſe, by their inſolence, now rendered themſelves hated by people of all ranks, Thoma Pereyra was the favourite at court; he had elephants of ſtate, and a guard of his own countrymen to attend him. One day, as he was coming with great ſtate from the palace, riding on a large elephant, he chanced to hear muſic in a burgher's houſe, whoſe daughter, a very beautiful virgin, had been married to a young man of the neighbourhood. The general went to the houſe, wiſhed them joy, and deſired to ſee the bride. The parents took the general's viſit for a great honour, and brought their daughter to the elephant's ſide, when being ſtruck with her beauty, he had the villainy to order his guards to ſeize her, and carry her to his houſe.

The general's orders were but too readily obeyed, and the bridegroom not being able to endure his loſs, cut his own throat; the diſconſolate parents of their injured children, rent their cloaths, and ran towards the king's palace uttering their lamentations, and imploring their gods and countrymen to revenge them on the inſolent Portugueſe, the oppreſſors of their country. The ſtreets were ſoon unable to contain the crowds with which they were filled, and the noiſe they made reaching the king's ear, he ſent to know the cauſe of the tumult, and being informed, let the people know that he would puniſh the criminal. He accordingly ſent for the general; but he being employed in raviſhing the unhappy bride, excuſed himſelf, by pretending to be ſo much indiſpoſed, as to be unable to wait on his majeſty.

The king, exaſperated at this anſwer, in the firſt tranſport of his rage, ordered the whole city to take arms, and make a general maſſacre of the Portugueſe, wherever they could be found. And this cruel order was ſo ſpeedily executed, that in a few hours all the Portugueſe were ſlaughtered, except the criminal, who being taken alive, was made faſt by the heels to an elephant's foot, and was thus dragged through the ſtreets, till the fleſh was torn from his bones. Three Portugueſe alone were ſaved; theſe were accidentally in the ſuburbs near the river, and hiding themſelves till night, made their eſcape in a ſmall boat, and coaſting along the ſhore, lived on what they found among the rocks, and in the woods, and at length arrived at Malacca.

Both theſe kingdoms being extremely weakened and exhauſted by theſe wars, ſuſpended all acts of hoſtility, till about the middle of the ſeventeeth century, when the king of Siam again invading Pegu, conquered ſeveral provinces tributary to that kingdom. The king of Pegu, now finding his forces unable to protect his more immediate dominions, called for the aſſiſtance of the king of Ava, whoſe dominions lay about five hundred miles up the river. He complied with the invitation, and drove the Siameſe from their new conqueſts; but afterwards perceiving the want of diſcipline among the Peguan forces, he murdered the king, whom he came to protect; broke the Peguan army, and ſeized the kingdom of Pegu; and ruined its capital.

They

The ancient city of Pegu ſtands about forty miles to the eaſtward of Syriam, and was once the ſeat of many great and puiſſant monarchs, who made a diſtinguiſhed figure in the eaſt; but now its glory is laid in the duſt; for not a twentieth part of it is inhabited, and its few inhabitants are of the lower claſs of the people. The ditches that ſurrounded the city, which are now dry, and bear good corn, ſhew that few cities in the world exceeded it in magnitude, for they are computed to be ſix or ſeven leagues round.

The city of Syriam is built on a riſing ground near the ſide of Pegu river, about ſix leagues from the bar, and is encompaſſed with a wall formed of ſtone without mortar. The governor, who is generally a perſon of the royal blood, reſides in it. The ſuburbs are however four times bigger than the city. It was many years in the poſſeſſion of the Portugueſe, till their inſolence and pride obliged the government to drive them from it.

SECT. II.

Of the Produce of the Country; the Perſons, Dreſs, Cuſtoms, and Manners of the Inhabitants; particularly the Form of Marrying a Pegu Woman to an European; the annual Ceremony of firing Sky-rockets of a prodigious Size. The Diſeaſes to which the People are liable.

THIS country is very fruitful in corn, excellent pulſe of ſeveral ſorts, fruits and roots, and produces timber for building, elephants teeth, iron, ſaid to be of ſo hard a nature as to be a kind of natural ſteel, tin, lead, oil of earth, wood oil, the beſt rubies in the world, ſmall diamonds, amethyſts, ſapphires, and other precious ſtones; bees-wax, ſtick-lack, and abundance of ſaltpetre. Wild game of all ſorts is extremely plentiful, and captain Hamilton ſays, that deer are ſo numerous, that he bought one for a groat; but though they are very fleſhy they are not fat. They have ſwine's fleſh, plenty of good poultry, and many ſorts of excellent fiſh.

The Peguans ſuffer their hair to grow very long, and tie it on the top of their heads with a cotton ribbon wrapped round it in ſuch a manner that it ſtands up in the form of a ſpire. They wear a garment ſo thin that the ſkin is eaſily ſeen through it, and have a large ſcarf about their loins, which reaches to their ancles, but they wear neither ſtockings nor ſhoes.

The natives of Ava are diſtinguiſhed from the Peguans by making figures on their ſkins, by pricking them with a bodkin, and rubbing them over with charcoal. This the Peguans are not allowed to perform. The men are generally plump, well ſhaped, and have good features; but are of an olive complexion.

The women are much fairer than the men; they are alſo well ſhaped, and have commonly pretty round faces, but are ſmall of ſtature. Their head-dreſs is their own black hair tied up behind, and when they go abroad they wear a piece of cotton cloth looſe on the top of their heads. They wear a cotton or ſilk frock, which ſits cloſe to their bodies and arms, and reaches half way down the thigh; under it a ſcarf which comes four times round their waiſt, and hangs almoſt to the ancle, but is ſo contrived, that at every ſtep they take it ſhews the right leg, and part of the thigh. This part of their dreſs is very ancient, and is ſaid to have been firſt contrived by a queen of the country, who, grieved to ſee the men ſo addicted to an unnatural vice, as to neglect the ladies, contrived this habit to raiſe deſire, and incite them to place their affections on proper objects. The queen had the pleaſure of ſeeing, that this expedient had the deſired effect, and now the odious vice of ſodomy is hardly known in that country.

The women are extremely courteous and kind to ſtrangers, and are particularly fond of marrying Europeans. Hence moſt of the foreigners who trade thither, marry one of theſe women, for the time they ſtay. After the parties are agreed, the bride's parents, or her neareſt relations, invite the bride and bridegroom, with the friends of each to a feaſt, and when it is over, the father, or bride-man, aſks them both if they are willing to cohabit together as man and wife, and both giving their conſent, they are declared lawfully married. If the bridegroom has a houſe, he conducts her thither; but if not, they have a bed provided in the houſe where they are married.

Theſe women are obedient and obliging to theſe temporary huſbands, and take the management of affairs within doors wholly into their own hands. The wife goes to market, buys and dreſſes the food, and takes care of her huſband's cloaths, in waſhing and mending them. If he has goods to ſell, ſhe takes a ſhop, and ſells them by retail, to a much better account than he could ſell them to the merchants, and ſome of them take goods to the inland towns, where they exchange them for ſuch as are proper for the foreign markets to which the huſband is bound, and generally bring fair accounts of their proceedings. If ſhe proves falſe to his bed, he may cut off her hair, ſell her for a ſlave, and keep the money. On the contrary, if the man goes aſtray, the woman will be apt to poiſon him. If ſhe proves prolific the children cannot be carried out of the kingdom without the king's permiſſion, which, however, may be purchaſed for forty or fifty pounds; and, if any irreconcileable quarrel happens between them, the father muſt take care of the boys, and the mother of the girls. When the huſband leaves the country he may continue the marriage, by allowing his wife ſix ſhillings and eight-pence a month, and if this be not done, ſhe may marry again at the end of the year; but if ſhe receives that ſum on his account, ſhe is obliged to ſtay three years. She is the better eſteemed for having been married to ſeveral European huſbands.

People of fortune annually let off ſky-rockets in the month of September, and if they fly a very great height, it is conſidered as a certain ſign that the owner is in favour with the gods, but if they fall to the ground, and ſpend their fire without riſing, the owner is greatly afflicted, and believes that his deities are not his friends. The perſons, whoſe rockets riſe in the air, ſhew their gratitude by building temples, and dedicating them to the gods they adore, and the prieſts whoſe temples are decayed, bringing their idols to adorn the new raiſed ſtructures, are rewarded with the benefice. Captain Hamilton aſſerts, that he ſaw ſome of theſe rockets ſo large, that one of them contained above five hundred pounds weight of powder, duſt, and coals, of which they are commonly compoſed. The carcaſe is the trunk of a large tree made hollow, into which they ram the compoſition, and then bind the carcaſe with thongs made of buffaloes hides from one end to the other, to keep it from ſplitting. After ſecuring the ends of the carcaſe, that the compoſition may come gradually out when fired, they place it on a branch of a large high tree, and having fixed it in a poſition for mounting, add a large bamboo for a tail to balance it, ſome of which are ſaid to be one hundred and twenty feet long. When the tail is fixed on, the day of ſolemnity is proclaimed, and multitudes of people of all ranks and ages being aſſembled, the owner ſets fire to it, and the rocket either mounts a prodigious height in the air, or flies five or ſix hundred paces in an irregular manner on the ground, ſcorching or wounding all in its way. Soon after they chooſe ſome women out of the people aſſembled to perform a dance to the gods of the earth. They have various kinds of inſtruments, but the tabor and pipe are eſteemed the beſt: they have alſo an inſtrument ſhaped like a galley, about three feet long, with twenty bells of ſeveral ſizes placed on the top, with which they make no bad muſic.

The diſtemper moſt dreaded in this country is the ſmall-pox. When any one is ſeized with it, all the neighbourhood remove for three weeks to the diſtance of two or three miles, where they ſoon run up new houſes made of bamboos, and leave the ſick perſon to live or die by himſelf, with only a baſket of rice, ſome earthen pots to boil it in, and a jar of water. If the patient lives they fetch him to their new habitations, of which they make him free. It is here ſaid that the moſt ravenous tyger will not touch a perſon afflicted with this loathſome diſeaſe.

SECT. III.

Of the Religion of the Peguans. A Deſcription of their Temples and Images, and of the Funeral of an High Prieſt.

THE talapoins are ſuch ſtrict obſervers of all the rules of humanity and charity, that if a ſtranger has the misfortune to be ſhipwrecked on the coaſt, though he is by the laws of the country the king's ſlave, they prevail on the governors to evade the cruel law, and deliver them to their care. When any unfortunate ſtrangers come to their temples, they are hoſpitably ſupplied with food and raiment; if they are ſick or maimed, theſe prieſts, who are alſo the chief phyſicians of Pegu, keep them till they are cured, and then furniſh them with letters of recommendation to the prieſts of another convent on the road they deſign to travel. They never enquire after the religion of a ſtranger; their humanity is too warm to permit them to confine their benevolence to thoſe of their own profeſſion; it is ſufficient, that the ſtranger has the human form, and that renders him the object of their charity. In their opinion all religions are good that teach men to be good; they believe that the gods are pleaſed with various forms of worſhip, but with none that is hurtful to man, becauſe cruelty is contrary to their nature.

When any contention happens between neighbours the talapoins uſe all their endeavours to produce a reconciliation, and never leave their good offices till they have obtained it; when, in token of friendſhip, the parties, according to an ancient cuſtom, eat champoc from each other's hand to ſeal their friendſhip. This champoc is a kind of tea that has a very diſagreeable taſte: like other tea it grows on buſhes, and is uſed on ſuch occaſions all over Pegu.

The talapoins frequently preach to numerous auditories, in which the uſual ſubject of their diſcourſes is, that charity is the moſt ſublime of all the virtues, and ought to be extended not only to mankind, but to animals. They alſo exhort the people not to commit murder; to take from no perſon any thing belonging to him; to do no hurt; to give no offence; to avoid impurity and ſuperſtition; and above all not to worſhip evil ſpirits. But their diſcourſes on this laſt point have no effect. The people attached to manicheiſm believe, that all good comes from God, and that the evil ſpirits are the authors of all the miſchief that happens to man; and that therefore they ought to worſhip theſe demons that they may not afflict them. This is a common notion among the Indian idolaters.

The images in their temples are placed croſs-legged under domes; their faces are longer than the human; their ears are very large, and the lobes are thick; their toes are all of an equal length, and their arms and hands are very ſmall in proportion to their bodies. The congregation bow to them when they come in and go out, and that is all the worſhip they pay them.

There are two large temples near Syriam, which ſo nearly reſemble each other, that they ſeem to be built on the ſame model. One of them, which ſtands about ſix miles to the ſouthward, is called Kiakiack, or the temple of the god of gods, in which is an image twenty yards in length, lying in a ſleeping poſture, and they pretend that he has lain in that manner ſix thouſand years. The doors and windows of this temple are always open, and every one is at liberty to ſee this idol. They are perſuaded, that when it awakes the world will be deſtroyed. The temple is erected on an eminence, and in a clear day may eaſily be ſeen at ſix leagues diſtance.

The other temple, named Dagun, is ſituated in a low plain about the ſame diſtance, to the north of Syriam, but the doors and windows are always ſhut, and none are allowed to enter this temple but the prieſts, who will not deſcribe the ſhape of this idol, though they ſay it does not reſemble that of an human being. As ſoon as Kiakiack diſſolves the frame of the world, Dagun, they imagine, will gather up the fragments, and form a new one. Near theſe temples are held annual fairs, at which are made free-will offerings for the uſe of thoſe temples.

According to Balbi, the Peguans in his time had annually five principal feſtivals, which they call Sapane, and celebrate with extraordinary magnificence. In one of them the king and queen went in pilgrimage about twelve leagues from the city, on which occaſion they rode on a triumphal car, ſo richly adorned with jewels, that it might be ſaid, without an hyperbole, they carried about them the value of a kingdom. This prince was at that time extremely rich, and had in the chapel of his palace ſeveral idols of ineſtimable value. One of them, he ſays, was of the human form, as big as the life, and of maſſy gold, having on its head a triple crown, adorned with all ſorts of precious ſtones; on the front was a ruby as big as a prune; at the ears were the richeſt pendants that ever were ſeen, and on the belly a girdle in the manner of a belt covered with diamonds and ſtones of an ineſtimable price. Two other idols of ſilver were by the ſides of the firſt, but higher by two feet. A fourth idol paſſed for the richeſt of them all, both from the quantity of metal, and its ornaments; and a fifth was no leſs eſteemed, though it was only made of braſs and pewter.

Mr. Hamilton obſerves, that he ſaw the ceremony of an high-prieſt's funeral, and was not a little pleaſed with the ſolemnity. After the body had been kept three or four months from putrefaction by ſpirits or gums, a great maſt was fixed firmly in the ground, and at fifty or ſixty yards diſtance on each ſide were placed four ſmaller maſts, all of them perpendicularly. Around the great maſt in the middle three ſcaffolds were erected above each other, the lowermoſt the largeſt, and the ſmalleſt at the top, ſo that it reſembled a pyramid. Theſe ſcaffolds were railed in, except an open place of three or four feet on each ſide. All the ſcaffolds, and the ground below them, were filled with combuſtibles. Four ropes were carried very tight from the maſt in the middle to the other four maſts, and a rocket on each rope was placed at each of the ſmall maſts. The corpſe was then carried to the upper ſtory of the pyramid, and laid flat on the ſcaffold, and after a great ſhew of ſorrow among the people who were preſent, a trumpet was ſounded, at which ſignal fire was put to the rockets, which, with a quick motion, flew along the ropes, and fire to the combuſtibles, and in a moment they were in a flame, and in an hour or two all were conſumed.

The people entertained ſuch veneration for this talapoin, that they eſteemed him a ſaint. He was highly reſpected by the king himſelf, and when any nobleman happened to incur the king's diſpleaſure, he uſed his intereſt with his majeſty to have him reſtored again to favour. This always happened, except the nobleman was guilty of atrocious crimes; and then he uſed his endeavours to have the rigour of his puniſhment abated.

SECT. IV.

The abſolute power of the King; the manner in which Traitors are puniſhed. The fulſome Adulation with which he is treated by his Subjects. Of his Army, and the Maintenance of his Troops. The Forms obſerved in the Courts of Juſtice, and ſome Account of the Palace and City of Ava.

THE king is deſpotic, and all his commands are laws; he, however, holds the reins of government in his own hands, and puniſhes with the utmoſt ſeverity thoſe governors of provinces and towns whom he finds guilty of oppreſſion. That he may be informed of every thing that paſſes throughout his dominions, every province or city has a deputy reſiding at court, which is generally in the city of Ava, the preſent metropolis. Theſe deputies are obliged to attend the court every morning; and when the king has breakfaſted he retires into a room where he can ſee all his attendants, without being ſeen: mean while a page waits to call the perſon from whom his majeſty would obtain an account of whatever has paſſed in his province or city, and this news he relates,

looking

looking with profound reverence towards the room where the king ſtays; but if he omits any thing of conſequence, which the king happens to hear of by another hand, he is ſure of being ſeverely puniſhed.

When his majeſty receives information of treaſon, murder, or any other crimes, he cauſes the affair to be tried by judges of his own chooſing; and, on the conviction of the criminal, aſſigns the puniſhment he is to undergo, which is either being beheaded, made ſport for the elephants, which is the moſt cruel death, or baniſhed for a time to the woods; whence, if he eſcapes being devoured by the wild beaſts, he may return when his baniſhment is expired, and then muſt ſpend the remainder of his days in ſerving a tame elephant: but for ſmaller crimes people are only ſentenced to clean the ſtables of the elephants.

The king is treated by his ſubjects with the moſt fulſome adulation. In ſpeaking or writing to him they ſtile him their god; and in his letters to foreign princes, he aſſumes the title of king of kings, to whom all other ſovereigns ought to be ſubject, as being the near kinſman and friend to all the gods in heaven and on the earth, by whoſe friendſhip to him all animals are fed and preſerved, and the ſeaſons of the year keep their regular courſe. The ſun is his brother, and the moon and ſtars his relations; and he pretends to preſide over the ebbing and flowing of the ſea: but, after all theſe lofty hyperbolical epithets, he ſinks ſo low as to call himſelf king of the white elephant, and of the twenty-four white umbrellas. When his majeſty has dined a trumpet is blown, to ſignify to all the kings of the earth that they may go to dinner, becauſe their lord hath already dined. And when any foreign ſhips arrive at Syriam, he is informed of the number of the people on board, with their age and ſex, and told that ſo many of his ſlaves are arrived to partake of the glory and happineſs of his reign.

When an ambaſſador is admitted to an audience he is attended by a conſiderable body of guards, with trumpets ſounding, and heralds proclaiming the honour he is about to receive, in ſeeing his majeſty's face, the glory of the earth; and between the gate and the head of the ſtairs that lead to the chamber of audience the ambaſſador is attended by the maſter of the coremonies, who inſtructs him to kneel three times, in the way thither, and to continue on his knees, with his hands over his head, till a proclamation is read.

When baſkets of fruit and pots of water are carried through the ſtreets for the uſe of the king, they are attended by an officer, and all the people who happen to be near muſt fall on their knees, and continue in that poſture while they paſs by; and when the king comes abroad, ſome of his elephants are inſtructed to fall on their belly.

The officers of the army have no ſalary, nor have the ſoldiers any pay; but the governors of the provinces and cities are obliged to give ſubſiſtence to a certain number of ſoldiers, and to find the palace at Ava ſuch a quantity of proviſions as is appointed. However, in time of war the king allows the army pay, cloaths, arms, and alſo provides magazines for the ſupport of the troops; but the war is no ſooner over than the cloaths and arms are returned, by which means the ſoldiers, being almoſt conſtantly without their arms, know not how to uſe them, and are little acquainted with diſcipline.

The quality of an officer is ſaid to be known by the head of his tobacco-pipe, which is of earth or metal, with a ſocket to let in a jointed reed, which at its upper end has a mouth-piece of gold jointed like the reed, and by the number of joints in this golden mouth-piece, the quality of the officer, and the reſpect that is due to him are fully known.

All the towns in the king's dominions have a government that reſembles a kind of ariſtocracy. The governor ſeldom ſits in council, but appoints his deputy and twelve judges, who ſit at leaſt once every ten days, but oftener when buſineſs requires it. They aſſemble in a large hall, on a kind of ſtage about three feet high, and benches are placed round the floor for people to ſit or kneel upon to hear the trials. The hall is erected on pillars, and is open on all ſides; and the judges ſitting on mats in the middle, in the form of a ring, there is no place of precedence. Every man has the liberty of pleading his own cauſe, or ſending it in writing to be read publicly; and all ſuits are determined within three ſittings: but if any man queſtions his own eloquence, he may impower a friend to plead for him. Theſe trials are attended with no expence: for the town, by an eaſy contribution, provides for the maintenance of this court. At the backs of the judges are ſeated clerks, who write down what is ſaid by the plaintiff and defendant, and the affair is determined by the governor and theſe twelve judges with the utmoſt equity; for if they are found guilty of the leaſt partiality, and the king is informed of it by the deputy of the town, the ſentence is revoked, and the whole board corrected; ſo that very few appeal from their deciſion to the king, which they may do if they think themſelves aggrieved; but if an appeal be made on ill grounds, the appellant is ſure to be chaſtiſed.

Though the king's palace at Ava is very large, and built with ſtone, it is a mean ſtructure. It has four gates; the Golden Gate, at which ambaſſadors enter, is thus named becauſe all ambaſſadors procure an audience by preſents. The ſouth gate is called, The Gate of Juſtice, and is entered by all who bring petitions, accuſations or complaints. On the weſt is the Gate of Grace, where all who have received favours, or have been acquitted of crimes, paſs out in ſtate, and all perſons condemned are carried away loaded with fetters: and the north gate, fronting the river, is ſtiled The Gate of State, and through it his majeſty paſſes when, according to the language of theſe ſlaves, he condeſcends to bleſs his people with his preſence; and all his proviſions and water are carried in at this gate.

Though the city is of conſiderable extent, and very populous, it is only built of teak planks, or ſplit bamboos, becauſe if any perſons are charged with treaſon, or any other capital crimes, they may find no place of ſecurity; for if they do not appear to the firſt ſummons, fire is ſet to their habitations to fetch them out.

SECT. V.

Of the Kingdoms of ARRACAN *and* TIPRA.

No authentic Account of thoſe Countries, except the imperfect one given by Mr. Hamilton. The cruel Manner in which the King treated Sultan Sujah, and the Deſtruction of the Country.

IT may here be expected that we ſhould give a deſcription of Arracan and Tipra; but a regard to that veracity which ought to be dear to the geographer and hiſtorian, makes us more willing to acknowledge our being unacquainted with thoſe countries, than to give abſurd accounts repeated from authors, who, fond of the marvellous, relate the moſt extravagant and ridiculous ſtories, and ſhew ſo little regard to truth, that what would otherwiſe appear probable, is rendered doubtful. Thus,' tis ſaid, that one of the kings of Arracan built a palace, and laid the foundation of it upon women with child; and that being told that his life would be of ſhort continuance, a Mahometan, whom he conſulted, adviſed him to avert the prediction, by eating a compoſition of ſix thouſand of the hearts of his ſubjects, four thouſand of the hearts of white crows, and two thouſand of the hearts of white doves.

In ſhort, it does not appear that any traveller of credit has viſited the interior part of either Arracan or Tipra; and it is certain, that Mr. Ovington, who has ſaid ſo much of Arracan, was never nearer that country than Bombay and Surat. Mr. Hamilton has indeed viſited the coaſt of that kingdom, which he ſays extends four hundred miles in length, from Xatigam, a town that borders on Bengal, to Cape Negrais; yet few places are inhabited, on account of the vaſt number of wild elephants, buffaloes, and tygers; the former of which would ſoon deſtroy the productions of the earth, and the

latter

latter the tame animals brought thither: only ſome ſmall iſlands near the ſhore are peopled by a few poor fiſherm n.

Arracan produces elephants teeth, tin, lead, ſticklack, and timber for buildings. Some of the Mogul's ſubject trade thither for theſe commodities, and ſometimes meet with good bargains of gold, diamonds, rubies, and other precious ſtones, which are ſuppoſed to be ſome of ſultan Sujah's treaſure.

This ſultan Sujah had been driven from Bengal by Emir Jemla, the general of Aurengzebe, and came a ſuppliant for protection to Arracan. This unfortunate prince had with him his wives and children, with about two hundred of his retinue, who were reſolved to follow his fortune, and ſix or eight camels loaded with gold and jewels, which proved his ruin, and at length the ruin of the kingdom.

When ſultan Sujah firſt viſited the king of Arracan, he made him preſents ſuitable to the quality of the giver and receiver, and the king promiſed him all the civilities due to ſo great a prince, with a ſafe aſylum for himſelf and family. Emir Jemla, knowing where he had taken ſanctuary, ſent to the king of Arracan to demand the diſtreſſed prince, threatening, if he refuſed to deliver him up, to march with his army into his country, and take him away by force. This letter had ſuch an effect on the king of Arracan, that he baſely contrived the means of quarrelling with his gueſt, in order to obtain a pretence for ſacrificing him to the ambition of Emir Jemla.

Sultan Sujah having a very beautiful daughter, the king of Arracan deſired her in marriage, well knowing that ſultan Sujah would not conſent to the match, he being a Pagan and ſhe a Mahometan. Her father in vain expoſtulated with the king, who daily becoming more preſſing, he gave him an abſolute denial; on which the king ſent him orders to leave his dominions in three days; and commanded that the markets ſhould no longer furniſh him with proviſions for his money.

Sultan Sujah, knowing it would be death for him to return to Bengal, reſolved to paſs over ſome mountains, overgrown with woods, into the dominions of the king of Pegu, which were not above a hundred miles diſtance; and therefore the next day after his receiving the meſſage, began his march, with his family, his attendants, and his treaſure; but the barbarous king ſent after him a ſtrong party, which overtaking him before he got into the woods, killed moſt of his attendants, and ſeizing the treaſure, brought it back in an inglorious triumph. But what became of the ſultan and his daughter is unknown; none being able to tell whether they were ſlain in the ſkirmiſh, or afterwards devoured in the woods by the wild beaſts.

So much treaſure had never before been ſeen in Arracan; but to whom it ſhould belong cauſed ſome diſturbance. The king thought that all belonged to him; thoſe that fought for it claimed a ſhare, and the princes of the blood wanted ſome fine large diamonds for their ladies; but the prieſts perſuading them to dedicate all the treaſure to the god Dagun, and to depoſit it in his temple, they all unanimouſly agreed to the propoſal.

In 1690 the king of Arracan dying without iſſue, two princes of the blood, contending for the crown, took up arms, and both reſolving to ſeize the treaſure, the prieſts removed it to a place only known to themſelves; and the two princes purſued their quarrel with ſuch warmth, that in one year both themſelves and families were deſtroyed, and the kingdom left in anarchy; but it is now ſaid to be ſubject, or at leaſt tributary, to the king of Ava; and this is alſo ſaid to be the [illegible] which extends along the north of Ava, [illegible] no more than a province of that kingdom.

SECT. VI.

Of the Kingdom of ACHAM.

Its Situation and Mines. The People free from [illegible] the Coin of Acham; the Funeral of the [illegible] Conqueſt of the Country. The People ſaid to be [illegible] tors of Gun-powder.

THE kingdom of Acham, or Azem, is [illegible] the eaſt of the great Mogul's dom[illegible] the weſt of the lake Chiamay, and [illegible] thing neceſſary for the ſubſiſtence of [illegible] country abounds in mines of gold, ſilver, [illegible] the king has reſerved them to himſelf, [illegible] ſubſidies from his people; and, that they may [illegible] oppreſſion, none are employed in working [illegible] the ſlaves he purchaſes of his neighbours. [illegible] people are free from taxes, and live at their eaſ[illegible] the reſt of the Indians are involved in all the [illegible] ſlavery and oppreſſion, in the midſt of a country [illegible] providence has provided for them all the riches [illegible] in the greateſt exuberance.

It is prohibited by the laws to carry gold [illegible] kingdom, or to coin it into money; yet it is [illegible] people in trade in great and ſmall ingots; but [illegible] not to be paid to ſtrangers. The king, however, [illegible] pieces of ſilver to be coined of the ſize and [illegible] roupies, and of an octagon form; and theſe [illegible] ported any where.

The king reſides in the city of Kemmerot; [illegible] tombs of the royal family are in the city of [illegible] the banks of the river Laquia, where every [illegible] a kind of chapel in the great pagoda to ſerve for [illegible] of burial.

Being perſuaded that after death they go into [illegible] where thoſe who are ſtained with guilt ſuffer [illegible] hunger and thirſt, they place food by the [illegible] corpſe, that it may feed upon it if neceſſary. [illegible] is ſaid to be interred with thoſe idols of gold [illegible] which he worſhipped when living; and [illegible] twelve camels, ſix horſes, and a great number [illegible] are alſo buried, from the belief that they may [illegible] to him in another world. In theſe funeral [illegible] barbarity is joined to ſuperſtition, and the [illegible] loved beſt, with the principal officers of [illegible] poiſon themſelves, in order to enjoy the honour [illegible] interred with him, and of ſerving him in the next [illegible] When a private perſon is interred, all his friends [illegible] lations aſſiſt at his funeral, and throw into the [illegible] bracelets and ornaments they wear.

This country was hardly known before [illegible] general of Aurengzebe, conquered it, about [illegible] century. He undertook this expedition with the [illegible] confidence, as Acham had been without any [illegible] the ſpace of ſix or ſeven hundred years, and [illegible] had entirely neglected the uſe of arms. He found [illegible] difficulty in conquering ſuch a people; yet tradition [illegible] tributes to them the invention of gun-powder, [illegible] ſaid to have paſſed from Acham to Pegu, and from [illegible] to China; which has given occaſion to ſay, [illegible] Chineſe were the authors of that diſcovery. It is [illegible] ſaid, that in this war Mirgimola took ſeveral [illegible] cannon, all of which were of iron.

CHAP. XXII.

Of INDOSTAN.

SECT. I.

Situation, Extent, Provinces, Climate, principal Rivers, and Minerals; with an Account of a remarkable Phænomenon in natural History, occasioned by the Chain of Mountains that extend through the Peninsula.

THE name of India was doubtless derived from the river Indus, the western boundary of this extensive country, which is situated between the Indus and the Ganges; but it is at present known by the name of Indostan, or India Proper, and by the natives is called Mogulstan, or the empire of the great Mogul, who is descended from Tamerlane, who was a Mogul Tartar.

This country is of very great extent, and is bounded by Usbec Tartary and Tibet on the north; by another part of Tibet, with Ava, Acham, and the bay of Bengal, on the east; by the Indian ocean on the south; and by the same ocean and Persia on the west. It extends between the sixty-sixth and ninety-second degree of east longitude from London, and between the seventh and fortieth degree of north latitude; and is two thousand and forty-three miles in length, from north to south, and in the broadest part one thousand four hundred and twelve in breath, from east to west; but the most southern part of the peninsula is not three hundred and twelve miles broad.

The north-east division of India contains the province of Bengal, which is situated at the mouth of the Ganges, and those of Naugracut, Jesuat, Patna, Necbal, Gor, and Rotas, which are in the mountains of Naugracut.

The south-east coast of the peninsula, called the coast of Coromandel, contains the provinces of Orixa, Golconda, the east side of Bisnagar, or Carnate, Tanjour, and Madura.

The middle division contains the provinces of Asme, or Bando, Jengapour, Cassimere, Hendowns, and Lahor, or Pencab, Delly, Agra, Gualeor, Narvar, Ratipor, Chitor, Berar, and Candish.

The north-west division, on the frontiers of Persia, and on the river Indus, contains the provinces of Cabul, Khican, Multan, Bucknor, Tatta, or Sinda, Jesselmere, and Soret.

The south-west coast of India, generally called the coast of Malabar, contains the following provinces: Guzarat, or Cambaya, Decan, or Visiapour, and Bisnagar, or Carnate.

The dominions of the Mogul are chiefly above the peninsula, though it is generally imagined, that the whole is under his immediate government, and that the royal mandates from Delli are obeyed in the most remote parts of the coast: but Mr. Cambridge observes, that "this is so far from the truth, that a great part of this vast "peninsula never acknowledged any subjection to the "throne of Delli, till the reign of Aurengzebe; and the "revenues from those Indian kings and Mooriſh gover-"nors who were conquered or employed by him, have, "since his death, been intercepted by the viceroys, which "his weaker successors have appointed for the govern-"ment of the peninsula; so that at this time neither can "the tribute from the several potentates reach the court of "Delli, nor the vigour of the government extend from "the capital to those remote countries. And ever since "the province of Indostan was ruined by Nadir Shaw, "the weakness of the Mogul, and the policy and con-"firmed independency of the viceroys, have in a manner "confined the influence of the government to its inland "department." Whence, as he afterwards observes, the sovereign really possesses only a third, and that the least valuable part of his own vast empire.

As the tropic of Cancer extends thro' the middle of it, the air is exceeding hot; but in the most sultry season the rains, which usually begin at the latter end of June, and continue till about the close of October, cool the air and refresh the earth. When these rains set in, a day seldom passes without terrible thunder and lightning; and even during the fair season, they have lightning, tho' without thunder, for several weeks together; but this kind of lightning does no manner of harm. The heavens are clear and serene, except in the rainy season and about the time of the vernal equinox; for all the rest of the year is exempt from storms and hurricanes, and there are only such moderate breezes as the heat of the climate requires. The pleasure to be found in the mornings and evenings is not to be conceived; for not only the heavens seem to enjoy a more than usual purity and brightness, such as is never seen in these northern latitudes, but all trees and plants retain a perpetual verdure, and you behold blossoms and ripe fruit on some tree or other all the year round; and a late author observes, that the sight, the taste, and the smell, are all regaled in those delicious gardens, which come up to our finest ideas of a terrestrial paradise.

The excellence of the climate appears from the uninterrupted health and long life of the natives; but this is partly to be ascribed to their innocent food and the liquors they use, namely, rice, herbs, and fair water; and partly to the salubrity of the air; but there are low grounds near the sea, where the vapours arising from the ooze and salt marshes render the air unhealthful, particularly in the English settlement of Bombay, and the country of Bengal, through which the Ganges discharges itself by several mouths into the sea, and the whole province is, like Egypt, annually overflowed. However, nine parts in ten of the continent of India is as healthful as any part of the world; and as agreeable to European constitutions, after their recovery from the illness they generally contract during the first months after their arrival, which proceeds as much from the alteration of their diet, and a different regimen, as from any other cause.

The principal rivers of this empire are the Ganges and the Indus; the former is held in the greatest esteem, not only from its long course, the depth of the channel thro' which it falls into the bay of Bengal, and the purity of its waters, but from the imaginary sanctity attributed to it by the natives, who worship this river as a god, and happy is the man who breathes out his soul upon its banks.

The Indus waters the western side of India as the Ganges does the east, both running a course of about three thousand miles; but the entrance of the Indus is so choaked up with sand, that it is not navigated by great ships. It flows from the north-east to the south-west, and discharges itself into the Indian ocean by three mouths, in about the twenty-fourth degree of north latitude. Though these rivers run so far asunder, their sources are said to be near each other, and both are held to be in the kingdom of Tibet.

Besides these rivers there are many others, most of which will be taken notice of in mentioning the places by which they pass.

The mountains produce diamonds, of which we shall give a particular account in treating of the kingdom of Golconda, and also rubies, amethysts, crysolites, granates, agate, and jasper.

Before we conclude this section, it is necessary to observe, that the chain of mountains, which run through the peninsula from north to south, are the cause of an extraordinary phænomenon in natural history. The countries which are separated by these mountains, though under the same latitude, have their seasons and climate entirely different from each other; and while it is winter on one side of the hills, it is summer on the other. On the coast of Malabar a south-west wind begins to blow from the sea at the end of June, with continued rain, and

rages againſt the coaſt for four months, during which time the weather is calm and ſerene on the coaſt of Coromandel; and, towards the end of October, the rainy ſeaſon, which they term the change of the monſoon, begins on the coaſt of Coromandel: at which time the tempeſtuous winds bearing continually againſt a coaſt in which there are no good ports, make it ſo dangerous for the ſhipping to remain there for the three enſuing months, that it is ſcarce ever attempted. This is the cauſe of the periodical return of our ſhips to Bombay, where there is a ſecure harbour and convenient docks.

SECT. II.

Of the Soil and Huſbandry of the Natives; with the Trees and Plants; particularly of the Indigo Shrub, and the Banian Tree.

AT the end of the fair ſeaſon the earth reſembles a barren deſart, without one ſpire of graſs or any thing green on its ſurface, except the trees, which never loſe their verdure; but the ſhowers no ſooner begin to fall, than the face of nature is changed, and the earth is almoſt inſtantly covered with graſs and herbs. The ſoil, conſiſting of a brittle fat mould, is eaſily broken up and prepared for tillage; and though they ſow the ſame land every year, it is never manured, but is rendered ſufficiently prolific by the annual rains.

In the northern parts of India they have as good wheat and barley as any where in the world; but in the ſouthern part of the peninſula they ſow nothing but rice, and indeed the natives ſcarce eat any thing elſe. The fields lie open, except near the towns and villages, where people form little incloſures for their own convenience; and as no man has any property in the land he ſows, the prince's officers take a third, or one-half of the crop, or more, as they think proper, and leave the poor huſbandmen the reſt. Nor is it left to their choice, whether they will ſow or not; for the reſpective governors and generals, having towns and villages aſſigned them, to enable them to ſupport the quota of troops they are to furniſh, order a particular ſpot of ground to be cultivated by every village, and at harveſt ſend their officers to take as much of the crop as is thought proper.

They have no oats; their peas and beans are ſmaller than ours, but full as good; they have alſo a ſort of peas called donna, rather larger than tares, with which they feed their horſes; theſe they boil, bruiſe, and mixing coarſe ſugar with them, make them up into balls, which they give to their horſes: they alſo ſometimes give them balls made of a compoſition of barley-meal, and other ingredients.

Their cream, inſtead of butter, produces a ſubſtance like thick oil, and will never be brought, in that hot climate, to ſuch a conſiſtence and hardneſs as ours, yet it is very ſweet and good; and as they have plenty of milk from their cows, buffaloes, and goats, the people in the north of India make a conſiderable quantity of cheeſe. There can be no whiter or better wheaten bread than that made at Bengal and ſeveral other parts of India, but the natives ſeldom eat any of it: they, however, make thin flat cakes of wheat flower, which they bake upon iron plates, and always carry with them in their journies.

The country produces no great variety of flowers, and yet the gardens are extremely pleaſant, being adorned with winding walks of fine fruit-trees, always green and blooming, with large baſons of water; and handſome caſcades. Thoſe flowers that are natives of the country laſt almoſt all the year; but, though they have a beautiful mixture of colours, few of them have any ſmell. The roſe and a white flower like that of the jeſſamine are the only ones that are very fragrant.

The fruit-trees are the banana, or plantain, the cocoa-nut, mangos, guavas, oranges and lemons, limes, mirabilons, pomegranates, jaccas, tamarinds, ananas, or pine-apples, and mulberries; to which may be added the areka-nut, and betel. In the north part of the empire are apples, pears, and other European fruits.

The kitchen gardens are well ſtocked with water-melons, muſk-melons, potatoes, and other roots, and pot-herbs. They have alſo ſaffron, turmerick, opium, the pepper-plant, ginger, cardamums, and conſiderable plantations of ſugar-canes, particularly in Bengal.

The cotton ſhrub is of great uſe, for of this are made their ginghams, muſlins, calicoes, &c. They ſow large fields of the ſeed, which grows up to the height of a roſe buſh, and then puts forth yellow bloſſoms, which are ſucceeded by little cods, which ſwell to the ſize of a ſmall walnut, and then the outer ſkin burſting diſcovers a fine ſoft wool as white as ſnow. The ſeeds are always found amongſt the wool.

They have alſo the cotton tree, which grows to a great height; the fruit, if it may thus be called, becomes of the ſize of a hen's egg, and then burſting like the other, yields a fine white wool.

The indigo ſhrub grows to the height of a gooſeberry-buſh, and has a thick round head, but no thorns. The people ſtrip off the leaves, and having laid them in a heap, they lie ſeveral days till they have ſweated, and are then put into deep veſſels, with a ſufficient quantity of water, to which they give their blue tincture. The water is afterwards drained off into broad ſhallow veſſels, made of a kind of plaſter of Paris, where the ſun having exhaled all the moiſture, there remains at bottom a hard dry cake about a quarter of an inch thick, which is our indigo. The beſt ſort is brought from Biana near Agra, and a coarſer kind is made near Amadabat.

There are alſo abundance of fine woods and groves, that afford timber for building of houſes and ſhips, and conſiderable quantities of red wood for dying. One of the moſt remarkable of their trees is the banian tree, the boughs of which bending to the earth, take root and grow up again like the mother-plant, whence one of them will have forty bodies and upwards, and ſpreading themſelves far around afford ſhelter for a regiment of ſoldiers under its branches; which bearing leaves that are ever green, afford a noble ſhade. Under theſe the gentoos frequently place their idols, and here their devotees reſide, and perform thoſe penances which appear extremely ſurpriſing to all Europeans, and which we ſhall mention in treating of the religion of the Gentoos.

SECT. III.

Of their Caravans, in which they uſe Oxen. Of the Camels, Elephants, and other Beaſts of India, with a Deſcription of the Shoegooſe. Of the Birds, Inſects, and Reptiles, particularly the Scorpions, and a remarkable Kind of Serpents, with ſome curious Particulars relating to the latter. Of the Fiſhes of India, among which are deſcribed the flying Fiſh, the Bonito, the Albacore, the Dorado or Dolphin, the Shark, and its Attendants the Pilot-Fiſh, and Sucking-Fiſh.

OF all the animals of India, none appear more uſeful than their oxen, which generally ſerve for draught and carriage, and are ſometimes ſhod: they are not very large, but ſwifter of foot than ours, and will carry a man twenty or thirty miles a day. Caravans, in which are ſometimes eight thouſand oxen, are employed in carrying rice, ſalt, and other things from place to place. Their drivers have no fixed abode, but take their wives and children with them. Each of theſe caravans has a captain, who wears a ſtring of pearls around his neck, and aſſumes the dignity of a prince. The people who follow the profeſſion of carriers are divided into four tribes, each conſiſting of about one hundred thouſand ſouls, who always ſleep in tents. One carries only corn, another tribe only peaſe and beans, another rice, and another ſalt; and the perſons of each tribe are diſtinguiſhed by certain marks made in their foreheads. The horns of the oxen would endanger the lives of their riders, by their toſſing their heads back, when tormented by the flies, were they not ſawed pretty ſhort. Ten or a dozen of them are employed in drawing one of their heavy carriages; but they have no more than two to their coaches, which will hold only two people. When they bait, they are fed with balls of paſte.

Camels are alſo uſed for carriage, though leſs frequently than oxen. They cannot tread ſure in ſlippery ways, but

but ſeem peculiarly formed by nature for thoſe dry and ſandy deſarts, which, without their aſſiſtance, would be impaſſable, ſince they will travel ſeveral days ſucceſſively over hot burning ſands without water.

The elephants of India, when at their full growth, are ſome of them twelve or fifteen feet high, and yet ſo tractable that a boy may govern them. It is a common miſtake, that they have no joints in their legs, for they lie down and riſe up like other animals; their pace is a walk, but they ſtretch ſo far as to travel five miles an hour, and are ſo ſure footed, that they never ſtumble. Their keepers by ſigns, and the ſound of their voice make them underſtand their meaning, and if they make a ſign to them to terrify any man, they will advance towards him in a threatening manner, as if they intended to trample him to death, and yet not hurt him. If the keeper directs him to throw water or dirt in a man's face, he will do it without farther miſchief. The elephant takes up whatever he eats or drinks with his long griſly trunk, and thus conveys it to his mouth, and this trunk, though extremely limber, has ſuch ſtrength that if he ſtrikes a horſe or a camel with it in earneſt, he will kill him at a blow. It indeed ſupplies the uſe of hands, for with it he will pluck up the corn and graſs by the roots, knock off the dirt that hangs about it againſt his legs, and then convey it to his mouth. He will alſo tear down the branches of the trees with it, and eat the tender twigs. Scarce any animal will ſwim faſter, for at Fort St. George, where the ſhips that bring them can only come within two or three miles of the ſhore, they frequently make them ſwim to land, but they have little more than their trunks above water, through which they breathe. The male elephant is ſometimes mad after the female, when he becomes ſo miſchievous as to ſtrike any one he meets, except his keeper; at that time therefore they chain the elephant by the legs, and if he happens to get looſe, he will overturn every thing in his way, nor is it poſſible to divert his rage without fireworks, which burſting with a loud noiſe will make him ſtand ſtill and tremble. When the elephants are in theſe mad fits they ſweat prodigiouſly, and ſmell much ranker than a goat.

In the Mogul army are ſeveral elephants that will not only ſtand fire, but ſuffer a great gun to be diſcharged from their backs. Thoſe they carry are about five feet long, placed on a ſquare wooden frame that is faſtened to a broad thick pannel, tied on with ſtrong cords and girths. At the four corners of this frame are four ſilk flags fixed to little ſtaves. Upon the neck of the elephant the man is ſeated who guides him, and has an iron rod in his hand, about half a yard long, ſharp at the lower end, and a hook turned up, with which he pricks him forward, or pulls him back. The gunner is ſeated on the wooden frame, where he has his ammunition and ball with every thing neceſſary for loading and firing. The balls diſcharged from theſe guns are about the ſize of a tennis ball.

The elephants are uſually faſtened by a chain about one of their hinder legs to great trees, under the ſhade of which they are kept. Each of the great war elephants is allowed by the Mogul four females, and they are ſaid to be ſo modeſt, that they will not permit any one to ſee them in the act of copulation.

They have alſo buffaloes and aſſes; the former are more ſluggiſh than the oxen, and have a ſmooth thick ſkin without hair; the female gives milk, and the fleſh, which is ſometimes eaten, is coarſe food.

In the ſouthern parts are thin long legged ſheep, whoſe backs are covered with a reddiſh hair inſtead of wool, but their fleſh is lean and dry. However, towards Perſia and Tartary they have fine ſheep with good fleeces and large tails, that weigh ſeveral pounds. It is obſervable of the Perſian ſheep brought into India, that they have each from three to ſeven horns, ſome of which ſtand upright on their foreheads, and the battles of their rams are very bloody. They have alſo plenty of goats, and their kids are pretty good eating. The Indian hogs are eſteemed the beſt butchers meat in India, eſpecially the wild hogs, which are very plentiful.

There are great numbers of antelopes, deer, and hares, and as nobody claim any property in them, every body are at liberty to kill them, as well as all other game; for tho' the Mogul is the proprietor of all the lands in the country, he does not monopolize either the wild beaſts, or the wild fowl. Even the graſs, herbs, and trees, and whatever grows ſpontaneouſly in the woods and extenſive fields, are enjoyed by the people in common: ſo that though they have no lands that they can call their own, they have almoſt an equivalent from the privileges they enjoy in thoſe of the prince. The only beaſt of the foreſt, the hunting of which the emperor reſerves to himſelf, is the lion. There are alſo tygers, leopards, wolves, monkies, and jackalls, which laſt are a kind of wild dogs of the colour of a fox, but ſomewhat larger. Theſe run about at midnight in companies, making a dreadful howling, not only in the country, but in the midſt of the great towns. It is ſaid, that one or more of theſe always attend upon the lion, and hunt his prey for him. However, there are great numbers of them in all parts of the country, as well in thoſe parts where there are no lions as where there are: they are very fierce, and if a corpſe is not buried deep, they will ſcratch it up out of its grave.

Among the beaſts of India we ought not to omit a fierce little creature called a ſhoe gooſe, which is about the ſize of a fox, with long ears like thoſe of a hare, and a face like a cat; its back and ſides are grey, and its breaſt and belly white. Theſe, as well as dogs, are uſed in hunting; on which occaſion a horſeman carries the ſhoe-gooſe behind him, hood-winked, and as the antelopes and deer are pretty familiar, they will not ſtart before the horſes come very near. He who carries the ſhoegooſe then takes off the hood and ſhews it the game, which with large ſwift leaps it ſoon overtakes, when ſpringing on their backs, and getting forward to their ſhoulders, it tears out their eyes with its claws, and makes them fall an eaſy prey to the hunters.

They alſo ſometimes hunt with a tame leopard, which runs down his game, and frequently gives the hunters as long a chace as the dogs, and when the game betake themſelves to ſwimming, which they frequently do, it will follow them into the water.

With reſpect to the feather'd race, they have here plenty of all kinds of poultry, and alſo pigeons, turtle-doves, quails, partridges, peacocks, and parokets. The fleſh of their poultry is, however, generally lean and dry, and ſome of them have bones as black as jet; but their fleſh is thought as well taſted as that of the others.

Vultures are here extremely common, and perfectly tame, which probably proceeds from the banyans feeding them as they do other animals; they are ſaid to be conſiderably larger than an eagle, and much of the ſame ſhape.

There is a kite here with a white head, for which the banyans have a high veneration, and ſeem to pay it religious honours. Theſe birds, when flying in the heat of noon, are frequently overcome by the ſcorching rays of the ſun, and drop down in the ſtreets. Upon ſuch an accident, the ſoldiers in our ſettlements always make money of it; for carrying the kite into the market place, they threaten to wring his neck off, upon which the ſuperſtitious crowd contribute ſmall pieces of money to purchaſe the bird's life and liberty.

They have not many ſinging birds; but they have one leſs than a wren, which has raviſhing notes, and a beautiful plumage. The multitudes of monkies which infeſt the woods in the ſouthern parts of India, are terrible enemies to theſe little birds; but nature has taught them to preſerve both themſelves and their young, by building their neſts at the extremity of the twigs, where they hang like ſmall purſes out of their reach. There are alſo in this country bats almoſt as large as kites.

The pleaſure of living in ſo delightful a country as India is much abated by the multitude of troubleſome inſects and reptiles. The muſketoes or gnats, and bugs, immediately ſeize upon the Europeans on their firſt landing, and are ſo venomous, that in one night's time a man's face will be ſo ſwelled that his companions cannot know him; but when they have been ſome time in the country, though they are always peſtered with them, they do not leave ſuch ſwellings as at firſt. They are indeed ſo troubleſome, that every man who can afford it, keeps a ſervant to bruſh them off his perſon, and it is

in

in vain to attempt to ſleep with the face uncovered, without ſomebody to beat away the gnats, and as for the bugs they ſwarm among the ſoldiers and the common people. They have, however, one way of avoiding them, and that is by daubing the feet of the couch on which they lie with tar, which they have either an averſion to, or are ſtopped by their ſticking in it.

During the rains frogs and toads multiply prodigiouſly, and grow to a conſiderable ſize. The rats are three or four times as large as ours, and are ſo bold that they will hardly give a man the way.

Of all the venomous creatures of this country the ſcorpions, centipedes, and ſerpents, of which there are many different kinds, are the moſt dangerous, for they breed in every corner, and there is no poſſibility of being ſecure from them without continually ſweeping.

Of the ſcorpions there are various kinds, thoſe in the woods are ſaid to be black, and their ſting mortal. The houſe ſcorpions are about the length and thickneſs of a man's little finger, and, according to Mr. Salmon, are ſhaped almoſt like a lizard, but carry their tails turned up to their backs, and at the end of the tail is a ſting not much bigger than a hornet's, and always viſible. They creep very ſlowly, and it is eaſy to cut off their ſtings, which the above author ſays he has often done. The ſtings of theſe are not mortal, but they create a violent pain, like that of a red-hot iron applied to the part; but the anguiſh is abated by anointing the part with the oil of ſcorpions, and in about twenty-four hours the pain entirely ceaſes.

The centipede derives its name from the great number of its legs; thoſe of this country are ſomewhat bigger than a gooſequill, and three or four inches in length; but though they are ſo ſmall, their bite is very dangerous.

There are here many kinds of ſerpents, but they will not attack a man, unleſs firſt provoked, or incited to it by their keepers; for there are people who keep them in baſkets, and carry them about to ſhew their tricks. One of thoſe which Mr. Salmon ſaw, raiſed himſelf up near half its length, then ſpread his head as big as the author's hand, and ſhewed a beautiful face, nearly reſembling the human; this ſpecies the Engliſh imagine is the ſame that tempted Eve.

Mr. Groſe mentions a kind of incantation of theſe reptiles, and ſays, that when a ſnake, lurking in a houſe, has bit any one, one of their jugglers is ſent for, who will with an inſtrument, ſomething reſembling a flageolet, play certain tunes, the ſound of which operates ſo powerfully on the ſnake, that he leaves his hole, and with viſible reluctance preſents itſelf to thoſe that ſtand ready to kill him. "I am fully aware, ſays that gen-
"tleman, of the ridicule this will meet with from many,
"but prefer even the certainty of incurring it, to the
"ſuppreſſion of what I tried myſelf to diſbelieve till con-
"vinced of it."

A clergyman, who was with our ambaſſador at the Mogul's court, relates, that while he was there the Mogul ſentenced a man to die for killing his mother, and as the moſt terrible death he could contrive, ordered him to be bitten by two ſerpents. Accordingly one of the people, who keep ſerpents in a baſket for ſhew, was ſent for: the criminal was ſtripped naked, and ſtood trembling, while the maſter of the ſnakes, having irritated and provoked them, put one to the wretch's thigh, which immediately wound itſelf about him, and bit him in the groin till the blood followed; the other was ſet on the outſide of the other thigh, and bit him likewiſe: notwithſtanding this, the criminal kept upon his feet a quarter of an hour, but complained of a fire raging in all his limbs, and his body ſwelled to a great degree; the ſerpents were taken off before he fell, and about half an hour after the wretch breathed his laſt.

The Indian ſeas abound with vaſt ſhoals of fiſh, among which we ſhall only mention a few of the moſt remarkable. The bald-pate is thus called from its head and neck being without ſcales, and is very good eating.

The raven-fiſh is ſo named from its mouth having ſome reſemblance to the bill of a bird: it is only a ſpan long, red on the back and tail, and yellow on the belly.

The flying fiſhes, which are moſt generally ſeen within the tropics, are commonly of the ſize of a large herring, to which they have ſome reſemblance. The large ſize of their ſide-fins countenance the opinion of their being aſſiſted by them, in the ſpring they make out of the water, on being purſued by larger fiſhes of prey, as thoſe fins continuing ſpread muſt naturally gather ſome air; but it is highly probable, that what is called their flight, is no more than an extended leap, like that of the flying-ſquirrels on ſhore; and that their neceſſity of replunging into the water is not ſo much owing to their fins drying in ſo ſhort a ſpace as twenty-five or thirty yards, and requiring a freſh wetting, as to the force of their ſpring being ſpent: for it is evident, that they are not guided by their ſight, but are urged on by a mechanical impulſe, ſo that they frequently fall into ſhips. They are well taſted, and are often ſeen in great ſhoals flying from the purſuit of the bonitos, albacores, and dorados, whoſe favourite prey they are; nor does this fiſh find enemies only in its own element, for ſeveral ſea-birds watch hovering for its immerſion, and dart down upon it with ſuch rapidity, as to make it their prey before its replunging into the water.

The bonito undoubtedly takes it name from its being highly agreeable to the taſte of the Portugueſe, the firſt Europeans that navigated the Indian ocean, and gave it this name, which, in their language, ſignifies delicious. It is indeed a firm and not unpleaſant fiſh, but rather dry, and requires a rich ſauce to entitle it to its name.

The albacore is nearly of the ſame kind as the bonito, but grows to a much larger ſize, ſome being taken from ſixty to ninety pounds weight, and upwards. Its name is alſo taken from the Portugueſe, who thus denominated this fiſh on account of its whiteneſs. It is rather dryer eating than the bonito. Both theſe fiſh are often caught by an imitation of the flying-fiſh, which being ſwung to and fro, repreſents their flight, ſo as to bring them greedily to the hook; they are likewiſe frequently ſtruck with the fiſh-gig. It is remarkable that both are alſo at certain ſeaſons infected with a worm that makes them in an agony ſpring ſo high out of the water, as to fall into ſuch boats as are in the way of their leap.

The dorado, or dolphin, is allowed to have obtained that name very improperly, it having not the leaſt reſemblance to the deſcriptions and delineations of it given by authors, painters, and ſtatuaries. The Portugueſe give it the name of dorado, from its golden hue, which appears through the ground-work of a beautiful azure that is blended with it; but though nothing can be conceived to have a more lively gloſs than its colours, this fiſh is no ſooner taken out of the water, than they begin to fade. It is caught in the ſame manner as the bonitos and albacores; but is greatly preferred to them in point of taſte. They are commonly three or four feet long, and finely ſhaped, only the head ſeems rather too large; though the chief bone of it, on diſſection, appears admirably modelled for a cut-water, and indeed they ſwim with inconceivable rapidity.

The ſhark, which is commonly met with near land, is not unfrequently found in the main ſea; but this is chiefly in calms, or very light breezes, when he will follow a ſhip for a conſiderable time, unleſs betrayed to the hook by his natural voracity; for he is generally too large to be maſtered by a harpoon or fiſh-gig. Almoſt any bait will ſerve, but it requires a ſtrong hook of the larger ſize, and running tackle to bring him on board. He no ſooner touches the deck, than he makes it ſhake with the violent flounces of his tail, which are capable of breaking a man's leg; but he is ſoon ſubdued by a cut of an ax upon it, which inſtantly depriving him of all power, he is ſoon diſpatched.

This fiſh is commonly from nine to fifteen feet in length, and it is ſaid ſome of them are upwards of twenty feet long. It has no ſcales, but the ſkin is rough, like ſhagreen, of a deep brown, inclining to a greeniſh colour, and whitening by degrees to the belly. The ſhark would have been much more terrible, had nature endowed it with an agility anſwerable to its voracity, which is remarkably aſſiſted by a dreadful triple row of teeth as ſharp as razors. But, beſides its not being the

ſwifteſt

ſwifteſt ſwimmer, its mouth, by being placed conſiderably within the projection of its ſnout towards the belly, obliges it to turn on its back, or at leaſt ſideways, to ſnap at its prey, which it does ſo heavily, that good ſwimmers will, with a knife, either for diverſion, or for the ſake of ſhewing their ſkill, attack it in its own element, and diving under the belly, where the ſkin is very ſoft, rip it open, or oblige it to ſheer off. How they engender is unknown: but Mr. Groſe ſays, it is certain that the females are not only viviparous, young ones being found alive in ther bellies when taken, but that they occaſionally afford them a retreat in it till they outgrow the ſize of wanting one.

A ſhark will generally afford a meal for a whole ſhip's company; but then they are the ranker in proportion to their ſize, and at beſt are but indifferent eating, except the fins, which, though covered with a very hard ſkin, when dried in the ſun, and well ſtewed, afford a very delicate diſh.

There is a ſpecies of this animal called the bottle-noſed ſharks, which are of a dark bluiſh colour, but are not thought good to eat.

The ſhark is attended by the pilot-fiſh, which is one of the moſt beautiful that ſwims; it is ſeldom above a foot or foot and a half long, and is ſtreaked tranſverſely with blue and a yellowiſh brown, that have a pleaſing effect in the water; but, when taken out, loſe much of their ſhining luſtre. They are frequently ſeen in ſmall ſhoals ſwimming near the ſhark, or at the head of him. They crowd about the bait that is thrown to the ſhark, without nibbling at it themſelves, and by their motions ſeem to guide the ſhark towards it, from whence they derive the name of pilot-fiſh. They ſeldom take a ſmall hook when in company with a ſhark; but when they have loſt him, or follow a ſhip either ſingly or in ſhoals, they will ſometimes bite and be caught. They are eſteemed, for their ſize, the moſt delicious eating that the ocean affords.

The ſucking-fiſh is a very troubleſome companion to the ſhark: it ſeldom exceeds a foot long, and is frequently much ſhorter; but, by means of an oval-ſhaped membrane, of a texture admirably adapted for that purpoſe, ſticks ſo cloſe to the ſhark's ſkin, commonly on its back or ſides, as not to part with it, even when they are taken out of the water; and no ſtrength of hands can ſeparate them if pulled againſt the grain of the ſucker; but ſliding them on forward with the grain, they eaſily come off. This force of adheſion continues while life laſts, as may be proved by applying them to a table, or any other hard ſubſtance. This fiſh doubtleſs annoys the ſhark in the manner of vermin, drawing its ſuſtenance from the ſlime that oozes from its body, while the ſhark can neither ſhake it off, nor come at it to deſtroy it: the gills open upwards, and it is of a dull, muddy, ſlate colour; but is unfit to eat, it having neither ſubſtance nor taſte.

As the ſea is infeſted by ſharks, ſo is the river Ganges by crocodiles, which are fed by the multitude of dead bodies which are caſt into that river.

The ſhell-fiſh on the coaſt of India are very good, particularly oyſters, which at Fort St. George are of the ſame ſize as thoſe of England, and not inferior to them in goodneſs. There are ſome ſhell-fiſh in theſe ſeas of a prodigious bulk.

SECT. IV.

Of the Perſons and Dreſs of the Gentoos and Mahometans of India: of their Manners and Cuſtoms.

THE Indians are well ſhaped, of a good ſtature, and agreeable features; and have hardly any crooked or deformed people among them. An Engliſh divine obſerves of their women, that their ſprightly motions, agreeable perſons, amorous glances, and irreſiſtible mien, are the admiration of all foreigners, and frequently captivate the wiſeſt. Thoſe who inhabit the northern part of this empire are of a deep tawny or olive colour, and thoſe in the ſouth perfectly black; and the inhabitants of the mountains in the middle of the peninſula are all extremely black: but in every part of the country the natives have black eyes and long black hair. Theſe blacks dye their teeth like their neighbours, and frequently rub over their ſkins a yellow powder: many of them likewiſe mark their foreheads with long yellow ſtrokes of a finger's breadth.

The Indians generally dreſs in a white veſt of ſilk, callicoe, or muſlin, which folds over before, and is tied with ſtrings, either on the right or left ſide; the ſleeves fit cloſe to their arms, and, being very long, are in wrinkles about the wriſt: the upper part of the veſt fits the body ſo as to ſhew the ſhape; but from the middle downward, it ſits full in plaits, reaching almoſt down to their feet. Under this veſt they wear another that is ſomething ſhorter, and, inſtead of ſtockings, their breeches cover their legs; and they put their bare feet into their ſlippers, which are made peaked like a woman's ſhoe, and turn up at the toes.

In the north part of India the people in affluent circumſtances have ſhirts open before that hang over their breeches, and in cold weather make uſe of a cloak. Some of the common people among the Gentoos go perfectly naked, except a ſtring tied round their waiſt, to which they faſten a cloth of a hand's breadth, which they bring up between their legs and faſten it to a ſtring before: this juſt covers, but ſcarcely conceals, what they pretend to hide; and theſe are the people who carry the palanquins, and attend the Engliſh ladies when they go abroad.

Thoſe women that are ſeen by the Europeans have a piece of white callicoe tied about their waiſt that reaches down to their knees, and the remainder of it is thrown over their bodies like a ſhoulder-belt, covering their breaſts and part of their back. The hair of their heads is made up in a roll, adorned with ſuch jewels and toys as they can procure: they have alſo jewels in their ears and noſe; and ſometimes ſtretch the hole that is bored in their ears to ſuch an extent, that it will admit a ſhilling to paſs through it. Their wriſts and ancles are adorned with bracelets, and they have rings upon their fingers and toes, either of gold, ſilver, or braſs. The men alſo frequently wear bracelets about their wriſts. As to ſhoes or ſlippers, the women in the ſouthern parts wear none.

The dreſs of the Moors is extremely becoming; they having, like the greateſt part of the other Aſiaticks, that originally Indian manner of wearing turbans of fine muſlin, the circumvolutions of which, ſays Mr. Groſe, form a covering to the head, at once light and cool, from the air eaſily penetrating its folds; at the ſame time that they defend it from the rays of the ſun, the heat of which acting in a ſtraight line, as cold likewiſe does, is rebated by the obliquity of the wreathing; which, admitting of an infinite variety in the making up, ſerves alſo to diſtinguiſh the tribes, profeſſions, and rank in life of the wearers.

The dreſs of theſe Indian Moors, nearly agrees with the deſcription given of it by Quintus Curtius, who ſays, that ſuch as are eminent for their birth and riches, clothe their bodies with a garment that falls down to their feet; they bind their hands with linen; they hang their ears with jewels, and deck their arms and limbs with gold. Thus it appears how tenacious the Indians are of their old cuſtoms, and how cloſely their Tartar conquerors have conformed to them.

Another point of their finery is their ſaſhes on the outſide of their long veſt, which are generally richly embroidered, with the two ends hanging before, bordered with gold or ſilver tiſſue interwoven. In theſe they ſtick on the left ſide the handles of their daggers, which are either curiouſly wrought or ſet with precious ſtones; the blade is ſhort, broad, and pointed. Their ſcymetars are alſo hung careleſsly before them, with the ſame curious workmanſhip in the hilts. They wear embroidered ſlippers, which they take off within doors, or leave at the foot of the ſophas when on a viſit. Even the Europeans, on obtaining an audience at the Durbar of Surat, before they are admitted to ſit in the divan in the preſence of the governor, muſt ſubmit to pull off their ſhoes, which is the leſs unreaſonable, as the floor is generally ſpread with the richeſt carpets.

The Moors are fond of ſmoaking, and the great among them affect the Perſian luxury in having cullioons, which reſemble glaſs decanters, with flowers painted in their proper colours at the bottom. Theſe are full of water, and plugged up with a machine, that holds the lighted tobacco, and alſo a leathern pipe wired round, two or three yards in length, pliant, and coiled like a ſnake. Through this pipe they ſuck in the ſmoke, which is rendered mild and cool, by firſt paſſing through the water, which it cauſes to gurgle, ſo as to form no unpleaſing noiſe. The poor make uſe either of a cocoa nut ſhell, prepared in the ſame manner for ſmoaking through the water, which is vulgarly called, from the noiſe it makes, a hubble-bubble; or merely the tobacco leaf rolled up, of about a finger's length, which they term a buncus, which is chiefly uſed by the Gentoos.

As to the manners of the Moors and Moguls, they are nearly the ſame as thoſe of the ſouthern Aſiatics, they being greatly degenerated from the hardineſs and martial ſpirit of the northern Tartars, as well from the relaxing ſoftneſs of the climate, as from their ſliding into the Indian voluptuouſneſs and effeminacy. They are, however, from their childhood, tutored and trained up to great gravity and circumſpection in public, and eſpecially to curb their paſſions, to prevent their breaking out into outward emotions of anger and reſentment, which they conſider as the higheſt indecency. It perhaps proceeds from this early habit of reſtraint and diſſimulation, that their reſentments, which might otherwiſe evaporate in menaces or opprobrious terms, wrankle in their boſoms, till it breaks out into more ſanguinary effects, and a vindictiveneſs much more fatal: thence ariſe the frequent plots, perfidious circumventions, and deep-laid ſchemes of the great to deſtroy each other.

Their ſchool education, which is generally no more than learning to read the Koran, and to write Perſian, or Arabic, is followed by their introduction into all companies, and into public buſineſs in their tendereſt youth: thus their fathers carry them without due preparation into the great ſchool of the world.

The Gentoo merchants alſo uſe the ſame method with their children, initiating them with the firſt dawn of reaſon into all the myſteries of trade; ſo that it is not uncommon to ſee boys of ten or twelve years of age ſo acute and expert, that it would be difficult to over-reach them in a bargain; and, indeed, their docility, ſedateneſs, and the awful reſpect they pay their parents, are ſurprizing, conſidering their extreme fondneſs for their children, which they temper ſo judiciouſly as not to ſpoil them.

The common Indian ſalute is lifting the right hand to the head, and if it be a perſon of diſtinction, bowing the body a little, but they never ſalute with the left hand alone. When the Mahometans meet, their moſt uſual compliment is, God give you health; to which the other replies, God give thee the ſame health, or Mayeſt thou have the prayers of the poor. The ſalutation of a prince is bowing the body low, putting the hand to the ground, then to the breaſt, and afterwards lifting it up to the head, and this is repeated three times.

A perſon viſited does not meet his gueſt, but intreats him to ſit by him on the carpet, and betel and areka are offered him to chew, which, as in the neighbouring countries, they have almoſt conſtantly in their mouths. They are very reſerved, and ſeldom talk aloud or very faſt. They play at a game that nearly reſembles cheſs, and ſometimes at cards; but ſeldom high, as in China, and in the neighbouring iſland of Ceylon: nor are they much diſturbed when they loſe, but preſerve an even temper.

SECT. V.

Of the Pleaſures and Luxuries of the Indians, particularly of their dancing Girls; their Equipages; and other Articles of Luxury. The Method of Champing uſed in India.

AT feſtivals, and on other occaſions, it is uſual to ſend for the dancing girls, who ſing and dance before the company, and readily retire with any young men that deſire it. They act comedies in the open air by torch light, nor are they ill performed: love and gallantry are the uſual ſubjects.

The dancing girls form a diſtinct branch of the community. Theſe are ſent for to a particular place, which is their diſtrict, where there are never wanting a ſufficient number for the uſe of the public, to which they are ſo devoted, that they ſeem to have made vows of unchaſtity: according to their inſtitutes, they are bound to refuſe none who will come up to their price, which is governed by their degree of beauty and accompliſhments. Particular ſets of them are appropriated to the ſervice of the Gentoo temples, and the uſe of the bramin prieſts that belong to them. They live in a community under the direction of ſome ſuperannuated female of the ſame profeſſion, under whom they receive a regular training, and learn all the arts of pleaſing, in which they are but too ſucceſsful; for nothing is more common than for the princes and chief men of thoſe countries to take a particular liking to one of theſe women, and to laviſh immenſe ſums upon them, though their harams are ſtocked with far ſuperior beauties.

Their dances, would, however, at firſt appear diſagreeable to the Europeans, eſpecially as they are accompanied with a dull kind of muſic, conſiſting of thoſe little drums called gum-gums, of cymbals, and a kind of fife, which make a hideous din, and are played on by men, who, with their grimaces and ſhrivelled features, ſhock the eye, and torture the ear; but by uſe they become reconciled to the noiſe, and may obſerve ſome pleaſing airs with which the dancers keep time. The words frequently expreſs the ſubject of a pantomine dance, ſuch as a lover courting his miſtreſs; a procureſs endeavouring to ſeduce a woman from one gallant in favour of another; or a girl timorous and afraid of being caught in an intrigue. Theſe love-ſcenes the girls execute in character-dances with no deſpicable expreſſion. In ſome of their dances they pay little regard to modeſty in the motions of their limbs, and the laſcivious attitudes into which they throw themſelves, though without expoſing any nudity; for they are richly dreſſed, and adorned with jewels. In ſhort, they omit no allurements, and meet with ſuch ſucceſs, that ſome of them amaſs great wealth.

Mr. Groſe obſerves, that the dreſs of theſe women is the moſt ſplendid and alluring that can be imagined. They are generally loaded with jewels from head to toe; for on their toes they wear rings. Their necks are adorned with carcanets, their arms with bracelets, and their ancles with chains of gold and ſilver, generally enriched with precious ſtones. They wear alſo noſe-jewels, which at firſt have an odd appearance; but to which the eye is ſoon reconciled. They, as well as other women in that country, have a peculiar way of covering their breaſts, which make no inconſiderable part of their finery. They incloſe them in a pair of caſes exactly fitted to them, and made of a very light wood linked together, and buckled on at the back. Theſe confine the breaſts, and prevent their growing to a diſagreeable ſize, and yet from their ſmoothneſs and pliancy, play freely with every motion of the body: they are beſides gilt, and ſet with gems, according to the ability of the wearer, and thus compoſe the richeſt part of their dreſs from the diſplay favoured by their orbicular form; at the ſame time they are eaſily laid aſide and reſumed at pleaſure.

Many of them uſe the ancient embelliſhment practiſed through the greateſt part of the Eaſt, of forming a black circle round the white of the eyes, by drawing a bodkin between them and the eyelids, that both may receive the tint of the powder of antimony, that ſticks to the bodkin. They pretend that this refreſhes and cools the eyes, beſides increaſing their luſtre by the ambient blackneſs.

The dancing girls occaſionally aſſume another ornament, compoſed of a necklace of many looſe turns, formed of flowers ſtrung together, that reſemble double Spaniſh jeſſamine, but have a ſtronger and more agreeable fragrance, and are far preferable to any perfumes.

Hall sculp.

The Swing on which the principal Persons in India pass away much of their Time.

As to the equipages and carriages of the Moors, they chiefly conſiſt in elephants, horſes, palanquins, and hackrees.

Riding on elephants is a piece of ſtate principally appropriated to the Mogul himſelf, the princes of the blood, the great officers of ſtate, and the Nabobs, or Viceroys of provinces; and nothing can ſurely be more adapted to ſtrike the mind with awe, and raiſe the impreſſions of pomp and grandeur, than one of thoſe enormous beaſts richly capariſoned, and bearing on its back a kind of canopied throne, in which the perſon who ſits in ſuch majeſtic ſtate is fully conſpicuous from ſuch an eminence. Theſe unwieldy animals are, however, growing into diſuſe for war, ſince the more prevailing uſe of fire-arms, and its being diſcovered that, notwithſtanding their amazing docility, it is impoſſible to break and train them to the field ſo perfectly, as to be certain they will not do more miſchief to thoſe to whom they belong, than to the enemy, eſpecially when exaſperated with wounds, to which their prodigious bulk makes them a mark hard to miſs.

The beſt horſes uſed in India are brought from Arabia, but chiefly from Perſia; theſe make a conſiderable article of trade both by ſea and land, and, indeed, no part of the world produces finer horſes than either of thoſe countries. The Moors likewiſe ſpare neither care nor expence in their keeping, and in breaking them for war.

Of all the methods of travelling that of the palanquins, or, as they are uſually pronounced, palanqueens, appears moſt adapted to humour their conſtitutional indolence, as a more lazy method of conveyance cannot well be conceived. It conſiſts of a bed and bedſtead, with ſhort feet, covered with an ample canopy, which is commonly either of velvet or cloth, faſtened by means of croſs ſticks, and ſilk or cotton cords, to an arch of bamboo; from the ends of which arch proceed the poles, which are all of one piece. The perſon carried may conveniently ſit upright under the arch, and be bolſtered up in that poſture by one or two large pillows; and occaſionally he may lie at his whole length and ſleep by the way. This arch is prepared, while the bamboo is young, by keeping it bent ſo as to grow in the deſired form, according to the perfection and ſize of which it bears a greater or leſs price. Some of theſe palanquins are rendered very expenſive from the decorations employed on them, as the rich ſtuff with which this portable couch and its canopy are covered; from the expence of its gold or ſilver taſſels, and the feet being carved and plated over, repreſenting couchant lions, griffins, or other figures. The ends of the poles, on which the palanquin is carried by ſix, but moſt commonly by four bearers, are likewiſe adorned with the ſame metals, in the form of tygers heads; but this is a badge of authority granted only to a few perſons of the higheſt diſtinction. In this point they are imitated by the Engliſh; for though there are few men of eminence in our ſettlements that do not keep palanquins, the tygers heads are reſerved for the governor and ſecond of the council.

Some of our gentlemen at Calcutta, diſliking perhaps the indolent attitude in which they are placed in theſe carriages, invented a new one, in which the bedſtead is converted into a platform that ſupports an armed chair fixed to it, in which they ſit more decently, and full as conveniently under the canopied arch; and others have contrived a perfect ſedan-chair, only preſerving the bamboo form at the top and at the ends, ſo as to be carried on the ſhoulders of the bearers. In Bombay and Surat they cover them during the rains with a kind of thatch, eaſily put off or on, made of the leaves of the brab-tree, a ſpecies of wild palm, and lined with calicoe, thus forming a ſhelter impenetrable to the moſt violent rain, and having windows that ſhut or open at pleaſure. In Bengal and other places they are defended, but not ſo effectually, with an oil-cloth thrown over them.

The jealouſy of the Moors makes them cover the palanquins, in which their women are carried, by a various coloured ſilk netting thrown looſe over the whole machine; which, without excluding the air, or obſtructing the ſight from within, only hinders thoſe without from ſeeing them. The Moors have indeed affixed ſuch an idea of ſtate to palanquins, that, in moſt countries they have conquered from the Gentoos, they are forbid from uſing them, except on the day of their marriage; for which inſtitution they preſerve ſo high a veneration, that it is proverbial with them that a man on that day is as great as a king, and conſequently they grudge him no enſigns of royalty.

They have a machine called andolas, which are of the ſame nature as the palanquins; but the croſs ſticks being faſtened to a ſtraight inſtead of an arched bamboo, will only admit of their lying at length. Theſe are much cheaper, and leſs eſteemed than the palanquins.

They have another carriage called a dooly, which reſembles the andola, but is only made of the meaneſt materials, and is ſeldom uſed but to carry the poorer ſick.

The hackrees are drawn by oxen, ſome of which, being trained for drawing, will go as faſt as horſes on a full trot, and the ſmalleſt are generally the moſt fleet. Theſe are chiefly uſed by the Gentoos, eſpecially by the banyans and merchants of Surat. Theſe oxen are kept as ſleek and as clean as poſſible, and a pair of them yoked together are far from having a diſagreeable appearance; the oxen of that country, eſpecially of Guzurat and Cambay, being generally white, and ſome of them at leaſt as large as our Lincolnſhire cattle. As a contraſt to the whiteneſs of their ſkins, they paint their horns with a ſhining black, and hang bells about their necks. The hackrees are open on three ſides, covered on the top, and made to hold two people ſitting croſs-legged in the oriental manner, with a pillow at their backs to ſupport them, or to recline upon; and conſequently they have no raiſed ſeats. Here their jealouſy has invented another method of concealing their women, by means of folding blinds or checks let fall round the open ſides. Theſe are generally coarſely painted, and made of the fibres of the cocoa-nut or brab-tree leaves, ſo diſpoſed and looſely ſewed together, as to let in the air, and not hinder the ſight of thoſe within. Each hackree has its driver, who ſits on the ſhaft equipped with a goad, and takes care of the oxen; but in Bengal the moſt eminent of the Gentoo merchants ride on horſeback, or in a chaiſe; and, being under no fear of fleecing under the Engliſh government, they ſhew themſelves fond of a parade which they dare not ſhew in a place under the government of the natives, and therefore have them richly ornamented, and even the reins adorned with ſilver or gilt ſtuds.

The Moguls themſelves and the principal Mooriſh courtiers generally affect great ſtate and ſplendor, and none ſtudy more the luxuries of life, though in a manner ſomewhat different from the Europeans. They take care to have their harams or ſeraglios furniſhed with the moſt beautiful women that can be procured. Thoſe of Caſhmire are the moſt admired by the Moguls, they being much fairer than in any other province, and have a delicacy in their ſhape that greatly pleaſes the Moors. Their taſte of beauty is pretty ſingular, for they ſcarcely ſcruple any price for a female ſlave, which, added to her other beauties, has a plumpneſs that covers the ſmalleſt bones.

They are extremely jealous of the women they ſhut up in their harams, and follow the uſual Aſiatic method of committing them to the guard of eunuchs, who are generally made ſuch by a total abſciſſion; and the blackeſt Abyſſinians are preferred both on account of their colour and of their fidelity and diſcretion, in which they excel the ſlaves of other nations. Nothing can well be imagined more cruel, or more oppoſite to the benevolent intentions of nature, than thus ſacrificing a number of poor creatures to the jealouſy and caprice of one man, who, perhaps, amidſt three or four hundred, nay as far as a thouſand and upwards, confines his embraces to a very few of them; while the others, in the flower of their age, and with all the violence of unſatisfied deſires, inſpired and nurſed by the heat of the climate, languiſh and pine away in miſery and gloomy diſcontent.

This cuſtom of engroſſing ſuch numbers of the fair ſex is, as a learned and ingenious traveller remarks, attended

tended with the moſt fatal conſequences; for beſides the injuſtice of rendering ſo many amiable perſons miſerable, and the injury done to the population of the country, it leads both the great and the meaner ſort from very different cauſes to the crime againſt nature; for as this cuſtom neceſſarily thins ſociety of the women that would otherwiſe appear on the rank for wives, the poorer ſort, from the ſcarcity of that ſex, are led to give a moſt criminal turn to their paſſions, and to betake themſelves to their own; while, on the other hand, the abundance of women at the command of the rich, create a ſatiety that produces the ſame effect: ſo that every conſideration, both human and divine, ſerves to eſtabliſh the preference of the European law in permitting but one wife, to the polygamy and concubinage of the orientaliſts.

In ſhort, the Moguls have adopted not only the language but the manners of the Perſians; their buildings are all in the Perſian ſtile, and, like them, they are fond of fine gardens; and eſpecially of water, both dormant and in action, from natural or artificial caſcades and fountains, and the climate ſupplies them with plenty of evergreens. They have commonly in the midſt of their gardens neat airy pavilions, contrived with a particular regard to coolneſs; there the owners frequently indulge themſelves during the heat of the day in parties of pleaſure with their women, and in the cool of the evening by the ſides of pieces of water, which are generally in the form of an oblong ſquare, neatly ornamented with ſteps, and with places for recumbence on the middle of every ſide, ſpread with Perſian or Turkey carpets.

Their gardens generally reſemble thoſe of the Chineſe, in the wilderneſs ſtile, with this particularity, that inſtead of having the door in the middle, as in the European manner, it is uſually placed at the corner of the wall, by which means the pavilion is not fronted by the avenue that leads to it; and, inſtead of preſenting to the view a length of gravel, or an uniform green walk, the eye is delighted with beds of flowers, as variegated as poſſible, and, in all the confuſion and agreeable wildneſs of nature, offering different ſcenes to the view on every ſide of the pavilion, to the corners of which the walks obliquely lead. They have no taſte for ſtatues, knots, and compartments, formed with perfect ſymmetry.

Amongſt the articles of luxury, which the Indians have in common with many other parts of the Eaſt, and eſpecially the Mahometans, they have public hummums for bathing, cupping, ſweating, and rubbing, which need no particular deſcription; but the practice of champing, which ſeems to have been practiſed by the antient Romans, is worthy of being fully explained. After a perſon has gone through the ceremony of ſweating, bathing, and rubbing, which, however, are not always previouſly uſed, the perſon lies down on a couch, bed, or ſopha, where the operator handles his limbs as if he was kneading dough, or pats them gently with the edge of his hands, and chafes or rubs them, concluding with cracking all the joints of the wriſts and fingers; and, if the perſon pleaſes, thoſe of the neck, at all which they are extremely dexterous. This they imagine not only ſupples the joints, but procures a briſker circulation of the fluids, which, from the heat of the climate, are apt to loiter through the veins. This excites in ſome a kind of pleaſing languor or delirium, under which they are ready to faint away, and ſometimes actually do ſo; and it is ſo common, that it would be difficult to find a barber, who is a native, unacquainted with the method of practiſing it; this being one of the eſſentials of their profeſſion.

In ſhort, "in moſt of the particulars in which the "luxuries of life conſiſt, theſe orientaliſts are, as Mr. "Groſe obſerves, little, if at all, inferior to the Euro-"peans. If they have not their taſte for ſtatues, paint-"ings, cabinets of medals, and ſuch articles of refined "curioſity, they are at leaſt not deficient in thoſe of "a ſenſuality, to which the warmth of the climate ſo "ſtrongly and ſo unhappily inclines them; being by this "enervity and relaxation, generally ſpeaking, rendered "unſuſceptible of thoſe manly virtues, and that hardi-"neſs conſtitutional to thoſe born under the colder and "rougher zones: thence, moſt probably, the indolent "and flaviſh acquieſcence of the eaſtern nations in "general, under that deteſtable form of government, "deſpotiſm; where not the profuſeſt fertility of the "ſoil, not the Elyſian temperature of the air in many "parts, nor the choiceſt bleſſings of nature, can atone "for the want of the greateſt of them, liberty. Here "an Engliſhman cannot but, in the compariſon, find "incentives, if that could be neceſſary, to the love of "his country, in which the mildeſt laws, under the "moſt admirably tempered conſtitution, ſecure to him "his life, his property, and, what is deareſt of all, his "freedom."

SECT. VI.

Of the Roads, and the Method of travelling. Their Buildings and Furniture.

THE roads are generally a deep ſand, which in the fair ſeaſon is ſo hot about noon, that it would burn the feet of the poor travellers, if they were not as hard as a ſhoe-ſole; and there is no ſuch thing as walking in theſe ſandy roads with ſhoes. Upon the great roads, at the diſtance of every ten or twelve miles, are choulteries, or caravanſeras, which are houſes for travellers to refreſh themſelves in: they have no doors, but are open on the ſide next the road, and generally conſiſt of two rooms, in one of which the travellers ſpread their carpets and ſleep, while the poons, or foot ſoldiers, who attend them, get ready their proviſions in the other. The erecting of theſe houſes for the accommodation of travellers is in this country eſteemed an extraordinary act of charity. There is generally a reſervoir of water near them, and ſome good people in the neighbouring villages frequently take care that fire ſhall be provided for dreſſing proviſions.

When a man of ſubſtance travels, he uſually hires eight or ten cooleys, or chairmen, to carry his palanquin; four of theſe run at the rate of four or five miles an hour, and their companions relieve them at certain times without ſtanding ſtill. Beſides theſe chairmen, it is uſual to hire as many muſqueteers and pikemen, to defend them from wild beaſts and robbers; and theſe twenty men will not coſt above five ſhillings a day, they being hired for three-pence each. Before a perſon intends to bait, he ſends ſome of his cooleys to the villages to buy proviſions, and an earthen pot, which does not coſt more than a half-penny, to dreſs them in, and they pick up ſticks for firing as they go along.

The uſual time for travelling is in the morning and evening; for during the heat of noon people generally ſleep. In many parts of India, where people are in danger of being attacked by the mountaineers, they travel in caravans, or large companies of two or three hundred men. On theſe occaſions, camels, oxen, and aſſes, are uſed for carrying of goods; for the Perſian horſes are too valuable to be uſed merely as beaſts of burthen, and their own ſmall breed are not very fit for it.

Travelling in the rainy ſeaſon is exceeding troubleſome, the flat country being overflowed, and innumerable torrents falling from the mountains; yet this is not ſufficient to hinder the common people from taking journies at this time of the year; for the people are extremely expert at ſwimming. Mr. Salmon ſays he happened to be in the country during the rains, and having two or three broad rivers to paſs, which ran with very great rapidity, he truſted himſelf to two blacks, who took him between them, and ſwam acroſs a river with one hand with all imaginable eaſe; and in the ſame manner the whole company, amounting to twelve or thirteen perſons, were taken over.

There are no ſuch things as poſts eſtabliſhed in the country, but all letters and paquets over-land are ſent by meſſengers on purpoſe, who are very reaſonable in their demands, and travel on foot with great expedition.

Having mentioned the roads, we ſhall now take notice of their manner of building, which is of two ſorts, thoſe erected by the original Indians, and thoſe of the

Moguls or Mahometans. As the Gentoo inhabitants are at leaſt twenty to one throughout the whole empire, their houſes fill the moſt conſiderable towns; but nothing can appear meaner than the generality of theſe ſtructures, which are low thatched cottages, with clay walls, and have only one floor. However, in the principal ſtreets, and in the bazars, or market-places, there is ſome uniformity obſerved: in the front of the houſes are ſheds, ſupported by ſmall pillars, under which are thrown up banks of earth. Under the ſhade of theſe ſheds people either expoſe their goods to ſale, or ſitting upon mats and carpets, entertain their friends, or tranſact their buſineſs, whilſt they enjoy the benefit of the open air, and of every breeze. They have no windows to the ſtreets, which render them ſtill more diſagreeable; even the palaces of the princes or rajas have nothing on the outſide that appears very elegant, and are moſt of them built in one form. Before the gate is a large piazza or roof ſupported by pillars open to the front. Upon advancing towards the gate, the earth is raiſed to the right and left, about a yard high; and upon theſe banks are ſpread fine carpets or pieces of European ſcarlet cloth, with cuſhions of the ſame ſort, to loll upon. Here the raja ſits to hear the complaints of his ſubjects, to entertain foreigners, or tranſact affairs of ſtate. A late author ſays, that he ſaw one of theſe princes ſitting under ſuch a cover before the gate of his palace, attended by his guards with glittering arms, and a hundred flambeaux: he was dreſſed in a muſlin veſt, a white turban, and abundance of jewels ſparkling about him; but the next day when our author ſaw him ſtripped of his ornaments, and with a ſmall retinue, the ſcarlet cloth and carpets removed, and the building, which the night before he imagined to be a ſplendid palace, to have only clay walls, it abated much of the opinion he had entertained of his greatneſs.

There are, however, ſome good houſes in their ſtile of building, which is partly Gentoo, and partly Moreſk. Thoſe of the greateſt note have the gateway ſo contrived as to render it defenſible againſt a ſudden attack of a few armed men; a circumſtance of conſiderable importance in cities where oppoſing the firſt attack of any perſons ſent by the government to oppreſs or deſtroy the owner, is often attended with future ſecurity, by giving time to raiſe a party capable of oppoſing ſuch proceedings. For the greater ſecurity of the women, of whom the Moors eſpecially are remarkably jealous, the private apartments always lie backwards. They are extremely fond of having one room, in the middle of which a fountain is kept playing; for by the noiſe of the falling water they are lulled to ſleep, and at the ſame time they are refreſhed by the coolneſs it diffuſes through the apartment; but it is attended with a dampneſs that might be prejudicial to the conſtitution of an European. They have the common convenience of the eaſtern ſophas, ſo commodious for ſitting croſs-legged, and they are fond of European looking-glaſſes, with which they chiefly adorn their rooms. They have another ornament which has a pleaſing effect; the beams of the cieling are ſometimes curiouſly inlaid with ivory and mother-of-pearl, in flouriſhes and ſcroll work. They have generally a kind of ſaloon, which they term a divan, entirely open on one ſide to the garden.

SECT. VII.

Of their Food, and their principal Diſhes. An Account of an Indian Entertainment. Of their Fondneſs for drinking ſpirituous Liquors, though prohibited. A Story of the Effects of Drunkenneſs.

THE times for eating are chiefly in the morning and evening; for as the middle of the day is generally very hot, they endeavour to paſs it away with ſleep; the Europeans, however, eat at noon, and lie down to ſleep ſoon after; but when they make an entertainment, it is uſually in the evening.

As to the diet of the Mahometans, it is far from being deſpicable. Inſtead of bread they uſe rice ſtewed dry, and think it more wholeſome, light, cooling, and natural to the climate. They correct its inſipidity by the ſauces with which they accompany it, which are made of fowl, fleſh, or fiſh, generally cut or ſtewed, ſo as not to want the knife when ſerved up. The great point with them is to have it ſavoury and high-ſeaſoned: Meat ſeldom comes to their table in joints, yet they are very fond of a lamb or kid roaſted whole, and ſtuffed with raiſins and piſtachio-nuts, which they then eat with it inſtead of bread.

They have a great variety of diſhes, for which they have different names; but the three moſt common ones are, currees, kitcharees, and pilow.

The currees are extremely various, they being a ſort of fricaſees made of any animals or vegetables eaten with rice: theſe laſt are chiefly uſed by the Bramins, who never eat what has had life; but the principal ingredients are the pulp of the cocoa-nut, for thickening it, turmeric for turning it yellow, and ſpices.

Kitcharee is only rice ſtewed with a kind of pulſe called dholl, which they eſteem very wholeſome and nouriſhing, and is generally eaten with ſalt-fiſh, butter, and pickles of various ſorts.

Pilow is a boiled fowl covered with rice boiled dry, to which are added ſpices and turmeric: they ſometimes render it extremely expenſive by the addition of ambergris.

Moſt of the Europeans ſoon become reconciled to the country diet, and many at length prefer it to their own, even in point of taſte, independently of its being more wholeſome, and more adapted to the climate than the quantities of fleſh we are accuſtomed to eat in theſe colder countries.

Mr. Salmon ſays, that when he was in the country, he was invited to dinner by a wealthy black, and was brought into a hall or outer room, which had a bank of earth, about a yard wide and near as high, all round it. When the company were ſat down croſs-legged upon this bank, a ſervant placed a leaf as big as the largeſt cabbage-leaf before every one of the company, inſtead of a plate: ſoon after he brought in a large brazen bowl full of boiled rice, and laid about a quarter or three pints of it upon each man's leaf: another brought in a deep diſh of ſtrong broth or ſoup, with the veniſon of which it was made cut into little ſquare pieces like dice. To every perſon he diſtributed a quantity of the ſoup to mix with his rice, and ſome of the meat, which was very ſavoury, was laid upon the ſide of each leaf. Every man had a bottle of water ſet by him, and drank when he pleaſed, without healths, or any other ceremony, nor was any other liquor brought. They ſit or lie reclined on carpets on the floor, when they eat, and have cloths ſpread to ſet their diſhes on.

As the meat is ready cut to their hands, they uſe neither knife, fork, ſpoon, or any other inſtrument in eating; but taking a handful of rice, ſqueeze it into a lump as big as an egg, and put it in their mouths; they have no napkins to wipe their hands and mouths with, but waſh before and after their meals. Some of them will not touch with their lips the bottle or cruſe out of which they drink, but, holding the veſſel high, pour the liquor into their mouths, and will thus ſwallow a great deal without once gulping, or ſpilling a drop.

Beſides water, which is their common drink, they have palm wine and toddy, neither of which will raiſe the ſpirits much when they are new; they have alſo the milk of the cocoa-nut, and when they are hot and fatigued, they drink milk with garlic infuſed in it; but beſides theſe ſmaller liquors, they have ſeveral kinds of ſpirits, that go under the common name of arrack, ſome of which is diſtilled from toddy, ſome from ſugar, and ſome from rice, but the laſt is both the weakeſt and the worſt, and is called pariar arrack, as fit only for the pariars or common people. This liquor is not very expenſive, a hogſhead, containing fifty gallons, is frequently ſold for forty or fifty ſhillings. As for beer and wine none are made in the country, and what is brought from Europe is exceſſive dear; for a bottle of common beer is worth eighteen pence, and fine ale and wine four ſhillings and ſixpence a bottle each.

Few of the Mahometans of India abſtain from wine, when they have an opportunity of being treated with it by the Europeans: but they are much fonder of cordials and drams; but do not think even arrack ſtrong enough for them, unleſs triple diſtilled; they are, however, ſo cautious, that the greateſt drinkers among them are never ſeen in public diſordered with liquor; yet the vice of drunkenneſs ſometimes precipitates their governors and great men into a dangerous abuſe of their power; of which the following ſtory, which we ſhall take from Mr. Groſe, will both ſerve for an inſtance, and ſtrongly characteriſe the genius and government of theſe people.

The Nabob of the diſtrict of Ahmadavad, a prince of the Mogul's blood, not many years ago, in a drunken fit, had given an order to ſet fire to the great city of that name. His vizier, who ſaw that he was not in his ſenſes, and yet durſt not by a wiſe but hazardous diſobedience ſhock the profound eaſtern jealouſy of deſpotic authority, in this nice dilemma, applied for advice what to do to a Perſian princeſs, wife to the Nabob, and not more remarkable for the exquiſiteneſs of her beauty, than for that of her wit and good ſenſe; being beſides, not only more learned than the generality of women in thoſe countries, but ſkilled in the compoſition of Perſian poetry, all which merit of the mind and perſon was not thrown away, ſince it had ſucceeded in entirely captivating and attaching her huſband to her, who repoſed himſelf principally upon her for the care of his government. Her anſwer upon this conſultation was entirely conformable to the maxims of eaſtern government, and to the dictates of humanity. "The authority of the prince, ſaid ſhe, is too ſacred a point, for either thee or me to take upon us to revoke his order. He muſt then literally be obeyed. Find out in any corner of the town, ſome of the moſt detached little houſes, from which there may be the leaſt danger of the flames ſpreading. Set fire to them, firſt giving the owners time to eſcape, and paying them amply for the damage; and thus my huſband's authority will be ſaved, and any material miſchief prevented."

This counſel was immediately put into execution, and, beſides entitling the authoreſs to the thanks of her huſband, when recovered from his intoxication, raiſed the reputation of that princeſs all over the empire of the Mogul.

But, to return from this digreſſion, ſome caſts of the Gentoos wholly abſtain from animal food, and among theſe the ſimplicity of their lives appears wholly anſwerable to that of their diet; for this regimen, an ingenious traveller obſerves, ſeems to have an influence on their minds as well as their bodies, they being generally free from the more violent paſſions and views, in which the cold one of avarice is certainly not included; thoſe of them at leaſt who enter into temporal affairs, vie with any other condition of men; and with reſpect to their conſtitution, they are generally healthy, though not ſtrong bodied. Their ſenſes of ſmell and taſte are exquiſite, which they doubtleſs owe to their abſtinence from fleſh: thus to them flowers produce a much ſtronger odour than the ſame ſort would to Europeans; and they are as nice in the taſte of different waters as the latter are in that of wines, and make as great a point of luxury in the choice of them. It is alſo obſervable, that the wounds of thoſe uſed to vegetable diet are much ſooner and much eaſier cured than thoſe of ſuch as eat fleſh.

SECT. VIII.

Of their Genius, Languages, Manner of Writing, Learning, and Skill in the Sciences.

THE Indians are men of ſtrong reaſon, and had they the advantage of literature, might have been the authors of many excellent works. They are, however, ſaid to have ſome of Ariſtotle's books in the Arabian tongue, and ſome of the works of that celebrated phyſician Avicenna, and likewiſe ſome fragments of the Old Teſtament in the ſame language; but this is only to be underſtood of the Mahometan inhabitants, many of whom are deſcended from the Arabs. Theſe have but few books, which are all in manuſcript, for the art of printing has not been introduced amongſt them.

The language of the Mahometans is very different from that of the antient original Indians; yet, being deſtitute of letters, they have borrowed the Indian characters, and in all their writings uſe either thoſe of the Pagan Indians or of the Perſians. The court language is the Perſian, which is not only ſpoke by all the great omrahs, but by all the polite in general; but the learned language is the Arabian.

The Indians have a great variety of languages very different from thoſe uſed by the Moors. The Bramins, the chief ſect of the Gentoos, have a language peculiar to themſelves, called the Hanſerit, in which the Vedham, Shaſter, and the other books of their law are written. There are alſo the Malabar and Gentoo tongues, which are moſt commonly ſpoken by the Pagans; the firſt upon the coaſt of Malabar, and the other upon the coaſt of Coromandel; but no language is more univerſally underſtood, both on the coaſts and in the trading towns, than the Portugueſe, which is the Lingua Franca of that part of the world; but it is mixed with ſome Indian words, and is far from being ſpoken with the ſame purity as in Portugal.

The Gentoos generally write with an iron ſtile, or bodkin, on cocoa or palm-tree leaves, not like the Chineſe in a ſtraight line downwards, but from the left hand ſlanting to the right. The Moors have, however, a thin ſhining paper, ſometimes ten feet in length and a foot broad, and tack as many ſheets together as the writing requires; the pen they write with is the ancient calamus, or reed, which is about the thickneſs of a gooſe-quill. When they write to a prince, the whole ſurface of the paper is gilt; and for the ſecurity of thoſe letters of conſequence that are ſent to court, they are rolled up cloſe and incloſed in a hollow cane, or bamboo, and the end of it ſealed up, that no wet may be able to injure them. Upon their ſeals, or chops as they are called in this country, they have no coats of arms; theſe are entirely unknown in India; but they have their own names engraved on gold or ſilver, or on a cornelian.

They have a great value for their hiſtory, which is written in verſe, and conſiſts of fabulous relations of their ſubordinate deities and heroes: they have alſo their ſaints and martyrs, whoſe memories they celebrate, and give entire credit to all the adventures and miracles recorded in the ſongs of the Bramins.

The Gentoos, or original Indians, begin their year on the firſt of March, and the Moors on the tenth, when, according to their aſtrologers, the ſun enters into Aries; and the year is compoſed of thirteen moons.

They divide the day into four parts, and the night into as many, which they call pores; and theſe they again ſubdivide into eight parts, which they call grees, or graris; and, according to the ancient cuſtom, meaſure them by water dropping out of one veſſel into another. In ſome great towns a perſon is appointed to look after the veſſel, and to turn it up when all is dropped out, at which time he ſtrikes the number of the pores and grees as they paſs with a hammer upon the brim of a piece of metal like a pewter-diſh; but the common people in the country are obliged to gueſs at the time of day: and indeed it is not very difficult to know it in the ſouthern part of India, where the ſun conſtantly riſes and ſets at about ſix o'clock.

Few people excel the Bramins in the practical part of arithmetic, this being their principal ſtudy; for, from their infancy, they are taught to caſt up ſums by their fingers, without the help of a pen.

The Bramins have ſome tables, formed by the ancient aſtronomers, for calculating eclipſes, and are pretty exact in their predictions; but they are entirely ignorant of the theory. They conſider the day in which an eclipſe happens as a time of plenary indulgence; and, by waſhing themſelves in water, believe they receive the remiſſion

remiſſion of their ſins. Nothing can be more extravagant than their ſyſtem of the heavens: they imagine that the moon is above the ſun, though the contrary is demonſtrable by eclipſes; and that the ſun, when he ſets, hides himſelf behind a mountain. Yet they are acquainted with the twelve ſigns of the Zodiac, and give them the ſame names in their language as we do in ours.

The ſcience moſt univerſally practiſed among them is aſtrology; and even the Mogul will not ſo much as undertake a journey, or form any important reſolution, except the aſtrologers tell him that it is a fortunate hour; and the very moment they preſcribe, he ſets about it. The Gentoo Indians are to this day ſo infatuated with aſtrology, that their merchants will not let a ſhip ſail, or ſtrike a bargain, or, in ſhort, undertake any buſineſs of importance on thoſe days that are ſet down for unlucky ones. The Indian Bramins are generally the almanack-makers of the country, and conſtantly mark in their calenders what they call their good and bad days, in the obſervation of which they are invincibly ſuperſtitious.

The Indians have no ſkill in anatomy; they however uſe ſimples, and apply them with ſucceſs. The Bramins are ſaid to poſſeſs many valuable ſecrets in natural philoſophy, which they have acquired by their ſtudious and contemplative turn; and which if not brought to Europe, is leſs owing to any reſerve in them, than to the want of curioſity and inquiſitiveneſs in the Europeans; who ſeldom travel to thoſe diſtant parts in ſearch of knowledge, and are too much engroſſed by views of raiſing a fortune to employ ſufficient attention, or to uſe the means of becoming maſters of ſuch diſcoveries.

For bloody-fluxes the Bramins ſuggeſt a very ſimple, and, according to them, a moſt infallible remedy, conſiſting of a ſtrict abſtinence from every thing but rice ſtewed dry, to which they allow no ſauce: to this they attribute an abſorbent quality, that is excellent againſt that acrimony which preys on the entrails, and breeds the diſorder. They allow no other drink but water, corrected by a very moderate quantity of cinnamon, or caſſia lignum.

The mordechin, a moſt violent diſorder, chiefly known on the Malabar coaſt, ſeizes the patient with ſuch violent purging, vomiting, and pain in the inteſtines, that it will frequently carry them off in thirty hours. In this the phyſicians know no remedy more effectual than the actual cautery applied to the ſoles of the feet, the powerful revulſion of which ſeldom fails of producing a ſalutary effect.

The popiſh miſſionaries, and even many of the proteſtants, are of opinion that the Bramins cure moſt diſtempers by charms. They tie little bits of paper about the patient's neck, uſing at the ſame time an unintelligible jargon, which ſerves to amuſe the common people; but at the ſame time uſe natural means, which there would be little occaſion for, had the devil as great a ſhare in theſe cures as is imagined. But in no inſtances do they make uſe of theſe pretended charms more than in recovering perſons bitten with ſnakes: beſides the other means uſed in this caſe, they always keep the patient awake, and ſing and play to him as they do to the ſerpents when they dance. Some Europeans have highly extolled the virtues of the ſnake-ſtone; this is a ſmall artificial ſtone almoſt flat, with a little protuberance in the middle, and of a grey colour. It is ſaid to be compoſed of the aſhes of burnt roots, mixed with an earth found at Diu, a Portugueſe town in India. It is ſaid that this ſtone being applied to the part invenomed ſticks faſt, and by its powerful attraction ſucks out the poiſon, till the pores being full, it falls off; but, on being put into milk, emits the venomous matter it has imbibed, and again recovers its alexipharmic quality, and may be applied as before; and if this ſtone be ſcraped into a glaſs of wine, or any other liquor, and taken inwardly, it is reputed to be a moſt powerful medicine againſt malignant fevers; but the pretended virtues of the ſnake-ſtone are now generally exploded in India, and the cure of thoſe wounds cauſed by the bite of theſe venomous reptiles are left to Indian phyſicians.

SECT. IX.

Of their Skill in the mechanic Arts, Manufactures, and Trades; with a particular Account of the Conſtruction of their Ships, and the Integrity of their Merchants. Of the Barbers of India, the Ingenuity of their Jugglers, and of their dancing Serpents.

THE mechanics and artificers of India are greatly admired for their fine muſlins and callicoes; ſome of theſe muſlins are ſo exceeding thin, that it is ſaid a whole piece may be drawn through a ring; and yet if a piece be torn in half, they will work it together ſo neatly that it cannot be diſcovered where it was torn. The chints and callicoes on the coaſt of Coromandel are painted with a pencil by the meaneſt of the people; but thoſe to the northward are printed; and yet the colours of either of them never waſh out. They not only paint birds, beaſts, trees, and flowers, but will draw the picture of a man tolerably well; and it is ſaid they will copy our beſt pieces ſo perfectly, that it will require a good judge to diſtinguiſh the copy from the original; but their ſkill in this particular is probably much exaggerated.

They have the art of drilling holes through China-ware, and ſowing it together with braſs wire; ſo that a bowl broke into half a dozen pieces will hold liquors as well as at firſt.

The goldſmiths work curiouſly in fillegrean, and imitate any goldſmith's work made in Europe; and yet both the forge and all the tools they uſe are not worth ten ſhillings. They are even frequently ſeen at work in the middle of the ſtreets; a goldſmith there being a mean employment.

The cement uſed by their builders is harder than their bricks, it being made of ſea-ſhells; and they will terrace the roof of a houſe, or lay a floor with it, that ſhall reſemble one entire ſtone, and be full as hard.

The Indians fail moſt in iron work. They make no watches, clocks, gun-locks, or any hard-ware that requires good ſprings; however, in ſome parts of India they forge very good ſword-blades and poniards.

At Surat they excel in the art of ſhip-building; and if their models were as fine as thoſe of the Engliſh, which they are the fondeſt of imitating, it might be aſſerted, without the leaſt exaggeration, that they would build incomparably the beſt ſhips in the world for duration; but their naval, as well as their other architecture, has always ſomething clumſy, unfiniſhed, and unlike the work of an artiſt. Their ſhips are much longer than thoſe of the Europeans in proportion to their breadth; and it is not uncommon for one of them to laſt a century, which is leſs owing to the ſummer ſeas in thoſe parts, than to the ſolidity of their workmanſhip, and the nature of the wood of which they are made. Their bottom and ſides are formed of planks let into one another, ſo that the ſeams are impenetrable; and the knees, or crooked timbers, are generally of the natural growth into that form, without their being warped by fire, eſpecially where particular care is taken of their conſtruction.

The wood is of a particular ſort called teak, which is full as durable as oak, and has this advantage, that it is not ſo apt in an engagement with cannon-ſhot to fly in ſplinters, which commonly do more miſchief to the men than the balls themſelves. They have likewiſe a peculiar way of preſerving their ſhip's bottoms, by occaſionally rubbing into them what they call wood-oil, which the planks imbibe, and is of great ſervice in nouriſhing and keeping them from decay.

Their ſhips are not launched from ſlips, but by digging canals from the water to where the ſtocks, or what they call their cradles, are, and dropping them into the ſtream that is brought up to them.

They uſe pohoon-maſts chiefly from the Malabar coaſt; but all the cordage that is good for any thing muſt come from Europe; their coyr-ropes, made of the fibres of cocoa-nut huſks, being more harſh and unmanageable for either running or ſtanding rigging than what is produced from hemp. They have, however,

very

very large and ſerviceable coyr-cables, which laſt much longer in ſalt-water than in freſh, which is apt to rot them; and as our iron is much better than theirs, their anchors are moſtly European. Their country manufacture of cotton into a ſail-cloth called dungaree, ſupplies them with ſails, which, though neither ſo ſtrong nor ſo laſting as ours, are more pliant, and leſs apt to ſplit; and, inſtead of pitch, they make uſe of the gum of a tree called damar, which is not inferior to it.

Their navigators have but little ſkill, but are ſufficient for the purpoſes of conducting ſhips where they ſeldom put to ſea but in the fair ſeaſon, and conſequently rarely meet with ſtorms. Their common ſailors are rather better in their claſs, though they want the vigour, expertneſs, and patience of fatigue, for which the Europeans are diſtinguiſhed.

The Banyans, who are profeſſedly merchants, have been repreſented by ſome authors as a tricking artful ſet of people, and full of ſuch low cunning as renders it difficult to deal with them; but this is ſo far from being true, that theſe merchants are in general the faireſt and openeſt dealers in the world. Thoſe of Surat eſpecially are famous for the ſimplicity and frankneſs of their tranſactions. As an inſtance of this, on a ſhip's coming thither laden with goods, nothing more is neceſſary to be done than for the commander or ſupercargo to bring his muſters or ſamples on ſhore, together with his invoice; and theſe merchants, reſorting to him, will, if the aſſortment ſuits them, immediately ſtrike a bargain for the whole cargo, with no other trouble than ſettling the per centage upon the items of the invoice. In this manner, ſays Mr. Groſe, many a cargo, from five to thirty thouſand pounds, and upwards, has been ſold in half an hour's time, with very few words, and the amount immediately paid, either in ready money, or by barter, according as the buyer and ſeller have agreed, with at leaſt as much probity as is ever practiſed by the European merchants of the moſt eſtabliſhed character.

Theſe Banyans have indeed one advantage over our merchants, but yet we cannot reaſonably complain of it; this is the remarkable coolneſs and ſerenity with which they conduct all their tranſactions. If you offer them ſhamefully leſs than their goods are worth, or fly into a paſſion at their under-rating yours, there is no ſuch thing as provoking them to ſhew the leaſt indecent heat of temper. They calmly ſuffer you to evaporate your reſentment without interruption, and patiently wait 'till your fit of drunkenneſs is over, for they conſider it in no other light, and then calmly return to the ſame point; and if they depart from it, you may be certain it is not occaſioned by any thing you have ſaid in the heat of paſſion, but in conſequence of their own inward reflections. In this particular they have the ſame advantage over the Europeans, as a cool gameſter has over a paſſionate one.

Amongſt their meaner trades we ſhall only mention here their barbers, who conſtantly ſhave with the grain, and perform their work with great eaſe and dexterity. They have all one uniform ſet of materials, a round glaſs with a handle, which they ſtick in their girdles like a dagger, and put it in your hands while you are ſhaving; a ſmall copper tumbler, no bigger than a tea-cup, and ſome inſtruments for picking the ears and paring the nails, either hung on a wire, like a bunch of keys, or put in a caſe. The orientaliſts in general muſt be allowed to be extremely ſtudious in the cleanlineſs of their perſons, which they imagine conduces to the pleaſure of the mind.

In deſcribing the ingenuity of the Indians it will not perhaps be deſcending too low, to take notice of their tumblers and jugglers, who, as in other countries, go from town to town; and are ſo dexterous, that ſome of our countrymen have very weakly attributed their tricks to magic and the power of the devil; and the ingenious Mr. Groſe ſays, their deceptions are ſo amazing, that he has not the courage to relate what he himſelf has ſeen them perform, for fear of being taxed with running into the marvellous, of which travellers are ſo fond. We have already mentioned their incantation of ſnakes; and it will not be improper to add here, that people carry thoſe reptiles in round baſkets; and when they uncover them begin to ſing and play upon their pipes, at which all the ſnakes raiſe up the upper parts of their bodies, and keep time with the muſic by the motion of their heads, while their lower parts remain coiled up in the bottom of the baſket. If the muſic ceaſes ever ſo little, they leave this kind of dancing, and getting out of the baſket hiſs at each other, as if they would fight; but, on renewing the muſic, they immediately fall to dancing again. The Europeans are not very fond of having theſe ſnakes, ſome of which are very large, come near them; though they are told by their owners, that there is no danger to be feared from them, for it is ſaid their teeth are pulled out. What degree of ſkill and ingenuity is neceſſary to teach theſe reptiles thus to divert the people by their actions, it is impoſſible for an European to conceive.

SECT. X.

Of the different Tribes of the Gentoos.

THE diſtinction of the Gentoos into caſts or tribes forms a remarkable peculiarity in their religion and government, and has both its conveniences and inconveniences. Their warriors, prieſts, merchants, huſbandmen, and all the various artificers and mechanics known among them, are each claſſed in their reſpective tribes; and, though all profeſs the ſame religion, they muſt neither eat, drink, nor intermarry with each other, ſo that a carpenter cannot marry his child to a ſmith's; for all muſt be born in the profeſſion they exerciſe, and no tranſition or mixture is allowed. Thus great injuſtice is frequently done to genius and talents, to which they pay no regard, nor make any allowance for that infinite diverſity produced by nature. Thus ſome are confined to make an inſignificant figure in one ſphere, who might ſhine in another. Yet this diſtribution has the advantage of order, and the prejudices of education in favour of this cuſtom diminiſhes, and even annihilates, the ſenſe of the injury done to a few.

Beſides, as moſt of the tribes have a chief, who is in ſome meaſure accountable for the conduct of the individuals of which his tribe is compoſed, it is eaſy to eſtimate number, or aſſemble, in any government, the individuals on any neceſſary occaſion. One would imagine, that moſt profeſſions, and more particularly the manual arts, being tranſmitted from father to ſon through a long ſucceſſion of ages, would be carried to the utmoſt perfection; but it does not appear that this is really the caſe; for they ſtick pretty nearly at the ſame point they were at many ages ago. Emulation is perhaps deadened by this confinement, or perhaps the people of thoſe ſoft climates want the ſolidity, curioſity, and application neceſſary to carry them beyond a certain degree of perfection; and beſides, the precarioufneſs of property muſt be a conſtant diſcouragement under a deſpotic government.

As the Indian Gentoos believe the doctrine of the metempſychoſis, and the ſtricter tribes will kill no animal whatſoever, leſt they ſhould oblige the ſoul of a parent or a friend to quit its habitation, it might be expected, that nothing but mildneſs, gentleneſs, and humanity, would prevail amongſt them, and that the horror of ſhedding blood would endanger every Gentoo ſtate, and render it a prey to the firſt invader; but that ſo rich and delightful a country might not want defenders, the province of war was, according to the Gentoo ſyſtem of religion, left to other caſts, particularly the Ketterees, from which are taken their rajahs, kings, chiefs, and generals, who are born to the profeſſion of arms. The Nayrs, Raſhboots, and others, are alſo born warriors; and theſe being the men, who, by the conſtitution of their religion, govern the ſtate, it is the leſs wonderful that they commit thoſe acts of injuſtice and violence which generally accompany the ſword, and ſhews how a religion that breathes nothing but humanity, mildneſs, and univerſal charity, produces ſuch tyrannical forms of government.

It alſo appears very extraordinary, that while they are ſo tenacious of their ſuperſtitious obſervances, they are liable to loſe their right of communion, not only for voluntary

A Gentoo Woman burning herself on the Funeral Pile of her Husband.

luntary breaches of them, but for ſuch as one would imagine extreme force or neceſſity might juſtify. Numbers of them, though in other reſpects afraid of death, would ſooner ſuffer it than violate any of thoſe fundamental points, on which their right of communion depends, ſuch as taſting of beef, drinking or eating out of the ſame veſſel with thoſe of another religion, which is a defilement never to be repaired. As for inſtance, when Lloſdaſs Vittuldaſs, a conſiderable Banyan merchant, was on his paſſage from Bombay to Surat in an Engliſh ſhip, he having made a proviſion of water, in veſſels of his own, under his own ſeal, ſuch as might ſerve for that ſhort run, being uſually of no more than two or three days, it happened that through delays occaſioned by calms and contrary winds, it was expended, and he reduced to the condition of periſhing with thirſt, though there was plenty of water on board; but that being profane to him, no intreaties could prevail on him to break his law, though he felt all the torments of thirſt, under which he would actually have ſunk, had not a favourable breeze ſprung up, and brought him to Gundavee near Surat, but ſo faint as to have his ſoul, as they expreſs themſelves, between his lips.

This religious ſcrupuloſity not only ſubſiſts among the Gentoos with reſpect to thoſe of other religions, but between the different tribes of their own, who never eat or intermarry under the ſame penalty. In ſome parts this nicety extends even to civil diſtinctions, as on the coaſt of Malabar, where it is capital for a nair, or noble, to approach ſo near an inferior caſt as to receive a wound in which blood is drawn. It is not many years ſince an extraordinary accident of this kind happened near Penany, the reſidence of the ſamorine of Calicut. A nair happened to have a ſtruggle with a thyvee, or tiller of the land, when as in jeſt they grappled each other, and the thyvee's ſickle accidentally wounded the nair, who no ſooner ſaw his own blood, than letting go his hold he entreated the thyvee to make off as ſoon as poſſible, and for both their ſakes to keep the accident a ſecret. It happening, however, to take air; the nairs aſſembled; and one of the elders riſing up and expoſing the caſe, they inſtantly fell upon the poor nair and cut him to pieces with their ſabres, after which they lamented over him, and then proceeded by way of revenge for the ſacrifice their law had compelled them to make, to exterminate the whole tribe of the thyvees in the village where the author of the miſchief dwelt. Yet even in this they ſhewed, that amidſt this wild ſuperſtition they could remember equity, for care had been taken to inform the thyvees of what was intended, that they might eſcape till the day ſet for the maſſacre was over, after which it is unlawful to revive the procedure, and they might without danger return to their habitations.

Amongſt theſe naires principally prevails the ſtrange cuſtom of one wife being common to a number; in which the great power of cuſtom is ſeen, in its never producing any jealouſies or quarrels among thoſe who poſſeſs the ſame woman. Beſides, the number of theſe huſbands is not ſo much limited by any ſpecific law, as by a kind of tacit convention, by which it ſeldom happens, that it exceeds ſix or ſeven. The woman is, however, under no obligation to admit more than a ſingle attachment, though ſhe is not the leſs reſpected for uſing her privilege in its utmoſt extent; and they are ſometimes ſaid to have twelve huſbands; but they, as well as ſhe, muſt be all of the ſame tribe.

When the daughter of a nair is married to the firſt of her huſbands, he builds her a houſe, in which he alone cohabits with her, till ſhe takes a ſecond. The huſbands all agree and cohabit with her by turns, according to their priority of marriage, each eight or ten days, or as they can fix the term among themſelves; and he who lives with her, during that time, provides for her ſupport. When the man who cohabits with her goes into her houſe, he leaves his arms at the door, and none dare remove them, or enter the houſe on pain of death; but if there are no arms to guard the door, any of them may freely viſit her. All the time of cohabitation, ſhe ſerves her huſband as purveyor and cook; ſhe alſo takes care to keep his cloaths and arms clean. When ſhe proves with child, ſhe nominates its father, who takes care of its education, after ſhe has ſuckled it, and taught it to walk and ſpeak; but from the impoſſibility of aſſigning the true heir, the eſtates of the huſbands deſcend to their ſiſters children, and if there are none, to the neareſt in blood to the grandmother.

This account, improbable as it may appear, is mentioned by ſeveral good authors: the celebrated baron de Monteſquieu, treating of this cuſtom in his excellent work, entitled, The Spirit of Laws, thus accounts for its origin: "The naires are the tribe of nobles, who "are the ſoldiers of all thoſe nations. In Europe ſol-"diers are forbid to marry: in Malabar, where the cli-"mate requires greater indulgence, they are ſatisfied "with rendering marriage as little burthenſome as poſſi-"ble; they give a wife amongſt many men, which con-"ſequently diminiſhes the attachment to a family, and "the cares of houſe-keeping, and leaves them in the free "poſſeſſion of a military ſpirit."

SECT. XI.

Of the Marriages of the Gentoos in general; the Behaviour of the Women; their early Pregnancy; and their Management of their Children. Of the Funerals of the Gentoos, and the Women's burning themſelves on the Funeral-pile of their Huſbands.

NOTHING can be more public and ſplendid than the ſolemnization of the marriages of the Gentoos; the little bride and bridegroom, who are frequently no more than three or four years of age, are carried thro' the ſtreets for ſeveral nights ſucceſſively, dreſſed in the richeſt cloaths, and adorned with the fineſt jewels their parents can procure; at the ſame time the ſtreets are rendered as light as day, by the great number of torches lighted upon the occaſion: and they are preceded by flags, ſtreamers, wind-muſic, and a crowd of their friends, who come to expreſs their joy upon the happy occaſion; which was not determined before the aſtrologer was conſulted, and the fortunate hour fixed. After the bride and bridegroom have finiſhed their pompous cavalcade, they are taken to the houſe where the father of the little wife lives, and being ſeated oppoſite to each other, with a table between them, they ſtretch out their hands, and having joined them acroſs the table the prieſt covers both their heads with a kind of hood, which remains ſpread over them about a quarter of an hour, during which time he prays for their happineſs, and gives them the nuptial benediction; after which their heads are uncovered, and all the company ſprinkled with roſe-water and perfumes out of ſilver cruets, till their cloaths are wet and diſcoloured with the ſaffron with which they are mixed; and thus they are worn for a week after, to ſhew that they have been at one of theſe joyful meetings. The evening concludes with a magnificent entertainment ſuitable to the quality and wealth of the parents, and ſometimes theſe feſtivals laſt ſeveral days.

The Gentoos, though frugal in every other article of life, are ſo very extravagant on theſe occaſions, that ſome of them almoſt ruin themſelves, and laviſh away upon their children's nuptials what would be a handſome proviſion for the married couple when grown up; for they ſpare no expence in proceſſions, muſic, dancing-girls, fire-works, feaſting, and the ornaments of their houſes, endeavouring in every thing to outvie each other; it being a matter of ambition with them to have it ſaid how much was expended at a ſon's wedding: and as the preſence of the Bramins are neceſſary in the performance of the ceremony, they come in for a ſhare of the entertainment and preſents. Some of the great merchants at Bengal have been known to ſpend a lack of roupees, which amounts to about twelve thouſand pounds; and, beſides making conſiderable preſents, have invited the Engliſh gentlemen to an entertainment, furniſhed in the Engliſh manner, under the direction of an Engliſh ſteward, for which they have allowed five hundred pounds. In ſhort, moſt of them, upon theſe occaſions, ſtretch their abilities.

The Gentoo women treat their huſbands with extraordinary reſpect and tenderneſs; their conduct is in ge-

neral blameleſs, and very few are ever known to violate the marriage-bed. They are intirely in the power of their huſbands, to whom they bring no other fortune beſides their cloaths, and perhaps two or three female ſlaves; and, among the wealthy, it is ſaid the father of the huſband advances a conſiderable ſum to the wife's friends; ſo that ſhe is in a manner purchaſed, like the reſt of his houſhold goods; but they have a greater liberty of going abroad than the Mahometans, at leaſt the tradeſmen's wives and thoſe of the other inferior caſts, go conſtantly in the morning and evening, with their earthen-pots, to the common wells, to fetch water to waſh themſelves, which they do ſeveral times a day from head to foot. Mr. Ovington ſays, a merry Banyan uſed often to complain of the folly of having two wives, becauſe they diſtracted him with their perpetual jealouſy of each other, and he never could enjoy one without diſpleaſing the other. Upon the leaſt ſuſpicion of his intending to favour one, the other was alarmed, and would break out into the moſt paſſionate expoſtulations, aſking if he intended to forſake her, and taking hold of his cloaths would partly by force, and partly by the tendereſt expreſſions ſhe could frame, endeavour to divert him from his deſign. One would urge that ſhe was the wife of his youth, with whom he had long contracted an intimate acquaintance, and plead a right to him by preſcription: the other would claim a greater ſhare in his favours, on account of her having yet enjoyed ſo little of them, but that her rival had him to herſelf for ſeveral years. Thus the huſband, diſtracted by their importunity, knew not which way to turn, and wiſhed, for his own tranquillity, he had confined himſelf to one. Indeed, the Bramins and Banyans generally content themſelves with one wife, except ſhe is found upon experience to be barren, which is eſteemed a great misfortune and reproach; but this is, however, very rarely the caſe: ſome of the other tribes of the Gentoos allow themſelves a greater latitude.

The women begin to bear children at twelve years of age, and even much younger, for Mr. Groſe ſays he has ſeen them pregnant in their tenth year; but then their teeming-time is ſoon over. They ſeldom have any children after they are thirty years of age, and frequently before that time they intirely loſe their bloom, and all that plumpneſs and delicacy for which they are juſtly remarkable. This is, however, not to be underſtood of the women brought from Caſhmire, who being born in a more northern climate, and in a purer air, amongſt the mountains bordering on North-eaſt Tartary, retain their charms and continue prolific as long at leaſt as any European women; but theſe generally fall to the ſhare of the principal Moors or Moguls.

When a child is about ten days old, they give it a name. On this occaſion they aſſemble ten or a dozen children, who ſtanding in a ring hold a ſheet in their hands, into which the Bramin, or prieſt, pours a quantity of rice, upon which he lays the child to be named. The boys who hold the ſheet ſhake the child and the rice together for about a quarter of an hour, and then the father's ſiſter advances and names the child, cuſtom having given her that right; but if the aunt be not preſent, the child is named by the father or mother. A month or two afterwards the child, it is ſaid, is carried to a pagoda, where a Bramin mixes ſome ſhavings of ſandal-wood, camphire, cloves, and other things, and puts them upon the child's head, from which time the infant is reputed a compleat Banyan.

The lying-in women are thought ſo impure, that none muſt touch them for the firſt ten days but their nurſes; and till forty days are expired, they muſt neither have any hand in the dreſſing proviſions, or in the performance of any other houſhold affairs.

The Indians never bind or ſwathe their children, but both their boys and girls go perfectly naked till they can run about; while infants, they are rocked in cradles faſtened to the beam of the houſe, which being ſwung backwards and forwards, go much eaſier and quieter than ours that ſtand upon the floor.

We ſhall now take notice of the funerals of the Gentoos, ſome of whom bury the body, and others burn it; but this laſt is the moſt common. As Mr. Groſe was preſent at both theſe ceremonies when at Bombay, we ſhall take our account from him, his veracity being undiſputed. The firſt he mentions was a Ketteree that buried his wife, who was a young woman, and ſeemed to be about twenty years of age. Thoſe who accompanied the huſband dug a pit exactly in the ſhape of a well, on one ſide of which was a niche hollowed out for the corpſe to be depoſited in a ſitting poſture, with room ſufficient for a plate of raw rice and a jar of water by her ſide. The pit was no ſooner ready than they put her into it with all her cloaths and jewels, exactly as ſhe wore them when alive. But as ſoon as ſhe was placed, her huſband, who till then had ſtood ſtill as a ſpectator, jumped into the grave, and very compoſedly took off all her jewels and brought them up with him; after which the pit was filled up.

As to the ceremony of burning; having waſhed the corpſe, and dreſſed it in ſuch cloaths as he uſually wore in his life-time, the relations and friends aſſemble and carry it out on a bier to a little diſtance from the town. This is uſually done the next day; but if a perſon dies in the morning, his body is ſometimes burnt the ſame evening, for a corpſe will not keep long in theſe hot countries. The funeral-pile is uſually prepared near ſome river, or pond; and if he be a perſon of wealth, great quantities of fragrant wood is mixed with the reſt that forms the pile. Mr. Groſe ſaw the ceremony performed on the corpſe of a youth about eighteen, the ſon of a Banyan. The funeral-pile was prepared on the beach, the father aſſiſting at it bare-headed, with the little cloaths he had on, coarſe and torn, which is their general manner of mourning. As ſoon as the corpſe is placed on the pile, and ſome prayers muttered by the attendant Bramin, fire is ſet to it at one of the corners; and the wood being dry, and in a great quantity, it ſoon blazed up and conſumed the body to aſhes, without any noiſome ſmell: ſuch, however, does not unfrequently happen, if there is but little wood, or the rain intervenes, to damp the flames. The aſhes are gathered together and thrown with ceremony into the ſea by a Bramin, who, for that purpoſe, wades into it as far as he ſafely can; but thoſe who are moſt bigotted, and can afford the expence, leave orders for their aſhes to be collected, put into an urn, ſealed up, and carried to be thrown into the Ganges, to whoſe waters they attribute a peculiar ſanctity. But what drew my attention moſt, ſays the above author, in the courſe of this ceremony, was the behaviour of the father, who, according to the Gentoo cuſtom of its being always the next and deareſt male relation that ſets fire to the pile, walked thrice round it with a ſort of deſperate haſte, and then, with his face averted, thruſt his hand behind him and gave fire to it; after which he, with the appearance of the utmoſt agonies, rolled himſelf in the ſand, beating his breaſt and tearing his fleſh.

Few travellers who have paſſed through India omit mentioning the cruel cuſtom of the women publickly burning themſelves at the death of their huſbands, which is ſaid to be ſtill practiſed in ſome places, though the Moguls have endeavoured to aboliſh it, and ſtrictly prohibit its ever being performed.

Mandeſlo, a traveller of great learning and acknowledged veracity, when at Guzarat, was preſent at one of theſe funeral-rites, of which he gives the following deſcription: "A young woman, twenty years of age, "having been informed that her ſpouſe had died at two "hundred leagues diſtance, reſolved to celebrate his ob"ſequies by burning herſelf alive. In vain was it repre"ſented to her, that the news was uncertain; nothing "was capable of making her change the reſolution ſhe "had taken. We ſaw her arrive at the place of her "ſuffering with ſo extraordinary a gaiety and confidence, "that I was perſuaded ſhe had ſtupified her ſenſes with "opium. At the head of the retinue which accompa"nied her was a band of the country muſic, compoſed "of hautboys and kettle-drums. After that came ſe"veral married women and maids ſinging and dancing "before the widow, who was dreſſed in her richeſt "cloaths, and had her neck, fingers, arms, and legs, "loaded with rich jewels and bracelets. A troop of "men, women, and children followed, and cloſed the "pro-

"procession. She had washed herself before in the "river, that she might join her husband without any "defilement or stain. The funeral-pile was made of "apricot-wood, with which they had mixed branches "of sandal and cinnamon. She beheld it from afar with "contempt, and approached it without being disturbed: "she took leave of her friends and relations, and distri-"buted her ornaments amongst them. I kept myself "near her on horseback, along with two English mer-"chants. Judging, perhaps, by my countenance, that "I was sorry for her, to comfort me she threw me one "of her bracelets, which I luckily catched hold of. "When she was seated on the top of the pile they set "fire to it, and she poured on her head a vessel of sweet-"smelling oil, which the flame immediately seized on: "thus she was stifled in a moment, without being ob-"served to alter her countenance. Some of the assistants "threw in several cruses of oil to increase the fire, and "filled the air with frightful cries. When she was "entirely consumed, her ashes were thrown into the "river."

Mr Hamilton says he has seen the ceremony performed several ways; he adds, they sometimes dig a pit about ten feet long, and six broad, which they fill with logs of wood; and when all is ready, a great quantity of oil, or the Indian liquid butter, is thrown on the wood. The corpse of the husband is then placed in the middle of the pile, and fire being set to it, it is instantly in a blaze. The wife then takes leave of her friends, and the drums, trumpets, and other instruments striking up, she walks two or three times round the pile, and then leaps in upon the corpse.

In other parts, he observes, they use no pits, but a pile being built, the corpse is laid upon it, and the victim dancing round it for some time to the sound of loud music, leaps in; and if she hesitates, the priests push her forward with long poles, making such a hideous noise that she cannot be heard; and all the while she is burning the priests dance round the fire. I heard a story, he adds, of a lady, who having received the addresses of a gentleman that afterwards deserted her, was obliged by her relations to marry another; who dying soon after the marriage, she was, according to custom, to be laid on his funeral-pile. The fire being kindled, she was preparing to act the tragedy on herself, when observing her former admirer, she beckoned him to come to her. This he did, when taking him in her arms, as if to embrace him, and being stronger than he, she rushed with him into the flames, and they were both consumed with the corpse of her husband.

It has been pretended that this inhuman custom was introduced by the Indian Gentoos, to put a stop to the cruelties of their wives, who, from jealousy, frequently poisoned their husbands. Mr. Grose, however, maintains this opinion is an over-refinement of conjecture equally false and injurious to the Indian women, no such practice being either related by credible tradition, or warranted by the behaviour of the other Indian women, who are not subject to the necessity of complying with this custom, and whose minds are generally too soft and tender to incur even the suspicion of their being inclined to such acts of cruelty. He attributes it to their prodigious affection and veneration for their husbands, and the dreadful power of religious phrenzy.

Their extreme fondness for their husbands, says he, is owing to their early marriage, after which the parties in the tenderness of the ductile age of childhood are brought up till that of consummation, in the constant inculcation to them of mutual dearness, as a sacred point of religion; and the women especially retain such strong impressions of this doctrine, that numbers of them readily embrace this cruel practice of burning themselves with their husbands. Some of them living under governments where this barbarous act of superstition was not suffered, have voluntarily gone to Gentoo countries barely to enjoy the liberty of performing it. Others, after bringing up their young children to a state of maturity, which it seems is an allowable reason of dispensation with them, and many years after the death of their husbands, have, as if they had endured life only till that duty to their children was fulfilled, paid that to their deceased husbands of seeking to rejoin them by burning themselves with the usual ceremony. Some indeed, who have not the courage either to undergo that fate, or the patience to endure the indignities and slights that fall upon those who decline it, such as cutting off their hair, which to them is the most intolerable of all pains, servile offices, and wearing a particular coloured garment of a dingy red, will, especially if they meet with encouragement, turn Christians or Mahometans. It must not, however, be understood that this practice of voluntarily burning is very general, many of the lower tribes especially are intirely exempted from it; and it is only with respect to the more considerable personages that it is ever used, and even amongst them the instances begin to be much rarer, and that point to be less insisted on.

We shall now take an impartial view of the religion of the Gentoos, and Parsees, or worshippers of fire.

SECT. XII.

Of the Religion of the Gentoos.

THOUGH the religion of the Gentoos is at bottom every where nearly the same, yet in the different parts of Indostan such various modes of opinion and practice are built upon it, as would require many volumes to specify the differences by which they are distinguished; we shall therefore only mention such as appear the most remarkable and striking.

Nothing seems more astonishing than the extreme tenaciousness of the Gentoos in their religion and customs, while, at the same time, they behave with the most perfect humanity, and give an unbounded toleration to those that differ from them in points which they esteem the most sacred. This is doubtless owing to that fundamental tenet of their religion, that a diversity of modes of worship is evidently agreeable to the God of the universe: that all the prayers put up to him by man are equally acceptable, when sanctified by the sincerity of the intention; and that the true universal religion being only that of the heart, the various outward forms of it are in themselves indifferent, and that therefore all change of religion is only a dangerous and needless experiment, since every honest man is sure to be saved in his own. Hence, instead of persecuting others for not being of their religion, they will admit of no proselytes; and though whole nations have adopted their principal tenets, as for instance, the vulgar among the Chinese, who believe the transmigration of souls, and follow their idol worship, they neither admit of a community, or hold any correspondence with them, and would as soon sit down to eat, or intermarry with Christians or Mahometans, as with those of their own religion in China. Even when any of their religion renounce it, though it be in countries where they are masters, they have the charity to suppose it was through a conscientious persuasion, and never persecute them any farther, than by cutting off all communion with them, and irrevocably expelling them from the cast or tribe in which they were born, after which they content themselves with only pitying them.

Nothing shews this tolerating spirit in a stronger light, than their behaviour to those who differ from them in their treatment of cows, or of that species in general. For these animals they have a most superstitious veneration, though the spirit of the law which forbids their being slaughtered, seems chiefly founded in gratitude, as their killing a creature so serviceable to mankind both in agriculture, and in furnishing so innocent a diet as milk, butter, and cheese, would, they think, be extremely cruel. They, however, annex a general sanctity to every thing produced by that animal; they purify themselves with its urine, and burning the excrements into a greyish powder, sprinkle it on their foreheads, breasts, and bellies: also when the dung is fresh made, they smear their houses and pavements with it as a kind of lustration. In short, their veneration for that animal is so excessive, that there could hardly be found a Gentoo, who, if under the necessity of killing his father, mother, child, or a cow, would not, with scarce any hesitation, prefer sacrificing any, or all of the former. Yet with this strange religious

gious horror for the ſlaying of theſe creatures, they have not the leaſt averſion or ill-will to thoſe who do. They ſcruple neither converſation, nor even friendſhip for thoſe who uſe them for their food; and this merely from their enlarged notions, and allowance for the difference of religions. Indeed in ſome countries immediately under the dominion of Gentoos, they do not permit the openly killing of cows, though they will wink hard not to ſee it.

This principle of tenderneſs is, however, not confined to the horned ſpecies alone: their belief of the metempſychoſis makes them extend it to every living creature, none being of ſo low a claſs or ſo minute, but they imagine it may be the receptacle of a human ſoul, and conſequently of their relations or friends. Hence that difference of ſize, which is apt to affect the eye with contempt or regard, and leſſens or augments compaſſion to an animal in the act of deſtroying it, has no ſuch effect upon them. They cannot without horror think of depriving any being of that precious gift of God, life; and do not leſs reſpect it in the flea that bites them, than in the elephant. But this is only to be underſtood of the Bramins, Banyans, and ſome other of their ſtricter tribes.

Authors mention ſeveral reaſons, beſides that juſt mentioned, for the veneration they pay to theſe animals: as that the happieſt ſouls take up their abode in them, and that after death this beaſt is to conduct the people over a great river, which it would be impoſſible to paſs without holding by her tail. They alſo alledge, that the god Mahadeu being highly provoked by the ſins of the people, and reſolving to deſtroy the world, was appeaſed by a cow.

The Banyans not only forbear to kill any living creature, but erect hoſpitals for them, particularly within a mile of Surat, the cows, horſes, goats, and dogs that happen to be lame or enfeebled by age, are plentifully provided for; and they will purchaſe a lame ox of his Mahometan or Chriſtian owner to prevent his being killed by his maſter. The Banyans alſo once a year prepare an entertainment for the flies, ſetting before them large diſhes of milk and ſugar; and at other times they take a bag of rice, and walking out two or three miles, ſcatter the rice round the ant-hills.

Indeed, the Banyans are ſo firmly perſuaded that departed ſouls enter the bodies of animals, that they no ſooner obſerve any of them frequent their houſes, but they immediately conclude it is ſome of their deceaſed friends come to pay them a viſit. Thus it is ſaid, that a perſon named Moradaſh, who was ſecretary to an Engliſh broker, being very melancholy on the death of his father, and ſeeing a ſnake enter his houſe, immediately concluded it was animated by his father's ſoul, and came thither for relief. This thought gave him no ſmall comfort, and he reſolved to pay the ſame duty to his father under this metamorphoſis, as when he was alive; and therefore provided milk and rice for his new gueſt, who liked his entertainment ſo well, that he took up his dwelling in a corner of the room, and came out to eat, when his food was ſet him, as regularly as if he was one of the family. The ſame man made a proviſion for the rats in his houſe, from his perſuading himſelf, that they were his relations; upon which they grew as tame as any other domeſtic animals.

But ridiculous as this may appear, it is a fault leſs inexcuſable than the barbarous treatment animals meet with from the moſt civilized European nations; for ſurely nothing can excuſe the taking away their lives from mere wantonneſs, and without any advantage to ourſelves. Life is certainly a bleſſing of the greateſt value, and perhaps more ſo to animals than to us, ſince they enjoy all the ſatisfactions of which their natures are capable, and taſte their pleaſures unmixed with care, and unallayed with apprehenſions of futurity. They were doubtleſs created by the benevolent and all-wiſe Creator for happineſs as well as for the uſe of man; and to deprive them of that is to defeat, as much as is in our power, the deſigns of his infinite goodneſs. But to uſe thoſe animals ill, which contribute to our convenience, and ſerve us by their labour, is adding baſeneſs and ingratitude to cruelty; and putting thoſe animals to a painful and lingering death, which nature deſigned for our food, by barbarouſly ſcourging and roaſting them alive, in order to give a reliſh to their fleſh, and indulge our appetites with a more delicious regale, is acting beneath the character of human and rational beings, and offering a more than ſavage inſult to him who beſtows thoſe refreſhments, and whoſe goodneſs extends to all his works.

According to the popiſh miſſionaries, the Bramins teach that there is but one God, infinitely perfect, who has exiſted from all eternity, but that he created three ſubordinate deities, Brama, Wiſtnow, and Routeren. To Brama he gave the power of creation; to Wiſtnow that of preſervation; and to Routeren that of deſtroying; but they obſerve, that the wiſer Indians reject this account, and aſcribe all to the Supreme Being, who by theſe ſeveral ways has manifeſted himſelf to the world; and maintain, that ſome of their images are allegorical repreſentations of his attributes, though the greateſt number of them, perhaps, repreſent thoſe perſons diſtinguiſhed by their virtue and piety, who being exalted to heaven, they ſuppoſe to be mediators for them to the great Supreme. They have alſo ſome confuſed notion of the creation and deſtruction of mankind by a flood, which probably gave a hint to the Jeſuits to improve upon the hint, by repreſenting Brama as Abraham, and endeavouring to ſhew a particular conformity between the traditions of the Gentoos, and many of the principal paſſages recorded in the Old Teſtament.

The Bramins maintain that Brama received from Mahadeu the power to make ſeveral worlds, and that he formed fourteen at leaſt. To our world they aſſign four ſeveral ages, the duration of each of which they ſuppoſe laſted ſeveral hundred thouſand years; and the preſent age has yet upwards of four hundred thouſand years to come before it be finiſhed.

They have ten principal images, which are the objects of their adoration, and repreſent ſuch figures as, according to their ſacred book the Vedam, their god Mahadeu was at ſeveral times pleaſed to aſſume for the ſervice of mankind. They have idols in which he is repreſented with four heads, and as many arms; in others he has a head like an elephant, with the body of a man, and ſeveral arms and hands: and a proteſtant divine relates, that a Bramin told him, they acknowledged one God, whom they deſcribed as having a thouſand eyes, and as many hands and feet, by which they endeavoured to expreſs his omniſcience and power.

They have ſeldom any public aſſemblies in their pagodas, but every one performs his devotions when he thinks fit, and to which of the images he pleaſes. The greateſt part of their worſhip ſeems to conſiſt in ſinging, dancing, playing on muſical inſtruments, and in making offerings of rice and other food; but a late author ſays, he has ſeen the people at Madraſs praying before the ſhrines of their gods with all the fervent devotion which a ſenſe of their wants can be ſuppoſed to inſpire.

Their Gioghies, who are a kind of wandering Bramins, ſeem deſcended from the antient Gymnoſophiſts; but, like other human inſtitutions, have been at length vitiated by abuſes, hypocriſy, and the admiſſion of corrupt members. Their original regulation includes a renunciation of the world, an itinerant life, and that perfect nakedneſs from whence they derived their Greek name. At preſent, when they occaſionally travel into countries under the juriſdiction of the Chriſtians or Moors, they diſpenſe with this laſt precept; and, out of deference to their cuſtoms, wear a ſcanty rag that ſcarce covers the parts to which their own opinions annex no idea of ſhame. As to thoſe painful poſtures, and other cruelties they impoſe on themſelves, a learned and ingenious author ſays, they do not mean by them to inſinuate that any torments of the creature can be acceptable to its Creator, but purely for the ſake of the merit they apprehend ariſes from the intenſeneſs and conſtancy of their ſpiritual contemplation of the Deity being ſufficient to call off their attention to bodily pain, and their fixing it immoveably on the only idea which they imagine can worthily fill the mind.

Authors have given very ſtrange and dreadful repreſentations of theſe ſelf-martyrizing poſtures, and deſcribe them as voluntarily diſtorting and diſlocating their bones. Some are ſeen with their hands ſtretched out to heaven, which, by holding long in that poſture, they cannot bring them down again without great violence. Others, it is ſaid, make a vow never to ſit or lye down, but either walk or lean; accordingly a rope being tied from one bough of a tree to another, a pillow or quilt is laid upon it, on which they lean; but theſe are ſaid to alter their poſture when they pray, being drawn up by the heels to the bough of the tree, their heads hanging down towards the earth as unworthy to look up to heaven. From the prayers of theſe people great bleſſings are expected, and many calamities thought to be averted. The people reſort with much devotion to the places where thoſe penances are performed; and the devotees, by torturing their bodies, obtain the reputation of great ſanctity.

Mr. Groſe mentions one of theſe Gioghies, who erected a ſmall pagoda out of the alms and voluntary donations he collected from the Gentoos of the iſland. This man, on his arrival at Bombay, was about five and thirty years of age, tall, ſtraight, and well made; and, by his own account, had been all over Tartary, Tibet, and on the borders of China, and at length took Bombay in his rounds, where, according to his inſtitution, he ought to have been perfectly naked; yet, out of deference to our manners, juſt covered thoſe parts which the common ideas of decency oblige us to conceal; and yet not ſo much, but that there might plainly be ſeen a braſs ring paſſed through the prepuce, which to thoſe of this profeſſion performs the ſame office as a padlock to the Italian ladies. His hair, which was twice the length of his body, and reaching down to his heels and thence again to the crown of his head, was wreathed in rolls round, and roſe in a kind of ſpire of a ruſſet colour, into which it was ſun-burnt from its original black. On his arrival at Bombay he addreſſed himſelf ſolely to the Gentoos for money to found a ſmall pagoda; but his ſcheme for exciting their devotion was ſomething extraordinary. He preached to them from the midſt of a great fire which ſurrounded him, and had ſomething of a miraculous appearance, though there was nothing in it but what was very natural. He had a platform of earth raiſed about two feet, and about twelve or fourteen feet ſquare; round this was ſet a pile of wood, which, being lighted, made him appear as if preaching from amidſt the flames, though they never touched him; but muſt have been inſupportable to any one but himſelf, who had from his childhood inured himſelf by degrees to bear ſuch a heat. This device, however, had its effect, for it produced a collection at ſeveral times to the amount of what he required.

It is alſo in the character of contemplatiſts, that they prove what is perhaps harder to attain, an inſenſibility to pleaſure. Thus ſome of them will ſit by the ſide of the banks, where the Gentoo women perform their ablutions, and ſuffer them to ſalute, with the utmoſt reverence and ſimplicity, what they exhibit for that purpoſe, while their eyes roll frightfully in their heads, and no ſymptom or geſture betrays the leaſt indication of human feeling, ſenſual emotion, or attention to the ſight or touch of thoſe females, who have formed an idea that there is great prolific virtue in this ſtrange act of adoration. They have generally, like the perſon juſt mentioned, that part bored, with a ſmooth ſoldered ring paſſed through it, as an atteſtation that incontinence with them is impracticable. The Gentoos, to whom the abuſes of this profeſſion are perfectly known, and who have been put on their guard by the impoſtures they have committed, ſtill retain the higheſt veneration for thoſe whom they think ſincere in the exerciſe of the torments they inflict upon themſelves, and even pretend to produce, in excuſe for this branch of bigotry, a number of miracles performed by theſe Gioghies.

Mr. Groſe, ſpeaking of the mendicant friars, ſays, "they ſeem but a copy, and a wretched one too, of "theſe mendicant Gioghies, whoſe abſtinence from all "animal food, contemplative life, auſterities, and ma"cerations, far exceed whatever their moſt famous "aſcetics ever ſo much as attempted. From them too, "he adds, the Mahometans borrowed the inſtitution of "Faquirs, or holy beggars; ſo that both Europe and "Aſia owe all that ſwarm of vermin, the monks of both "thoſe religions, to a perverted imitation of the Gentoo "religion in that point."

There are many reaſons, ſays the above author, to think the Gentoo religion one of the moſt ancient in the world: nothing of ſo remote an original can be reaſonably ſuſpected of borrowing from others, eſpecially among a people who have ever made it a ſacred point to follow their own peculiar inſtitutions without deigning to admit of any foreign mixture. It is then highly probable, that the doctrine of the metempſychoſis, by which Pythagoras was ſo particularly diſtinguiſhed, was derived from them, with many other articles and modes of worſhip and opinion, which, from certain reſemblances, might be traced from the ſame ſource. Thus, among many other conjectural inſtances, may be quoted the Paphian Venus; for the form of which Tacitus could not account, it riſing from a broad baſis to a narrow point at the top, which is exactly the figure of the idol in India conſecrated to ſuch an office as that heathen deity was ſuppoſed to preſide over, and to which, on the borders of the Ganges, the Gentoo virgins are brought to undergo a kind of ſuperficial defloration, before they are delivered up to their huſbands.

This idol, which is worſhipped by the Gentoos under the name of Jaggernaut, is repreſented by captain Hamilton as a pyramidal black ſtone, fabled to have fallen from heaven, or at leaſt to have miraculouſly appeared in the place where they have erected his temple. It appears that this ſtone, of which all the images of that form in India are eſteemed but copies, is meant for the power preſiding over univerſal generation, which they attribute to the genial heat and influence of the ſun acting in ſubordination to it, and to whom is addreſſed the following prayer, which the Bramins eſpecially often repeat in a day, with their eyes lift up towards the ſun: "Thou, power, which illuminates that reſplendant "orb, deign alſo to illuminate my mind, ſo as that I "may thereby be directed to walk in the way the moſt "pleaſing to thee."

Now conſidering the dignity which the ideas of the Gentoos attach to the generative power, it is no derogation to the ſupremacy attributed to Jaggernaut, by their making his temple and image the head place of their worſhip, to infer, that he is their god Brama under that title, juſt as Jupiter had ſeveral names, according to his various functions, and equivalent to the Mythras or Venus Urania of the Perſians, or ſimply the Venus of the heathens. The Gentoo inhabitants on the banks of the Ganges form domeſtic idols after that of Jaggernaut, to which they give its name, and which are placed in a conveyance decorated with gilding and tinſel, that is to ſerve them for a triumphal car. Formerly this idol uſed to be adorned with jewels and expenſive finery, according to the circumſtances of the owner; but of late they are much abated on that point. This machine is kept for ſome days in the beſt apartment of the houſe, during which time it is matter of devotion with them to exhibit the moſt obſcene poſtures, and to act all manner of laſciviouſneſs before the idol, as the moſt acceptable mode of worſhip to the deity it repreſents. After which they carry it in its gilded car in a proceſſion to the Ganges, and throw all in together, as an acknowledgment to that river of its congenial fertilization with that of the ſun.

As to the cauſe of the Gentoos chooſing this pyramidal form, it ſeems loſt in the remoteſt antiquity. But might I be allowed, ſays our ingenious author, to hazard a conjecture, it ſhould be that it was originally ſuggeſted to them by that pyramidal aſpiration of flame, which is one of the moſt conſpicuous properties of fire.

SECT. XIII.

Of the Ordeal Trials practiſed by the Gentoos.

THE ordeal trials of melted lead, or boiling oil, as practiſed here, are conſidered by the Gentoos as a ſtanding miracle; and, according to Mr. Groſe, they are

are not managed by the leaſt degree of prieſt-craft, unleſs it could be ſuppoſed combined with the whole governing laity againſt the intereſt of juſtice and their own, it having been practiſed for ages through the various provinces, particularly of the Malabar coaſt, as the criterions of innocence. Several of the Engliſh chiefs of the ſettlements of that coaſt are ſaid to have uſed the utmoſt care and precaution to detect whatever fraud might be found in this method of trial. They have cauſed the party that was to undergo it not only to be locked up in their own guard-room, or priſon, but ſeen the hand that was to be plunged into melted lead, or oil, bound up with a handkerchief, cloſely tied round the wriſt, and ſealed with their own ſeals, which remained unbroke till the inſtant of the public ceremony; and, notwithſtanding this, and every other precaution which the moſt determined incredulity and ſuſpicion of fraud could deviſe, they were unable to diſcover that there was any trick or juggle in it. Indeed there is the higheſt improbability that ſo many princes of different dominions and intereſts ſhould for many ages join in a cheat, only to ſkreen obnoxious criminals, and to baffle that juſtice by which alone any government can ſubſiſt.

The ceremony is performed with great ſolemnity. The party who has appealed to this trial for his innocence, whether on ſuſpicion of murder, theft, conjugal infidelity in the women, or even in denying a debt, is publickly brought to the ſide of the fire, on which is a cauldron, or ladle-full of boiling water, or oil, but moſt commonly melted lead: the prince or magiſtrates of the country being preſent, his hand is previouſly clean waſhed, and a leaf of the brab-tree, with the accuſation written upon it, is girt round his waiſt; and then, on a ſolemn invocation of the Deity by a Bramin, the perſon plunges in his hand, ſcoops up the boiling fluid, and if he draws it out unhurt is abſolved, otherwiſe he receives the puniſhment preſcribed by the laws for the crime on which the accuſation lay; and ſo firmly believed is this method of purgation on that coaſt, that our author ſays, he has been aſſured, that even ſome of the Indian Chriſtians and Moors have voluntarily ſubmitted their cauſe to its deciſion on their own perſonal experiment.

Mr. Groſe, from whom we have borrowed this article, on account of his having treated the ſubject in a fuller and more curious manner, concludes with the following obſervation: "As the princes of thoſe countries, where this cuſtom ſtands at this day in full force, uſe no ſort of reſerve, or refuſe any examination that might be required, certain it is, that, on the leaſt intimation from any perſon of authority here to any of the Engliſh gentlemen on that coaſt, ſuch an inquiry would be very readily ſet on foot, as would ſatisfactorily liquidate what truth and falſhood there is in this practice; and the iſſue muſt be, ſince the fact is inconteſtably true, either to diſcover a natural method of reſiſting fire, far more ſubtle than what is known to our European jugglers, or to prove that Divine Providence, when ſolemnly appealed to, does not diſdain its immediate interpoſition in favour of innocence; an act which, though not unworthy of the goodneſs of God, the Romiſh prieſts in thoſe parts, not denying that the effect produced is ſupernatural, attribute it to the power and craft of the devil: but with what propriety let any one judge."

SECT. XIV.

Of the Religion of the Parſees.

THERE ſeems to be two diſtinctions neceſſary to be made in the religion of the Parſees, or Gaures, who tranſplanted themſelves from Perſia when the Mahometans conquered that country: the firſt, the pure religion, as taught by Zoroaſter; and the ſecond, and more modern one, diſfigured by various adulterations, as it is at preſent practiſed among the Parſees of India and Perſia.

Zoroaſter flouriſhed under the reign of Hyſtaſpes, king of Perſia, about five hundred years before the birth of our Saviour, and was profoundly verſed in the mathematics and natural philoſophy, whence he probably drew thoſe ſublime notions in relation to fire, on which he founded the baſis of his religion, and which his followers ſtill retain.

It is however evident, that he found an homage paid to that element already eſtabliſhed in that country, ſince Pyræums or conſervatories of perennial fire were known to be there long before his time; but whether that worſhip of it was a religious act, or whatever it was, it was accompanied with ſuch idolatry that Zoroaſter employed himſelf in purging it of its groſs errors, and reducing it to the two grand points on which he founded his religion. The belief of one ſupreme God, and of the ſun or element of fire being his firſt miniſter, and alſo the ſymbol of his purity; from theſe principles the reſt of his opinions flowed.

Some writers obſerve, that there were two Zoroaſters; and that the laſt, ariſing ſix hundred years after the firſt, explained and new modelled this religion, which he ſtripped of the errors and ſuperſtitious practices by which it had been diſfigured.

However, agreeably to the above doctrine, 'the followers of Zoroaſter are ſtill ſo penetrated with the idea of the immenſity and omnipreſence of God, that they eſteem it a proof of great narrowneſs of ſentiment to erect temples to him, as conveying the grovelling idea of confining him who fills all ſpace between four walls; hence they make uſe of that celebrated ſaying, that "There is no temple worthy of the majeſty of God, "except the whole univerſe, and the heart of an honeſt "man." Of all their opinions, they eſteem that moſt ſacred, that God was the ſole neceſſary ſelf-exiſtent being from all eternity, and is the ſupreme Author of all good. Hence they deteſt the ſchiſm of thoſe Perſians who admit the co-eternity of the two principles of good and evil, and all the abſurdities of Manicheiſm.

Without entering into a minute detail of their manner of accounting for the appearances of evil found in the world, it is ſufficient to obſerve, that they maintain, that ſince many effects in nature, which at the firſt view appear to be evils, are juſtified as to the wiſdom of their cauſes, by their ultimately iſſuing in a known ſuperior good, it is juſt that we ſhould believe that all the reſt are ſo, though their ends probably, for very wiſe reaſons, are concealed from us. Hence they alledge, that it is the utmoſt raſhneſs and impiety to infer abſolute evil from ſome individuals occaſionally appearing to ſuffer, from thoſe primordial laws to which God has ſubjected all his works in general, without excepting man, whoſe good has been as much conſulted as was fitting it ſhould be, of which God ought ſurely to be eſteemed a competent judge. Hence they deny that omnipotence has introduced real evil into nature; and maintain, that no evil actually exiſts but what is imaginary, temporary, and bearing no proportion to real, infinite, and eternal goodneſs, and therefore not incompatible with it.

As to fire, they place its ſource in the ſun, to which they pay a very high reverence, out of gratitude for the numerous benefits that flow from it; but they are ſo far from confounding the ſubordination of the ſervant with the majeſty of the Creator, that they attribute no degree of ſenſe to the ſun, or fire, in any of its operations; but conſider it as a purely, paſſive, blind inſtrument, directed and governed by its Creator. They even give that luminary, all glorious as it is, no more than the ſecond rank among his works, reſerving the firſt for that ſtupendous production of divine power, the mind of man.

They believe the immortality of the ſoul, and found the doctrine of rewards and puniſhments in the other life on the light of reaſon, which enables them to perceive the difference between right and wrong; or, to ſpeak in their figurative ſtile, the conflict between Oroozm the good principle, and Harryman the evil one; or between the fleſh and the purer ſpirit. As to their puniſhments, they exclude material burning from being any part of them, and eſteem the element of fire too pure, and too noble, to be employed in the office of an executioner. They even pretend, that the fire of divine

The Ordeal Trial practis'd by the Gentoos.

love will moderate the puniſhments inflicted by juſtice.

The modern Parſees repreſent the place of ſuffering as a dark, dreary, diſconſolate region, where every thing is big with horror, pain, and diſguſt; caverns abounding with ſerpents, water thick like melted pitch, and cold as ſnow. They do not, however, believe them to be eternal, but imagine that the guilty ſufferers will be at length delivered, when they will be placed in a ſtate of bliſs, but inferior to that of the good, from whom they will alſo be diſtinguiſhed by a brand in their foreheads. In fine, they imagine that both in degree and duration theſe puniſhments will be proportioned to human frailty; but that rewards, like the Divine goodneſs, will be infinite and unbounded.

Such was the doctrine of Zoroaſter, as may ſtill be collected from the adulterations it has ſince undergone; for the religion of that great man was too ſimple to ſatisfy the groſs conceptions of the vulgar, or to anſwer the lucrative views of the chief Magi, now known in India by the name of duſtoors, or directors of their ritual. A number of years being elapſed ſince the death of Zoroaſter, his religion was no longer ſuffered to continue in its original purity. His books had been loſt, and the preſent work, called, The Zendavaſtaw, was wrote in the ſame old Perſian language by Erda Viraph, one of the chief Magi, who pretended to compile it by memory from the ancient work, and of this a tranſlation has been made into the modern Perſian by a perſon who lived about two hundred and ſixty years ago, and intitled it Saad-dir, or The Hundred Gates. Theſe works ſeem to have greatly ſophiſticated the original doctrine by interpolations, and introducing ſuperſtitions that have greatly disfigured the religion of Zoroaſter. Hence, they dare not be a moment without their girdle; and pay ſuch a ſuperſtitious reverence to fire, as not to venture to pray before it without covering their mouths with a ſquare flap of linen, leſt they ſhould pollute the fire by breathing on it. They ſtill keep pyræums, or conſervatories of fire, in which lamps are kept continually burning, by being fed with oil by the prieſts who conſtantly attend them; and, as they relate, have burnt, without ever being extinguiſhed, for many centuries.

Yet, notwithſtanding the ſuperſtitious follies ingrafted on the original ſtock of this religion, ſuch, continues our author, has been the force of its ſap, as to prevent the fruit from being ſpoiled; for even at preſent the Parſees are remarkably diſtinguiſhed by the purity and innocence of their morals, and no people in general behave better either in public or private life.

It is ſaid that the greateſt honour theſe people think they can do to the remains of their deceaſed friends, is to expoſe them to be devoured by birds of prey; for theſe living tombs they eſteem preferable to any other kind of ſepulture. About a mile from the city of Surat they have a place to which they carry their dead; this is within a circular wall, open at the top, twelve feet high, and one hundred in circumference. The ground within is raiſed about four feet, and made ſloping, that all the moiſture may drain from the carcaſſes into a ſink made for that purpoſe; nothing can have a more ſhocking appearance than this burying-ground, as it is called, where are ſeen a multitude of dead bodies, loathſome and diſcoloured; ſome green, ſome yellow, ſome with their eyes torn out by the vultures, and ſome with all the fleſh of their cheeks pulled off; great holes eaten in different parts of their bodies, and the ſkin all over torn and mangled. In ſhort, ſome are hardened by the ſun like a piece of tanned leather, while the fleſh of others is clean picked from the bones, which remain like a ſkeleton. The vultures, it is obſerved, will place themſelves down the wind, in order to enjoy the ſmell of theſe carcaſſes; and ſometimes cram themſelves with human fleſh till they are ſcarce able to fly.

SECT. XV.

Of the Mahometans of India.

IT might be expected, that as the Mahometan religion is that of the court, we ſhould here give a particular account of it; but this we ſhall reſerve till we come to Perſia, only obſerving, that it is practiſed here with leſs bigotry than among the Turks; and that, though a faint reverence is kept up for the name of Mahomet, it is rather a matter of habit than of devotion; and the fanaticiſm of the Mahometans being ſubſided into a ſober common ſenſe, they are become leſs troubleſome to the Chriſtians, and all religions live peaceably under their government.

They indeed ſeem to grow more purely Unitarians in proportion as their zeal for the mere ceremonial part of their religion relaxes, nor will they ſo much as hear with patience any argument againſt that fundamental point of their religion, the unity of God, whoſe name alone they invoke at the hour of death, and generally die with it in their mouths; their diſtance from the country whence that religion ſprang rendering them more indifferent to any mention of the name of Mahomet. Indeed moſt of his followers, as an ingenious author obſerves, carry their veneration for the Supreme Being ſo far, as not only never to mention the word Alla, or God, with the leaſt irreverence, but think it in a manner blaſphemous to praiſe or define a being whom they conſider as ſo infinitely above all praiſe, definition, or comprehenſion. Thus they carry their ſcrupuloſity to a ſuperſtitious length, and do not even approve of calling him good, righteous, merciful, from their thinking ſuch epithets as ſuperfluous and impertinent, as if one was emphatically to ſay of a man that he had a head, or any other members neceſſary to the human form: for they conceive it as profaning the name of God to aſſociate it with human attributes or conceptions, and that nothing fills the idea due to that Being ſo well as the name itſelf, "a ſubſtantive ſingularly, "and for ever above the company of an adjective."

SECT. XVI.

Of the Power and State of the Mogul, with a Deſcription of the Feſtivals celebrated to his Honour. Of his Court, his Officers, and Women: his civil Government, and the Puniſhment inflicted on Criminals.

THE power of the Mogul is ſo deſpotic, that he has the ſovereign diſpoſal of the lives and effects of his ſubjects. His will is their only law; it decides all law-ſuits, without any perſon's daring to diſpute it, on pain of death. At his command alone the greateſt lords are executed, their fiefs, their lands, their poſts, and offices are changed or taken from them. The higheſt officers of his empire are the prime vizier, which anſwers to the firſt miniſter; the treaſurer; the chief of the eunuchs; the firſt ſecretary of ſtate; the general of the elephants; the great maſter of the wardrobe, who has the care of the furniture, the tenths, cloaths, and precious ſtones that are commonly uſed.

This prince uſually appears at a window at ſun-riſing, when the lords of his court are obliged to attend in his apartment to pay him their homage; he alſo ſhews himſelf at mid-day to ſee the fight of the wild beaſts, and in the evening alſo appears at a window, from which he ſees the ſetting ſun. He retires with that ſtar amidſt a multitude of drums, and the acclamations of the people, wiſhing him a long and happy life. No other perſons are allowed to enter the palace but the rajas, or princes, and the great officers; who behave towards him with ſuch veneration, that it is impoſſible to approach the moſt ſacred things with more profound reſpect. All the diſcourſe is accompanied with continual reverences. At taking leave they proſtrate themſelves before him: they put their hands upon their eyes, then on their breaſt, and laſtly upon the earth, to ſhew that with reſpect to him they are only as duſt and aſhes. As they retire they wiſh him all manner of proſperity, and go backwards till they are out of ſight.

In order to give ſome idea of the magnificence in which the Mogul appears, we ſhall here give Sir Thomas Roe's deſcription of his dreſs at his going abroad; for though it be a long time ſince he was at that prince's court, and though he has loſt much of his wealth and power,

power, ſince his being conquered by Nadir Sha, yet as the eaſterns ſeldom or never alter their faſhions, the preſent Mogul may probably appear much in the ſame manner, though he may have fewer jewels, and ſome of them may be of leſs value. As he came out, ſays that ambaſſador, one girt on his ſword, and another hung on his ſhield, covered with diamonds and rubies; another hung on his quiver with thirty arrows, and his bow in a caſe. On his head he wore a rich turban, in which was a plume of heron's feathers: on one ſide hung a ruby unſet as big as a walnut, on the other a diamond as large; in the middle an emerald in the form of a heart, but much larger than the diamond and the ruby. His ſtaff was wound about with a chain of large pearls, rubies, and diamonds drilled. About his neck he wore a chain of three ſtrings of excellent pearl, the largeſt the ambaſſador had ever ſeen. Above his elbows he had bracelets ſet with diamonds, and on each ſide of his wriſts three bracelets of ſeveral ſorts, and upon almoſt every finger was a ring. His coat was of cloth of gold without ſleeves, and underneath it he had a ſemain as fine as lawn, and on his feet he had a pair of buſkins embroidered with pearl, the toes ſharp and turned up. Thus armed, and thus dreſſed, he went into his coach, which was made ſo exactly like an Engliſh one the ambaſſador had preſented him with a little before, that he could only diſtinguiſh it by its being covered with Perſian velvet, embroidered with gold.

When this prince marches at the head of his army, goes a hunting, or retires to one of his country houſes, he is accompanied by above ten thouſand men, and about one hundred elephants, with houſings of velvet and brocade, march at the head of this little army. Each elephant carries two men, one of whom governs him by touching his forehead with an iron hook, and the other holds a large banner of ſilk embroidered with gold and ſilver; each of the firſt eight carry a kettle-drum. In the middle of this troop the Mogul rides on a fine Perſian horſe, or in a chariot drawn by two white oxen, whoſe large ſpreading horns are adorned with gold, and ſometimes he is carried by men in a ſplendid palanquin. His retinue is compoſed of the officers of his court, who are followed by five or ſix hundred elephants, camels, or chariots loaded with baggage.

Two ſolemn feſtivals are annually celebrated in the royal city to his honour. The firſt is held at the beginning of the new year, and laſts about eighteen days. Before the palace a theatre is erected fourteen feet high, fifty-ſix long, and forty broad, covered with rich tapeſtry, and ſurrounded by a baluſtrade. Near it is a ſtructure of painted wood embelliſhed with mother of pearl, in which ſome of the principal lords of the court ſeat themſelves; though their tents are at the ſame time erected in the firſt court of the palace, where they ſtrive to diſplay all their riches and ſplendor. The Mogul anciently entered theſe tents, and took whatever he liked beſt; but for above a century paſt the prince accompanied by the ſeven firſt play-miniſters aſcends the theatre, and ſeating himſelf on a velvet cuſhion embroidered with gold and pearls, waits for the preſents that are brought him, which he receives equally from the people and the grandees of his empire, during the eighteen days that the ceremony laſts, and towards the concluſion of that time, diſtributes among them his bounties, conſiſting in places and dignities which he confers on thoſe who have made him the moſt valuable preſents. Tavernier ſays he ſaw him receive at one of theſe feaſts above the value of thirty millions of livres in diamonds, rubies, emeralds, pearls, gold, ſilver, fine ſtuffs, elephants, camels, and horſes.

The other feſtival is the anniverſary of the Mogul's birth. He begins the day with all manner of diverſions, which he breaks off, to wait upon the queen his mother, if ſhe be yet alive, at her palace, and ſhews his gratitude to her, by cauſing the grandees of his empire to make her magnificent preſents. After he has dined he dreſſes himſelf in his fineſt robes, covers himſelf with gold and jewels, and being rather loaded than adorned with riches, enters a ſuperb pavilion, where he is attended by the principal lords of his court. He there finds the great ſcales, and the chains by which they are ſuſpended, both of maſſy gold adorned with jewels. In one of the ſcales he places himſelf, and the other is filled with gold, ſilver, jewels, pieces of ſilk, fine linen, cinnamon, mace, cloves, pepper, corn, pulſe, and herbs, and an exact regiſter is kept every year of the difference of his weight. It is a ſubject of great joy when he weighs one year more than another, and of as great concern if he be found to have fallen away.

This ceremony is ſucceeded by the greateſt act of generoſity, which the Mogul exhibits during the whole year. It conſiſts in his giving to the poor ſome ſmall pieces of money, and in throwing among the grandees, nuts, piſtachios, almonds, and other fruit made of gold, but ſo ſmall and ſo thin that a thouſand of them are not worth more than ſeven or eight piſtoles. After experiment made, a baſon filled with thoſe trifles was found not to exceed the value of ten crowns. Thus the liberality of this wealthy monarch on his birth-day amounts to no more than the pitiful ſum of a hundred crowns. The feſtival concludes with his giving a magnificent ſupper to the lords of his court, with whom he paſſes the night in drinking.

The ſons of the Mogul have the title of ſultans, and his daughters of ſultanas. The viceroys, or governors of provinces, are called nabobs. The next in degree, which anſwers to our nobility, have the title of khan, or cawn, as it is uſually pronounced, and theſe are diſtinguiſhed by names which they receive upon their advancement, as Aſaph Khan the rich lord; Khan Khanna, lord of lords. The great military officers are named Omrahs, and one who has been general is called Mirza. The chief eunuchs have the poſt of treaſurers, ſtewards, and the comptrollers of the houſhold. The other great officers are the ſecretaries of ſtate, the governors of the elephants, the maſter of the tents, and the keepers of the wardrobe, who are intruſted with the jewels.

The women of the ſeraglio are either wives or concubines, princeſſes of the blood, governeſſes, or ſlaves. Thoſe called wives are contracted to the Mogul with much ceremony, and ſeldom exceed four; but the number of his concubines is uncertain, though they generally amount to above a thouſand. The Mogul never marries the daughter of a foreign prince, but generally one of his own ſubjects, and ſometimes advances the meaneſt ſlave to that dignity.

His firſt ſon by any of theſe wives is conſidered as the lawful heir to the empire, though the throne is uſually poſſeſſed by him who has the longeſt ſword, who no ſooner aſcends it, than he generally deſtroys all his brothers and their male iſſue.

The young ſultans are married at thirteen or fourteen years of age, and then are allowed a ſeparate court, little inferior to the emperor's; and when they come to age all of them, except the heir to the crown, who ſtays with his father, are ſent to diſtant governments.

The young ſultaneſſes are educated with all the tenderneſs and indulgence imaginable; they are not under the ſame reſtraint as other women, and there are inſtances of the Mogul's indulging them in their gallantries, which is the more reaſonable, as being of the royal blood, they muſt never marry, and be under the controul of a ſubject. Their jewels and precious ſtones are extremely valuable, and their cloaths are as thin and light as poſſible, on account of the heat of the climate.

The governeſſes of the young princeſſes, and thoſe who are ſpies upon the conduct of the king's women, form a conſiderable body in the ſeraglio, and are ſaid to have a great ſhare in the government of the empire. If the Mogul can properly be ſaid to have any council, it is compoſed of thoſe ladies; for the governments and great offices of ſtate are diſpoſed of by their influence, and each of them has a title anſwerable to ſome great office. One is ſtiled prime miniſter, another ſecretary, and another viceroy of a province, and each lady keeps up a correſpondence with the miniſter, whoſe title ſhe bears, and there are eunuchs continually employed in carrying letters backwards and forwards between them. By their interpoſition all buſineſs of conſequence is conducted, for they have better opportunities of repreſenting things to the emperor than his miniſters can have.

The emperor in his retirement is ſerved intirely by women, and is alſo ſaid to have a guard of Tartar women, armed with bows and ſabres, who have the care of his perſon. The gates and all the avenues to the palace are guarded by a multitude of eunuchs, who are ſaid to have a very difficult province; for if they are too rigid, they procure the hatred of the queens and princeſſes, who ſometimes have great power; and if the Mogul thinks them too complaiſant, they run the hazard of their lives. Neither the emperor nor any other great men lie with their women after they have paſſed a certain age, which ſome ſay is twenty-five, and others thirty; yet, notwithſtanding this, they continue guarded as ſtrict as ever.

An Engliſh divine who was at the Mogul's court, mentions one of theſe women being put to a cruel death, for being ſurprized by the Mogul while kiſſing an eunuch: for this ſuppoſed crime the emperor had the barbarity to cauſe her to be ſet up to the neck in the ground, and the earth to be rammed cloſe about her. Thus ſhe ſtood two days in the ſcorching ſun, and then expired, crying out as long as ſhe could ſpeak, "Oh my head, "my head!" To add to her miſery, the offending eunuch was brought before her, and her humanity ſhocked by ſeeing him torn in pieces by an elephant.

As the Mogul conſiders moſt of the other princes greatly inferior to him, he, like the other Aſiaticks, is above ſending ambaſſadors to them, nor are ambaſſadors treated as the repreſentatives of their ſovereign, but only as common meſſengers. The Mogul's letters are received with as much reverence as if he himſelf was preſent; for the governor to whom they are diſpatched, on receiving intelligence that they are upon the road, rides out with all his officers to meet the meſſenger who brings them, and no ſooner ſees the pacquet than he alights from his horſe and falls proſtrate on the earth; then takes them from the meſſenger, and placing them on his head, binds them faſt, and returns back to the court where he uſually diſpatches buſineſs, and having read them, inſtantly returns an anſwer.

The governors have alſo another method of ſhewing their reſpect, for though they ſhave every day when at court, yet on their being ſent to a government, they neither ſhave nor cut their hair till their return.

The Mogul, as hath been obſerved, adminiſters juſtice himſelf in capital caſes, wherever he reſides, as his viceroys do in their reſpective provinces; but an officer, named the catoual, cauſes offenders to be apprehended, and inflicts puniſhments for ſmall crimes. The cadi is judge in civil caſes between man and man, and of marriages and divorces.

Though there are no written laws in the empire, certain puniſhments are uſually inflicted for certain crimes. Thus murder and robbery are puniſhed with death, but the manner of execution is entirely in the breaſt of the Mogul or viceroy, who never ſuffers malefactors to be above a night in priſon, and very frequently he is not conveyed to any place of confinement; for if the offender be apprehended in the day time, he is immediately brought before the governor, and either acquitted or condemned; and from judgment he is hurried to his execution, which is generally performed in the market-place.

Some malefactors are hanged; others beheaded; ſome impaled on ſharp ſtakes; ſome torn in pieces by wild beaſts, or killed by elephants. If an elephant be ordered to diſpatch a criminal inſtantly, he ſtamps upon the wretch, who lies trembling before him, with his broad round foot, and in a moment cruſhes him to death: if he is to die in torture, the elephant breaks firſt the bones of his legs, then thoſe of his thighs and arms, and leaves him to die by the wounds he has given him. Sir Thomas Roe obſerves, that when he was at the Mogul's court, one hundred robbers were brought chained before that prince, with their accuſation; and the Mogul having paſſed ſentence of death, gave orders that the chief of them ſhould be torn in pieces by dogs, and the reſt put to death in the ordinary way. The priſoners were accordingly divided into ſeveral quarters of the town; their chief was torn in pieces by twelve dogs before the ambaſſador's houſe, and at the ſame place thirteen of the robbers had their heads tied down to their feet, and their necks chopped half off with a ſabre, after which they were left naked and bleeding in the ſtreets, where they became a great annoyance to the neighbourhood.

SECT. XVII.

Of the Camps and Forces of the Mogul; the Method of procuring Subſiſtance, and the Cauſe of the ill Succeſs of the Indian Troops againſt the Europeans.

THE camp is conſtantly pitched in one form, and is nearly round. A detachment always marches before the army and clears the ground, that the ſtreets may lie in the uſual regular order; and if it be removed ever ſo often, it preſerves the ſame appearance. The whole circumference ſeldom takes up leſs than twenty miles, for the military men alone generally amount to about one hundred thouſand.

The tents are commonly white, like the cloathing of the people; but that of the Mogul is red, and pitched in the center. It is erected much higher than the reſt, and from it he has a complete view of the whole. As the queens and the whole ſeraglio take the field, the emperor's quarter is as large as a conſiderable town. It is ſurrounded with an incloſure about ten feet high, guarded by the troops of the houſhold, and other great bodies of horſe and foot, and no body is ſuffered to approach it within the diſtance of a muſquet ſhot. The tents of the omrahs ſtand at a diſtance round the emperor's, thoſe of the firſt quality neareſt, and the inferior people are placed in the remoteſt parts of the camp. The ſtreets, formed by the tents, are wide and ſtraight, and the principal of them extend in a direct line from the ſpace of the royal quarter. In theſe are ſhops, and all manner of trades are carried on as in a city; and in every quarter is a market-place, where proviſions are frequently ſold almoſt as cheap as in garriſon: the camp of the Mogul was formerly ſaid to be the greateſt market for diamonds in the world.

The camp ſeldom moves ten miles at a time, and is generally fixed at a place where there is plenty of water. The Indian armies have frequently a number of barges, placed on carriages which follow the camp, and theſe are uſed by the Mogul when he takes his pleaſure upon the lakes and rivers, as well as in paſſing over his army; he has alſo with him hawks, dogs, and leopards bred for the game. Thus while he ranges from one part of his dominions to another, he divides his time between his recreations and his enquiries into the conduct of his viceroys and governors.

In theſe marches ſome of the Mogul's women are carried in little towers upon the backs of elephants; others in coaches; others in palanquins; and ſome of the meaneſt are ſaid to have no better carriage than a kind of cradles hanging on the ſides of camels; but all of them are cloſe covered, and attended by eunuchs: beſides, they have an advanced-guard before them to clear the way; for though it is impoſſible to ſee them, it would be thought a crime even to look at the vehicles in which they ride, and the men are frequently ordered to quit the villages through which the road lies, till the ladies have paſſed by.

The Mogul's forces are principally compoſed of the troops furniſhed by the rajahs or pagan princes; he has alſo Mooriſh foot, but he principally depends on his horſe. He has alſo ſeveral regiments, named the body-guards or houſhold troops: the principal of theſe is a regiment of four thouſand men, called the emperor's ſlaves. This is the moſt honourable body among the Mogul's troops: their captain is called the daroga, and is an officer of great authority, who has ſometimes the command of the whole army. Every ſoldier admitted into this regiment is marked on the forehead, and from theſe troops the ſubaltern officers are taken, who are by degrees preferred to the dignity of omrahs or general officers.

There are alſo the guards of the golden mace, of the ſilver mace, and the iron mace, who carry a mace or

club on their ſhoulders with a large ball at the end. The ſoldiers of theſe bodies are differently marked in the foreheads, and their pay proportioned to the metal of the mace. Theſe are all picked men, who have recommended themſelves by their courage. The arms of the horſemen are a ſabre, a dagger, a bow and quiver of arrows, a lance, and ſometimes a ſhort piece like a carbine, and to theſe are added a great ſhield, ſo that they are incumbered with arms. A foot ſoldier alſo carries a ſword and dagger, a bow and arrows, a ſhield, and ſometimes a match-lock muſket. Others of them have pikes inſtead of muſkets; they have alſo heavy artillery; but have generally European gunners to manage them. Some ſhort pieces have been already mentioned that carry a bullet of about the ſize of a tennis-ball, and are fired from the back of an elephant; there are alſo about threeſcore ſmall field-pieces, which attend the grand army.

Mr. Cambridge obſerves, that it is equally difficult to conceive by what means a handful of Europeans have rendered themſelves ſo reſpectable in the field when oppoſed to a multitude of Aſiatics, and the poſſibility of ſubſiſting ſuch vaſt numbers as the Aſiatic armies frequently conſiſt of, eſpecially with a very large proportion of horſe: but our aſtoniſhment muſt be increaſed, if we add to the account, that every horſeman has two ſervants, one to take care of his horſe, and the other to procure him forage; and that all thoſe, as hath been already mentioned, are accompanied by their wives and children, and that there always follows the camp a moveable town of ſhops, where every thing is to be ſold, as in their cities, ſome hundreds of elephants merely for ſtate, and a train of women with a numerous retinue belonging to the prince and the great officers. Wherever the ſovereign moves, he is more taken up with a vain oſtentation of pomp and magnificence, than with the object of the war; and it is his pleaſure that his ſubjects ſhould abandon the capital, in order to augment his numbers.

To provide for all theſe the whole country is put into motion, and ſtrict orders are diſpatched for proviſions to be brought into the camp; by which means all the cities far and near are exhauſted, while the camp is in general plentifully ſupplied. The perſon allowed every horſeman to procure forage, is conſtantly employed in cutting turf and waſhing the roots, and this affords a more hearty food for a horſe than graſs. A ſhower of rain may in a few days produce another crop; and if the weather continues dry they move their camp.

However, theſe numerous armies ſeldom keep the field any time without great loſs by famine; for a very conſiderable diminution is ſcarcely felt amongſt ſuch multitudes, and are very little regarded from any ſentiments of humanity: a famine is therefore neither conſidered as any thing extraordinary, nor will the memory of it ever prevent the aſſembly of another multitude, that muſt alſo be liable to the ſame chances of ſubſiſting or ſtarving. Allowances muſt alſo be made for the great loſs they ſuſtain in men, beaſts, and all the implements of war, as often as they move in difficult roads, and particularly in their manner of paſſing over great rivers: for their rivers, in the rainy ſeaſon, become ſo rapid, that the landing-place is frequently a mile below the place of embarkation. In croſing them they uſe large boats of a kind of baſket-work, which they cover with ſkins. As there are always great plenty of hides in ſo numerous an army, they are eaſily made; and, tho' they are light and manageable, are capable of carrying a conſiderable number of horſe, and of tranſporting the heavieſt artillery.

The true cauſe of the ill ſucceſs of the Indian armies in an engagement, proceeds from their being unacquainted with the advantages of diſcipline, and their keeping their infantry upon too low a footing. Their cavalry, though not backward to engage with ſabres, are extremely unwilling to bring their horſes within the reach of our guns; for they are leſs afraid of their lives than of their fortunes, which are all laid out on the horſe upon which they ride.

Nothing is more prejudicial to them than the falſe notion they generally entertain in relation to artillery. They are terrified with that of an enemy, and weakly put a confidence in their own, placing their chief dependance on the largeſt pieces, which they neither know how to manage nor to move. Some of theſe carry a ball of ſeventy pounds. When the Europeans march round them with their light field-pieces, and make it neceſſary to move thoſe enormous weights, if a ſhot comes among their bullocks they become quite ungovernable, and are ſo ill harneſſed, that it cauſes no ſmall delay to free the reſt from any one that happens to be unruly or ſlain.

We have a much greater advantage in their being tenacious of their antient manners, than in their want of bravery; not only the prince, but every rajah, who has the command of all the forces he can bring into the field, always appears among them mounted on an elephant, and is at once the general and enſign of his men, who conſtantly keep their eyes on him; and if they loſe ſight of him for a moment, conclude that all is loſt, and inſtantly diſperſe. This affords our engineers a fair opportunity of deciding the fate of a whole detachment by one well directed diſcharge of a ſix-pounder; and thoſe enormous beaſts now ſeem brought into the field only to be a mark for our artillery. Thoſe rajahs, ſenſible of being thus expoſed, ſometimes avail themſelves of the only expedient that can afford them any ſecurity; for it has been obſerved, that ſeveral elephants, with the ſame capariſons, and with riders in the ſame rich and ſplendid habits, have appeared in different parts of the field on the ſame day.

Though they have ſeverely ſuffered by being ſurprized in the night by the Europeans, they can never be brought to eſtabliſh in their camp either order or vigilance; for at the cloſe of the evening every man eats a great quantity of rice, and many take after it ſoporific drugs, ſo that about midnight the whole army is in a dead ſleep; the conſequence of which is obvious: and yet, ſays the above author, an eaſtern monarch would think it very ſtrange, ſhould any body endeavour to perſuade him, that the ſecurity of his throne depended upon the regulation of the meals of a common ſoldier; much leſs would he be prevailed on to reſtrain him in the uſe of that opium which is to warm his blood for action, and animate his ſoul with heroiſm. The mind of an European ſoldier muſt be equally filled with compaſſion and contempt at ſeeing a heap of theſe unhappy creatures, animated by a momentary intoxication, crowded into a breach, and both in their garb and impotent fury reſembling a mob of frantic women. In ſhort, the very eaſtern dreſs has an appearance of effeminacy, and the Europeans are not inclined to be ſtruck with much apprehenſion at ſeeing a body of horſe in ſilk or cotton robes.

SECT. XVIII.

Of the Revenues of the Mogul, the Coins, Weights, and Meaſures of Indoſtan; and of its Trade and naval Veſſels.

THE revenues of the Mogul ariſe from the produce of the ground, the cuſtoms of the ſea-ports, the eſtates of the great men at their death, which devolve to the crown, the preſents from his ſubjects, who never approach their prince or governor empty-handed, and the treaſures produced by the diamond mines. The viceroy, or governor, of every province, who owns his ſubjection to him, is obliged to ſupply the crown with a certain ſum, which he raiſes out of the manufactures and produce of the ſoil. This, added to the other revenues, is ſaid to amount annually to between forty and fifty millions ſterling; an immenſe ſum, which muſt be greatly leſſened ſince Nadir Sha ravaged the empire, took away its treaſures, and, by weakening the power of the prince, enabled many of the Nabobs to throw off their ſubjection to him.

The coins of this country are the pice, or caſh, which are of copper, and about the value of a half-penny: the fanam, a ſilver coin, worth three-pence; the rupee, a ſilver coin, worth two ſhillings and three-pence; the gold moor, or rupee, worth about fourteen ſilver rupees; and the pagoda, ſo called from its having the figure of a pagoda ſtamped upon it. The laſt, which are worth nine

nine ſhillings, are flat on one ſide and convex on the other, and are chiefly coined by the rajahs or petty princes.

Gold and ſilver coins are finer here than in any other country. Foreigners have their mints, and coin both gold and ſilver, particularly the Engliſh at Fort St. George. Foreign coins are alſo current, but for trifling matters they ſometimes uſe bitter almonds, or ſea-ſhells called couries, or blackmoor's-teeth, ſixty of which are valued at about a half-penny. Whatever foreign coin falls into the hands of the Mogul's governors is melted down into rupees, with the characters of the reigning emperor; and after his death they loſe the value of a half-penny, or penny, on account of wear; and none but the new coin is current at the full value.

Large ſums are reckoned by lecks, carons, and arabs. A leck is one hundred thouſand rupees; a caron, or carol, is one hundred lecks; and an arab is ten carons.

Their weights differ almoſt in every port, and frequently in the ſame port, and therefore they cannot be exactly ſpecified. The common weight at Surat is the ſeer, which is about thirteen ounces one-third; and forty ſeers generally make a maund. The ſeer at Agra is ſaid to be equal to two at Surat. The candy varies from five hundred weight to five hundred and ſeventy; but it is generally ſaid that twenty maunds go to a candy. Salt-petre, turmeric, aſſafœtida, pepper, dry ginger, benjamin, and tyncal, have, according to Mr. Lockyer, forty-two ſeers of Surat to the maund. Copperas, aloes, brimſtone, long-pepper, dammer, ſtick-lack, and wormſeed, have forty-four ſeers to the maund; and, for the moſt part, ſuch goods as have no waſte, as quickſilver, copper, ivory, vermillion, Lahor indigo, tutanag, &c. are ſold at forty ſeer to the maund, or three maunds to one hundred weight.

At Surat, corn, rice, and other commodities, ſold with us by meaſure, are there ſold by weight; but ſilks and callicoes are ſold by the pieces, and by the cobit, which contains twenty-ſeven inches.

The coſs, by which the roads are meaſured, is, near the coaſts, about an Engliſh mile and a half; but farther up the country, and particularly near Brampour, it is almoſt two Engliſh miles.

In liquid and dry meaſures, one meaſure is one pint and a half: eight meaſures are one mercall; and four hundred mercalls are one garſe.

The principal manufactures of Indoſtan are ſilks, callicoes, and muſlins: we alſo import from thence diamonds and other precious ſtones, great quantities of pepper, the growth of the Malabar coaſt, indigo, ſalt-petre, cardamums, opium, aſſafœtida, and a great variety of phyſical drugs. The goods exported thither from Europe are Engliſh broad-cloth, lead, looking-glaſſes, ſword-blades, knives, haberdaſhery-wares, gold and ſilver lace, tin-ware, brandy, beer, and ſome other proviſions chiefly taken in by our own factories. The ſhips alſo frequently take in flints with their ballaſt, for there is not a flint to be found in India, at leaſt in the parts viſited by the Europeans; ſo that in the inland country, where the people have not an opportunity of being ſupplied by our ſhipping, a bag of flints is almoſt as valuable as a bag of money.

It muſt however be confeſſed, that all the goods we carry to India are a trifle, compared with the bullion and foreign coin exported thither. Our ſhips, when they go out, are in a manner empty of merchandize, though few of them carry leſs than three or four ſcore thouſand pounds in ſpecie. This has raiſed a queſtion, whether the India trade be of any advantage to this nation; but, in return, the company anſwer, that the Indian merchandize they re-export and ſell in ſeveral parts of Europe bring in more treaſure than they carry out; and were it otherwiſe, we ſhould have other nations monopolize the trade, and ſupply us with the ſame commodities, and conſequently more treaſure would be paid to them than is now carried to India.

But to return, there are no greater merchants in the world than the Mogul ſubjects, though their ſhips never paſs the Cape of Good Hope; for they carry on a prodigious trade to Perſia and the Red Sea, and ſupply both Turkey and Perſia with all the rich merchandize of India; in return for which they bring back carpets, pearls, and other Perſian commodities, but chiefly treaſure, which they frequently load on board Engliſh or Dutch ſhips, and the freight is ſaid to be one great branch of the company's profit; for they ſeldom diſpatch a ſhip from Perſia to Surat but ſhe is as deep laden as ſhe can ſwim, full of paſſengers, with vaſt quantities of pearls and treaſures on board, ſometimes to the amount of two or three hundred thouſand pounds.

The Indians make uſe of European ſhips to import their treaſure chiefly for ſecurity; for they conſider them as being in much leſs danger from pirates than their own ſhipping. They have ſhips indeed of four or five hundred tons burthen built in India after the Engliſh model; but their laſkars, or Indian ſailors, would make but a poor defence ſhould they be attacked, and they have but little ſkill in navigation.

We have already given an account of the Indian ſhips and their manner of conſtruction, and ſhall here only add, that their boats uſed on the coaſt, called muſſoulas, are flat-bottomed veſſels, the ſides of which are five or ſix feet high; the planks are very thin, and ſewed together with cocoa-nut cordage, ſo that they will yield like paſteboard, and are in no danger of ſplitting when they ſtrike, as they muſt frequently do on many parts of that coaſt before they can get to ſhore, and on this account they are generally uſed by the Engliſh in landing their goods: they are rowed by ſix or eight hands; but as they are very deep, and will carry great quantities, it is not very expenſive to employ them in landing or embarking goods. They have another kind of veſſel, if it may be called by that name, which is termed a catamaran, and is only formed of three or four rough pieces of timber tied together, and are chiefly uſed by the fiſhermen on account of their not being fit to carry ſuch goods as may be damaged by the wet, very little ſea beating over them. For the ſame reaſon paſſengers ſeldom make uſe of them, though they are really ſafer on that coaſt than any other veſſels, and ſome people have ſailed along the ſhore upon one of them for a hundred miles together; and upon theſe kind of floats the Indians carry the heavieſt weights; as great guns, anchors, &c.

Having now taken a view of the country and people of India in general, we ſhall preſent before the reader a view of the two capitals of that empire, and of the remarkable revolutions that have lately happened at Delli, the preſent capital.

SECT. XIX.

Of Agra, one of the capital Cities of the Empire; with a Deſcription of the Palace.

AGRA, the capital of the province of the ſame name, and the ancient metropolis of the whole empire, is ſituated in twenty-ſix degrees twenty minutes north latitude, and in ſeventy-nine degrees eaſt longitude from London. It is about ſeven hundred miles north-eaſt of Surat, and is ſituated upon the river Jemma, in the midſt of a ſandy plain, which greatly adds to the heat of the climate. The city is ſeven or eight miles in length, but not near ſo much in breadth, and no part of it is fortified except the palace; but there is generally a great army in the place, eſpecially if the Mogul be there.

The palaces of the omrahs and other great men are built with ſtone in a magnificent manner; they ſtand upon the banks of the river Jemma, and have large gardens adjoining to them; but the reſt of the houſes are mean buildings: however, the great number of moſques, caravanſeras, large ſquares, baths, and reſervoirs of water, intermixed with trees and gardens, added to the river Jemma running the whole length of the city, renders its proſpect very agreeable; and the Mogul's palace is a noble building.

A large area extends between the town and the palace, where the rajahs draw up the raſhboots when they mount the Mogul's guard, as they do every week in their turns with fifteen or twenty thouſand men. The palace is ſituated by the ſide of the river in the form of a creſcent, but from the town it appears to be round; it is three or four leagues in circumference, and fortified with a high

high ſtone wall mounted with artillery. As the ſtones with which this wall is built are red, and have a luſtre like poliſhed marble, the wall appears extremely noble when the ſun ſhines upon it: it is ſurrounded with a deep broad moat, over which are draw-bridges, and the terraces of the gardens ſerve for a rampart.

On entering the firſt gate of the palace you find a handſome broad ſtone walk, with canals running along the ſides; and beyond it a large ſquare, where the Mahometan guards are drawn up, and here the omrahs pitch their tents; ſo that you paſs through two armies, one on the out-ſide and the other within the palace, before you reach the royal apartments.

Beyond this ſquare is another court, where the Mogul's muſic uſed to ſound every morning, noon, and night, and whenever he went abroad. From this court you come to the Durbar, another large court, where all people reſorted at the time of audience. It is divided by baluſtrades into three parts; at the outer baluſtrade ſtood the common people; without the next, which is raiſed on a platform ſomething higher, were thoſe of ſuperior rank; and within the third, upon a platform ſtill more elevated, ſtood the omrahs and great lords of the court. In this manner all waited the approach of the Mogul at the time of audience; who, upon the playing of the muſic, appeared in a kind of gallery above the place where the omrahs ſtood, and ſeated himſelf upon a throne covered with jewels of ineſtimable value. Here the emperor received petitions from his ſubjects, and ſpent ſeveral hours every day in hearing cauſes.

On leaving the Durbar the emperor retired to his baths, followed only by ſome of his prime miniſters, with whom he adviſed on affairs of ſtate. From another gallery in the palace the emperor reviewed his troops, his elephants, and horſes; and ſaw the combats of wild beaſts, or thoſe of men and beaſts, which ſome of the Moguls eſteemed a favourite amuſement. Here alſo malefactors were frequently executed before him, by being torn to pieces, or trampled to death by elephants; and ſometimes beheaded, according to the emperor's pleaſure; the execution immediately following the ſentence.

The Haram, or women's apartment, where there were ſeldom leſs than a thouſand, who had their eunuchs and ſlaves to attend them, takes up a conſiderable part of the incloſure; and, as it wants neither gardens, canals, parks, or any thing which can contribute to the beauty or pleaſure of the place, the circumference muſt be very great. Beſides, within the walls was a quarter where all manner of artificers were daily employed in the emperor's ſervice. Theſe obſerved a profound ſilence, and no other noiſe was heard but what was unavoidably occaſioned by their buſineſs.

With reſpect to the city, the moſques and magnificent tombs which are ſeen there, ſhew that it has been one of the moſt flouriſhing places in the Indies. In the year 1638, it was computed that it had ſeventy great moſques, among which were ſix principal ones, at which the Mahometans offered up their devotions at their public feſtivals. In one of the laſt is the ſepulchre of one of the ſaints, thirty feet in length, and ſixteen in breadth. The people ſay he was a giant, and the greateſt warrior their nation ever produced. To this tomb they make frequent pilgrimages, when their offerings amount to prodigious ſums, which ſerve to feed every day a vaſt number of poor. Theſe moſques and their courts afford an aſylum for criminals, and for thoſe who are threatened with a priſon by their creditors. Even the Mogul himſelf dare not ſo much as attempt to take a criminal from thence, for fear of violating the reſpect which his religion makes him think due to thoſe who are honoured with the title of ſaints. The wife of the emperor Sha Jehan thought to render her memory illuſtrious, and to merit the veneration of after ages, by the mauſoleum which ſhe cauſed to be erected near the walls of Agra. This work is ſaid to be extremely magnificent, and was twenty-two years in building, though twenty thouſand men were inceſſantly employed about it.

There are in Agra near eight hundred baths, from which the Mogul annually receives very conſiderable ſums; for thoſe purifications being one of the principal points of the Mahometan religion, there does not paſs a day in which thoſe places are not frequented by an almoſt infinite number of people.

The inhabitants are chiefly Moors and Moguls, who have the government entirely in their hands; there are alſo a conſiderable number of Gentoos, Jews, Armenians, and Portugueſe. But though Agra is extremely populous when the court is there, it is at other times a perfect deſart; for not only thoſe who have an immediate dependance on the court and army, but the merchants and tradeſmen remove with their families to follow the camp.

SECT. XX.

Of the City of Delli, the preſent metropolis; a Deſcription of the Palace, and an Account of the Revolutions that have lately happened in that City.

DELLI, the capital of the province of the ſame name, and the preſent capital of the empire, is ſituated in ſeventy-nine degrees eaſt longitude from London, and in twenty-eight degrees north latitude, and ſtands on the river Jemma, which divides it into two parts: that laſt built was erected by Sha Jehan, and from thence is called Jehanabad; but they are both together called by the Europeans by the name of Delli. In the part built by that emperor, all the houſes encloſe ſpacious courts, and in the inner part of theſe buildings the people lodge, to prevent any from approaching the places appointed for their women. Moſt of the great men have houſes without the city, on account of the conveniency of the waters.

The entrance into the city is by a long ſtreet, on each ſide of which are regular arches, under which the merchants have their ſhops. This ſtreet leads to the palace, which is above a mile and a half round. The wall is built of hewn ſtone, with battlements, and at every tenth battlement is a tower. The ditches which ſurround the wall, are full of water, and alſo faced with hewn ſtone. The grand portal has nothing extraordinary in it's appearance, and as little has the firſt court into which the great lords are permitted to enter, ſeated on their elephants: this leads to a large and long paſſage adorned with fine porticos, under which are many ſmall rooms, into which a part of the guards retire: on each ſide are the women's apartment, and the great halls where juſtice is adminiſtered; and in the middle of the paſſage is a canal filled with water, which at equal diſtances is formed into little baſons. From thence a paſſage leads to a ſecond court, where the omrahs mount guard in perſon. They have their quarters there, and their horſes are tied before the gates.

On entering the third court, the divan, where the king gives audience, appears in front. It has a hall, to which is an aſcent of ſeven or eight ſteps: this ſtructure is open on three ſides, and its roof, which conſiſts of a number of arches, is ſupported by thirty-two marble columns. When the emperor Sha Jehan cauſed this hall to be erected, he gave orders that it ſhould be all over enriched with the fineſt work formed of jewels inlaid: but when the men had made the trial on ſome columns to the height of two or three feet, they found it would be impoſſible to find a number of jewels ſufficient to execute ſo grand a deſign, and that the expence would be immenſe; the Mogul was therefore obliged to abandon the project, and to be contented with painting it with different flowers.

In the midſt of this hall, oppoſite to the wall which looks into the court, is a kind of alcove, and there the throne on which the king gives audience is erected: after the manner of the ancient orientals, it is in the form of a ſmall bed with three feet; but its magnificence could not be believed, were it not atteſted by the moſt credible witneſſes. This bed is adorned with four columns, a canopy, a head-board, a bolſter, and a counterpane: one would imagine that Sha Jehan, who cauſed it to be made, was reſolved to exhauſt upon it all the riches of his kingdom. It ſhines with gold, ſilver, emeralds,

emeralds, diamonds, and rubies, which have been diffused over it with great profuſion. The canopy is ſo covered with them, that the eyes of the beholders are dazzled; its fringe is compoſed of gold and pearls; the columns which ſupport it are equally covered with them. The furniture of the bed with the counterpane which the prince has over him, are embroidered with gold and pearls; and the feet on which the bed ſtands, are no leſs adorned than the columns: to each of theſe laſt are fixed the Mogul's buckler, ſabre, bow, quiver, arrows, and other arms.

At a ſmall diſtance from the hall of the divan are the great ſtables, which are always full of the fineſt horſes, in which the Mogul uſually takes great delight; theſe are brought from Arabia, Perſia, and Tartary at a great expence. Before every ſtable-door is hung a kind of mat made of reeds, and bound together with ſilk twiſted in the form of flowers. Theſe are intended to prevent the flies from entering: but they are not ſatisfied with this precaution; every horſe has two grooms, who relieve one another, and fan them continually. All the day they have carpets over them, and at night they lie upon a litter made of their own dung dried in the ſun, and well pounded.

The other public buildings in this city are a great moſque, which has ſeveral fine marble domes; and a noble caravanſera, built by a Mogul princeſs for the accommodation of ſtrangers.

It is neceſſary to inform the reader, that the account we have here given of the ſplendor of the divan, was written before the city was plundered of its jewels and treaſures by Nidir Sha, and before the late revolutions in that city, which have ſerved to reduce that capital from its ancient grandeur, and to weaken the ſtrength of the Mogul.

The Pattans, a race of northern people who inhabit the mountains of Candahar, though Mahometans, are no leſs enemies to the Mooriſh government, than the Morattas, or other Indian Gentoos. They were always eſteemed good ſoldiers, and are now conſidered as the very beſt infantry in the whole empire. This warlike nation rendered themſelves formidable to Nadir Sha in their march; and after that conqueror had left the Mogul empire in the weak and indefenſible ſtate to which he had reduced it, they invaded that country, on a ſuppoſition that it was then in too low a condition to be able to reſiſt the force which he then thought fit to bring againſt it.

The emperor being appriſed of their march, aſſembled his council, and ſitting on his throne ſurrounded by his generals and twenty-two principal omrahs, held in his hand a betel, which, according to the cuſtom of the country, he offered to that chief who would immediately engage to take the command of the army, and repulſe the enemies of his country. But ſo univerſal was the treachery or the cowardice of his courtiers, that not one of them advanced to take the betel as a pledge of their fidelity; which the young prince, who was then about eighteen, obſerving with extreme concern, preſented himſelf before his father, earneſtly intreating that he might be permitted to receive it.

His father, refuſing his requeſt, told him, that it was not proper for the heir of the empire to expoſe himſelf in ſo dangerous an enterprize, while there were ſo many experienced generals more fit for that ſervice. The omrahs, on the other hand, all maintained, that as his ſon had offered to take the betel, he alone ſhould put himſelf at the head of the troops; and joining their ſolicitations with thoſe of the prince, at length prevailed on the emperor, who immediately gave orders for raiſing three hundred thouſand men.

The omrahs, exaſperated at the prince's boldneſs, on their withdrawing from court, entered into a conſpiracy, and gaining the chiefs of the ſeveral bodies of which this army, ſo haſtily aſſembled, was compoſed, concerted with them the means of betraying the prince; but the young hero being informed of the plot laid againſt his life, had the addreſs, a little before he engaged the Pattans, to ſecure the perſons of thoſe treacherous commanders; and then attacking the enemy, gained a complete victory, and obliged them to quit the country by a precipitate flight.

While the brave prince was thus glorioufly delivering his country from the Pattans, the conſpirators in the capital cauſed it to be reported, that he was fallen in battle; and entering the palace, ſeized on the emperor and ſtrangled him, and then gave out that he had poiſoned himſelf in a fit of deſpair, occaſioned by his ſon's death, and the loſs of the battle. The horrible aſſaſſination reached the ears of the prince, who was now returning in triumph to Delli; and being ſenſible of the danger that threatened his own life from ſo formidable a conſpiracy, he adopted the ſtratagem which his grandfather Aurengzebe practiſed on another occaſion. Pretending to believe that his father died a natural death, he appeared inconſolable for the loſs of his father, and tearing off his garments, took the habit of a fakir, publickly declaring that he renounced the world, and would never more concern himſelf in the government. A court of juſtice for ſtate criminals is a thing unheard of in theſe lawleſs governments, and the only way of puniſhing a traitor is by turning againſt him his own acts of treachery and deceit.

The prince acted his part ſo perfectly as to deceive the conſpirators, who went out to meet him with aſſurances of their readineſs to acknowledge him for their lord and king; and in return he declared his intentions to give up all thoughts of the crown, and even to retire from the world; and telling them, that as it was neceſſary ſo extenſive an empire ſhould not be deſtitute of a head, he entreated their aſſiſtance to direct him in the choice of an emperor, deſiring them to aſſemble that evening in his palace to deliberate on this important affair. The omrahs retired, flattering themſelves that they had now obtained an opportunity of ſetting up a creature of their own; while Amet Sha, for that was the young emperor's name, entered the royal palace, and placed a number of truſty perſons on each ſide of the doors of the ſeveral avenues which lead to the inner court.

The entrance to the apartments of the princes of the Eaſt is diſpoſed with a view to prevent the irruption of aſſaſſins, there being no approaching the preſence-chamber but through long oblique paſſages, in which, at proper intervals, are receſſes for the poſting of guards; a contrivance that at once ſecures the monarch from the attempts of the moſt determined villains, and at the ſame time affords him an opportunity of executing his purpoſes on thoſe who have incurred his diſpleaſure.

Every thing being thus diſpoſed for the reception of the omrahs, each as they arrived were introduced to theſe fatal avenues; and as they ſtooped to paſs the curtains, which are generally kept lowered, were ſeized by the guards, and immediately received the juſt reward of their crimes. Thus the Mogul Amet Sha eſtabliſhed himſelf in the quiet poſſeſſion of the throne, by triumphing at once over his foreign and domeſtic enemies. But it was not long before the peace of Delli was more fatally diſturbed; for the Pattan chief ſoon after aſſembled a much more formidable army, and entering Delli, gave up that city to be plundered three days by his ſoldiers. In the mean time he ſeized upon the royal treaſury, and obliged the collectors of the public revenues to account to him for all they had received. He then marched home, being ſuppoſed to have taken away more riches, except jewels, than Nadir Sha carried out of the country. He, however, then made no revolution, nor any alteration in the government of Indoſtan; but when he returned to Lahor, he drew a line from north to ſouth, claiming a vaſt extent of country to the weſt of that line, which was at leaſt nominally dependent on the empire of Indoſtan; and leaving his ſon Timur there as governor of his new dominions, gave at that time no farther diſturbance to Indoſtan.

Since this time ſeveral revolutions have happened at Delli, and in 1757 this Timur was ſeated on the throne, and the empire of Mogul became ſubject to the Pattans.

We ſhall now take a view of the moſt conſiderable countries and cities of India, either diſtinguiſh-

ed by peculiar advantages, or by their containing European ſettlements, which ſhall be deſcribed, and ſome account be given of the military operations in each.

SECT. XXI.

Of the Province of Bengal, and of the Factories of Fort William at Calcutta, and thoſe of Chandenagore and Hugley or Ouglia, with a remarkable Inſtance of the Strength of the Opium on the Banks of the Ganges. Of the Towns of Saumelpour, Daca, Chaligan, and Patna.

BENGAL is well known by giving its name to the greateſt gulf in Aſia, which ſeparates the two peninſulas of the Indies. This kingdom, which is ſituated at the north-weſt extremity of the gulf, is near two hundred and fifty leagues from eaſt to weſt, and is eſteemed the moſt fertile country of the Indies in ſugar, ſilk, fruits, pepper, opium, rice, ſalt-petre, gum-lack, and civet, with all which commodities it furniſhes the moſt diſtant provinces. The country is interſected by numerous ſtreams, which ſerve to water it, and to facilitate the tranſporting of mercantile goods. Their banks are covered with towns and villages extremely well peopled, and with great fields of rice, ſugar, and wheat, much larger than that of Europe. It is uſually compared to Egypt for its fertility, the river Ganges here dividing itſelf into ſeveral branches, and annually overflowing the country as the Nile does Egypt.

The fineſt canes brought to Europe come from this kingdom, and a ſmall ſort of canes grow here much more ſupple than oziers; theſe the inhabitants work into veſſels in ſo cloſe a manner, that having glazed them on the inſide, they are able to contain all kind of liquors as ſecurely as glaſs or ſilver. An herb is alſo gathered in this country, which ſends up firſt a pretty high ſtem of the thickneſs of one's finger, afterwards leaves, and on the top of all a large bud like a tuft. The Indians ſpin it and make it into tapeſtry and very beautiful ſtuffs, upon which they repreſent all ſorts of figures.

Fort William is a factory belonging to the Engliſh Eaſt India Company, ſeated up the river Hugley, the moſt weſterly branch of the river Ganges, and received its name from king William III. who came to the throne juſt about the time when it was built. It was firſt erected in the form of an irregular tetragon of brick and mortar, and the town is built without the leaſt order, becauſe every one built a houſe where he liked beſt, and as moſt ſuited his own convenience. About fifty yards from the fort ſtands the church, which was erected by the contribution of the merchants who reſided there, and of the ſea-faring people who traded to that place. The governor's houſe is within the fort, and is as regular a piece of architecture as is to be ſeen of the kind in India. Here are alſo convenient lodgings both for the factors and writers, ſtore-houſes for the company's goods, magazines for ammunition, and an hoſpital. The company have a garden and fiſh-pond for the uſe of the governor's kitchen; and moſt of the inhabitants, that make any tolerable figure, have the ſame advantages. On the other ſide of the river are docks for repairing the ſhip's bottoms, and a garden belonging to the Armenians.

The garriſon generally conſiſts of two or three hundred ſoldiers, who are uſually employed in conveying the company's fleet from Patna with their ſalt-petre, piece-goods, raw-ſilk, and opium.

All ſorts of proviſions are extremely cheap and very good, and cloathing may be purchaſed for a trifle. The town is named Calcutta, and is governed by a mayor and aldermen.

The place is eſteemed very unhealthy on account of there being a ſalt-water lake three miles to the north-eaſt, which overflowing in September and October vaſt numbers of fiſh are left dry, when the floods retire, and infect the air by their putrefaction. Another inconvenience is the houſes fronting the afternoon's ſun, which renders the ſtreets, both above and below the fort, ſo hot as to be almoſt inſupportable.

In the year 1757 the viceroy of Bengal, being irritated by ſome tranſactions of the company, levied a numerous army and inveſted Calcutta, which was then in no poſture of defence. The governor, intimidated by the number and power of the enemy, deſerted the fort, and, with ſeveral of the principal perſons in the ſettlement, went on board a ſhip in the river, taking with them their moſt valuable effects, and the company's books. Mr. Holwell, the ſecond in command, defended the place; and, by the aſſiſtance of a few brave officers and a feeble garriſon, repulſed ſeveral attacks of the enemy with great intrepidity; but was at length obliged to ſubmit, after he had received the promiſe of the ſuba, or viceroy, that no injury ſhould be done to any of the garriſon. But, notwithſtanding this promiſe, he no ſooner entered the fort, than the garriſon and inhabitants, conſiſting of one hundred and forty-ſix perſons, were driven into a place about eighteen feet ſquare, called The Black-hole priſon: there they were cruelly confined during the whole night, and deprived of the freſh air in a very ſultry climate; by which means only twenty-three ſurvived; for all the reſt periſhed in a moſt dreadful manner by a lingering ſuffocation, in which they experienced all the miſeries of extreme heat and thirſt.

However, on the thirty-firſt of January following admiral Watſon and colonel Clive appeared with two ſhips before the town of Calcutta, to revenge the tragedy acted upon their countrymen, and were received by a briſk fire from the batteries: but they ſoon ſilenced the enemy's guns; and in leſs than two hours the place and fort were abandoned; for colonel Clive had, in the mean time, inveſted the town, and by the vigour of his attack greatly contributed to its ſudden reduction. A few days after they reduced Hugley, and the Nabob's ſtore-houſes of ſalt, and vaſt quantities of proviſions for the ſupport of his army, were burnt.

The viceroy, now more than ever incenſed againſt the Engliſh, reſolved to take ample revenge for his late diſgraces. He marched towards Calcutta, and encamped about a mile from the town; when colonel Clive applying to the admiral for a reinforcement, obtained ſix hundred men, and then drawing out his forces, advanced in three columns towards the enemy. He began the attack with ſuch vigour, that the viceroy, after a feeble reſiſtance, retreated, with the loſs of a thouſand men killed, wounded, and taken priſoners.

Chandenagore, a French ſettlement higher up the river than Calcutta, and the moſt conſiderable place poſſeſſed by that nation in the bay of Bengal, is ſtrongly fortified and encompaſſed by a wall; but was beſieged and taken by the admirals Watſon and Pocock, who battered it with their ſhips, while colonel Clive made his approaches on the land-ſide; and taking poſſeſſion of the place, they found that the garriſon conſiſted of five hundred Europeans and twelve hundred Indians, and that the fortreſs was defended by one hundred and twenty-three pieces of cannon and three mortars.

Fifty miles to the north of Calcutta is Hugley, or Ouglia, where the Engliſh once had a factory, which they afterwards removed to Calcutta. This town is ſeated on the moſt weſterly branch of the river Ganges, and is of conſiderable extent, it reaching above two miles along the ſide of the river, and carries on a conſiderable trade in all the commodities of Bengal. It annually affords rich cargoes for fifty or ſixty ſhips, beſides what is carried in carriages to the neighbouring towns. Salt-petre is brought hither from Patna in veſſels of about two hundred tons burthen.

The ſtreets are wide, but not paved. They are full of rich ware-houſes and ſhops of all ſorts of India goods, eſpecially ſilks, fine cloth, and ſtuffs. The beſt opium in the world is ſaid to come from this town, which, at leaſt, carries on the greateſt trade in this commodity, it being exported from thence all over India.

The ſoil of the Ganges is eſteemed the moſt proper for producing the ſtrongeſt ſort of this drug; in proof of which Mr. Groſe mentions a remarkable inſtance: a Nabob of thoſe parts having invited an Engliſh factory to an entertainment, a young gentleman, a writer in the company's ſervice, ſauntering about the garden plucked a poppy, and ſucked the head of it, probably apprehending no greater danger from it than is to be found from thoſe

those plants in England. But he soon fell into a profound sleep, of which the Nabob being informed, eagerly enquired, with much concern, of the particular bed out of which the poppy was gathered; and being told, he, with strong expressions of sorrow, apologized for his having supposed that the nature of poppies was too well known to require any warning, especially as the taste was far from being tempting; but that the sort which the English gentleman was so unfortunate to pitch upon admitted of no human remedy, and nothing could save him: this was really the case, for that sleep was his last.

There are abundance of Moorish merchants, who carry on a considerable trade here, and have five pagodas in the great market-place.

The Dutch have also a factory here built in an open place, about a musquet shot from the river. It resembles a castle, being encompassed with deep ditches full of water; and also defended by high stone walls and by bastions, being faced with stone and mounted with cannon. Their great ware-houses are also of stone, and their apartments for the officers and merchants are spacious and convenient.

Saumelpour, situated in the same kingdom about thirty leagues to the north of Ougli, is famous for the fine diamonds, which are not found, as in other places, in the bowels of the earth, but in the sands of the river Gauel. They begin their search at the town of Saumelpour, and carry it up to the mountains whence the Gauel has its source; a space of about fifty leagues. In this work eight or ten thousand persons are employed. From thence come those fine small diamonds called genuine sparks: but stones above a certain size are seldom found. This is said to be a large town; but the houses are chiefly built of earth, and covered with branches of cocoa-trees.

Daca, the largest city in Bengal, lies upon the same branch of the Ganges, in twenty-four degrees north latitude, and from thence come the best and finest Indian embroideries in gold, silver, or silk. Provisions of all sorts are very plentiful and exceeding cheap.

Chaligan is situated in twenty-three degrees north latitude, near the mouth of the most easterly branch of the Ganges, in the kingdom of Bengal. Here the Portuguese formerly erected a kind of sovereignty, and associating with the pirates and banditti of all nations, owned no subjection either to their own prince or to the prince of the country, but committed daily robberies both by sea and land, and so interrupted all commerce, that one of the late Moguls found it necessary to send an army against them, and to extirpate that pest of society. The town is now a poor place, and has but few cotton manufactures; but it affords the best timber for building of any place about it. The inhabitants are said to be so afraid of each other as to go continually armed.

Patna, the capital of the territory of the same name, is situated in a pleasant and fruitful country, and is said to be six miles in length, and one of the largest cities in India. Mr. Hamilton says 'tis the seat of the viceroy of Bengal, who resides in the highest part of the town; and observes, that the place is the more extensive, as the houses, which are only of cane, are erected at some distance from each other. The English and Dutch have factories here for salt-petre and raw-silk.

SECT. XXII.

Of Golconda, with an Account of the Diamond Mines of that Province, and of the Factories situated on its Coast, particularly Vizagapatam, Masulipatan, and others of less Note.

THE kingdom of Golconda extends two hundred and sixty miles along the bay of Bengal, and is about two hundred miles where broadest from east to west. This country has neither mines of gold, silver, or copper; it has, however, many of salt and fine iron; but is most remarkable on account of its diamond mines, which have rendered it very famous.

The diamond mines are generally adjacent to the rocky hills and mountains which run through the country, and it is supposed that they are to be found in all these mountains. In some of these mines the diamonds are found scattered in the earth within two or three fathoms of the surface, and in others they are found in a mineral in the body of the rocks forty or fifty fathoms deep. They here dig five or six feet into the rock, and then softening the stone by fire, proceed till they find the vein, which often runs two or three furlongs under the rock. All the earth is brought out, and being carefully searched, affords stones of various shapes and of a good water. The earth in which they are found is of a yellowish and sometimes of a reddish colour, which frequently adheres to the diamond with so strong a crust, that it is difficult to get it off.

In order to find the diamonds the workmen form a cistern, made of a kind of clay, with a small vent on one side a little above the bottom; into this they put a plug, then throwing into the cistern the earth they have dug, pour in water to dissolve it. They then break the clods, and stir the wet earth in the cistern, the lighter part of which is carried off in mud when the vent-hole is opened to let out the water. Thus they continue washing till what is in the cistern is pretty clean; and then in the middle of the day, when the sun shines bright, carefully look over all the sand, at which they are so expert, that the smallest stone cannot escape them; for the brightness of the sun being reflected by the diamonds assists them in the search; and if a cloud was to intervene, they would be apt to overlook them.

The undertakers watch the labourers very narrowly, lest they should conceal what they find; and take great care that the labourers expose to view no stone of a larger size than common, which if the governor should hear of he would cause it to be seized; for the governors of the mines enter into an agreement with the adventurers, that all the stones they find under a pagoda weight are to be their own; but the large ones above that weight belong to the king. A pagoda is nine mungelleens, and the mungelleen is five grains three-fifths.

These governors generally use the adventurers and miners very tyrannically; and by their extortions, and the taxes they oblige them to pay, keep them poor; at least they are obliged to appear so, to avoid their impositions; and therefore both the merchant and the miner generally go naked, with only a cloth about their waist, and a turban on their heads. This only relates to Golconda; for in Visiapour they are said to be kindly treated and permitted to enjoy their own; so that when they find in the mines of Golconda a larger stone than ordinary, they run away with it, and remove with their families to Visiapour.

This trade is almost entirely engrossed by the Banyans of Guzurat; and the workmen in the mines, as well as their employers, are for the most part Gentoos.

The kingdom of Golconda, whose principal harbour is Masulipatan, extends from the gulph of Bengal to the kingdom of Visiapour, and from north to south is contained between those of Berar and Carnate. It was antiently a part of a vast empire, the sovereign of which was called the emperor of Bisnagar, and contained almost all the peninsula from the northern extremity of Orixa to Cape Comorin. The Pattans, a nation of northern Tartars, deprived him of part of his dominions; another part was taken from him by the Mogul princes, who had advanced farther and farther towards the south; and the generals of this unfortunate prince, after betraying him, divided the rest of his dominions among themselves. From them the kingdoms of Decan, Visiapour, and Carnate, had their beginning, about two centuries ago. The present Nabob, or prince, is of the Mahometan religion, as are also a great part of his subjects, and is tributary to the Great Mogul.

The city of Golconda, which gives name to the kingdom, is now two leagues in circuit. Its walls are built of hewn-stone three feet square, and surrounded with deep ditches. It has several superb mosques, in which are the tombs of the kings of Golconda.

On

On this coaſt ſtands Vizagapatam, an Engliſh factory, with eighteen carriage guns mounted on its ramparts. The country round it affords fine and ordinary cotton cloths, and the beſt dureas or muſlins of all India. But in the year 1709 the Nabob of Chikacul levied war upon this factory, becauſe their former chief had borrowed money of him on the company's ſeal; and afterwards dying, his ſucceſſor refuſed to pay it. The Nabob applied to the governor of Fort St. George, but with no better ſucceſs. He therefore marched againſt Vizagapatam; but the war being drawn to a conſiderable length, grew burthenſome to the company, and they at laſt compromiſed the affair, and paid the Nabob a ſum almoſt equal to what he demanded.

Maſulipatan ſtands on the north ſide of the river Nagundi, which parts the provinces of Golconda and Biſnagar in eighty-one degrees forty minutes eaſt longitude from London, and in ſixteen degrees thirty minutes north latitude. In the latter part of the laſt century this was eſteemed one of the moſt flouriſhing towns in India, and one of the moſt profitable factories belonging to the Engliſh; though not only they, but the Dutch, Danes, and Portugueſe, had factories here, it being at that time the greateſt place of trade for calicoes, indigo, diamonds, and other precious ſtones. But notwithſtanding its great trade the city is ill built, though very populous.

What is related of the heats felt in this city, appears almoſt incredible. It is ſaid annually in the month of May the weſt wind blows during ſeven or eight hours in a day, the heat of which exceeds that of the ſcorching rays of the ſun, and reſembles that felt on approaching a houſe in flames. Though their chambers are cloſely ſhut up, the wood of the chairs, tables, and wainſcot is ſo heated, that people are obliged continually to throw water upon them; but the rains which ſoon after fall plentifully, refreſh the air, and lay the whole country under water; and the inhabitants receive the ſame benefit from it, that the Egyptians do from the inundations of the Nile, for they ſow their land thus prepared with rice and other grain, without expecting any more rain for eight months, in all which time the trees are green, and alternately loaded with ripe fruits.

The city is encompaſſed by a wall and ditch, and towards the land-ſide is a deep moraſs, ſometimes overflowed by the ſea; and over it is a wooden bridge half a league in length, on breaking of which the town was ſuppoſed to be ſecure from invaders; but in the year 1759, when it was in the poſſeſſion of the French, it was beſieged by the Engliſh, commanded by colonel Forde. Our troops were employed in making the neceſſary approaches from the ſeventh of March to the ſeventh of April, when finding their ammunition almoſt ſpent, and ſeveral breaches made in the wall, a party of the troops croſſed the moraſs, and took the town by ſtorm, when the marquis de Conflans aſking quarter for the garriſon, it was granted: the Engliſh found in the place one hundred and fifty pieces of cannon, and a great quantity of ammunition.

About thirty miles to the ſouth-weſt of Maſulipatan, ſtands the town of Pettipoly, where the Engliſh have a ſmall factory. About a hundred miles farther ſouth is Coletore, where the Engliſh have another ſmall factory; and about a day's ſail farther to the ſouth is Palicate, or Pullicat, which is ſituated at the mouth of a river of the ſame name, about twenty-three miles from Madraſs. This place has been in the poſſeſſion of the Dutch upwards of an hundred years, and was one of their firſt ſettlements on the continent of India.

SECT. XXIII.

Of Madraſs, or Fort St. George, the Capital of the Engliſh Company's Settlements in the Eaſt-Indies.

MADRASS, or Fort St. George, the capital of the Engliſh company's dominions in the Eaſt-Indies, has its laſt mentioned name from the fort in that City, and is ſituated in thirteen degrees north latitude, and in eighty degrees eaſt longitude. Thus it is near four thouſand eight hundred miles to the eaſtward of London, ſo that the ſun viſits them about ſix hours before he riſes in England, and ſets before we ſit down to dinner; and there is ſo little difference in the length of the days, that the Engliſh always reckon it to be ſix o'clock at ſun-riſing and at ſun-ſet.

This place is ſituated on one of the moſt incommodious ſpots imaginable; for the ſea beats perpetually with prodigious violence on the land on which it ſtands; there is no freſh water within a mile of it; in the rainy ſeaſon it is ſubject to inundations, from a river of ſalt-water that runs behind it; and the ſun from April to September is exceeding hot, the ſea-breezes alone rendering it habitable. Various reaſons are given for this injudicious choice of a ſettlement; according to ſome accounts, the perſon entruſted by the company about the beginning of the reign of king Charles II. to erect a fortreſs on that coaſt, made choice of this place as the moſt proper to ruin the trade of the Portuguſe ſettlement at St. Thomas; while others aſſert, that his only motive was to be near a miſtreſs he had at the Portugueſe colony. It is, however, certain, that there were ſeveral places in its neighbourhood free from moſt or all of theſe inconveniencies.

However, the war carried on by the company at Bombay and Bengal from the year 1685 to 1689, againſt the ſubjects of the Mogul, was a conſiderable advantage to Madraſs: for the tranquility which reigned there, and its vicinity to the diamond mines of Golconda, where good purchaſes are frequently to be made, cauſed a prodigious reſort of Indian merchants to this place, and contributed to render it populous and flouriſhing.

The fort is a regular ſquare extending about one hundred yards on each ſide, and has four baſtions built with what is there called iron ſtone, from its being of the colour of unwrought iron, and very rough. The fort is defended by no ditch, and the walls are arched and hollowed within. It has two gates, one of which opens to the eaſt, and the other to the weſt. The former, which is towards the ſea, is but ſmall, and is only guarded by a file of muſketeers; but the weſtern gate, which opens towards the land, is pretty large, and defended by the main guard, the ſoldiers belonging to it lying on the right and left under the wall, which, being hollow, anſwers the purpoſe of a guard-houſe. In the middle of the fort is the governor's houſe, in which are apartments for the company's ſervants; it is a very handſome lofty building of ſquare ſtone, to which there is an aſcent to the firſt rooms by ten or twelve ſteps, and from thence a pair of ſtairs leads to the council-chamber and the lodgings of the governor.

To the northward of the fort are three ſtraight handſome ſtreets, and there are the ſame number to the ſouth. The buildings are of brick, and the houſes of one ſtory above the ground-floor; they have flat roofs, covered with a plaſter made of ſea-ſhells, which no rain can penetrate; and, being ſecured with battlements, the Engliſh take the freſh air upon them morning and evening. The walls of theſe houſes are very thick, and the rooms lofty; but the upper floors are laid with bricks inſtead of boards. Theſe are all ſituated in the White-Town, which is inhabited by Europeans, and forms an oblong ſquare of a mile in length, but not half ſo much in breadth, and are encompaſſed by walls. The fort ſtands in the center of theſe buildings, and faces the ſea on one ſide, and a river on the other.

Oppoſite to the weſt gate of the fort is a barrack, or rather a long room, in which all the company's ſoldiers are obliged to lodge when off the guard; and adjoining to it, on the north, is a commodious hoſpital, where care is taken of them when they are ſick. At the other end of the barrack is the mint, where the company coin bullion brought from Europe, and elſewhere, into rupees; and this brings them a conſiderable revenue. They alſo coin gold into pagodas of different denominations and value.

On the ſouth ſide of the fort is the Engliſh church, which is a pretty elegant building of a moderate ſize, and has a handſome altar-piece, a gallery of fine carved wood reſembling cedar, and an organ, with which they ſalute

ſalute God and the governor; for he no ſooner enters the church than the organ ſtrikes up. The floor is of black and white marble, the ſeats regular and convenient, and the windows large and unglazed, to admit the cooling breezes, for otherwiſe the heat would be inſupportable, as the people, who are as thinly cloathed when at home as poſſible, always come to church in the European dreſs.

The church has uſually a ſtock of three or four thouſand pounds, which is put out to intereſt, and that applied to the repairs of the church and the relief of the poor; but theſe are generally ſo few, that the greateſt part of the intereſt goes to increaſe the principal; and as there is alſo an addition of a hundred pounds and upwards annually collected, the buildings belonging to the church are always kept in good repair and properly beautified.

The orphan children of the wealthy inhabitants are frequently committed to the care of the truſtees for the church, who put out their fortunes to intereſt at ſeven per cent. out of which they maintain and educate them, and reſtore the principal with the ſurplus when they come of age. Where there is no will made, the government takes care of the effects of the inteſtate, and reſtores them to the relations of the deceaſed who are intitled to them, whether they reſide there or in England.

There is a free-ſchool, where children are taught to read and write; and a public library, which chiefly conſiſts of books of divinity.

On the north ſide of the fort ſtands the Portugueſe church, in which they are indulged the free exerciſe of the Romiſh religion. Theſe are the only public buildings in the White Town, except the Town-houſe, where the mayor and his brethren, choſen by the free citizens, aſſemble, and a court of juſtice is held for civil cauſes.

A river runs cloſe to the buildings on the weſt part of the town; but on that ſide there is no wall, and only a large battery which commands the plain beyond the river. On the eaſt is a ſlight ſtone wall pretty high, which to the ſhipping in the road has a grand appearance; but on that ſide there is little occaſion for any fortification, the ſea coming up cloſe to the town, and being ſo very ſhallow that no large veſſels can ride within two miles of it; and yet the ſurf runs ſo high that there is no landing but in the country flat-bottomed boats. Both the north and ſouth ends of the towns are defended by a ſtone wall of a moderate thickneſs; but, like thoſe of the fort, each of theſe is hollow within, and would ſcarcely hold out one day's battery. To the ſouthward of the White Town is a ſmall ſuburb, inhabited only by the black watermen and fiſhermen, conſiſting of little low thatched cottages; and beyond it is an out-guard of blacks, who ſerve to give intelligence to the fort.

Adjoining to the White Town northward is the Black Town, inhabited by Portugueſe, Armenians, Indians, and a great variety of other people. It is built in the form of a ſquare, and is above a mile and a half in circumference, ſurrounded with a brick wall ſeventeen feet thick, with baſtions at proper diſtances, after the modern way of fortification: it is alſo waſhed on the weſt by a river, and by the ſea on the eaſt; and to the northward a canal is cut from the river to the ſea, and ſerves on that ſide for a moat; ſo that Madraſs, conſidering its ſituation, may be reckoned a town of ſtrength when properly garriſoned.

The ſtreets of the Black Town are wide, and ſome of them planted with trees; and having the ſea on one ſide, and a river on the other, few towns are more pleaſantly ſituated, or better ſupplied; but, except a few brick houſes, the reſt are poor cottages, built with clay and thatched, without ſo much as a window on the outſide, or any furniture within, except the mats and carpets on which the people lie. The houſes of the more wealthy Indians are uſually in the ſame form, and have a little ſquare in the middle, from whence they receive all their light. The great ſtreets and the market-place are thronged with people; for though the houſes are low and ſmall, the place is extremely populous, ſix or ſeven people ſleeping in one little room, with no other bed than a mat or cloth ſpread under them; but, notwithſtanding this appearance of poverty, there is no place where wealth abounds more, or where ready money is more plentiful, and the people from the higheſt to the loweſt are extremely neat.

In the Black Town is an Armenian church, and ſeveral ſmall pagodas, to which belong a conſiderable number of female choriſters, as well as prieſts. Theſe girls are early devoted to the ſervice of the temple, and ſpend part of their time in ſinging anthems to their idols; and the reſt with their gallants of any nation or religion: they alſo make a part of the retinue of great men when they go abroad; for every man of figure in the country has a number of theſe ſinging women to run before them.

Beyond the Black Town is the company's garden, which is half a mile in length, and is planted with orange trees, guavas, cocoas, mangoes, and a great variety of other fruit. There every body has the liberty of walking as often as they pleaſe. The Eaſt India company has ſeveral of the neighbouring villages under their government, which yield a conſiderable annual revenue; and have alſo a houſe and garden at St. Thomas's Mount, a hill ſeven or eight miles to the weſtward of Fort St. George.

The company's affairs are under the direction of the governor and his council, who inflict any corporal puniſhments, ſhort of life and member, on the Europeans in their ſervice, and diſpoſe of all places of truſt and profit.

There is alſo a court held by the mayor and aldermen twice a week at the Town-hall, where the Aſiatic inhabitants ſue for their debts and implead each other. Theſe magiſtrates appear in their gowns, and have a mace carried before them; but civil cauſes among the Europeans are uſually decided by a jury in the court of the judge-advocate, to which belong two or three attornies, and as many bailiffs, who arreſt for debt, &c. There are alſo juſtices of peace, who hold their ſeſſions in the Black Town on criminal affairs among the inhabitants. A court of admiralty is alſo held for maritime affairs, and the governor ſometimes permits the officers of the land-forces to hold a court-martial and inflict puniſhments on the ſoldiers. Capital offenders are impriſoned and kept with rice and water till they can be ſent to Europe.

The governor has not only the command of Fort St. George, but of all the ſettlements on the coaſt of Coromandel, and the weſt coaſt of the iſland of Sumatra; he is alſo captain of the firſt company of ſoldiers, as the ſecond in council is of the next; yet his ſalary amounts to no more than three hundred pounds per annum. The great advantages made by the governor ariſe from his trading on his own account. On his going abroad he is paid as much reſpect as a ſovereign prince. The guards are drawn out, the drums beat as he paſſes by, fifty or ſixty armed blacks run before him, and ſome of the handſomeſt young fellows he can pick out of the European ſoldiers run by the ſide of his palanquin armed with blunderbuſſes: he is alſo attended by a numerous train of ſervants, and with the muſic of the country.

The ſix perſons who compoſe the council have ſalaries, from a hundred to forty pounds a year, according to ſeniority; but theſe being great merchants, depend more on their trade than the company's allowance. There are alſo two ſenior merchants, who have forty pounds a year each; two junior merchants, who have thirty pounds; five factors, each of whom is allowed fifteen pounds; and ten writers, who have five pounds a year each. Theſe dine at the company's table, and have lodgings provided for them; but it is ſaid that no people in the world work ſo hard for ſuch a trifling ſalary as the company's writers. Their friends indeed uſually ſupply them with ſomething to trade with, or no man would undertake ſo hazardous and tedious a voyage in the quality of a writer, who was ſenſible of the fatigue he muſt undergo.

Beſides theſe officers, who tranſact the buſineſs for the company, they allow the two clergymen of the fort a hundred pounds a year each; the ſurgeon of the fort has a ſalary of about forty pounds a year; the judge-advocate is allowed a hundred a year; and the attorney-general, as he is called, has only twenty-three pounds a year.

a year. The company have likewiſe two eſſay-maſters of their mint, who have a hundred and twenty pounds a year each: but all theſe officers make very great fortunes.

As to their military forces, a lieutenant is allowed fourteen pagodas, or ſix pounds ſix ſhillings, a month; an enſign is allowed four pounds nineteen ſhillings a month; the ſerjeants have two pounds five ſhillings a month; the corporals and gunners of the fort one pound five ſhillings a month; and the private ſoldiers one pound two ſhillings and nine-pence a month each; upon which they may live very comfortably, and wear a clean ſhirt every day: and there is not a common ſoldier in the place who has not a boy to wait on him, the Indians ſuffering their children to ſerve the Engliſh for a trifle, on account of their learning their language.

This colony, however, produces very little of its own growth, and ſcarcely any manufactures for foreign markets, and the trade is in the hands of the Armenians and Gentoos. The chief things in which the Engliſh here deal are diamonds, callicoes, chintz, muſlins, and the like. The diamond mines are but a week's journey from this city, which renders theſe jewels pretty plentiful. Some years ago there were computed to be in the towns and villages belonging to Fort St. George eighty thouſand inhabitants, and about five hundred Europeans.

As the country does not produce food ſufficient for the ſupport of the people, they have rice from Ganjam and Orixa, wheat from Bengal and Surat, and wood for fewel from the iſlands of Diu; hence they might eaſily be diſtreſſed by an enemy who has a ſuperior force at ſea.

In ſhort, this city was actually taken by the French in 1746, who reſtored it after the peace. But in 1758 the French army, under the command of M. Lally, attacked it again; it was then defended by the colonels Laurence and Draper; but though the French entered the Black town, the garriſon in the fort made ſo judicious and ſo brave a defence, that they at length obliged the enemy to retire and abandon the enterprize.

SECT. XXIV.

Of the principal European Settlements from Madraſs to Cape Comorin; particularly Meliapour, Sadraſs, Pondicherry, Gingee, Fort St. David, Tanjore, Tranquebar, Negapatan, Trichinopoly, Madura, and Karical.

THREE miles to the ſouth of Fort St. George is Meliapour, or St. Thomas, which was once the moſt conſiderable place on the coaſt of Coromandel. When the Portugueſe ſettled there it was in ruins, and almoſt abandoned by the inhabitants. The Portugueſe, on their rebuilding the city, gave it the name of St. Thomas, from that apoſtle, who is ſaid to have been martyred there; and it is pretended, that his ſepulchre was on a hill at a ſmall diſtance from the town. The Portugueſe, however, found ſome bones, which they readily ſuppoſed were thoſe of that apoſtle; and having enſhrined them, they became the objects of adoration. As this town had ſeveral villages under its juriſdiction, it was erected into a biſhop's ſee, and its churches, monaſteries, and private buildings were very magnificent. It was alſo regularly fortified; and, as hath been obſerved, became the greateſt place of trade upon the coaſt of Coromandel; but the Portugueſe were driven out of it by the Moors. It then became ſubject to the king of Golconda, but in 1666 it was taken by the French; but the Dutch apprehending that if the French got footing in India, they might diſpute the empire of thoſe ſeas with them, about four years after blocked up the town by ſea with fifteen ſhips, while the king of Golconda laid ſiege to it by land. The town held out beyond expectation; but the Dutch landing ſeven hundred ſoldiers, they joined the beſiegers and took the place; upon which the fortifications were deſtroyed, and it is at preſent a place of no ſtrength. The inhabitants conſiſt of the deſcendants of the Portugueſe, Moors, Gentoos, and a mixture of other nations; but the people are in general poor, the trade being removed to Madraſs.

At an equal diſtance from Madraſs and Pondicherry is the Dutch ſettlement of Sadraſs. In 1759 Mr. Lally ſhewed ſo little reſpect to the neutrality which ſubſiſted between the French and the Dutch, that, being reſolved to make a magazine of this place, he turned out the Dutch ſoldiers and garriſoned it with French, pretending that he did it to prevent its being taken by the Engliſh.

Pondicherry, the capital of the French ſettlements in India, is a large, ſtrong, and handſome town on the coaſt of Coromandel, ſituated in twelve degrees, twenty minutes north latitude, and in eighty degrees, thirty minutes eaſt longitude from London. The ground on which it ſtands is low, and the ſhips cannot caſt anchor nearer to it than about a mile and a half: nor can the boats or canoes come nearer it than the diſtance of a muſquet ſhot; ſo that the blacks come in flat-bottomed boats to carry the men and merchandize to the fleet. The city is extremely regular in its buildings; for the ſtreets are entirely ſtraight, and the principal ſtreet, which runs from north to ſouth, is half a league in length, and that which croſſes the city in the middle extends twelve hundred yards. The fort is two hundred paces from the ſea, and is very irregular, but it is built with bricks, covered with ſuch fine plaſter, that it reſembles white marble. The city is alſo walled round, and has ſeveral great magazines, ſix gates, eleven forts or baſtions, and four hundred and five pieces of cannon mounted upon the walls; beſides bombs, mortars, and other pieces of artillery in the arſenal. The principal houſe is the governor's, and on the other ſide, towards the weſt, lie the company's gardens planted with fine viſtas, which ſerve for public walks, with a large building richly furniſhed, where foreign princes and ambaſſadors are lodged: the jeſuits have a fine houſe, in which are twelve or fifteen prieſts, who teach the youth reading, writing, and mathematics, but Latin is not taught in the city. There are only two or three prieſts in the houſe of the foreign miſſions, and about ſeven or eight in the convent of the capuchins. Some private perſons, who are rich, are very well accommodated in their houſes, though they conſiſt only of one ſtory, as is uſual in moſt of the cities of the province.

The Gentoos have two pagodas. Theſe people are poor, but indefatigable and laborious, and, in reality, are the ſole ſource of the riches of the city and country. Their houſes are uſually eight fathoms in length, and ſix in breadth, containing about fifteen or twenty perſons; but are all ſo dark that it is difficult to conceive how they are able to carry on their manufactures for want of light. Moſt of them are weavers, painters of ſtuffs, and goldſmiths. They paſs the nights in their courts, or on the tops of their houſes, lying almoſt naked on a mat, which is indeed common with them with the reſt of the inhabitants. The beſt of the Gentoo workmen ſcarcely gains more than a penny a day, and yet this is ſufficient to maintain not only the man, but his wife and children. Rice boiled in water, which is very cheap, is almoſt their only food. Unleavened cakes, baked in the aſhes, are their only bread, and that they ſeldom eat; but there is as good bread at Pondicherry as any in Europe.

Notwithſtanding the dryneſs of the country, it produces a prodigious quantity of rice, which may be ſaid to grow only in the water; this is owing to the indefatigable labour and induſtry of the Gentoos. At certain diſtances in the fields they dig wells from ten to twelve feet in depth, and fix a ſwipe on the top with a weight without, and a great bucket within. A Gentoo gets upon the middle of the ſwipe, and works it by leaning alternately with one foot on each ſide, ſinging, as he makes each movement, in the Malabar, their ordinary language, "And one, and two, and three, &c." Thus reckoning how many buckets he has drawn. One well being exhauſted, he goes to another, and thus proceeds through the whole day. Theſe people diſtribute and manage the water with ſurprizing dexterity, and after the overflowing of the great rivers, preſerve it in canals or ponds. But the Mahometans are as indolent as the Gentoos are induſtrious.

The governor-general of the company has twelve horſe guards clothed in ſcarlet, with black facings, and a border of gold; their captain is clothed in the ſame manner, but with lace on the borders and ſeams. He has alſo three hundred foot guards, called Peons, who, upon occaſion, are employed in other ſervices. All this retinue attends the governor when he receives a king, a prince, or an ambaſſador extraordinary. In theſe ceremonies, in which it is thought neceſſary to conform to the pomp of the orientals, he is carried by ſix men on a palanquin, the couch and canopy of which are adorned with embroidery and taſſels of gold.

The company alſo maintain a commandant of the infantry, a major, three companies of French infantry, and between two and three hundred topaſſes, who have been inſtructed in the Romiſh religion, and are clothed and diſciplined in the French manner.

The company, as ſovereigns of Pondicherry and its dependencies, have the privilege of coining money.

Pondicherry was taken by the Dutch in 1693, but reſtored to the French at the peace of Ryſwick. In 1748 it was beſieged by admiral Boſcawen, but the periodical rains obliged him to deſiſt: but in the next war the Engliſh were more ſucceſsful; for in 1760, col. Coote formed the blockade of that important city by land, while an Engliſh fleet, being maſters of the ſea, prevented any ſuccours being ſent to its relief. By this diſpoſition, and the vigilance of the Britiſh officers, the place was ſoon diſtreſſed for want of proviſions, even before the ſiege could be undertaken in form, for the rainy ſeaſon rendered all regular approaches impracticable, but that was no ſooner over than batteries were erected, and, at length, a breach was made in the curtain. The weſt face and flank of the north-weſt baſtion were ruined, and the enemies guns entirely ſilenced. While their walls were in this ſituation the garriſon and inhabitants ſuffered by the moſt ſevere famine, and ſurrendered to Mr. Coote priſoners of war in January, 1751. Of whatever detriment the loſs of this important place might be to the French, it could not be of any great advantage to the Engliſh, after the concluſion of a peace: it was therefore reſtored by the definitive treaty concluded in 1763.

Thirty-five miles to the weſt of Pondicherry is Gingi, or Gingee, which is ſurrounded with mountains, and the roads, or more properly the paſſes which lead to it, begin between thoſe mountains at about ten miles diſtance, and in them an army may be eaſily blocked up, except they are ſo numerous as to be able to keep up a communication with the neighbouring country. The place conſiſts of two towns, called Great and Little Gingee, the firſt to the ſouthward, and the other to the northward: but both are ſurrounded by one wall, three miles in circumference, which incloſes the two towns, and five high and rugged rocks, on the ſummits of which are built five ſtrong forts. The two towns are divided from eaſt to weſt by a wall lined with cannon, which one of thoſe five rocks defends as a citadel. There are four roads which lead to Gingee; but the place is inacceſſible, except from the eaſt and ſouth-eaſt. The Mogul beſieged it in 1690, and though he carried on the ſiege three years, was at length obliged to deſiſt.

The next place of conſequence is fort St. David, a colony and fortreſs belonging to the Engliſh. It is ſituated five leagues to the ſouth of Pondicherry; in twelve degrees three minutes north latitude, and in eighty degrees eaſt longitude from London. It was purchaſed by the governor of Fort St. George for the Eaſt-India company in 1686, for the ſum of 90,000 pagodas. The fort is pretty ſtrong, and its territories extend eight miles along the ſhore, and four miles, within the land. The country is pleaſant, fertile, and watered by ſeveral ſmall rivers. The company have a good garden and ſummer-houſe, where the governor generally reſides; and the town has gardens to moſt of the houſes. This is reckoned a place of the greateſt conſequence to the Engliſh on this coaſt, next to Fort St. George, to which it is ſubordinate.

This ſettlement was taken by the French under the command of M. Lally, who beſieged the town with an army of three thouſand five hundred Europeans, and after battering the place from the ſixteenth of April 1758 to the thirtieth, obliged the deputy-governor to ſurrender. After which the French blew up the fortifications, and reduced them to a heap of ruins. For this, ſays Mr. Cambridge, they cannot be condemned; "but the "ruin of villas, and the injury done to many beautiful "ſtructures in the neighbouring country, will be a laſt-"ing reproach of wanton barbarity to the French." But victory ſoon forſook them, and they were obliged to ſurrender moſt of their own poſſeſſions to the Engliſh.

Tanjore, the capital of a kingdom of the ſame name, is ſituated to the ſouth of Fort St. David, in eleven degrees twenty-ſeven minutes north latitude. The kingdom to which it belongs is bounded on the north by the river Coleroon, on the eaſt by the ſea, on the ſouth by two powerful poligars, or lords, whoſe territories are ſmall; and on the weſt by Trichinopoly. Near the mouth of the Coleroon the Engliſh have a fort called Davecotah, with ſome territory annexed, granted by the king of Tanjore, who was a friend to the Engliſh during the late war. In 1748 M. Lally marched up to the town of Tanjore, and while he was amuſing the king with a negotiation, erected batteries, and began to fire upon the town, and had even made a conſiderable breach, when the Tanjoreans made a general ſally, and at once attacked the French camp and batteries with ſuch ſucceſs, that M. Lally ſpiked up the heavy guns on his batteries, and made a ſudden retreat.

The next ſettlement on the coaſt belongs to the Danes, and is called Tranquebar. A fort was built here in 1610, by a Daniſh admiral, with the permiſſion of the governor of the country, and in 1621 it was purchaſed of the king of Tanjore. This town, which is ſituated in eleven degrees ſixteen minutes north latitude, is about two miles in circumference, and ſurrounded with a good wall faced with ſtone. The houſes of the Indians are mean; but thoſe of the Danes and other Europeans are built of brick and ſtone, and ſufficiently commodious; but have only the ground floor. The ſtreets are wide, ſtraight, and paved on the ſides with brick. The town affords a pleaſant proſpect from the ſea, which waſhes one half of the walls of the fort. There are here Daniſh miſſionaries for the propagation of the goſpel; but they have been much oppoſed by the popiſh miſſionaries in this country. They have a ſchool, with maſters who underſtand the Malabar tongue, into which they have tranſlated the Bible; they alſo inſtruct youth in the proteſtant religion, and have erected a printing preſs, and a paper mill. In 1699 this town held out a ſiege of ſix months againſt the whole forces of the king of Tanjore, and had not Mr. Pitt, the governor of Fort St. George, ſent a reinforcement of Engliſh to their aſſiſtance, it would probably have been taken.

Negapatan, a town belonging to the Dutch, is ſituated in eleven degrees latitude, and was built by the Portugueſe, who erected ſeveral churches there, with a monaſtery, a college of jeſuits, and other public ſtructures; but was taken by the Dutch in 1568. It is populous and well fortified, and in ſeveral of the neighbouring villages the Dutch have planted Chriſtianity. The adjacent country abounds with rice, tobacco, and long pepper.

Trichinopoly is ſituated in a plain once crowded with rich villages and plantations of trees, but ſince the late war hardly any trace of either is left. The town is in the form of an oblong ſquare, the longeſt ſides of which face the eaſt and weſt. On the north runs the river Cauvery, at leſs than half a mile from the fort. This town was formerly incloſed within a wall about twelve hundred yards in circumference round the foot of a rock, but as the inhabitants increaſed it was augmented to half of its preſent length; and the third augmentation being made, incloſes the town as it now ſtands. It is at preſent near four miles round, fortified with double walls, and defended by round towers at equal diſtances, according to the eaſtern method of fortification. The ditch is near thirty feet wide, but not half ſo deep, and at different ſeaſons is more or leſs ſupplied with water, but is never quite dry. The outward wall is built of a greyiſh ſtone, each of them from four to five feet long, and all of them laid endways; it is about eighteen feet high, and four or five thick. The other

is

is more properly a rampart thirty feet high, placed at about twenty-five feet within the wall.

A very extraordinary rock ſtands in the middle of the old town: it is about three hundred feet in height, and on the top of it is a pagoda. The buildings on this rock, and thoſe cut out of the ſides of it, are ſurprizing works in a country where the people have few tools to facilitate their labour. The town is well ſupplied by water courſes from the river, which carry the water into large ſquare tanks or ponds, that have a communication by aqueducts.

This city was taken by the Marattas on the laſt day of April 1741, after a ſiege of five months, and in the laſt war was the chief ſcene of our military operations, it being of the utmoſt importance on account of the ſtrength of the fortification, and the large tract of country it commands. In 1753 the French made an attempt to take it by ſurprize; for on the twenty-eighth of September, at three in the morning, ſix hundred of the French, under the command of Mr. Maſſin, ſcaled the outer wall, while two hundred more, and a body of ſepoys, waited the event below, and prepared to ſecond and join the firſt party. The French, perſuaded that firing alone would frighten the garriſon, turned two of our twelve pounders on the battery againſt the town, and diſcharged them with a volley of ſmall arms, their drums beating, and the ſoldiers crying, *vive le roy*.

Captain Killpatrick being ill of the wounds he had received in a victory colonel Laurence had juſt gained over the French, the next officer in command came to him for orders. Mean while the French came down from the battery, and were between the two walls. There was a ſlight gate in the inner wall, which led into the town; their guide knew where it was, and had two petards ready to clap to it, while, to amuſe the Engliſh, another party was to ſcale the inner wall. The ſcheme was well laid, and had not the French diſcovered themſelves too ſoon, they might, perhaps, have entered the town. The Engliſh officer, on coming to the place attacked, found it difficult to diſcover the enemy's ſituation; but in his hurry and confuſion he did not forget the gate, on the flanks of which he poſted a number of men, with plenty of ammunition, to fire from thence inceſſantly, whether they heard or ſaw any thing of the enemy or not. And luckily he did, for both the guide and petardier were found killed within ten yards of the gate. The eſcaladers began to mount, and their commanding officer, preceded by his drummer, were the firſt who attempted to enter, in which the latter loſt his life, and the officer, receiving a ſhot and a cut at the ſame time, was pulled within the town. The frequent flaſhes of fire, proceeding from the briſkneſs of the attack and defence, were the only guide to the officer of the artillery for pointing his guns, which he did with ſuch ſucceſs, having loaded them with grape, as to ſhatter the ladders, wound and kill a number of men, and entirely diſappoint their well-concerted ſcheme.

The enemy now only thought of making their eſcape, or ſkreening themſelves from the fire; ſome therefore leaped from the battery into the ditch; but the greater number lay hid under the parapet. The long-wiſhed for day at length dawned, which diſcovered the enemy, who inſtantly begged for quarter, which was granted them, and three hundred and ſixty-four Europeans were taken priſoners, ſixty-five of whom were wounded; and forty private men and one officer were found ſlain.

Madura, the capital of a province thus named, and ſometimes the reſidence of the prince, is ſituated in ten degrees five minutes north latitude, in the center between the eaſt and weſt coaſt, and is a large town, fortified in the old way with two walls, round towers at proper diſtances, and a ditch. This city was taken by the Engliſh under the command of captain Caillaud in 1757.

Karical a French ſettlement, is ſituated in ten degrees thirty-five minutes north latitude, four leagues ſouth of Tranquebar, and twenty-five leagues ſouth of Pondicherry. The city, which is ancient, appears to have been very conſiderable, and has at preſent upwards of ſix hundred houſes of ſtone and brick; beſides a great number formed of clay, and is ſaid to contain five moſques, five large pagodas, nine ſmall ones, and about five thouſand inhabitants. It is ſeated on one of the branches of the river Colram, into which ſloops may eaſily enter, and has the following places under its juriſdiction.

The fortreſs of Karcangery is built after the country faſhion, it being flanked with eight large towers; it lies about a cannon-ſhot from the city of Karical, and half a quarter of a league from the ſea-ſide. The French have blown up part of it, having judged it more convenient to ſettle at the entrance on the banks of that branch of the Colram which runs to Karical.

Tiroumale Rayan Patuam is a very conſiderable town, lying to the ſouth of Karical, and one of its dependencies, being about a league diſtant from it, and one thouſand two hundred fathoms from the ſea: it conſiſts of five hundred brick houſes, four moſques, four large pagodas, twenty-eight ſmall ones, and twenty-five inns for the reception of travellers. According to a computation that was made at taking poſſeſſion of it, it contained two thouſand five hundred men.

The reſt of the territory of Karical conſiſts of nine towns, or villages, extending five or ſix leagues round. The ſoil is excellent, and produces great quantities of indigo, cotton, rice, and other grain. A great quantity of cotton and painted ſtuffs are alſo manufactured there.

We have now taken a view of the two capitals of Indoſtan, and of the principal European ſettlements on the eaſtern coaſt; we ſhall therefore return to the interior part of the country, and afterwards proceed with the weſtern coaſt of the peninſula.

SECT. XXV.

Of the interior Part of Indoſtan, particularly a conciſe Account of the Pattans, the Country and City of Caſhmire, and of Lahor. With a general View of the Modern Diviſions of the Peninſula, and ſome Obſervations on the peculiar cuſtoms of Malabar; and particularly of the Women's expoſing their naked Breaſts.

THE Pattans, a nation which in former times fled to the mountains on the borders of Perſia, in order to eſcape the ſword, or to avoid ſubmitting to the conquerors of India, there formed a ſeparate ſtate, which was never thoroughly ſubdued by the Moguls; and occaſionally exerciſed their depredations on the adjacent countries, without its being poſſible for the Moguls to extirpate them. Senſible that the climate and ſoil of the delicious plains would only ſerve to rob them of that hardineſs they contracted in the hills to which they were confined, they for a long time gave no indications of a deſire to exchange them for more pleaſing abodes, or a more acceſſible ſituation. This enabled them to brave the victorious army of Nadir Shah, whoſe troops they quietly ſuffered to penetrate into Indoſtan, and waited his return with the ſpoils of that country. They then harraſſed his troops in the ſtraights and defiles of the mountains, and ſhewed that they were ſo much maſters of the paſſes, as to force him to come to a compoſition with them for leave to paſs them. Since that time they have imitated the Perſian conqueror in plundering the city of Delli; and the chief of that people has at length even placed Timur, his ſon, on the throne of Indoſtan.

Caſhmire, one of the moſt delightful provinces in India, is ſituated on the north of that empire, and is divided from Tartary by Mount Caucaſus, and, according to Berdier, who was many years in India, is but thirty leagues in length, and ten or twelve in breadth. It enjoys a clear healthful air, as temperate as any in Europe, and a ſoil ſo well cultivated and accommodated with all the neceſſaries of life, that it is ſtiled the Paradiſe of India. It is ſurrounded with mountains riſing above each other, the lower abounding with cattle and all kinds of game, and the higher covered with ſnow, which melting forms many rivulets and ſeveral ſmall lakes, rendering the country ſo fruitful, that it reſembles a ſpacious garden of evergreens. It abounds with fruit-

trees of various ſorts, as well as with ſaffron, hemp, rice, and other corn, which, together with the mildneſs of the climate, and the villages ſcattered among the trees, renders this country ſo pleaſant, that Bernier ſays, he was aſtoniſhed at finding himſelf ſuddenly tranſported from the ſtifling heat of the torrid zone into the temperate freſhneſs and fertility of Europe. The woods alſo abound with bees, and the rivulets joining their ſtreams form the river Chenas, by which goods are carried through the greateſt part of the kingdom into the Indus.

The ſnowy mountains are clear at the top, and, like Mount Olympus, riſe above the clouds. Bernier ſays, that among them are many caſcades; and that one of the Mogul emperors aſcended the higheſt of them, with a long train of elephants, on which his ladies rode; when one of them, being frighted at the view of a precipice, fell back on the next, and the reſt behind one upon the other, by which means ſeveral of the women were killed, and all the elephants loſt. The ſame author adds, that in leſs than an hour he felt both ſummer and winter; for on his aſcending this mountain he was ſcorched by the ſun; but when he reached the top he found ſnow, with a miſling rain, and a cold wind; and within leſs than two hundred paces; he perceived one wind from the ſouth, and another from the north, which he imputes to the different exhalations iſſuing from the mountains.

The people who are Mahometans, are of the European complexion, ingenious, witty, and induſtrious; and the women are remarkable for their beauty, on which account they are purchaſed, as hath been already mentioned, by the principal omrahs.

The people employ themſelves in making houſhold furniture, which they ſend to different parts of the Indies, and are excellent at varniſhing; but their principal trade is in the ſtuffs, called chales, one ſort of which is made of their own wool, which is extremely fine; and another of wild goats hair, which they have from Tibet. Some of the pieces are valued at a hundred and fifty rupees, but others are not worth more than fifty; they are about an ell and a half long and an ell broad, and are embroidered at the ends. In winter both ſexes wear them on their heads, and throw one end over their ſhoulders.

The principal city of the province is of the ſame name, and is ſituated in a plain at the north end of a lake formed by the river Chenas. In this lake are many iſlands, and from it a river runs through the town, which has two bridges over it. Several of the Great Moguls have built palaces here, adorned with beautiful gardens, water-works, and canals faced with free-ſtone.

The city is a league long, and half a league broad, but has no walls; the houſes are of timber, well built, and three ſtories high, with gardens and canals both towards the lake and the river, on each of which the citizens have pleaſure-boats, and the banks are adorned with trees. According to Bernier the city is encompaſſed by mountains in the form of a ſemicircle, at the diſtance of about two miles; and there are fine walks on both ſides the lake adorned with arbours. There are alſo many gardens on the adjacent hills, with a moſque, a hermitage, and ſeveral houſes of pleaſure, richly painted and gilt, and fine walks of trees.

Lahor, a province to the north of Caſhmire, was conquered by the Pattans ſome years before they obtained the empire of Indoſtan, and is ſituated in thirty-two degrees north latitude, which was the reſidence of the chief of that nation. It is adorned with moſques, public baths, caravanſaras, palaces, and gardens; and as there are many Gentoos ſettled in it, there are alſo ſeveral pagodas. There is likewiſe an antient palace of the Moguls, on the walls of which are painted the exploits of ſeveral of thoſe emperors. What is moſt remarkable with reſpect to this city is, that here begins the road which leads to Agra, which ſome travellers ſay is five hundred miles in length, and is finely planted with tall trees on both ſides, forming in a manner a continued arbour; at every mile and a half is a turret, and along it are little inns for travellers.

As to the other places in the north of the Mogul's dominions, we have no certain account of them, and therefore ſhall not amuſe our readers with the contradictory relations of former authors, or with ſetting down boundaries that were never marked out; or the latitude of places in which all travellers diſagree.

It has already been obſerved from Mr. Cambridge, that the ſovereign poſſeſſes only a third, and that the leaſt valuable part of his own vaſt empire; and from the ſame author we ſhall here add, the general diviſions that gentleman has given of the peninſula. "Bengal, the "ſmalleſt but moſt fertile province, is governed by a "viceroy. The other diviſion, called the Deckan, ex-"tending from about Balaſore to Cape Comorin, is "alſo delegated by the Mogul to another viceroy, of "exceeding great power, he having within his juriſ-"diction ſeven large territories, to which he has the "right of nominating ſeven nabobs, or governors of "provinces. In all parts of India are ſtill large diſ-"tricts, which have preſerved, with the Gentoo reli-"gion, the old form of government under Indian "kings, called rajahs. Such are Maiſſore, whoſe capi-"tal is Seringapatam, and Tanjore, whoſe capital is "alſo named Tanjore. There are alſo among the "woods and mountainous part of the country ſeveral "petty princes or heads of clans, diſtinguiſhed by the "name of Polygars. Theſe are all tributary to the "nabobs, and thoſe to the viceroy, whoſe capital is "Aurengabad. The Carnatic is that part of the "Deckan which comprehends the principal ſettlements "of the Europeans."

Nothing can be imagined more different than the cuſtoms and manners of the Malabars, and thoſe of the inhabitants of the more northern parts; though they are only divided by an imaginary line, which begins at Mount Dilly, in the latitude of twelve degrees north; for here the government and people wear a new face and form. Malabar comprehends a tract of land which extends to Cape Comorin, and is bounded within land by that vaſt chain of mountains which ſeparates that coaſt from Coromandel, and extends through Indoſtan, till it loſes itſelf in the extremities of Northern Tartary.

Among the ſingularities of this country, one of the moſt remarkable is, that the women are not allowed to cover any part of their breaſts, to the naked diſplay of which, ſays Mr. Groſe, they annex no idea of immodeſty, which ceaſes by their becoming familiar to the eye. Moſt Europeans at their firſt arrival, continues that ingenious author, experience the force of temptation from ſuch a nudity, ariſing from the ideas to which they are accuſtomed by education: but it is not long before theſe impreſſions, by their frequency, entirely wear off, and they view them with as little emotion as the natives themſelves, or as any of the moſt obvious parts, the face and hands. This cuſtom is in ſome parts of Malabar more rigorouſly obſerved than in others.

SECT. XXVI.

Of the Province of Sind, or Sindy, and of Tatta its Capital.

WE ſhall now deſcribe the principal places on the weſt of India, beginning with the river Sind, or Sindy, the antient Indus, which is navigable for the country veſſels as high as Caſhmire. One branch runs from the weſtward, and others through ſeveral large provinces from the north eaſt. Theſe veſſels are called kifties; they are flat-bottomed, and have one maſt, carrying a ſquare ſail. The cabins extend from ſtem to ſtern, and in each is a kitchen and neceſſary, which opens into the water. Theſe cabins are let to traders, and the hold being divided into ſeparate cabins, and every perſon having a lock to his own, has his goods always ready whenever he finds a market.

The province of Sindy, ſituated on the banks of that river, ſeldom knows the miſery of famine; for the Indus overflows all the low grounds in the months of April, May, and June; and, when the floods retire, leaves a

fat ſlime: it is then ſowed, and ſeldom fails of bringing forth a plentiful crop.

The people manufacture ſilks, callicoes, and cotton cloths of ſeveral kinds; and alſo chintz and very beautiful counterpanes. They likewiſe make fine cabinets, both japanned and inlaid with ivory.

Thoſe in the government are of the Mahometan religion; but there are many Gentoos to one Muſſulman.

The inland part of the country produces lapis-lazuli, ſalt-petre, ſal-amoniac, borax, opoponax, aſſafœtida, bezoar, and raw-ſilk.

The city of Tatta is ſituated in a ſpacious plain, about two miles from the river Sindy, from which canals are cut to bring water to the city and gardens, which are well ſtored with fruit and flowers. It is about three miles long, and one and a half broad. On its weſt ſide is a citadel, with barracks and ſtables ſaid to be capable of lodging ſeveral thouſand men and horſe; and there is alſo a palace for the nabob. The Portugueſe had formerly a church here, which is now abandoned.

The country around this city is almoſt level, and over-grown with ſhrubs and buſhes, in which the robbers lurk in order to attack travellers.

At the diſtance of about four miles from Tatta are forty-two fine large tombs, the burying-place of ſome of the kings of Sindy, when that country was governed by its own monarchs. Mr. Hamilton went into the largeſt; this was built in the form of a cupola, and in the middle of it ſtood a coffin about three feet high and ſeven feet long, with ſome others of a ſmaller ſize. The cupola was of a yellow, green, and red porphyry finely poliſhed; and, being ſet chequer-wiſe, had a very pleaſing effect. This tomb is about thirty feet high, and twenty-one in diameter, and was then ſaid to be the burying-place of the laſt king of Sindy.

SECT. XXVII.

Of the Province of Cambaya, or Guzurat, Amadabad its Capital, Cambaya, and the City of Diu.

GUZURAT, or Cambaya, is ſituated to the ſouth of Sindy, and extends from nineteen degrees odd minutes to near twenty-five degrees north latitude, and is upwards of three hundred miles from north to ſouth, and four hundred miles from eaſt to weſt. The bay of Sindy on the north-weſt, and the bay of Cambaya on the ſouth-eaſt, form a great part of this province into a peninſula.

Amadabat, the capital city of Guzurat, and the ſeat of the viceroy, is ſituated in twenty-three degrees forty minutes north latitude, and ſeventy-two degrees eaſt longitude from London, and is about one hundred and forty miles to the northward of Surat. It ſtands in a fine plain, watered by a ſmall river, which, during the rains, is overflowed. The city is incloſed with a wall of brick and ſtone, ſtrengthened by towers, and has twelve gates. The town, with the ſuburbs, is three or four miles in length, and the ſtreets are generally wide, particularly the principal ſtreet, which is no leſs than thirty paces in breadth. The Meidan-ſhah, or king's ſquare, is ſeven hundred paces long and four hundred broad, and has trees planted on every ſide. On the ſouth ſtands the great caravanſera for the lodging of ſtrangers, and on the weſt ſide of the ſquare is the caſtle: it has alſo ſeveral other public buildings. Near the Meidan is one of the palaces of the Mogul, and over the gate is a large balcony, where the trumpets and other country muſic play in the morning, at noon, and in the evening. The Engliſh factory is in the middle of the town, and the Dutch have another in the great ſtreet, and their ware-houſes are generally filled with rich Indian goods.

In this city are many moſques belonging to the Mahometans; but the moſt noble of theſe ſtructures is one called Juna Meſgid, or the Friday's moſque, to which vaſt numbers reſort on that day. It has an aſcent of ſeveral large ſteps, and before it is a ſquare cloiſter one hundred and forty paces in length, and a hundred and twenty in breadth; it is adorned with twelves domes, and has an open paved ſquare in the middle of it. In the front of the moſque are three large arches, and on the ſides two great doors which open into it, over which are very high minerets, or ſteeples, from whence they call the people to their devotions. The chief dome is ſurrounded by ſeveral ſmall ones and two ſpires. The whole pile is ſupported by forty-four pillars, which ſtand in two rows, and the pavement is of marble. There are alſo a great number of pagodas at Amadabad.

This city is ſo intermixed with groves and gardens, that at a diſtance it reſembles a foreſt. The king's garden, which is ſituated by the river ſide without the walls, is filled with all the fruits of India: it is in the form of an amphitheatre, ſeveral parts of the garden riſing gradually one above another, and on the higheſt is a terrace from whence there is a fine view of the country villages for ſeveral miles.

Four or five miles from Amadabad is the village of Serquech, where are the tombs of the former kings of Guzurat. Theſe are large ſquare buildings, with three great arches in each front, and over them many leſſer ones. In the middle is a magnificent dome, and there are ſeveral ſmall ones on the ſides.

Cambaya is ſituated in the twenty-third degree of north latitude, at the bottom of the gulph of the ſame name. It is, at leaſt, two leagues in circumference, and is ſurrounded with a brick wall, which has towers at proper diſtances. It has alſo a large old caſtle. Without the walls are very extenſive ſuburbs, and fifteen or ſixteen public gardens. The ſtreets of the city are ſpacious, ſtraight, and handſome, and the houſes built with brick dried in the ſun; but, as great part of the trade is removed to Surat, it is not now above half inhabited. The Banyan inhabitants are ſo bountiful to the monkies, that they perfectly ſwarm here; and in this city was formerly an hoſpital for ſeveral ſorts of beaſts, which is now run to ruin. It is ſaid that the tide ruſhes ſo furiouſly into the bay of Cambaya, that the ſwifteſt horſe cannot keep pace with it.

There are vaſt numbers of peacocks in the neighbouring fields and woods, which are taken in the night in the following manner: a flag, with a peacock painted on both ſides, and two lighted candles at the top of the ſtaff that holds it, is carried to a tree on which they rooſt; when the peacock being ſurprized at the light of the candles, and ſtretching out its neck to the end of the ſtick, is caught by a nooſe with a ſlip knot, which is drawn by the man who holds the flag. The fleſh of the young ones is white, well taſted, and not much unlike that of a turkey.

The city of Diu is ſeated upon an iſland of the ſame name in the gulph of Cambaya, in the latitude of twenty degrees forty minutes. The iſland is about three miles in length and one in breadth, and is ſeparated from the continent by a narrow channel. The Portugueſe poſſeſſed themſelves of it about the year 1515; and, though it is naturally very ſtrong, they added to it all the advantages of art. The city is pretty large, and encompaſſed with a ſtone wall, with baſtions at convenient diſtances well furniſhed with cannon; the harbour is ſecured by two caſtles that can bring above a hundred large cannon to bear upon its entrance; and by ſea it is fortified by nature with dangerous rocks and high clifts. This is one of the beſt built and ſtrongeſt cities of India; and its edifices of free-ſtone and marble are ſufficient witneſſes of its antient grandeur and opulence. It contains five or ſix fine churches, which ſtanding on a riſing ground, of an eaſy aſcent from the great caſtle, and each of the great churches gradually riſing higher than the other, ſhew their front to the ſea to great advantage, and within they are adorned with images and paintings. It has the advantage of a very good port, where the Portugueſe fleets were uſually laid up while they poſſeſſed the dominion of the Eaſtern ſeas, and here the Moors and all other traders in the Indies were obliged to take out their paſſports before they were permitted to ſail any farther towards the eaſt. At preſent little of its antient traffic is left, the greateſt part of it being removed to Surat, and the ſmall commerce ſtill in the hands of the Portugueſe is carried on under the

the protection of Gentoo colours; for they believe their effects safer with them than under the flag of Portugal, formerly so much respected in those seas. The Portuguese in the castle and city do not exceed two hundred, and the rest of the inhabitants are Banyans, of whom there are said to be about forty thousand, but few of them are rich, the insolence of the Portuguese rendering it unsafe for strangers of great property to dwell among them.

The king of Portugal has about twelve thousand pounds per annum in poll-money paid from hence into his treasury, and the customs and taxes amount to about six thousand pounds more; but, was this island in the hands of some industrious European nation, it might be made the best mart-town on the coast of India for carrying on a trade up the Indus.

SECT. XXVIII.

A particular Description of the City of Surat; with the Manners of the People. An Instance of the strange Effect of Opium. The Manner in which the Gentoo Women of that City bathe in the River; the Manufactures carried on there, and the Manner in which the English lately became possessed of the Castle.

SURAT is situated in the province of Guzurat, a little to the northward of Bombay, about sixteen or twenty miles up the river Tappee, which has nothing remarkable, though the city on its banks is perhaps one of the greatest instances in the known world of the power of trade to bring in so small a time wealth, arts, and population, to any spot where it can be brought to settle.

No longer ago than in the middle of the last century a few merchants repaired to this place, and under the shelter of an old insignificant castle, built a town, which in a few years became one of the most considerable in the world, both for its trade and size, it being at least as large, and as populous as London within the walls, and contains many good houses according to the Indian architecture. Soon after its taking the form of a town, a wall was built round it to defend it from the insults of the Marattas, by whom it had been twice pillaged; but this wall is far from being capable of standing a regular siege, and the castle, which is by the river side, and which you pass in your way up to the city, seems a strange huddle of buildings, mounted here and there with cannon without order, or meaning, and without the least attempt at any thing like military architecture.

Before the English East-India company obtained the possession of Bombay, the presidency of their affairs on the coast of Malabar was held at Surat; and they had a factory established there, which received from the Mogul government several important privileges, and even after the presidency was transferred to Bombay, the factory was continued at one of the best houses in the city, and this becoming too little to contain their effects, they hired another nearer the water-side, which obtained the name of the New Factory.

Mean while this city flourishing extremely, it became the centre, and indeed the only staple of India, it being much frequented on account of the vent goods of all sorts met with there, from whence they were distributed to the inland provinces; and at the same time the manufactures of the country form a considerable part of its commerce. Thus there is hardly any article of merchandize that can be named but is always to be found here, almost as readily as in London itself. The company annually carries on a large trade in piece-goods, especially of the coarse ones, byrampauts, chelloes, and others, for the Guinea market.

While the Mogul government was in its vigour, there was such a shew of justice, as induced the merchants of all religions and denominations to shelter themselves under it, particularly the Gentoos, who came to reside here, not only from their preferring the Mogul form of government to their living under that of the Gentoos, who had none at all; but on account of trade. At that time no flagrant acts of oppression were committed; but the merchants, from personal pique or jealousy, would sometimes find means to engage the government to interfere in their quarrels, to which it was not averse, being sure to be the only gainer.

Besides the number of Gentoo inhabitants of Surat, and in the suburbs and neighbouring villages employed in trade, money-changing, brokerage, and manufactures, they have frequently posts under the Mooriſh government; as collectors, surveyors of the customs, and other offices of trust, where accomptantship is required, in which they generally excel the Moors. And it has been found that none are more rigorous exacters over the Gentoos, nor more ready to oppress them, then these Gentoos themselves.

The streets of Surat are irregularly laid out, but have one advantage which renders them agreeable to those who walk through them during the heat of the day; that is, they are sufficiently wide at the bottom; but the stories of the houses project so far over each other, that the uppermost apartments on each side of the street are so close, that people may easily converse from them, by which means the streets are overshaded, and a free ventilation is preserved. But the shops in this great trading city have a very mean appearance, the principal dealers keeping their goods chiefly in warehouses, and selling by samples.

In summer, when the heats are most intense, though they are never so intolerable as in many other places, the principal inhabitants have country houses a little way out of town, where they reside, or go in parties to enjoy themselves in their gardens and frescades, by the side of the waters with which they are furnished. The English company in particular have a very pleasant garden kept for the use and recreation of the gentlemen of the factory, though the incursions of the Marattas have sometimes rendered these rural recesses very unsafe.

While the communication with the country is kept open, there is no better place in the world for provisions; for besides the abundance of every article, which an unbounded importation brings into the market, the natural productions of the soil are excellent in their kind. All manner of eatables are at a reasonable price, and as good as can any where be found, particularly the wheat of Surat is famous all over India for its remarkable whiteness, substance, and taste, and nothing can exceed their roots and sallads. There are likewise many kinds of wild fowl and game exceeding cheap. The Europeans depend chiefly on importation for their wines and spirituous liquors, few of them relishing the distillery of the country, which produces various strong spirits to which the natives give very odd names, as the spirit of deer, spirit of mutton, spirit of goat, which arise from their throwing into the still a haunch of venison, a joint of mutton, or a quarter of a goat, which respectively give their names to the distillation, and this flesh they imagine gives the liquor a mellowness and softness that corrects its fiery spirit.

Most of the hard labouring people of Surat, and especially the hamals or porters, who get their living by carrying goods to and from the warehouses, and bear loads of a very great weight, have contracted such a habit of taking opium, that an author of great veracity says, he has been credibly assured, that some of these fellows will take at one dose three copper gorze weight of this drug without danger, which is considerably above an ounce, and pretend that it enables them to work and carry heavy burdens.

Many of the great and wealthy also contract a habit of it, from their considering it not only as a high point of sensuality, on account of the pleasing deliriums they experience from it, but as an extraordinary provocative; they usually take it in milk, boiled away from a large to a small quantity, and when they would put an end to its operation, they swallow a spoonful or two of lime juice, or any other acid of the same kind; but those who use it, by thus forcing nature, wear out its springs, and prematurely bring on all the inconveniencies of old age; but this is of little weight with the generality of the Orientalists, who are always more actuated by present enjoyments, than a regard for the greatest remote advantages.

They

They pretend that opium has a ſtrange paradoxical mixture of effects in its operation, cauſing at once a ſeeming heavineſs of the head, an apparent ſleepineſs of the eye, and yet an extraordinary watchfulneſs; in confirmation of which the people of Surat relate the following ſtory: One of the governors of the town receiving a viſit from a Gentoo rajah his friend, at a garden without the city walls, they met with each their guards and attendants. As they were walking the governor took notice of the rajah's guards, who were ſquatted down after their manner, in an open guard-room, with their heads leaning on their naked ſwords, and in appearance either dozing or faſt aſleep. The governor obſerved with a ſmile to the rajah, that he had a very juſt opinion of his good faith, ſince he would venture this interview with guards in ſuch a condition from the opium he knew it was their cuſtom to take. "That, ſays the rajah, is "a miſtake, and if there be any body here for whom "thou haſt no concern, bid him pluck a flower as ſoftly "as he pleaſes out of any of their turbans." The governor inſtantly ordered a perſon, who was near him, to do what the rajah had mentioned. The man obeyed; he proceeded with the utmoſt caution, and approaching him who ſeemed the moſt overcome with ſleep, ſnatched off the flower. The rajah's guard felt what was done, and without more ceremony, at one ſtroke cut off his arm, and the reſt were inſtantly on their feet. Thus the governor was convinced of their vigilance at the expence of a ſervant, who, whether he was innocent, or ſo guilty as to deſerve being expoſed to ſuch a trial, was probably thought of no conſequence under that arbitrary government.

Bang is alſo much uſed at Surat, as well as all over the eaſt; it is an intoxicating herb, and it is difficult to conceive what pleaſure can be found in the uſe of it, it being very diſagreeable to the taſte, and ſo violent in its operation, as to produce a temporary madneſs; for it cauſes ſome to run furiouſly about killing all they meet, without any diſtinction, till, like mad dogs, they themſelves are knocked on the head.

The Gentoo women of the beſt faſhion at Surat make no ſcruple of going to the river, and bathing publickly in the ſight of the men. They indeed go into the water with their cloaths on, but wetting them makes them cleave ſo cloſe to their bodies that they perfectly expreſs the turn of their limbs. When they come out of the water, and change their wet for dry cloaths, they ſhift themſelves with ſuch dexterity, that though it be done openly not the leaſt glimpſe of any thing immodeſt can be ſeen.

All religions are tolerated in this city, and nothing can be more political in a place of ſuch univerſal trade. The Moors, who have the government in their hands, here ſeem to lay aſide that rigour, and that fondneſs for making of proſelytes, they have ſhewn in moſt other parts where their religion prevails. Thus, if they take an European into their ſervice in quality of gunner, for they imagine all Europeans are born engineers, they never give themſelves the leaſt concern about his religion. The inhabitants of Surat and the neighbouring country are commonly very induſtrious, and have a number of manufactures; but the moſt conſiderable of them is the atlaſſes, or ſattins flowered with gold or ſilver, which have a rich ſubſtantial look, but are not performed in a very elegant taſte, the flowers being ill-fancied, and without air: and the red ground moſtly uſed, dull, and unpleaſant.

A few ſhawls are manufactured here, but the fineſt ſort come from the province of Caſhmire, they being made of a peculiar kind of ſilky hair, that produces from the loom a cloth beautifully bordered at both ends, with a narrow flowered ſelvage. The pieces are about two yards and a half long, and a yard and a half wide; theſe, without the trouble of making up, ſerve the natives for a wrapper or mantle. The price is ſaid to be from ten pounds and upwards to fifteen ſhillings, and though it is extremely fine, it has a ſubſtance that renders it warm, and the fine ones are ſo pliant as to be eaſily drawn through a ring for the fingers.

The manufacturers have commonly their work beſpoke by the wholeſale merchants; but when this is not done, the workmen repair to the bazar or market-place, where they ſtand holding up the piece to any chapmen that will give the price, and ſeldom return without diſpoſing of them; for there are a number of petty dealers, who thus purchaſe goods at the firſt hand, and afterwards ſell them in quantities to the merchants.

This being the only ſea-port of any conſequence in the dominions of the Mogul that is not poſſeſſed by the Europeans, the inland trade, particularly to Delhi and Agra, employs a number of caravans in diſtributing the goods imported. But the roads are never perfectly ſafe, on account of the independant rajahs, and the troubles of the country.

A conſtant intercourſe is preſerved betwixt Surat and Bombay, not only by ſea, but by foot paſſengers over land, hired at a moderate rate. They are very expeditious in theſe journies, and commonly uſe opium to preſerve them from wearineſs, and by this means keep running and dozing, as it were with their eyes open, without feeling the fatigues of the way.

The governor of Surat keeps his ſeat of adminiſtration at what is called the Durbar, where he is generally preſent in perſon, and gives his orders. All actions of a criminal and civil nature are brought before him, and ſummarily diſpatched in the eaſtern manner. He obſerves one piece of ſtate that appears pretty remarkable: he never, on any material affair, ſpeaks to his attendants; but writes his orders in the Perſian tongue upon ſmall ſlips of paper that lie before him ready for that purpoſe, and when written muſt be obeyed without reply. Theſe are afterwards brought him, and being ſtrung ſerve as a record of his actions.

It will not be unintereſting to the Engliſh reader to ſee here an account of a remarkable revolution which has happened in this city; a revolution that muſt be attended with conſiderable advantages, with reſpect to our India company.

The late Mogul, moved by his zeal for the Mahometan religion, and a concern for the intereſts of commerce, in order to keep the ſeas open between Surat and the Perſian and Arabian gulphs, had been at the annual expence of fitting out a large ſhip to carry pilgrims to Judda, which is at no great diſtance from Mecca, and to protect the trade of Surat. For this purpoſe he granted his admiral the Siddee, a revenue called the tanka, of the yearly value of three lacks of rupees, ariſing partly from ſome adjacent lands, and partly from the revenues of Surat, which were annually paid him by the governor; but he had not the leaſt title to any thing independent of the marine.

At length the government of Surat being backward in their payments, and with-holding from the Siddee great part of the ſum, that officer ſent ſome of his cruizers into the river of Surat, when the monſoon was ſetting in, and made the ſeaſon a pretence for remaining there. Siddee Muſſoot took this opportunity of getting ſome footing in the government, and ſeized on the caſtle, which he held till his death; after which he was ſucceeded by his ſon in 1756.

Muſſoot not only kept the caſtle, but appropriated to his own uſe one third of the revenues of the town; and another third had for a long time been annually paid to the Marattas, who farm them out to an officer who reſides at Surat; and as they are maſters of the whole country up to the very gates, it has been thought expedient to pay them duly their allotment, rather than ſubject the inland trade to be interrupted by them. The Siddee at length depoſed the governor, and placed Meah Atchund in his room; the city was then reduced to a ſtate of anarchy; for the lawleſs behaviour of the Siddee's ſon filled the city with riots and murders, while the new exactions and burthens upon trade grew intolerable.

Hence in the year 1758, the principal merchants and inhabitants earneſtly ſollicited Mr. Ellis, the Engliſh chief, to perſuade the preſidency of Bombay to fit out an expedition for taking poſſeſſion of the caſtle and tanka, and entered into an obligation to be reſponſible for five years for any deficiency in the revenues of the caſtle and tanka, which were rated at two lack of rupees per annum;

annum; and as Pharraſs Khan or Cawn, who had been deputy-governor to Meah Atcund, had regulated the police to the ſatisfaction of the whole city, it was propoſed to have him for governor.

In the beginning of the year 1759 Mr. Spencer, who ſucceeded Mr. Ellis, informed the governor and council of Bombay, that though Meah Atcund was ſtill governor of the town, the Siddee left him ſo little power that he was not even allowed to nominate the officers that properly belonged to him. The dread of the continual ravages, and the frequent murders now committed with impunity, ſtruck ſuch terror into the inhabitants, that many people of ſubſtance left the place, and thoſe who ſtaid there became ſtill more ſolicitous that the caſtle ſhould be in the hands of the company, from their confidence in the humanity and juſtice of their government. There ſeemed but one thing to be apprehended, which was, leſt Atcund or the Siddee, ſhould, in diſtruſt of their own ſtrength, fly to the deſperate reſource of calling in the Marattas.

The preſidency of Bombay at length complied with the earneſt ſollicitations that had been offered them, and, in order to ſecure themſelves from any danger from the Marattas, either by ſea or land, deſired admiral Pocock to join the enterprize with two ſhips of his ſquadron. The admiral conſented to their requeſt, and gave orders for the Sunderland and Newcaſtle to countenance the enterprize. The Siddee, who enjoyed the tanka, on condition of keeping up a fleet for the Mogul, had ſo neglected the marine, that it was incapable of oppoſing the company's ſhips. Captain Maitland was now appointed to take the command of eight hundred and fifty men, artillery and infantry, and fifteen hundred ſepoys; which, being put on board the company's veſſels, landed on the ninth of February. On the captain's approaching the town he had a ſmart engagement, which laſted four hours, with ſome of the Siddee's people who had taken poſt in the French garden. A battery was then erected, and a briſk fire kept up againſt the caſtle from two twenty-four pounders and a thirteen inch mortar, but without effect; when a council of war being called, it was determined to make a general attack; and, in purſuance of this reſolution, the company's grabs and bomb-ketches warped up the river in the night, and anchored early in the morning oppoſite the Bundar, or cuſtom-houſe, which was poſſeſſed by the enemy; and a general attack began from the veſſels and a battery, in order to drive the enemy from their batteries, and to facilitate the landing of the infantry. The firing laſted till after eight, when the boats putting off, the men were landed, and putting the enemy to flight, took poſſeſſion of all the outer town. Three mortars were then planted at the diſtance of about ſeven hundred yards from the caſtle, and five hundred from the inner town; the bombarding and cannonading, which continued a whole day and a night, threw the beſieged into ſuch conſternation, that they never returned a gun.

Pharraſs Cawn's friends, who had not made the leaſt effort in his behalf, now ſignified, that they choſe he ſhould be naib, or deputy-governor; and that the government ſhould be continued to Atcund: it was therefore agreed to ſecure the government to him, on condition of his making Pharraſs Cawn naib, and eſtabliſhing the Engliſh in the poſſeſſion of the caſtle and tanka. To this Atcund readily agreed, and opening the gate of the inner town, ordered a party of men to bring the Siddee to terms, who was now ſenſible that it was impoſſible for him to hold out againſt the combined forces, and the general voice of the people. After many repeated meſſages, and a variety of propoſals, it was at laſt granted, that the Siddee's people ſhould have liberty to take away all their valuable effects, and even the common furniture of their houſes. This was done with the greateſt regularity, and the Engliſh were peaceably put in poſſeſſion of the caſtle and tanka. The guns and ammunition found in the caſtle, with the veſſels and naval-ſtores, as part of the tanka, were ſecured for the company, till the Mogul's pleaſure was known; theſe advantages were ſollicited and obtained, and grants arrived appointing the company admiral to the Mogul, before the murder of that prince and the revolution at Delli. Thus was accompliſhed a revolution of general benefit; peace and good government was reſtored to the city, and the Engliſh acquired a valuable poſſeſſion, to the univerſal ſatisfaction of the inhabitants.

SECT. XXIX.

Of the Portugueſe Settlements of Daman and Baſſaim, and of the City of Aurengabad.

DAMAN, a Portugueſe factory, fifty miles ſouth of Surat, is, like their other Indian factories, dependent upon Goa, whoſe archbiſhop has a vicar-general here. The Portugueſe firſt took it in 1535, and it being recovered from them, they took it again in 1559, and have kept it ever ſince, though the Moguls have made ſeveral attempts to regain it; but they have made it ſo ſtrong as to baffle all their force. Aurengzebe beſieged it about the middle of the laſt century with above forty thouſand men; but the garriſon making a ſally upon a part of his camp guarded by two thouſand elephants, thoſe unwieldy animals were ſo terrified by the fire-works, that they broke in upon his camp and trampled down half of his army; upon which he raiſed the ſiege, and never more made war upon the Chriſtians.

It is ſituated in a good air, at the mouth of a river of its own name, which running through it divides it into the Old and New Towns. The New Town, which ſtands on the ſouth of the river, is built in the Italian taſte, and moſt of the houſes ſtand by themſelves, and have an orchard or garden. They are tiled, but are generally only one ſtory high, and have windows of tranſparent oyſter-ſhells. It is about two miles in circumference, and has four good baſtions, with a ſmall intrenchment caſt up on the ſouth and eaſt ſides; and on the other two ſides a branch of the river enters its ditch. The walls have a platform and two gates. The port, which is but ſmall, is formed by the river betwixt the two towns, but is quite dry at ebb, ſo that no veſſel can enter it except at high water, and the great ſhips only at the ſpring-tides. Its entrance is defended on the ſide of the Old Town by a ſmall fort of white ſtone, called St. Salvadore, with three baſtions.

The Old Town is in a manner deſerted, and the New is far from being ſo populous as might be expected from its extent: however, there are ſome manufactures of ſilk carried on there, with which they furniſh the market of Goa; and there are ſeveral villages and iſlands belonging to it, which pay tribute to the Portugueſe.

Baſſaim is a fortified city belonging to the crown of Portugal, and ſituated about eighteen leagues to the ſouth of Daman, on a ſmall iſland ſeparated from the continent by a rivulet. The walls are pretty high, and about two miles in circumference. In the middle of the city is the citadel; it has three or four churches, a college, an hoſpital, and ſome monaſteries and convents. It is a place of ſmall trade, for moſt of its riches lie uſeleſs in the Portugueſe churches, or in the hands of indolent country gentlemen, who ſpend their days in eaſe, pride, and luxury, without giving themſelves the leaſt concern about trade, or having any feeling for the poverty of the reſt of the people.

To the eaſt of Baſſaim, in the latitude of twenty-one degrees, is the large and populous city of Aurengabad, the capital of the Deckan, and the ſeat of the viceroy, whoſe power is exceeding great, it extending from the province of Bengal to Cape Comorin, and has the power of nominating ſeven nabobs. The city carries on a conſiderable trade, and is ſituated in a very fruitful country, one hundred and forty miles ſouth-eaſt of Surat.

SECT. XXX.

Of the Iſland and City of Bombay. Its Situation, Name, Climate, Fortifications, and other Buildings; with an Account of the Inhabitants and Government.

BOMBAY is an Iſland ſeated in eighteen degrees forty-one minutes north latitude, on the coaſt of

Decan, the high mountains of which are full in view, and is ſo ſituated as, with the winding of other iſlands along the continent, to form one of the moſt commodious bays in the world, on which account it received its name of Bombay by a corruption of the Portugueſe word Buon-Bayhia, or Good Bay; for the harbour is ſo ſpacious as to contain any number of ſhips, has excellent anchoring ground, and from its circular form can afford them a land-locked ſhelter againſt any winds to which its mouth is expoſed.

This iſland, which is ſeven miles in length, and twenty in circumference, is admirably ſituated for the center of the commerce between the Malabar coaſt, the gulph of Perſia, the Red Sea, and all the trade of that ſide of the great Indian peninſula, and the northern parts adjoining to it; which are therefore properly ſubordinate to the government of the preſident who reſides there.

Though this iſland is within the tropics, its climate is far from being intolerable with reſpect to heat, and is never ſo cold as to be diſagreeable to an European conſtitution. In the very hotteſt ſeaſon, which is that which immediately precedes the periodical returns of the rains, the inhabitants ſeldom want the alternate refreſhment of land and ſea-breezes, and there are but few days in the year when the heat is exceſſive; and even theſe may be rendered ſupportable by avoiding violent exerciſe, keeping out of the unabated heat of the ſun, and by a light diet. Great care ſhould alſo be taken of your not expoſing yourſelf to the night-dews, and a too quick tranſition from a ſtate of open pores to the perſpiration being entirely ſhut up. Bombay had long the infamous character of being the burying-ground of the Engliſh; but experience, purchaſed at the expence of a multitude of lives, has now rendered the cauſes of this mortality more known, and conſequently enabled people to guard againſt them; and the iſland is better ſupplied with able phyſicians and ſurgeons. Thus the climate is no longer ſo fatal to the Engliſh inhabitants; it is even incomparably more healthy than many other of our ſettlements in India; and this place, the name of which uſed to carry terror with it, is no longer to be dreaded, provided that common meaſures of temperance be obſerved, without which the tenure of health muſt in any climate be very hazardous.

The ſeaſons may properly be divided, as in the other places near the tropics, into the wet, which continues about four months, and into the dry, which laſt about eight months in the year. The ſetting in of the rains is generally uſhered in by a violent thunder-ſtorm, uſually called the elephanta, a name it probably received in the Aſiatic ſtile from the compariſon of its force to that of the elephant. This is a pleaſing prelude to the refreſhment occaſioned by the rains moderating the exceſſive heat, then at its height. They begin about the twenty-eighth of May, and ceaſe about the beginning of September; after which there is no more than a few tranſient ſhowers. Though this rainy ſeaſon is very hot, yet in any dry intervals, when the ſun ſhines out for a few hours, it is accounted the pleaſanteſt; and the end of it, and ſome days after, is eſteemed the ſickline ſt time in the year, from the exhalations forming a kind of faint vaporous bath, from which thoſe who lodge in the higheſt apartments are leaſt in danger.

The trading veſſels of the country are laid up during this ſeaſon, eſpecially thoſe belonging to the black merchants, who ſend none to ſea till after a feſtival at the breaking up of the rains, when they conſecrate a cocoa-nut, which they gild and ornament, and throw it, by way of oblation, into the ſea.

The chief town, which is alſo named Bombay, has a caſtle, which is a regular quadrangle, well built of ſtrong hard ſtone. In one of its baſtions that faces an eminence, called Dungharee-point, is a large tank, or ciſtern, hollow, which contains a great quantity of water, that is conſtantly repleniſhed by the periodical rains. There is alſo a well within the fort; but the water is not extremely good, and in general that of the iſland is brackiſh. There is a ſmall fort on Dung-haree-point, and the town is encompaſſed with a wall and a ditch, into which water may be admitted at pleaſure, by letting in the ſea; ſo that the town is ſurrounded with water, and is eſteemed one of the ſtrongeſt places poſſeſſed by the company in India. Conſidering the commodiouſneſs of its harbour, it might have been made our capital place of arms, and been of nearly the ſame uſe to the Engliſh company as Batavia is to the Dutch, eſpecially if the Portugueſe had not unjuſtly detained from us the large and fertile iſland of Salſett, which would have ſerved as a granary to it; and which they ſuffered to become an eaſy conqueſt to the Marattas, who inhabit the neighbouring coaſt of the continent.

At proper poſts round the iſland are ſeveral little out-poſts, none of which are capable of making any long defence, except the fort of Mahim, which is the moſt conſiderable next to that of Bombay, and is ſituated at the oppoſite extremity of the iſland.

The Engliſh church at Bombay is able to contain all the Engliſh that are ever there. This is a building that has nothing to boaſt of with reſpect to its architecture; but is extremely neat, commodious, and airy. It is ſituated on the Green, a ſpacious area that extends from it to the fort, and is pleaſantly laid out in walks planted with trees, and round it are the houſes of the Engliſh inhabitants.

Theſe have generally only a ground-floor; but they have a court-yard both before and behind, in which are the offices and out-houſes. They are ſubſtantially built with ſtone and lime; and being ſmooth plaſtered on the out-ſide, and kept white-waſhed, they have a neat air; but are offenſive to the eyes, from their reflecting the too dazzling rays of the ſun. Few of them have glaſs-windows to any of their apartments, the ſaſhes being generally paned with a kind of tranſparent oyſter-ſhells, which have the ſingular property of tranſmitting ſufficient light, while they exclude the violence of its glare, and have a cool look. The flooring is generally compoſed of a kind of ſtucco, called chunam, made of burnt ſhells, which, if well tempered, is extremely hard and laſting, and takes ſo fine a poliſh that one may ſee one's face in it.

The houſes of the black merchants, as they are called, though ſome are far from being of ſo deep a colour as to deſerve the name, are generally ill built and inconvenient. The window-lights are ſmall, and the apartments ill diſtributed. Some, however, make a better appearance by being built a ſtory high; but the beſt of them have a meanneſs in the manner and a clumſineſs in the execution, that renders them inferior to the buildings of the moſt ordinary of thoſe of European architecture. Both their and the Engliſh houſes have ſmall ranges of pillars, that ſupport a penthouſe, or ſhed, either round, or on particular ſides, and afford a pleaſing ſhelter from the ſun, at the ſame time that they keep the inner apartments cool and refreſhed, by the draught of air under them. However, moſt of the beſt houſes are within the walls of the town, which is little more than a mile in compaſs.

As to the pagodas of the Gentoos, they are ſcarce worth mentioning, they being low mean buildings, that commonly admit the light only at the door, facing which is placed the principal idol. The Gentoos imagine, that darkneſs and gloom inſpire a kind of religious reverence, and are remarkably fond of having their pagodas amongſt trees, and near a tank or pond, for the ſake of their ablutions, which they do not, like the Mahometans, practiſe as a religious ceremony, but merely out of cleanlineſs, and the pleaſure of bathing in thoſe hot countries. Theſe tanks are frequently expenſive works, they being generally ſquare, and encompaſſed with ſtone ſteps. The moſt remarkable pagoda on the iſland is on Malabar hill, above two miles from the town, and is a promontory that ſtretches into the ſea. From one ſide of the pagoda is a gentle deſcent to the ſea, and the other three ſides are ſurrounded with trees that form an amphitheatre on the ſlopes of the hill, affording a moſt wild and agreeable landſcape. Theſe trees being expoſed to the winds follow the general law, and take a ſtrong bent to the oppoſite point with ſuch regularity, that they appear as if trimmed or pruned into the figure they exhibit.

At the extreme point of Malabar hill is a rock on the deſcent to the ſea, flat at the top, in which is a natural

tural crevice, that has a communication with a hollow that terminates at an opening outwards towards the ſea. This is uſed by the Gentoos as a place for the purification of their ſins, which they ſay is effected by their going in at the opening and emerging out of the crevice.

The king of Portugal, in the year 1663, transferred the property of this iſland to king Charles II. on his marriage with the Infanta of Portugal, as part of her fortune; and ſome time after his majeſty made a preſent of it to the Engliſh Eaſt India company. The iſland was then, and ſtill continues, divided into three Roman catholic pariſhes, which are thoſe of Bombay, Mahim, and Salvaçam; the churches of which are governed by popiſh prieſts, of any nation but the Portugueſe, againſt whom the Engliſh wiſely objected, from the danger of their carrying on a too cloſe correſpondence with the prieſts of their own nation in the neighbouring Portugueſe ſettlements. Hence moſt of the proprietors of the land are popiſh Meſtizos and Canarins: the firſt are a mixed breed of the natives and Portugueſe, and the other are aborigines of the country converted to the Portugueſe faith. The other land-owners are Moors, Gentoos, and Parſees. All thoſe enjoy the perfect ſecurity of their property, and the right of inheritance is regulated according to the reſpective laws and cuſtoms of the people of each religion. The land is chiefly employed in groves of cocoas, rice-fields, and onion-grounds, this iſland producing an excellent ſort.

The company have alſo acquired a conſiderable eſtate in land by purchaſes, confiſcations for crimes, and ſeizures for debt. They have alſo two pleaſant gardens, cultivated after the European manner: the one a little way out of the gates, open to any of the Engliſh gentlemen who pleaſe to walk in it; the other, which is much larger and finer, is about five miles from the town, at a place called Parell, where the governor has a very agreeable country-houſe, which was originally a Romiſh chapel belonging to the jeſuits, but was confiſcated about the year 1719, on account of their being guilty of ſome foul practices againſt the Engliſh intereſt. This chapel is now converted into a pleaſant manſion-houſe, and, with the additional buildings, is rendered a ſpacious and commodious habitation. There is an avenue to it of a hedge and trees near a mile long; and, though it is ſituated not far from the ſea, it is ſheltered from the air of it by a hill between. The governor ſpends moſt part of the time during the heats at this villa, the air being cooler and freſher than in town, and nothing is wanting that can render it an agreeable retreat.

The cocoa-nut groves conſtitute a conſiderable part of the landed property. When a number of theſe are contiguous, they form what is called the woods, through which ſpaces are left for roads and path-ways, where you are agreeably defended from the ſun at all hours in the day. They are alſo thick ſet with houſes belonging to the reſpective proprietors, and with the huts of the poorer ſort of people; but they are unwholeſome for want of a free ventilation.

The government of the iſland is entirely Engliſh, ſubordinate to the directors of the Engliſh Eaſt India company, who by commiſſion appoint a preſident, to whom is joined a council of nine perſons; but all of them are ſeldom on the ſpot, they being employed as chiefs of the ſeveral factories ſubordinate to the preſident. Thoſe at Bombay are ſuch as enjoy poſts of the greateſt truſt, as the accomptant, the warehouſe keeper, the land-paymaſter, the marine-paymaſter, and other officers for tranſacting the company's affairs. Theſe are generally ſuch as have riſen by degrees from the ſtation of writers, and take place according to ſeniority. The preſident and the members on the ſpot conſtitute a regular council, in which every thing is determined by plurality of votes: yet the influence of the preſident is generally ſo great, that every thing is carried according to his dictates: for ſhould any of the council oppoſe him, he can make their ſituation ſo uneaſy, as to oblige them to quit the ſervice, and return home.

As to the military and marine force, they are more immediately under the direction of the preſident, who has the title of general, and commander in chief. The common ſoldiers are chiefly thoſe whom the company ſend in their ſhips; deſerters from the ſeveral nations ſettled in India, as Portugueſe, Dutch, and French, which laſt are uſually called Reynols; and laſtly, Topaſſes, who are moſtly black, or of a mixed breed from the Portugueſe. Theſe are formed into companies, under Engliſh officers. In this ſervice may alſo be included regular companies formed of the natives: theſe ſoldiers are called ſepoys; they uſe muſkets; but are chiefly armed in the country manner, with ſword and target, and wear the Indian dreſs, the turban, veſt, and long drawers.

Nothing has contributed more to render this iſland populous, than the mildneſs of the government, and the toleration of all religions, which is ſo univerſal, that the Roman catholic churches, the Mahometan moſques, the Gentoo pagodas, and the worſhip of the Parſees are all equally tolerated: they have all the free exerciſe of their religious rites and ceremonies, without either the Engliſh interfering, or their claſhing with each other. This toleration forms an amiable and a very advantageous contraſt to the rigours of the inquiſition exerciſed in the neighbouring territories of the Portugueſe, whoſe unchriſtian zeal has rendered them odious, and was one of the principal reaſons of their being driven out of the greateſt part of their conqueſts there by the Marattas, who are all Gentoos.

SECT. XXXI.

Of the principal Iſlands near Bombay, particularly Butcher's Iſland and Elephanta; with a Deſcription of the remarkable Temple in that Iſland cut in a Rock; and an Account of the Iſland of Salſett.

THE principal of the ſmall iſlands near Bombay are Butcher's Iſland, ſo called from the cattle being kept there for the uſe of Bombay and Elephanta. The former is ſubject to the Engliſh, who keep an enſign's guard there, with a very ſmall fort. This iſland is not above two miles long, and is no where above a mile broad.

The moſt remarkable of theſe iſlands is that of Elephanta, which fronts the fort, and is two miles from Butcher's Iſland. It does not exceed three miles in compaſs, and conſiſts of almoſt one entire hill, at the foot of which, as you land, you ſee above the ſhore on the right hand an elephant, coarſly cut in ſtone, of the natural ſize, which, at a ſmall diſtance, may be taken for a living elephant, from the ſtone being naturally of the colour of that animal. It ſtands on a platform of ſtones of the ſame colour. On the back of this elephant was placed a young one ſtanding, that appears to have been of the ſame ſtone, but has been long broken off. No tradition is old enough to give an account of the time or uſe for which this elephant was formed.

On aſcending an eaſy ſlope, near half way up the hill, you come to the entrance of a ſtupendous temple, hewn out of the ſolid rock. It is an oblong ſquare eighty or ninety feet long, and forty broad. The roof is formed of the rock cut flat; it is about ten feet high, and is ſupported towards the middle, at an equal diſtance from the ſides, and from one another, by two regular rows of pillars of a ſingular order. They are very maſſy and thick in proportion to their height, and have capitals, which bear ſome reſemblance to a round cuſhion, preſſed by the weight of the ſuperincumbent mountain, with which they are alſo of one piece. At the farther end are three gigantic figures, the face of one of which is, at leaſt, five feet in length, and of a proportionable breadth; but theſe monuments of antiquity were much diſfigured by the blind fury of the Portugueſe, when they made themſelves maſters of the place, and muſt have taken great pains thus to mutilate and deface them. About two-thirds of the way up this temple are two doors fronting each other, leading into ſmaller grottos that open upon the hill. By the door-way, on the right hand, are alſo ſeveral mutilated images, ſingle and in groupes, particularly one that has ſome reſemblance to the ſtory of Solomon's dividing the child; a figure ſtanding

ing with a drawn ſword in one hand, and holding an infant in the other, with the head downwards. The door-way on the left hand opens into an area of about twenty feet in length, and twelve in breadth; at the upper end of which, on the right hand, is a colonade, covered at the top. It is ten or twelve feet deep, and in length anſwers to the breadth of the area: this joins to an apartment adorned with regular architecture; it is an oblong ſquare, and has a door in perfect ſymetry. The whole is executed in a taſte very different from any of the oldeſt and the beſt Gentoo buildings any where extant. It is remarkable that round the cornices are ſome paintings, the colours of which remain exceeding bright and freſh, though, ſuppoſing they are as old as the temple, they muſt have been there ſome thouſand years. The time when this great work was performed is entirely unknown. The moſt probable conjecture is, that it was formed by the aborigines of the country, and that the religion of the Gentoos has undergone ſome revolution; which is the more probable, as the preſent Gentoos do not appear to retain any veneration for the place, except on account of its undoubted antiquity.

The ſituation of this place ſo near Bombay, not only affords the Engliſh inhabitants an eaſy opportunity of gratifying their curioſity in viſiting ſo remarkable a piece of antiquity, but occaſionally of a very agreeable party of pleaſure. In their way thither they ſometimes dine at Butcher's Iſland, on account of the conveniency of the officer's houſe to receive them. But others, taking their proviſions with them, dine in the cave itſelf, for, during the ſultry heats, there cannot be imagined a cooler and more pleaſant retreat; for though the air abroad is exceſſive hot, you no ſooner enter the cave than you are refreſhed with a ſenſible coolneſs, the three openings not only furniſhing ſufficient light, but a thorough draught of air, that does not ſo properly convey freſhneſs into the cave as receive it from its conſtant temperature, which is preſerved by its being impenetrable to the ſun from the thickneſs of the mountainous maſs above it; for it is obſerved in India, and other hot countries, that the excluſion of light is alſo the excluſion of heat; and that by only darkening an apartment, it is ſenſibly cooled. This admits of no exception, but where the ſoil and ſituation are of ſuch a nature as to continue the heat after the actual preſence of the ſun is withdrawn.

This iſland contains nothing more that is worthy of notice; for there are not above two or three huts upon it, and it has no water but what is ſaved from the rains. The growth of the hill is only underwood and graſs, which in the dry ſeaſon are often ſet on fire, and will continue burning for three or four days.

To the northward of Bombay is the fertile iſland of Salſett, which in one place is only divided from it by a narrow paſs, fordable at low water. It is about twenty-ſix miles in length, and, on a medium, eight or nine in breadth. The ſoil is very rich, and capable of being improved by cultivation, ſo as to bear every thing produced between the tropics. It is well watered, and was employed by the Portugueſe chiefly to raiſe rice, with which it uſed to furniſh Goa, whence it was called its granary. It has alſo great plenty of almoſt every ſpecies of game, both of the fur and feather kind, and it is not eaſy to conceive a more agreeable ſpot in the univerſe. It was formerly comprehended under the regality of Bombay, and was conſequently comprehended in the treaty of ceſſion made of that iſland to England; but we were afterwards defrauded of it by the Portugueſe, though it is ſo eſſentially neceſſary to Bombay, that the numerous inhabitants of the laſt mentioned iſland, cannot well ſubſiſt without ſupplies of all manner of proviſions from thence.

But while this iſland remained in the hands of the Portugueſe, it was at leaſt ſome alleviation of the damage we ſuſtained in loſing it, that it formed a barrier for us againſt the invaſions of the Marattas. But ſuch was the ſupine indolence and blindneſs of the Portugueſe government to its own intereſt, that no care was taken to defend it from thoſe their conſtant and natural enemies, who had not then the leaſt maritime force. As the iſland could only be attacked by land at one narrow paſs, fordable only at low water, the Portugueſe had only a miſerable redoubt of no ſtrength; but at length the appearance of an approaching rupture induced them abſurdly to begin the conſtruction of a fort, without providing any means of covering the building. The Marattas let them go quietly on, that they might build it for them, and, when it was near finiſhed, poured their troops into the iſland, and eaſily took the fort, before any of the batteries were mounted with cannon, and thus the whole iſland fell as eaſy a prey to them as they could wiſh; by which means Bombay is now become a frontier open to their incurſions, and they are always able to diſtreſs that ſettlement, by refuſing them ſupplies of proviſions.

But to return to the iſland itſelf. It has nothing remarkable in it, beſides the riches of nature, except the ruins of a place called Canara, where there are ſeveral caves in the rocks, ſuppoſed to be cotemporary with that of Elephanta, but none of them approach near it, either in point of ſize or workmanſhip. The mountains are pretty high, and there is a tradition, that they, together with the reſt of the iſland, were raiſed from the ſea by a violent earthquake; in confirmation of which it is pretended, that not many years ago, one of the ſtone anchors, anciently uſed in the veſſels of that country, was found on the top of the higheſt hill; but it does not appear that there is ſufficient foundation for this ſtory.

SECT. XXXII.

A particular Account of an Indian Nation, called the Marattas, who inhabit the Country near Bombay.

HAVING treated of the iſland, we ſhall now add ſome account of the continent bordering upon Bombay. It is inhabited by the Marattas, a powerful tribe of Indian Gentoos ſubject to the mar-rajah, or arch-rajah, who is their king or chief. They are generally a clean limbed, ſtraight people: their complexions are of all ſhades from black to light brown, and they are obſerved to be fairer in proportion to their diſtance from the ſea. Their features are generally regular, and even delicate. They ſhave their heads, only preſerving in the middle a lock, which grows to its full length, ſo as to tie and hang down behind, and two curls, one on each ſide, juſt above the ears. Their women are for the moſt part very handſome, while the bloom of life continues; but that ſoon fades, for few preſerve the charms of their ſhape and ſkin till they are thirty.

The common people wear round their heads a ſmall turban of coarſe muſlin, or a ſmall piece of cloth or calicoe; they have alſo a ſhort piece of cloth about their waiſts, and a looſe mantle, which they throw over their ſhoulders, and when they take their reſt, ſpread it on the ground. They are equally bred to agriculture and arms; but the pay of thoſe in actual ſervice is extremely ſmall, and not furniſhed in money, but in rice, tobacco, ſalt, pieces of cloth, and in the other neceſſaries and conveniencies of life. They have extended their dominions by the ſword, and as they encourage Europeans to deſert to them, have learned the art of war, and can form regular ſieges, but are moſt fit for ſudden excurſions.

Their horſes, on which they principally rely, are ſmall, but hardy, inured to fatigue, and ſure footed. Many of the men have muſquets; but they are very indifferent ones, and moſt of them match-locks: but their chief dependance is on their ſwords and targets; the former are of an admirable temper, and the men, who are well trained in the exerciſe of them, look with great contempt on thoſe brought by our ſhips from Europe. Their targets are perfectly round, and riſe in the middle almoſt to a point; they are hard, ſmooth, light, and well varniſhed; they will therefore eaſily turn a piſtol ball, and at ſome diſtance the ball of a muſquet. They have likewiſe among them excellent archers and ſlingers.

Their

Their food is extremely portable, a little rice, and a leathern flask for water, is all they require, so that every soldier carries his own allowance: the officers themselves have no better diet, especially during their expeditions, which are conducted with great address and amazing rapidity.

The people affect the appearance of the utmost poverty in their dress and houses, to avoid becoming a prey to their rapacious government, which never spares a subject known to be rich, for though they are sometimes left to amass wealth in quiet, this is only considered as so much in bank, to be seized whenever the government pleases to call for it. No distinction is here made with respect to the rank and office of the persons plundered, except of the great military officers, who are made the instruments of oppression, and whom it is unsafe to disoblige. This has occasioned immense treasures to be buried.

The mar-rajah usually keeps his court, or more properly head military quarters, at the fort of Raree in the mountains of Decan, said to be the most impregnable place in the world, it being fortified with a mound of very high rocks so steep, as to be only accessible by one narrow path; and has this advantage, that the land thus inclosed is sufficient to produce grain enough for the maintenance of the garrison; and besides, great quantities of corn are constantly kept in the magazines there. A small number of men is sufficient to defend this natural fortress against the greatest armies that can be brought against it, as all the passes and defiles leading to it thro' the mountains, are extremely narrow and rugged.

Here the mar-rajah usually resides with a kind of military court, composed of his generals and officers, in all the state of a sovereign prince; but both he and his courtiers are so entirely engrossed by military operations, that they are extremely incurious with respect to the arts, manufactures, and rarities of the Europeans. It would be in vain to shew them any of those exquisite pieces of workmanship, which are produced by our artists; they would indeed out of civility praise them with an air of careless indifference; but have so little taste, that tho' no people are fonder of adorning their women with rich jewels, yet they would prefer those of their own workmen's comparatively coarse and clumsy setting, to those of our greatest artists.

These people, from time immemorial, have had settlements to the north of Delli, great part of which they still possess, though such numbers were driven from thence by Aurengzebe, that he employed above twenty years to reduce them in their new settlements in the mountainous parts of the Decan. Ever since they have carried on continual wars with the Moguls, subahs and nabobs, and have made innumerable treaties of peace, which they only observe while it suits their interest.

Those who have had a share in the late wars of India, were only a body of horse, who may be termed freebooters, that alternately take the pay of the highest bidder, but render themselves formidable to the Moors, who marching such numerous and incumbered armies into the field, are by them perpetually harrassed, and reduced by famine; for continually galloping round the country, they cut off the convoys, and as they have no baggage, easily elude all pursuit; and if pursued by superior numbers instantly retire to their fastnesses in the mountains. They have principally enriched themselves by obliging their more wealthy neighbours to become tributary to them; who submit to this from the consideration, that it is less expensive, and a lighter tax upon trade, to agree to some certain payment, than to engage in the unknown expence of armies, to free themselves from so irregular a foe.

In short, these people are destructive enemies, and unserviceable friends. They ruin their enemies by plundering and burning the country, and their allies by their avaricious demands for money. Instead of meriting their pay, which they might easily do after a defeat, by cutting off all the broken troops, they fly to the camp, where every man procures a good burthen for his horse, and walking on foot, drives him away loaded with spoil.

SECT. XXXIII.

Of Angria the Pirate, with an Account of the Conquest of his Dominions by the English.

AS the fame of Angria has spread all over Europe, and as he has given great disturbance to all the nations who have traded to India, it is proper that some account should be given of so formidable an enemy, that the English reader may see by what means a small nest of pirates established a little empire, and how the dominions acquired by those pests of society were conquered by the bravery of our troops.

About a hundred years ago Conojee Angria, from being a private Maratta, rose to be general and admiral under the Saha Raja in his wars with the admiral of the Mogul; and being afterwards made governor of a small, rocky, well fortified island, named Severndroog, seized many of the vessels he had formerly commanded, and with these began to commit acts of piracy, but confined himself to this island till, by repeated successes, he became more formidable. The Marattas were alarmed; but as he had taken most of their fleet, they were unable to attack him in his island, and therefore erected three forts upon the main, within less than point-blank shot of his little territory, which was only about a mile in circumference. They flattered themselves that, by means of these forts, they should reduce him to obedience; but he being superior to his countrymen in skill and bravery, attacked and took several of their sea-ports, and at length extended his conquests on the sea-coast near sixty leagues in length, in which space were several commodious harbours. He also in some places extended his conquest twenty miles, and in others thirty, into the country, and secured his conquests by building small forts that commanded all the narrow passes.

His successors increased their strength by entertaining every desperate fellow they could seduce from the European settlements, and became so powerful, that the Marattas agreed to conclude a peace with them, on condition of their acknowledging the sovereignty of the Raja, and paying him an annual tribute. They now made very considerable captures, and not only took several India ships richly laden from the English, French, and Dutch, but had the presumption to attack commodore Lisle in the Vigilant, of sixty-four guns, the Ruby, of fifty guns, and several other ships in company; and the Dutch suffered so much, that about twenty years ago, they sent seven armed ships from Batavia, and two bomb-vessels, with a number of land-forces, and attacked Geriah, but without success.

Angria now threw off his allegiance to the Marattas; upon which their chief sent ambassadors to remonstrate with him; but he was so far from regarding them, that he ordered the ears and noses of these ambassadors to be cut off. The Marattas, exasperated at this insult, meditated his ruin, and made repeated application to the governor and council at Bombay to assist them with their ships.

The piracies of Angria's successors, who being of his family, bore his name, still greatly annoyed not only the natives both by sea and land, but all European and Mooriſh ships, and our East India company was at the constant expence of a marine force at Bombay to protect their trade; they therefore made some attempts to destroy these pirates, but without success, till the year 1755, when commodore James, commander in chief of the company's marine force in India, sailed from Bombay in the Protector, of forty-four guns, with the Swallow, of sixteen guns, and Viper and Triumphant bomb-vessels, and attacked the fortress of Severndroog.

This fortress is situated on an island within musquet-shot of the main-land, and is strongly, but not regularly fortified; the greatest part of the works being cut out of the solid rock, and the rest built with stones ten or twelve feet square, and on the bastions were fifty-four guns. The largest of the forts on the main-land, called Fort Goa, is built in the same manner, with large square stones, and mounted with forty guns. Two other forts,

in which were mounted above twenty guns each, were formed with leſs art, of ſtones of an irregular ſhape.

The commodore began to cannonade and bombard the Iſland Fort on the ſecond of April; but finding the walls on the ſide where he began his attack of extraordinary ſtrength, for they were fifty feet high and eighteen thick, he changed his ſtation, ſo as to reach Fort Goa with his lower-deck guns, while he plied Severndroog with his upper tier. About noon the north-eaſt baſtion of the latter and part of the parapet were laid in ruins, when a ſhell ſet fire to the houſes, which the garriſon were hindered from extinguiſhing by the inceſſant fire from the round tops. The wind being northerly the flame ſpread almoſt all over the fort; one of their magazines blew up, and a general conflagration enſued. A multitude of men, women, and children running out on the farther ſide of the iſland, embarked in boats; but moſt of them were taken by the Swallow, who was ſtationed to the ſouthward, to prevent any ſuccours being thrown into the iſland on that ſide.

The commodore then directed all his fire againſt Fort Goa, and, after a ſevere cannonade, the enemy hung out a flag of truce; but the governor, with ſome choſen ſepoys, croſſed over to Severndroog, which was ſtill tenable; but, upon the blowing up of their ſecond, and grand magazine, the houſes there were entirely evacuated.
